THE Pyrocratic Electrical Co., Farm Street, Birmingham, are now marketing a new mica

plug which consists of three pieces only, and when being placed together the point centres itself. The mica is put on with a special cement that is grease proof. The makers claim that it is impossible to break the layers of mica when adjusting.

THE report of the directors of the Lanchester Engine Company, Limited, presented to the shareholders at the fourth ordinary general meeting, held at Birmingham, on Wednesday, showed a net profit for the year, after charging directors' fees, interest on debentures, depreciation on plant, tools, etc., and providing ample reserves for bad and doubtful debts, of £8,667 2s. 6d., which the directors propose to carry forward. In consequence of the development of the undertaking additional capital is now required, and the directors propose to offer for subscription, at an early date, a further issue of ordinary shares, preference in allotment being reserved for the present shareholders.

Plan of Chassis of 5-h.p. "Humberette."

CONTINENTAL NOTES.

AT the leading French motor-car factories all attention is just now centred on hurrying along the 1904 patterns. It is declared by many that the stage of experiment has now been fully passed, that radical improvements and marked improvements are equally impossible, and that the forthcoming *Salon* will be more characterised by greater attention to details and a movement toward greater refinement than any radical change in design. While this may be true to a large degree, it is none the less true that the show will be as full of interest as ever. Already a few particulars of the new models of different concerns are leaking out. For instance, the De Dion Company, in addition to their popular 6-h.p. car, are bringing out a new 8-h.p. single-cylinder vehicle with three speeds and several modi-

rival show has for the moment been dropped. Now it is the composition of the French team for the 1904 Gordon Bennett race that has upset the peace of mind of motor-car builders. As has already been mentioned, the Sporting Committee of the A.C.F. had agreed that an eliminatory trial should be organised, but proposed that this should only be to select two cars for the team, a Panhard car to be given a place without competition. It is this proposal that has almost set the French motor world on fire.

THE different "Syndicales" connected with the motor trade have held meetings and have adopted a resolution that an eliminatory trial should be organised to select the cars, not for two places, but for the whole team, and open to all builders, and have charged the Marquis de Dion to bring their resolution before the

Count de Cadignan on his Bardon Car fitted with Roussel Spring Wheels.

(La France Automobile.)

fications in the steering and control. Of double-cylinder cars there will be three sizes—10, 12, and 16-h.p., while a feature will be made of the heavy petrol lorries and public-service vehicles to which reference has already been made in the *Journal*.

THE 1904 programme of the Peugeot Company comprises several new models, chief among which is a 7-h.p. double-cylinder car with cardan shaft transmission, and a 25-h.p. four-cylinder chain driven vehicle. A number of improvements are being introduced in all the old models, which will be found to be much quieter in the running than hitherto.

THERE is at present considerable excitement in automobile trade circles in France. Trouble has been experienced in connection with the spaces at the *Salon*, but apparently the demands of the large exhibitors have been met, and the proposal to hold a

Committee of the A.C.F. Not for a long time has there been such a show of feeling on the part of the trade as has been aroused by this question, and the result of the next meeting of the French Club Committee is impatiently awaited.

RUMOURS are rife in French motoring circles of a new fuel for petrol cars, which not only costs less than the ordinary essence, but is also more economical in use. At present very little is known of the new product beyond that it is ordinary petroleum "modified by a physical process," and that its specific gravity is 720.

THE Automobile Club de Nice is already busying itself with the 1904 Nice week. A provisional programme has been drawn up, according to which the meeting will open on Sunday, March 20th, with a procession of decorated motor-cars. On the

22nd and 23rd March there will be a competition of touring cars over a course yet to be decided.

THE Adler Fahrradwerke Gesellschaft of Frankfort-am-Main, which is reported to be building a racer for the German team in the 1904 Gordon Bennett race, has recently completed a special 24-h.p. racing car, of which an illustration is given herewith. As will be seen, the vehicle is on novel lines, the driver's seat being placed as low and as far back as possible, being entirely separated

The 24-h.p. Adler Racing Car.

by the petrol tank from the mechanician's seat. The engine comprises four cylinders, in pairs, the cylinder diameter being 105 mm. and the stroke 120 mm. The inlet valves are of the usual automatic suction variety. The governor acts on a special throttle valve, which not only controls the quantity of mixture allowed to pass to the engine, but varies the quality to the desired proportions. By means of a hand lever on the steering column the speed of the motor can be regulated as desired from 200 to 1,600 revolutions per minute. A combined honeycomb radiator and tank is used in connection with the pump-actuated water circulation, while as regards the ignition, this is by means of a Bosch magneto. Three speeds forward and a reverse are provided, the power being transmitted from the gear box to the rear live axle by a universally jointed shaft and bevel gearing. Both foot and hand brakes are available, a point about the latter being that a hand lever is fixed at both sides of the car. The frame is built of steel tubing. Although only fitted with a 24-h.p. motor, it is claimed that the car can attain a speed of 50 miles per hour.

BELGIAN automobilists are already formulating plans for next year's "Circuit Nationale Belge." Various alterations in the programme have been proposed. It is suggested that, leaving Brussels on a Saturday, a tour should be made in easy stages to Antwerp, Hasselt, Liege, Arlon, Rochefort, and Namur, the latter place to be reached on the following Tuesday, where a couple of days' rest will be enjoyed. On Friday a fresh start will be made, and Mons, Tournai, Courtrai and Oudenarde visited, Brussels being again reached on the Monday.

THE Krieger Company has lately completed an electrical victoria for the Queen of Italy. It is fitted with a spider seat at the rear for a mechanician. As usual in the Krieger system, there are two electric motors, one to each of the front wheels. The current is supplied by a battery of Fulmen accumulators, the capacity of which is sufficient to run the vehicle a distance of over fifty miles on one charge.

ONE of the novelties at the forthcoming Salon is likely to be found on the stand of the Germain Company, of Monceau-sur-Sambre, Belgium, for, according to report, this concern has a new car on the stocks, fitted with a double-cylinder two-cycle engine.

A CHALLENGE in respect of the Gordon Bennett Cup has been received by the German Club from the Italian Club. This is the first appearance of Italy in this international event.

THE track race meeting organised by the German Automobile Club was held at Westend, Berlin, on Sunday last, in the presence of a large gathering. Owing to the heavy rain of the previous week the track was in a bad condition, which prevented any record speeds being attained.

SOME USEFUL NOTES.

TRANSPARENT celluloid accumulators should always be purchased in preference to the untransparent variety, because, (i.), the condition of the plates; (ii.), the condition of the fluid; (iii.), the level of the fluid; and (iv.), the presence of loose particles in the fluid can then be easily ascertained. As regards the condition of the plates, these should be of a uniform deep slate or chocolate colour, according as they are positive or negative. Whitish-grey patches may be due to "sulphate," and, unless extensive, are not of much importance. They may be reduced by repeatedly charging and discharging the accumulator.

THE fluid should be clear except immediately after charging, when it is milky in appearance. The level of the fluid should always be a quarter to half an inch above the top of the plates. The level may be lowered by (a) evaporation, (b) spilling or leakage. When it is lowered by evaporation all that is necessary is to replace the lost fluid by distilled water. When it is lowered by spilling or leakage the lost fluid must be replaced by acid solution. This is made as follows:—Take one part of pure concentrated sulphuric acid and five parts of distilled water (both obtainable from any chemist), slowly pouring the acid into the water. The resulting solution will be hot and must be set aside to cool before it is poured into the accumulator. Remember that it is dangerous to pour the water into the acid.

The presence of loose particles in the fluid may be due to (a) foreign matter, (b) pieces of paste dislodged from the plates. Such loose particles are apt to lodge between the plates and short-circuit them, and should therefore be removed without delay.

MUCH apparently mysterious trouble may be caused by the union between the positive and negative terminals of the two cells of an accumulator becoming partially or completely broken. Such a contingency is especially likely to give protracted trouble when, as is the habit with some drivers, each cell is tested separately. Moral: Test each cell separately, if you wish, but do not neglect to test them both together.

NEVER forget that the method of testing an accumulator with a four-volt lamp is only reliable when the accumulator has been in use for at least half-an-hour immediately prior to the test.

ACCUMULATOR terminals should be smeared with vaseline to prevent corrosion and "setting." To do this most effectually, remove the nuts, and, having left the wires in position, thoroughly lubricate the terminals and replace the nuts. On screwing these down, enough vaseline will be squeezed out to lubricate them externally.

A GERMAN firm has lately brought out the useful patch press illustrated herewith. As will be seen, it is intended for use in connection with the repair of punctured inner tubes, especially in the application of larger patches than can be easily

pressed by hand. It is not necessary to remove the wing nuts, they are merely unscrewed a little, allowing the top part to be swung round. The tube is then placed in position, the patch applied, and afterwards placed under pressure by screwing down the top part. The device is so simple that almost any motorist could easily make one for himself.

MOTOR-CYCLING NEWS.

THE Jehu Motor Co., Ltd., have just brought out a useful little tool for punching holes in the driving belts of motor-cycles. The accompanying illustration depicts the tool in actual size. The method of using it will at once be apparent, an ordinary

spanner being used to grip the head nut. The screw punch is hollow, the tip being hardened and ground to give a good cutting edge. The tool can be carried in the vest pocket or in the tool bag. It will, the makers claim, cut a hole in any belt up to a full half-inch thick, and the "Magnum Lincona" size expeditiously and cleanly.

MR. A. W. FORINTON, of West Street, Boston, has facilities for the repair of motor-cycles, and also stocks accessories. During the past season he has had good success with his "New Victor" motor-cycle.

A Duplex Manu-Motor Car—Built in Germany about 1885.

THE Motor-Cycling Club will meet at the Marble Arch at 10.30 a.m. on Sunday, 25th October, calling at the Angel, Ditton, at 12 noon. Under the leadership of Mr. S. F. Fry, the party will ride to Abinger Hatch, where lunch will be partaken at 1.30 p.m.

MR. L. R. OSWALD-SEALEY, of Dublin, has made an end-to-end of Ireland record on his Brown motor-bicycle. Leaving Mizen Head, in co. Cork, at 10.5 a.m. on Friday, he reached Fair Head, Antrim, at 6.54 p.m. the following day. The average pace, allowing for stoppages, was seventeen miles an hour. The distance is about 400 miles.

THE Moto Club de Marseilles is organising a motor-cycle touring competition for November 8th. The course is over a distance of 98 kilometres.

THE motor-cycle is now making its entry into Royal circles. Prince Henry of Prussia has lately acquired a motor-bicycle, with which he has been making tours in the Darmstadt district.

TO-DAY (Saturday) the Wolverhampton Motor-Cycling Club will have a run to Stafford, making the Swan Hotel the venue for the day. A run to Wellington has been arranged for the 31st inst.

MR. B. A. HOLMES, of Peterborough, made an attempt last week to break the motor-cycle record from Land's End to John o' Groat's on a 2½-h.p. "Vince" machine. He had placed 238 miles to his credit during the first twelve hours, but, on approaching Warrington, his machine skidded in turning a corner and he fell heavily upon the road, and discontinued the attempt after covering 357 miles in 19 hours and 25 minutes, 92 miles in advance of record time.

The Southport Meet—The Start of one of the Motor-Bicycle Heats.
Photo by [Mr. V. A. Simon.]

CALLING in at the depot of the Beaufort Motor Company the other day we were able to inspect examples of the latest models of 10-h.p. and 14-h.p. Beaufort cars, which comprise a number of detail improvements. The pump and magneto are now driven by enclosed gear wheels, while a new feature is the improved throttle governor, which can be set from the steering column, to govern at any desired speed. The change-speed gear box is an ingeniously arranged piece of mechanism. There are only two sliding pinions on the square shaft, these having teeth both internally and externally. Two speeds are obtained by the external teeth of the pair, and a further couple of speeds by the internal teeth. The gear box itself is so made that the two shafts it carries, with their trains of pinions, can be taken out without it being necessary to detach the box from the frame. Other improvements are to be found in the clutch, in the fitting of internally expanding brakes and the provision of more roomy carriage work. Finally, we may refer to the great advance that has been made in the production of a quiet running car. We were given a demonstration of this by means of a short trip in one of the new 10-h.p. vehicles with Mr. Lorenzen, who a year or so ago succeeded in driving a motor-car up the Round Tower at Copenhagen, at the wheel. We ran out as far as Finchley, successfully mounting *en route* Netherall Gardens, credited with being the stiffest short climb in the Metropolis. The car ran very smoothly and on the high gear nothing but the quiet tick tick of the engine could be heard. Altogether the Beaufort cars appear to have been greatly improved all round and should meet with considerable favour during the coming season.

LONDON TO BUXTON IN ONE DAY ON A MOTOR-CYCLE.

—

BY THE REV. EDWIN NOYES,

Of St. George's, Hanover Square, W.

THE following account of a ride from the West End of London to Buxton in thirteen consecutive hours may perhaps be of interest to your readers. On the 3rd of August last—Bank Holiday—my wife and I started from our house in the West End of London on our long journey to Buxton. The machine used is a tricycle, with a fore-carriage for the passenger, as shown in the accompanying photograph. We intended to start at five o'clock in the morning, but, as probably many of your readers will remember with sorrow, the weather in London was of the worst type, and to start in the heavy rain which was then falling was quite out of the question. At about 6.30, however, the rain temporarily ceased, so at 7.15 we started.

It was impossible, however, to make any decent pace around London; for, although the roads were clear as regarded traffic,

The Rev. and Mrs. Edwin Noyes on their Motor-Cycle. (Muir, Ealing.)

yet the surface was dreadfully greasy, and in half an hour the machine was plentifully spattered with mud. Rain came on again very heavily as we approached Barnet, and we were obliged to stop and shelter under some trees. We reached St. Alban's at length, after encountering several heavy showers, one of which delayed us at least a quarter of an hour, but after that the weather cleared, and the roads soon dried up.

Leaving St. Alban's we passed on through Dunstable, Fenny Stratford, and Stony Stratford to Towcester, thence along the lovely stretch of level road through Daventry to Coventry, and from Coventry to Stonebridge. At this part of the journey we made our best pace, but perhaps, if I told you what it was, I might fall into a police-trap even now! Stonebridge is exactly 100 miles from our house. Leaving the high road at Stonebridge, we went by a somewhat ill-kept road to Lichfield, and there we stayed for tea. After a rather hurried meal we went on through Abbot's Bromley to Uttoxeter. Here I was doubtful as to whether to take the shorter route to Buxton, *via* Longnor, or the longer one *via* Ashbourne. I explained to the holiday-makers we met that I wished to go, not necessarily the shorter, but the less hilly road, and when this idea had fully taken possession of one or two who had been keeping holiday not wisely but too well, I gathered that it would be best for us to go the longer way, as being the less hilly

of the two. So to Ashbourne we went, and here our trials began. From Ashbourne there is a stiff ascent of some three or four miles, and such gradients, here and there, as I fancy but few motors would take. So it was a case of pushing the motor up, and we fell to it, and at last got to the top. We were then some eighteen miles from Buxton, but we had reached a switchback road, and by rushing at the rest of the hills we climbed all but one, which, though short, was very steep. By this time we were on the highest ground, the moon was shining brightly, and lit up the wild grandeur of the mountainous scene with wonderful distinctness. All about us were peaks and woods and rocky heights, and the stillness which had fallen made the summer night very impressive and beautiful.

We pushed on along the roads, which were now altogether deserted, and at last we saw, far away and beneath us, the gleaming of the incandescent lights of Buxton. At 10.15 we drew up in the market-place. We had stopped at least two hours on the way, partly for lunch and shelter, and partly several times to tighten a new driving belt, which stretched a good deal. The distance altogether by the route we travelled was 170½ miles from door to door; and this distance, in spite of the wet, we covered without a single mishap in thirteen hours.

The machine, built by Messrs. Wass and Cocks, Limited, of Ealing Dear, W., gave no trouble whatever on the journey, either as regards the engine, ignition, or tyres. The reliability of the 2½-h.p. Kerry engine, is, I think, amply proved by such a test as this; and its excellence was matched and supported by the careful and admirable way in which the machine was built.

ADJUSTABILITY OF STEERING WHEELS.

NO very great amount of adjustability is provided in the average motor-car, the theory apparently being that motorists are very much of a size and that what is suitable for one is suitable for all. Sometimes, therefore, the fat man, the tall man, the thin man, or the short man have an uncomfortable time of it, and doubtless wish that they had been formed on a different model. This is particularly true in the matter of steering wheels and rods. These are almost invariably designed to suit the average man. The fat driver finds the wheel pressing with uncomfortable persistence against his ample person, while the spare man has to lean forward to grasp it; the short man reaches up for this necessary article, while the tall man usually has to stoop to get his grip on it. There are more of the average men than all others put together, and the ready and obvious conclusion is that they are the ones who should be catered for. At the same time, the others form a distinct and by no means insignificant class, and unquestionably deserve some consideration.

It would not be a very difficult matter, remarks the "Horseless Age," to make the steering wheel adjustable in all directions. At present, nothing of the kind is done. The steering rod can be shortened by the simple process of cutting off an inch or two of its length. This is a crude arrangement, however, and works only one way; the rod cannot be lengthened should it become desirable—as in the case of a car passing into the hands of a tall man. Similarly, the tilt should be adjustable, so that it could always be brought within easy reach of the driver.

THE case of the Dechamps Motor Co. (Limited) v. International Automobile Manufacturing Company (Limited) was down on the paper last week for hearing in the London Chancery Division before Mr. Justice Bucknill. It was a motion on behalf of the plaintiffs to restrain the defendants from improperly using a trade name. When the motion was called on it was stated that it had been agreed that there should be no order on the motion, that it should stand over until the trial of the action, and that the question of costs would be reserved. To this course Mr. Justice Bucknill agreed.

HERE AND THERE.

THE Swift Cycle Co. have purchased additional premises for the extension of the motor branch of their business.

THE residents of Palmerston North, New Zealand, now have their bread delivered in a steam motor-van, the first of its kind in the colony.

THE British Motor Fittings Company have registered the word "Britmo" as their trade mark for engines, gears, and all other parts of motor-cars.

A SERIES of lectures on motor-cars are to be given this winter at the Technical High School at Charlottenburg, Berlin, by Professor Von Borries.

A Dennis Car in the Highlands.

AN automobile club is, we learn, about to be formed in the Malay States, where the number of motor-cars in use has already attained a respectable quantity.

AN order for a two-seated electrical car for the use of the electrical engineer of the West Ham Town Council has been placed with Messrs. Pritchett and Gold.

THE exports of motor-cars and parts from the United States during the eight months ending with August last reached a total of £209,862, as compared with £157,227 in the corresponding period of 1902.

THOSE motor-cycle builders who are anxiously awaiting the advent of the new Longuemare carburettor with automatic air regulation will learn with interest that the Motor Castings Co. hope to receive a supply of the same within a few days.

MR. L. P. MOOERS, who drove a Peerless car in the Gordon Bennett race, was the victim of an accident a few days ago that left him with a wrist broken in two places. It occurred when starting the engine of his racing car, the motor giving a "back kick," his arm catching between the starting handle and the frame, breaking his wrist.

BARNEY OLDFIELD, the well-known American racing motorist, made a new record for five miles on the 29th ult. on the Glenville track, Cleveland, U.S.A., with the eight-cylinder Winton racer used by Winton in the Gordon Bennett race. The time for the five miles was 4 min. 49 2-5 sec. Unfortunately the event was not officially timed.

AT a meeting of the Christchurch (New Zealand) Automobile Club it has been suggested that the club should make representations to the Government to have automobile tyres admitted free of duty. Mr. M. A. Jenny has been elected to the club, which, like the sister organisation at Auckland, intends to have a series of weekly runs.

To meet the demand for a popular priced motor-vehicle, the Star Engineering Company are bringing out a small two-seated car to be known as the "Little Star." It is a reproduction in miniature of the company's larger cars, being fitted with a 6-h.p. single-cylinder engine, three speeds forward and reverse, with a direct drive on the top speed.

OWING to the increasing number of motor-cars calling at Warne's Hotel, Worthing, the proprietor does not intend to close this winter. Plans are now being got ready to double the size of the present garage, which will be finished by Christmas, and will be capable of holding fifty cars. Two engineers will be ready night and day to go to any part of Sussex for motor repairs. A plant for charging accumulators has been fitted in the garage.

THE Electricity Department of the Aberdeen city corporation is using a 16-h.p. Milnes-Daimler car in connection with the maintenance of the overhead conductors from which the electric tramways in the city take their current. The corporation only purchased the chassis, the tower and platform, lockers, etc., being constructed in the workshops of the central power station. When fully extended, the platform which surmounts the tower is about nineteen feet above the ground.

THE A.C.F. competition of motor-cabs and vans has been in progress during the week, and will be brought to an end to-day (Saturday). The trials have been organised with a view of supplying data as to the reliability of the various motors, their powers, consumption of fuel, suitability for hill climbing, the durability of different kinds of tyres, etc. It cannot be said that very great interest has been taken in the competition, for in the van section there are only two entries, both by De Dion, while in the cab category there are only five competitors—a De Dion two-seated coupe, a Collin avant-train or motor fore-carriage, to be fitted to ordinary horse-drawn vehicles, two Gillet-Forest cars, and a new two-seated vehicle known as the Aries.

THE production of a special racing car is just now engaging the attention of quite a number of American motor-car builders. The latest concern to enter the field with a racer is the Packard Motor Car Company, whose "Gray Wolf" is illustrated herewith. It is equipped with one of the company's standard four-cylinder 25-horse-power engines located under the bonnet. The machine has sliding gear transmission, giving two speeds forward and reverse. When running on the high speed all gears are disengaged, the drive being direct from the motor to the differential. The two forward speeds are said to give 30 and 75 miles per hour [at an engine speed of 1,000 revolutions per

The Packard "Gray Wolf."

minute. The spring suspension combines the same transverse front spring used in the Packard touring car and gives to the "Gray Wolf" the same three-point bearing and the flexibility of the running gear necessary for traversing uneven surfaces at high speed without disturbing the alignment of the mechanism. In all its essential features, such as ignition, carburettor, water circulating system, steering gear, brakes, etc., the racer is similar to the standard cars, differing only in its shape and the elimination of all surplus weight for racing purposes. The weight of the car, filled with petrol, water and oil, is slightly below 1,400 pounds. On a track at Providence, R.I., recently, the vehicle covered a distance of 5 miles in 5 min. 32 sec.

FOLLOWING the example of the Hotchkiss Co., it is announced that Messrs. Schneider and Co., of Le Creusot, the great French gun builders, have decided to take up the construction of motor-cars.

SOME time ago we illustrated the tilting steering wheel introduced by the Hussey Drop Forging and Mfg. Co., of Cleveland, U.S.A. The same concern has now brought out a new pattern of wheel which accomplishes the same purpose of providing easy entrance to and egress from the driver's seat, but in an

entirely different manner. In the new wheel a sliding seat or fastening for the wheel has been provided as a substitute for the hinge. The illustration shows the wheel in its central position for steering and, in dotted lines, in its forward position on the sliding seat, to which it can be moved by simply unfastening a catch.

THE Northern Counties Motor Garages, Limited, has been registered with a capital of £1,250 to acquire the business of storing, repairing, and selling mechanically-propelled vehicles now carried on by Mr. D. E. Campbell, at 27, Pilgrim-street, Newcastle-on-Tyne, as the Northern Counties Automobile Garage.

ON the occasion of the marriage of Prince Andreas of Greece with the Princess Alice of Battenberg, which was celebrated at Darmstadt on the 7th inst., the Czar of Russia presented them with a Wolseley motor-car, of the Berkeley wagonette type. The vehicle is one of the new 12-h.p. models, and has been very tastefully upholstered and finished in dark blue morocco leather with silver fittings. Accommodation is provided for five passengers, exclusive of the driver. A detachable omnibus top is supplied for winter use, a separate canopy and wind screen being fitted for summer. The car was despatched from Birmingham to Darmstadt in charge of a special messenger, and soon after its arrival there the Empress of Russia went for a lengthy drive in it, afterwards expressing herself as being very pleased with the appearance and running of the vehicle.

A MOTOR-CAR accident, which resulted in Lady Winnington and the driver of her motor-car being seriously injured, occurred near York on Monday night. The car was being driven by an experienced man, and Lady Winnington sat beside him. Sir Francis Winnington and a valet were in the seats behind. They were proceeding to Settrington House, the residence of Lord Listowel, and were passing through the village of Stillington when the accident happened. Deceived by the imperfect light, the driver took the wrong turning, and before he realised the mistake the car was rushing down a steep hill, at the bottom of which was a mill dam. The car could not be stopped, and it plunged into the water. Sir Francis and the valet escaped with a wetting, but unhappily Lady Winnington and the driver were pinned under the car, which had overturned. Several men ran to the spot to give assistance. On being extricated the unfortunate people were taken into the mill house. Lady Winnington was unconscious, and besides being half-drowned had sustained fracture of three ribs on the left side and concussion of the brain. She did not recover consciousness for over six hours. The driver sustained concussion of the brain and a broken jaw, and lies in a critical condition.

A NEW accumulator repairing plant has been put in the works of Messrs. Brandes and Johnstone, at Coventry.

A GARAGE has been opened in Medfield Street, Roehampton, by Mr. W. Molesworth, who also supplies petrol, etc.

MR. SMITH'S garage at Droitwich was flooded during the heavy rains of last week, the water running like a river through the premises.

IT has been decided to appoint a road surveyor for Invernesshire, to be responsible for the condition of the roads in that county, which, at present, are among the worst in Scotland.

MR. GOVAN, managing director of the Hozier Engineering Company, Limited, will read a paper on "Motor-cars" before the Scientific Society of the Glasgow and West of Scotland Technical College on the 14th prox.

THE Wolseley Company are at present building a 100-h.p. petrol engine for use on the North-Eastern Railway, also a huge transport carriage weighing several tons fitted with a powerful motor for military purposes.

MESSRS. ALFRED DUNHILL, LTD., have just introduced a duplex lens headlight, which is said to give a light equal to 2,500 candle power. The lenses of the lamp are a combination of lenticular and parabolic systems, producing an intensely white, penetrating light.

AT the opening of the Worcestershire Quarter Sessions, Mr. J. W. Willis-Bund, the chairman, dealing with the statutes passed in the last session of Parliament, regretted that the registration and licensing fees for motor-cars had not been made heavier, that the cost of the regulations as to the provisions of notice boards, &c., laid upon local authorities might have been thus met, instead of falling upon the ratepayers.

AN American firm, Messrs. Ryan and Long, of Appleton, Wis., have recently introduced the special hose-supporting swivel arrangement for washing motor-cars illustrated herewith. As will be seen, it is handier to use than the old style hose and reel, and is always ready for use. The device, which is attached to the ceiling, supports the hose in such a manner that it can be carried

round the car in either direction and the stream of water directed upon any part of the vehicle. The hose is held up off the floor and is never in the way of incoming or outgoing vehicles. A very short piece of hose suffices, and as there is practically no wear on it, it will last indefinitely. The hose arm, which is of galvanized wrought iron, is $4\frac{1}{2}$ feet long, thus describing a circle nine feet in diameter. It revolves on a ball bearing.

THE USE OF OIL IN ROAD IMPROVEMENT.

(Concluded from page 638.)

BY JAMES W. ABBOTT.

THE White sanding machine is a device for spreading the sand more uniformly. It consists essentially of a hopper and a corrugated drum mounted on an axle on two wheels and with a castor wheel in front. The sand falls on to the drum and runs out in a sheet whose thickness is regulated by appropriate mechanism. In practice, it is attached by a sort of triangular bracket to a wagon loaded with sand, carrying two men facing each other, who shovel the sand into the hopper. The wagon runs beside the oiled strip. The hopper runs on the sheet of sand which has fallen from it. When the wagon is empty, it is disconnected from the machine and replaced by a loaded wagon.

After an oiled road has been travelled over a few weeks it is an advantage to roll it with a light roller; but the best rolling effect

been properly formed, all the oil required will not exceed twenty-five barrels to the mile for repairs each subsequent year.

With an oiled road, as with macadam or any other kind, it is the constant vigilance and the stitch in time that accomplishes the best results in maintenance. It requires persistent attention. If the crust gets broken it should be repaired at once. For winter repairs it is well to mix in the autumn a lot of sharp sand or fine gravel with oil, stirring it all up with a hoe in a mortar box as mortar is mixed, and being careful not to put on so much oil that any will run away when the mixture is left standing. When a hole starts, clean it out thoroughly with a hoe or brush broom, fill the hole to a little above the adjoining surface with some of the oil and sand mixture, and thoroughly ram it.

Most of the distributors which are now made have a short hose attachment, with gate and nozzle and shut-off valve for use in repairs. When a patch appears to have too little oil, or a hole needs repairs and no oil mixture is at hand, a little oil, with this hose, can be put just where most needed, and with a rake, hoe, shovel, and rammer the difficulty is quickly remedied. In making repairs when fresh material is required, care should be exer-

Across the American Continent. A Stop at a Californian Mining Town.

is obtained if, as soon as travel begins on the newly-oiled road, a wagon is used with broad tyres (at least six inches) with front axle shorter than the rear by an amount nearly equal to double the width of the tyre.

In California, where the aim is to always use an oil containing as much asphalt as possible, the amount of oil required for a 16-foot roadway varies between 250 and 400 barrels of 42 gallons each to the mile. This depends upon the thickness of the oil crust made, the porosity of the material and the percentage of asphalt in the oil.

The quicker this oil crust is made the better. If two applications are made to a porous material and the oil properly stirred in each time, the crust will be finished. If the hard material is a clay, it should have at least two treatments. One will be sufficient for macadam. A dusty clay will require some gravel added for the first application. On the second application the crust which has begun to form should not be disturbed, but after all the oil sinks in that will, a layer of sand should be sprinkled on top. In this oiled crust the bottom will be made from the added sand, while the middle will be a mixture of the two.

In the first experiments a part of the oil was generally put on the first year, and the crust was completed the second or third year. The first year the thin crust was often broken through and a hole was left in the road. After the oiled crust has once

cised not to use any which has been subjected to travel and has refuse in it.

The White smoother is a device for shaving off elevations and filling up depressions in an oiled crust. It consists of a pair of runners sixteen feet long and four feet apart. Between them, at the front end, are set on a slant backward obliquely to the left three rows of three-quarter-inch steel harrow teeth, so adjusted that they shave along lines just one inch apart. As their edges get dull the teeth can receive a quarter or half turn and their height from the ground can be regulated. There is also a blade set obliquely which scrapes off the shavings made by the harrow teeth. These shavings, confined by the two runners and the blade, naturally seek the depressions. In the left-hand runner is an opening, through which any surplus shavings are forced out towards the centre of the road, thus tending to raise the crown.

The question will naturally be asked, "Where can oiled roads be made to advantage?" The answer certainly must be: Any place where, through long, hot, dry summers the roads become very dusty, and where water can be kept out of their foundations in the winter, so that they remain firm and do not give way beneath the oiled surface in the spring. Where the purpose is only to mitigate the dust, any crude oil or its residuum will be found efficacious.

CORRESPONDENCE.

LOSS OF POWER IN MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a constant reader of the *Journal* and also connected with motors, my advice may perhaps prove useful to those motorists who complain of loss of power in engines that have been in use for some time. I have had a number of motors through my hands, and in nine cases out of ten the loss of power has been due to burnt oil forming a scale on the piston head and cylinder walls, and especially in valve passages. In one case it had effectually choked the inlet valve passage; when the valve was completely open it rested on the oil scale and so choked the inlet to the cylinder.—Yours truly,

C. WHITE.

ACCUMULATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue I see a query with regard to accumulators, signed H. J. B. I venture to send the result of my enquiries and slight experience, in the hope that somebody else will follow suit and give us some more information. I believe two chief causes of sulphating are under and too infrequent charging and the raising of the sp. g. through the electrolyte being filled up with acid solution, when it often only needs water. I have come to the conclusion that voltage is only a very slight guide to amperage, and that, however high voltage there is after charging, this soon after falls to 4.2 or only 4.

Messrs. Peto and Radford, whose primary battery I use and find very satisfactory, have been very kind in answering my enquiries and tell me the acid solution generally only requires water to keep the level.

The full number of ampere hours should be charged. I think many users have the idea if the accumulators are not used they do not lose, but they require to be properly charged at least once in six weeks.

I have also come to the opinion that when two accumulators are charged from one source of current series charging is far preferable to parallel. The sp. g. of electrolyte should, I believe, read 1.190 at 3.8, and this rises to 1.200 or 1.210 when charged. This can be easily ascertained by means of a glass syringe with a piece of valve rubber on the nozzle and a small hydrometer and test tube. The colour of the plates (in celluloid cases) and the sp. g. (if in proper order) gives a good guide as to amperage. I was once told by an expert, "That you cannot get much more into an accumulator after it starts to boil." I need not say this is not quite correct. I hope some reader, more able than I am, will give his experience and correct me where I am wrong.—Yours truly,

THOMAS HALLEWELL.

WATER HEATING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an 8-h.p. Argyll car with thermo-syphon cooling, and I cannot keep the water from boiling away. I use soft water, run on the weakest mixture, and keep on the third speed as much as I can, but I have to fill up almost every half-hour. I am thinking of fitting a small hand-pump and a tank to hold about two gallons, so that I could pump a little in when the steam warns me that the water is over-heating. Before doing this I write to ask whether any of your readers have managed to get over a similar difficulty. I have had the bonnet taken off lately and the repairer told me it was clean and free. I am afraid to let much water boil away, as after a little has gone the top tubes are above the water level, and then, there being no circulation, the water boils with great violence.—Yours truly,

H. P. A.

KIRKSTONE PASS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—By way of comment on the Rev. R. Oakley's motor-cycle tour, I write to point out that the hotel at the top of Kirkstone Pass is not 2,854 ft. above sea-level, but only 1,496 ft.; that it is not the highest in England by a long way, there being at least four higher. If the landlord really thought that Mr. Oakley's motor-cycle was the first to cross Kirkstone, he can only have been there a few days. I saw one outside the hotel on Whit-Sunday, and know that many others have been over. It would have been interesting to hear the reverend gentleman describe how he got his load of 419 lbs. up to the top of the Pass, for it is quite certain that he did not ride it. I fancy the ascent would be best described as "agonising struggles."—Yours truly,

W. FITZWATER WRAY.

SERGEANT JARRETT AND HIS ESTIMATES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When returning from Hindhead on my motor-car on the 25th ult. I was stopped at Ripley by Sergeant Jarrett and charged with travelling over a measured distance at the rate of twenty-two miles an hour. It appears that Mr. Dunhill was likewise charged with driving his car

through Cobham (close to Ripley) at exactly the same speed. I observe that Sir Alfred Cooper was also charged by the same sergeant with travelling through Ripley at the rate of 22 miles an hour. In each case a strong protest was made against such accusation, but, needless to say, without avail. Here, then, we have three different types of cars, driven by three different persons, on three different occasions, in the same locality, and yet the alleged speed of each car is precisely the same. Can this be a mere coincidence, or has the renowned sergeant a stock speed for all alike?—Yours truly,

EDWIN JONES.

THE NEW MOTOR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not think Hampshire can be accused of any lukewarmness in relation to this matter, as we have already arranged to hold meetings both at Winchester and Southampton in order that the whole subject may be fully discussed and steps taken to combat the influences at work against us. It seems to me that similar meetings might with advantage be held in all the large towns, the associations formed to act as feeders to the Motor Union keeping that body informed of all that was being done in either direction. There is no doubt that at present there is a strong feeling against us in many places, and the immediate object of such associations should be to endeavour in all possible ways to influence public opinion favourably and remove the many prejudices which exist, largely from ignorance.

In order that our influence may be as far-reaching as possible, I suggest that many who are only indirectly connected with motoring should be induced to join our ranks, such as hotel proprietors, shopkeepers, etc., who are more or less benefited thereby. It is a question, too, whether we should not gain by having one large association with various aims, rather than several smaller ones—e.g., why should not the Roads Improvement Association amalgamate with us, seeing our aims and interests are so much alike? If the subscription were a small one, there is no doubt we should form a strong organization, and until we can do this I fear we shall have a very small voice in future legislation.—Yours truly,

R. W.

RADIATORS AND ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The first two letters in last week's *Journal* interested me. I have a Benz, like "Novocastrian," but I think I could run 150 miles with one supply of water. Recently I made a run of fifty miles with a fall of one inch in the gauge glass, all due to a little alteration I made in the condenser, at the back of the front seat (which cost about 30s.) a sketch of which I will send if it will be of interest. My cooling water never boils. Would a radiator do better than this?

With regard to H.I.B.'s letter, I have experienced all the trouble this correspondent mentions. There may be a short circuit somewhere to account for the rapid exhaustion of his accumulators, but it is most probable, I should, from my own experience, say, that the accumulators have been injured in the charging. Only about six volts is required, but when high tension currents are employed there is risk of injury being done, owing to the trouble (not the difficulty) of intervening the right amount of resistance. It is here where the ill-treatment comes in. I charge mine myself with the Boron battery, which, with its latest improvements, is so effectual, so little trouble and expense, that I wonder at anyone bothering to send their accumulators out to be charged.—Yours truly,

J. HOPE.

P.S.—Since writing the above I have found a plate showing how to charge accumulators with a battery, but the day being dull, it has taken all day to get a print of it, leaving no time to tone and fix. I will, however, enclose it should you care to make use of it. Permit me to say I have no interest in the battery referred to.

We shall be pleased to receive the sketch our correspondent refers to.—Ed. M.-C.J.

CLUB NEWS.

SCOTTISH.

AN anniversary run in celebration of the passing of the 1896 Act has now become an annual institution with the Western Section of the Scottish Automobile Club, and on Saturday a representative gathering took place in Blythwood Square, Glasgow, and proceeded to the Auld Toon of Ayr, a place redolent with the memories of Burns and his associates, Tam o' Shanter and Soutar Johnnie. The weather was none too favourable for a full turn out, a heavy haze hanging, and the continuous heavy rains of the earlier part of the week having turned the roads at some parts into a quagmire. Over two hundred guests, however, sat down to dinner in the Station Hotel, being fully representative of the sport in the West. The police made good arrangements, showing a most reasonable and tolerant spirit, and on the steep incline at Renfield Street, Glasgow, they sprinkled sand. They also did all that was possible

at Kilma'nock and Ayr to control the crowds which gave the motorists a rousing welcome. Many of the motorists went through Ayr to the Brig o' Doun. Among those who attended the run were Dr. W. Grant, Messrs. John Adam, H. Prosser, J. W. Drysdale, A. T. Reid, Anderson, McIntyre, W. Robertson, Dr. James Luke, H. Ewing Smith, W. Kennedy, J. Denholm, J. M. Ross, W. McLean, Alec Govan, A. W. Stevens, J. Cameron, J. Watt, J. Wilson, Major McKean, Messrs. F. F. Wilson, T. Arroll, W. J. Crun, W. Agate, J. A. Johnstone, and George Barclay.

WEST SURREY.

THE run arranged by the West Surrey Club on Saturday last took the form of a paper-chase, the "hares" being Col. Fairtlough and Mr. Ponsford, on the latter's 9-h.p. Clement. Starting from the Club garage at Guildford, they took a course up the Hog's Back, making good use of their six minutes' start. At the summit, a strategically laid false scent led all the pursuers, among whom were Mr. Wilson Noble and party (14-h.p. Daimler), Miss Crothers at the helm of a 9-h.p. Darracq, Messrs. Crothers, Tessier (Argyll) King (Benz), Buttemer (10-h.p. Decauville), towards Farnham, which the leading cars reached before finding their error. Striking across country the trail was picked up by Messrs. Buttemer and Noble at Compton, and eventually the "hares" were found at the rendezvous, which they had reached twenty minutes ahead of their completely outwitted pursuers. By the use of a two-inch cardboard tube about three feet long, the "scent" was discharged near the road surface in a trail which was easy to see at a moderate speed. It is somewhat to be feared, though, that so long as it lies it may lead to a needless observance of the law by subsequent motorists following the same road, though the weather will have probably prevented any long duration of this inconvenience.

dismissed. On the other summons the defendant would be fined 5s., with 2s. costs.

NOT PROVEN.

IN the Aberdeen Police Court, John Paterson, managing director of the Caledonian Motor-car Company, was charged with having, in Crown Street and Union Street, driven a motor-car recklessly and carelessly, and collided with a bicycle ridden by James Thomson, farmer, Countesswells, with the result that the bicycle was smashed. After hearing the evidence Bailie Brown said it was somewhat contradictory. He had come to the conclusion that defendant was not driving at the fast speed which some of the witnesses had suggested. If he had been driving so fast he could not have stopped his car so quickly. He also was of opinion that the cyclist had hesitated unduly. Under the circumstances he had to find the case not proven.

THE EMISSION OF SMOKE.

AT Lambeth, S. F. Dugeon, of the Motor Carriage Works, Exeter Street, Strand, was summoned by the London County Council for using on the highway a locomotive which did not, as far as was practicable, consume its own smoke. Mr. Helman Pidsley, who supported the summons on behalf of the Council, said that the proceedings were taken under Section 30 of the Locomotives on Highways Act, 1878, the offence being the emission of the volume of smoke from a light locomotive used for drawing brewers' drays. The section of the Act required that every

The Reliability Trials. The Police Marshalling the Cars at Brighton.

[Mr. C. Friessell.

EAST SURREY.

THE members of the above club had a most enjoyable run on Saturday last, to Horsham, where a stop was made for tea, a start being made for home about 5.30. The roads were in beautiful condition, and the entire absence of police traps was much appreciated, although one of the cars on the down journey had the honour of being "paced" for over a mile by a cycling representative of the law. Among those who took part in the run were the president, Major Kingsley O. Foster, and party (20-h.p. and 10-h.p. Ariel) Messrs. C. H. and R. Whittington (20-h.p. and 10-h.p. Wolseley), Mr. A. Makovski and party (6-h.p. De Dion, 9-h.p. Dennis), Dr. Wakefield (5-h.p. Benz), Mr. G. H. Bowden (3-h.p. Rex bicycle), Mr. Rees Jeffrey, Miss Hislop, Mr. and Mrs. Gunning Keen, Mr. and Mrs. D. J. Barry.

MOTOR-CAR "OBSTRUCTION."

MR. PLOWDEN had before him, at Marylebone, two summonses issued by the police against Evelyn Beerbohm, of 19, Dover Street, Piccadilly, for obstructing the free passage of the carriageway at Upper Berkeley Street, W., by allowing a motor-car to remain there, and neglecting to carry a light on his car. Police-constable 179 D said the car remained outside No. 48, Upper Berkeley Street, for nearly two hours, and although it was dark there was no light upon it. Mr. Plowden: Is there any limit in which a private carriage may stand in front of a private house? Suppose, for instance, this had been a doctor's carriage, would you have called it obstruction? Receiving no answer, his worship said it could not be contended that a person who paid a visit in a motor-car or carriage must leave in a specified time or be summoned for obstruction. It was ridiculous. The summons for obstruction would therefore be

locomotive used on the highways should be constructed on the principle of consuming, as far as was practicable, its own smoke. On the 12th ult., in the Brixton Road, a locomotive bearing the defendant's name was seen to emit a volume of smoke for a period of four minutes. Police-Sergeant Sutherland and Police Constable Fiddy having given evidence in support of the summons, the defendant's representative explained that the coal merchants neglected to supply Welsh steam coal as they should have done. Mr. Hopkins imposed a penalty of £3 and 23s. costs.

THE MOTOR CAR ACT.

IN view of the operation of the Motor Car Act several local authorities are petitioning the Local Government Board with a view to restrict the speed of motor-cars in their areas to the number of miles per hour indicated by the number given in brackets in the list below. The governing bodies of the following localities have definitely decided to ask the Board to restrict the speed within their districts:—

DERBYSHIRE :—	YORKSHIRE :—
Glossop (10)	Elland (6)
HAMPSHIRE :—	SURREY :—
Swaythling (6)	Ham (10)
PERTSHIRE :—	SUSSEX :—
All villages.	Midhurst (6)
HAMPSHIRE :—	SURREY :—
Lyndhurst (6)	Woking

The Ham District Council have decided to fix sign-posts warning motorists near the New Inn and in Sandy Lane.

* Indicates Motor-Cycle Cases.

MR. J. W. ORDE was summoned at Guildford for furious driving on the Hindhead road, at Shottermill, on the 27th September. Sergeant Stevens said defendant rode a motor-bicycle at the rate of 21½ miles per hour. There were many people about. Defendant said he was the secretary of the Automobile Club, and consequently had to deal with motorists going over the regulation speed, therefore he was himself naturally most careful to keep within the proper speed. He considered himself a good judge of speed. He estimated the speed at which he was travelling at eight miles an hour. He asked the sergeant whether, considering the pedestrians, vehicles and dogs, it was possible for him to exactly time him over the distance. Sergeant Stevens: Yes, within a yard. Defendant: If you can do that, you are the man we have been hunting for a very long while (laughter). He maintained that the sergeant could not time anyone correctly over a distance of 176 yards, when standing at one end of it. The chairman said they had no doubt that defendant was travelling over the legal limit, and he would have to pay £3.

SIR ALFRED COOPER, of Surbiton, a member of the Kingston County Bench, was summoned before the Woking justices on Saturday for driving his motor-car more than twelve miles an hour at Ripley on September 27th. Sergeant Jarrett deposed that the measured 176 yards were covered in 16 sec., or at the rate of over twenty-two miles an hour. When stopped the defendant said, "I am a Surrey magistrate, and we are beginning to doubt your watches and you people, too. It is an easy matter for you men to swear to any lie and get two others to corroborate you." Sir Alfred Cooper said he was going at the rate of eight or nine miles an hour, and was astounded to find a constable holding up his hand. He stopped the car, and Sergeant Jarrett produced his stop-watch. The witness said, "I attach no importance to stop-watch evidence, for I

have seen too much of it, as I happen to be a Surrey magistrate myself." The Bench imposed the usual fine of £3, but intimated that the sergeant ought to have shown the defendant the measured distance when requested.

A NUMBER of motor-car cases were heard at the Uckfield petty sessions, on Thursday of last week, before Captain Noble (chairman), Lieut. Colonel Thompson, Colonel Todd, Mr. C. H. Corbett, and Mr. H. Clarke Jervoise. The Chairman said that the bench had hoped that the fines which had been inflicted there "would have had some effect in moderating you scorchers," but they had not done so to the extent they had hoped. In one case, it appeared that a police trap had been arranged in the chairman's grounds, although without his knowledge. The offender was fined £2.

MR. S. F. EDGE was summoned to appear at Mark Cross Petty Sessions last week, but was represented by Mr. J. E. Hart. It was stated that during the reliability trial run from the Crystal Palace to Eastbourne the defendant covered a furlong near the Court House at the rate of thirty-two miles an hour. Defendant was called upon to stop, but did not do so until two officers jumped upon the steps of the car. Mr. Hart said it was unfair to measure a short distance and time the defendant over it, and that no danger to the public had been proved. The magistrates fined the defendant £2 and 8s. costs for driving to the common danger, and £3 and 8s. costs for refusing to stop when requested.

AT Winchester, Mr. J. T. Overton, of London, was summoned for furiously driving a motor-car at King's Worthy, on September 25th, but as he sent an affidavit proving that he was in Brighton on the day he was supposed to have committed the offence, the case was adjourned for a fortnight to enable defendant to appear.

POLICE TRAPS.

TELEPHONIC communication between Dickleburgh and Scole has enabled the Norfolk police to secure several convictions at Diss.

MOTORISTS touring in Cheshire will be interested to know that between Heswall and the Queen's Ferry cross roads, on the Chester road, there is a police trap.

MOTOR-CAR ACCIDENT.

WILLIAM FRAZER, aged 18, a motor-car driver living at Bind-in-Bush Road, Peckham, surrendered to his bail at the South Western (London) Police Court, to answer the charge of furiously driving and causing injury to John Wright, a watchman, living at 23, St. Cyprian Street, Lower Tooting. After hearing evidence Mr. Garrett thought it was a case for a jury, and committed the prisoner for trial, accepting the bail of his employer for his appearance.

M. A. CLEMENT has ceased his connection with Clement-Gladiator, Limited, as from the 1st inst., but the British Automobile Commercial Syndicate, Limited, will remain his sole agents. The cars to be manufactured by M. Clement will be known as the "Bayard" cars in Paris, but will be designated the "Talbot" in this country, whether made by him at his works at Levallois-Perret, Paris, at Mezieres, France, or by Clement-Talbot, Limited, at their new works in London. The firm with which M. Clement has been connected has still the right to style its productions as "Clement" or "le Clement," and the change of title now notified by Clement-Talbot, Limited, is to prevent confusion arising in the minds of the trade.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

COMMENTS.

INDIVIDUAL motorists must have regard to the dangers of isolation in view of the operation of the Motor Car Act, and should avoid these by becoming associated with their fellows in an attitude of defence. To protect the rights of motorists and advance the interests of Automobilmism the Motor Union has been formed, under the auspices of the A.C.G.B.I., and already has assumed a position of importance and of usefulness. In the early days of the new legislation police errors and judicial ignorance may act adversely upon some of our readers in various parts of the country; hence the earnest warning now given as to the advisability of joining the Motor Union, so that advantage may be taken, in case of necessity, of its facilities for financial and legal assistance, as well as the right to consultation with its officials and committee on general questions affecting automobilism. The Union also places its services at the disposal of intending tourists in the selection of routes, etc., Customs formalities, hotel charges, negotiations with local authorities, and the score and one other matters of concern to those who own or drive cars. Already much good work has been achieved by the Motor Union, the secretary of which, Mr. W. Rees Jeffreys, will be glad to supply further information as to the advantages of membership to readers who communicate with him at the offices, 16, Down Street, Piccadilly, W.

A Good Test Case.

HAVING thus drawn attention to this organisation as one with which all motorists should be associated, we would make a suggestion to the Union. There is much uncertainty prevailing as to the legal status of motorists who warn others as to the presence of police traps, and, as will be seen from the next paragraph, a case has occurred where a considerate driver has fallen a victim to his own goodness of heart. This seems to have all the essential merits of a good test case, and the Motor Union might very well take up the matter with a view to securing the highest legal opinion on the point. Everyone recognises the importance of the subject, and all would be glad to know exactly what the powers of the police are in such cases. Hence our request to the Union to consider this case and to place automobilists under a debt of obligation by obtaining a judicial pronouncement which would have the effect of setting all minds at ease. Surely the motorist who warns others against breaking the law is a friend of the police; and should not be liable to the vexation of a summons, the annoyance of a police court appearance, or the wanton extravagance of a fine.

Warning against Police Traps.

At the Beaconsfield Police Court, on Monday, Mr. Percy Brennan, of Belgrave Square, W., was summoned for driving his motor-car backwards for a greater distance than was necessary on the Bath road. A constable said that he saw the defendant driving backwards and forwards for half an hour, the

distance backwards on one occasion being one hundred yards. His object was evidently to warn other motorists of the police trap further along the road. Mr. Brennan failed to appear, and the Bench issued a warrant for his apprehension. Really those who try to save others from committing illegalities ought to be regarded with some amount of respect and not as common offenders.

Correspondence.

Now that the short touring season that was allowed to motorists this year is over, and we seem to have settled down to a period of dampened enthusiasm for outdoor pursuits, readers are invited to make use of our columns for the discussion of practical points likely to prove useful when opportunities again present themselves for motoring on dry land. Not only do we invite the contribution of questions, but the experiences of readers are also requested, and it may be that they can thus clear up matters which are puzzling to others. Arrangements have been made for queries to be answered by experts in their particular subjects of study and practice, so that, in addition to being an up-to-date chronicle of the doings of the automobile world, the *Journal* will also maintain and extend the position it has won as an authority in the details of practical knowledge that go to make up the competent motorist.

Police Testimonials.

REALLY it would appear that the long feud between the police and motorists of the southern counties is coming to an end, for the Automobile Club has received a batch of letters from chief constables all testifying to the satisfactory nature of the arrangements made in connection with the recent Reliability Trials and the excellent behaviour of the drivers of the cars. The Chief Constables of Winchester, Brighton, Eastbourne, Portsmouth and Maidstone have written to this effect, and the only comment we have to offer is to remind these kind officials of the exciting run from Winchester on the last day but one of the trials.

Bournemouth Automobile Association.

HAMPSHIRE motorists are proving extremely active in view of the forthcoming operation of the Motor Car Act. Meetings have been held at Portsmouth and Winchester, and now comes the news that the Bournemouth Automobile Association has been formed, with Dr. J. R. Thomson, Dr. Harold Simmonds, Dr. H. Nankivell, and Mr. H. E. Acklom among its first list of members. Motorists travelling through the county will be in some strange quandaries, and the County Council might usefully seek to secure something like uniformity in the suggestions of the various smaller bodies within its area. Portsmouth has decided not to have a ten-mile speed limit, and the Bournemouth Town Council proposes at present only to put up notice of dangerous corners. On the other hand, the Christchurch Town Council is proposing a speed limit of ten miles an hour, and other neighbouring bodies are advocating similar restrictions. There is plenty of educational work to be done by the Bournemouth Automobile Association in that part of the country.

The Proposed Federation.

MR. NEWTON, the hon. secretary of the Reading Automobile Club, writes with regard to the proposed federation of existing clubs informing us that favourable replies continue to reach the originators of the plan. Considerable discussion has been aroused by the publicity given the idea, and the secretary of the Reading Club evidently anticipates that its realisation would secure a more influential standing for the provincial associations, which have, he contends, given up some of their independence by becoming affiliated to the London body. So great is the development of automobilism in the country that some such scheme as that now before motorists was inevitable.

Marine Motoring.

ON Thursday, at the A.C.G.B.I., Mr. Bernard Redwood read a paper on marine motoring—a subject which is becoming as fascinating as rapid travel on land. In fact, motoring seems but a step to the airship or the motor-launch. Mr. E. Estcourt is well known as one of the most enthusiastic motorists in the eastern counties. He is also an ardent yachtsman and hopes to combine both pleasures now that he has a motor-launch. This new boat is built on fine lines, and is fitted with a six-cylinder Brooke petrol motor giving 26-h.p. on the brake when running at 900 revolutions per minute. Our photograph of this 34 ft.

launch was taken on Mr. Estcourt's private water adjoining Wroxham Broads, Norfolk. The owner is standing in front of the rustic bridge.

A Motor-Van in Court.

MR. JUSTICE GRANTHAM, sitting in the High Court of Justice, had directed that a motor-van should be brought within the precincts of the court to enable the jury to decide for themselves whether it was of such a description as to be calculated to frighten horses. The vehicle is the property of the Kannenbeer Supply (London), Limited, against whom an action is being brought as the result of a carriage accident, and it duly appeared at the Law Courts on Tuesday. The case, however, was not reached, and the motor-van had to make a second appearance on the following day.

Scouts at Trials.

POLICE traps were such a feature of the Reliability Trials of the A.C.G.B.I., and there were so many victims, that we would suggest a fund should be established to meet the expenses of defence and the amount of fines on future occasions. All engaged on such runs incur the risk of being caught, although they may be only carrying out the official

regulation with regard to speed. Should a car happen to be at the head of a single file of competing vehicles, its driver will probably be stopped, while the others will profit by the warning. Thus it would seem fair that all competitors should place their names to a guarantee fund which could be drawn upon by any competitors convicted while travelling in accordance with rules. The fund might also be employed to engage one or two cars to make preliminary inspections of the roads, and to act as scouts, thus frustrating the intentions of the police.

An Illustration.

AN illustration of the foregoing suggestion comes in the case which was heard at the Alton Petty Sessions on Tuesday, when Mr. W. C. White, managing director of the White Steam Company, was fined for driving a motor-car in the recent Trials at an alleged excessive speed. The police stated that the car travelled over a distance of 352 yards in 38 seconds, as timed by a stop watch. They denied that any other car was in proximity to that of the accused, but four witnesses swore there were ten or twelve cars all within a few yards of each other. These witnesses also declared that when the car stopped the police charged Mr. White with covering 135 yards in 35 seconds, which would work out at under seven miles an hour. An Observer of the Automobile Club, whose duty it was to see that the cars did not exceed a limit of eight miles an hour while within a "control area," stated that the car was actually stopped in a "control area" by the constables. The bench decided to rely upon the police evidence, and imposed a fine of 40s. What a travesty of justice!

America's Reliability Trial.

THE American Reliability Trial, organised by the National Association of Automobile Manufacturers, took place from the 7th to the 15th inst., the distance of 793 miles being covered in eight daily stages. Out of 42 entries only 34 started, of which 20 finished, notwithstanding that the state of the weather and roads, almost throughout, were of the worst description possible. There was almost continuous rain during the first four days, which flooded the valleys through which the route lay, adding considerably to the natural difficulties of the route. The result was that after the first night only a small fraction of the actual contestants succeeded in reaching the specified night control—some running all night, and some stopping at intermediate points. Long detours were found necessary by some of the delayed cars to avoid washed-out roads and on account of bridges which had been swept away by the flood. To give an idea of the extent of the downpour and the consequent floods, it may be stated that the rainfall in New York on the second day of the contest was the greatest ever recorded. The entries comprised petrol cars of the following makes:—Columbia, Peerless, Toledo, Stevens-Duryea, Phelps, Arrow, Pierce, Packard, Rambler, Fredonia, Searchmont, Covert, Knox, Franklin, Haynes-Apperson, Northern, Stearns, Locomobile, Holley, Springer, Oldsmobile, and St. Louis. The only steam cars competing were those of the White Company. A noticeable feature of the entry list is that all the vehicles were of American manufacture, not a single foreign-built car competing. The extreme weather conditions necessitated some modifications in the rules. It was soon found that if each car which failed to arrive by midnight was disqualified there would be too many disqualifications, and this rule was therefore rescinded. It was also concluded that the terrible plastering of mud on the cars after several days' run through clay and dirt, into which the wheels sometimes sank a foot deep, could not fail to seriously affect the operation of the mechanism, however well the more delicate parts were enclosed, and it was therefore decided to allow the machines to be cleaned on the intervening Sunday. No official results are at present available, but, according to telegraphic advices, the first three places have been secured by the two-cylinder Toledo, a single-cylinder Pierce and a White steam car.

Names as well as Numbers.

THE Lord Chief Justice Clerk of Scotland, in the letter he addresses to our Correspondence columns, advocates the use of names as well as of numbers on motor-cars, and probably some English readers may wonder why his Lordship does not also propose to have the address of the owner painted in conspicuous letters. Doubtless the new legislation will cause many suggestions to be made with regard to the future, and it is well that these should be made early, for the consideration of all concerned. But we must be careful that too much is not painted on the cars, else their panels will appear as full of information as the contents bill of a daily paper.

Motor-Bus Licences in London.

MOTOR vehicles may now be regarded as a feature of the annual reports of the Commissioner of Metropolitan Police. They do not bulk largely as yet, but they are an increasing quantity, while it is significant that the number of licences issued to drivers of horse-drawn omnibuses in London last year was 3,667 as compared with 3,736 in 1901, and 3,681 in 1900. The first year that licences were issued for drivers of mechanically-propelled vehicles was 1899, when five were registered at Scotland Yard. In the following year four licences were granted to such vehicles, in 1901 the number was increased to ten, and last year twenty-nine licences were granted. Now that we know about the licences we want to see the motor-buses.

The Liability of Innkeepers.

THE case at the Preston Quarter Sessions in which a motorist has taught a Lancashire innkeeper a lesson and demonstrated to hotel-keepers generally their duties, is of considerable interest to travellers. Apparently, there was really no defence of the refusal of the Lytham innkeeper to accommodate the unfortunate wayfarers who found themselves in that inhospitable region in consequence of the vagaries of their motor-car. As a rule, hotel-keepers seem only too pleased to receive motorists, and subsequently to hand them bills which do not err on the side of modesty. The refusal of Mr. Earle to find lodgings for Mr. Todd is not likely to be repeated, and the legal action resulting should not be forgotten by motorists when on tour.

The New Motor-Car Regulations.

THE forecast we are able to give on another page of the regulations which the Local Government Board intend to make under the Motor Car Act is of more than ordinary interest. The question of the size of the numbers will probably be the first point for which readers will look, and here we may say the present idea of the Board is that the numbers shall be white in colour on a black rectangular plate. Each number will have to be of a uniform height of four inches, of an average width of three inches, and of a uniform thickness of one inch. For the details as to spacing, etc., readers are referred to the forecast itself.

An Innovation of Importance.

AN innovation is about to be made which may form the precedent for important developments in the future. One of the regulations gives power to the County or Borough Councils to dispense with one of the two plates ordinarily required on cars, should they be satisfied that the vehicle cannot go more than twelve miles an hour on a level road. More than that, the other plate may be reduced to not less than one-sixth of the prescribed dimensions in such a case. A little experience of such a regulation may easily warrant the authorities to make the limit of speed twenty miles, and to then allow both plates to be ignored. Thus it would seem we are on the way to reason, and

that, as we have all along urged, a wise administration may do something to ease the feeling of irritation occasioned by the proceedings in Parliament earlier in the year.

Wolverhampton Club's Hill-Climbing Competition.

On Saturday last the Wolverhampton Automobile Club held a hill-climbing competition at Hermitage Hill, Bridgnorth, this being preceded by a luncheon over which Mr. S. R. Rhodes, the hon. secretary, presided. He testified to the help received in arranging the event from the Town Clerk, Borough Surveyor, and Superintendent of Police of Bridgnorth. The Town Clerk proposed, "Prosperity to the Wolverhampton and District Automobile Club." The competitions, as already stated, were open only to members of the club, and each car had to be the bona-fide property of the entrant, and driven either by a member or the owner's mechanic. Prizes were offered to the fastest cars, and one prize to the fastest motor-cycle. There was a large crowd of spectators gathered on the hill, and Mr. William Clarke (Motor Manufacturing Company), who entered a 20-h.p. car, did the best time performance, his ascent taking 2 min. 0.2-5 sec. Mr. F. W. Bayliss was second, his 20-h.p. Wolseley car completing the journey in 2 min. 13 sec. The particulars of the competition have been sent to the official handicapper, whose adjudication as to prizes is now being awaited.

The Governing of Gas and Petrol Engines.

ON another page we give a summary of the paper by Mr. Dugald Clerk on this subject at the Automobile Club on Thursday of last week. Mr. Lyons Sampson and Mr. W. Beaumont gave their testimony, in the course of the discussion, to its value, the former joining with the author in condemning governing by ignition, and the latter urging the need for greater simplicity in connection with automobile engines. Colonel Crompton, who also spoke, referred to the success of the steam-driven cars in the recent reliability trials, and deprecated the many complications that had been introduced into petrol engines. Mr. C. W. S. Crawley having concluded the discussion, a hearty vote of thanks was accorded to Mr. Clerk on the motion of the chairman, Mr. Roger Wallace, seconded by Mr. R. E. Phillips, who mentioned that the author of the paper was devoting considerable study to the improvement of the petrol motor.

THE Marquis de Chasseloup-Laubat has presented a cup to the A.C.F. for a race between light cars.

MR. THOMAS ANDERSON has been appointed general manager of the Road Carrying Company, Limited.

WE congratulate Mr. Staplee Firth on getting about again after having undergone a somewhat serious operation.

MR. C. HOLMES, the Master of the Worshipful Company of Coachmakers, is offering prizes of ten guineas for drawings of motor-cars.

AN inquiry into the speed of the London United Electric Co.'s trams was conducted by the officials of the Board of Trade, in the Goldhawk Road, W., on Wednesday.

THE City and Suburban Electric Carriage Co., of Niagara Hall, Westminster, will be among the exhibitors at the ninth annual International Motor-Car Exhibition at the Agricultural Hall, London, N., in March next.

AT Wigan County Police Court on Wednesday, Edward Whitbread, of Lexham Mews, Kensington, was brought up on a charge of manslaughter. Accused was stated to be the driver of the motor-car which killed a child at Ashton, near Wigan, on September 26. He gave evidence on Tuesday night at the inquest, when the jury returned a verdict of accidental death, and censured him. At the police court he was remanded for eight days, bail being allowed.

THE MOTOR-CAR ACT.

—*—

FORECAST OF THE LOCAL GOVERNMENT BOARD'S REGULATIONS.

IN accordance with the Locomotives on Highways Act of 1896, and the Motor Car Act of 1903, the Local Government Board has power to make regulations with regard to the registration of cars and licensing of drivers. Motorists generally are anticipating with considerable interest the scope and tenor of these Regulations, the spirit of which will so largely affect the character of the legislation which is to come into effect in January next.

Already we have mentioned that the Board has practically decided that the measurement of the roadway shall be taken as between hedge to hedge for the purpose of Clause 8, which deals with the 16-foot roadway, about which there has been so much discussion.

REGISTRATION OF CARS.

The Regulations which the Local Government Board intend to make will provide that the Council of all counties and county boroughs shall establish and keep a Register of Motor-Cars. So

Should the ownership of a registered car be changed, the existing registration will be deemed to be void, until the new owner makes a fresh application. If this is sent to the Council with whom the automobile was previously registered, a fee of 10s. for cars, and 2s. 6d. for motor-cycles, will be charged.

The Council will not be allowed to assign the same number to more than one car registered under the same index letter or letters, unless they have previously satisfied themselves that it is destroyed or permanently removed from the United Kingdom, or should the owner express, in writing, his desire to cancel the registration.

IDENTIFICATION PLATES.

An important point will be that dealing with the plates to be fixed to the cars. These will have to be black in colour, and rectangular in shape. The letters and figures will have to be clearly delineated in white characters upon each plate, the registered number being in Arabic figures. The index letter or letters of the Council will have to be placed in a horizontal line, not less than half-an-inch below the upper side of the plate, and parallel to and above the figure or figures of the registered number, with the uniform space of one inch intervening between the bottom of the letter or letters,

Photo by)

Motoring in the Floods on the Great North Road.

(J. T. Newman, Berkhamsstead.

far as "motor-cars not being motor-cycles" are concerned, this will have to give the following particulars:—

1, Index letter or letters of Council; 2, registered number of motor-car; 3, full name of owner; 4, postal address of owner; 5, make or type of engine or car; 6, number of cylinders of engine or car; 7, horse-power of engine; 8, type of body of car; 9, weight unladen; 10, colouring; 11, seating accommodation; 12, whether used or intended for use as stage carriage or as hackney carriage; and 13, date of registration.

As regards motor-cycles, information equivalent to the first four particulars required in the case of motor-cars will be required, together with the type of motor-cycle and the date of registration.

Owners of cars, desirous of registration, will be required to forward to the Council of the county or county borough the necessary particulars to be specified in the Register of Motor-Cars, together with 20s., in the case of motor-cars, or 5s. for motor-cycles. The Council will then register the vehicle, giving each a separate number. The owner will be furnished with a copy of the entries in the Register of Motor-Cars relating to his own vehicle, and also with the plates, forming the identification marks. For these plates, a fee will be chargeable, the amount of which will most probably be fixed by the Local Government Board itself. Before using the car on a public highway, the owner will have to fix the plates in such a position as the Council which supplies them may direct.

It will be open to the owner of a motor-car to amend the entries with regard to his vehicle, and for this no fee will be chargeable.

and at the top of the figure or figures. These letters and figures will be required to be of a uniform height of 4 inches, an average width of 3 inches, and of a uniform thickness of 1 inch, with a space of not less than $\frac{1}{2}$ inch between the adjoining letters or figures.

The Local Government Board will also require that the space intervening between the letters and figures and the two vertical sides of the plates shall be equal in width with a space of not less than $\frac{1}{2}$ inch between the bottom of the lower line of figures and the lower side of the plate.

In order to prevent confusion, no letter, figure, design, or other mark of any kind, must be placed upon the plate or on the car, within 2 feet of such plate.

The foregoing regulations with regard to the size of plates affect cars only. Those for motor-cycles will have to be exactly half of these dimensions.

The regulations will require that every car in public use shall carry two identification plates, one on the front, and the other on the back of the car. These plates will have to be fixed in an upright position, so that the upper and lower sides of the plate shall be horizontal, the letters and figures being clearly and distinctly legible both in front and on the back.

An important point will be introduced by the permission to dispense with the plate on the front of the car, and the reduction of that on the back of the car to a size not less than one-sixth of

of the dimensions already mentioned, should the Council satisfy themselves that the vehicle is not capable of travelling at a greater speed than 12 miles an hour on level ground.

Whenever the vehicle is driven or remains stationary on a highway, between one hour after sunset and one hour before sunrise, lamps will require to be fixed so that the plates on the car shall be illuminated in a way sufficient to secure the letters and figures being easily legible from in front and behind the automobile.

When another vehicle is attached to a car, either in front or behind, the plate will have to be conspicuously displayed on the front or on the back of the vehicle propelled or drawn as the case may be.

THE TRADER'S MARK.

In Section 2 of the Act of 1903 provision is made that the Council might assign to any manufacturer of, or dealer in motor-cars for use in connection with motor-cars on trial after completion, or on trial by an intending purchaser, a general identification mark. This the Local Government Board will require shall consist of the index letter or letters of the Council, and not more than three other letters. The register of such general identification mark will be kept by the Council, and the manufacturer or dealer shall assign a temporary number to any unregistered motor-car, in order to distinguish such vehicle from any other motor-car belonging to him and similarly used. This temporary number will require to be of the same dimensions as the numbers on private cars. The dealer or manufacturer will have to keep a book containing a record of every car belonging to him so used upon the highway, giving a description of the vehicle, the dates on which it is used, the name of the person in charge, and the temporary number assigned on every such occasion. This record will have to be produced for inspection when demanded by a police constable, and should the Council be satisfied that the manufacturer is not observing the general regulations, this mark may be withdrawn.

LICENSING DRIVERS.

With regard to the licensing of persons to drive motor-cars or motor-cycles, the applicant shall furnish the Council with particulars as to name and address, etc., together with the fee of 5s. provided for by the Act of 1903. Anyone not resident in the United Kingdom may apply to the Council of any County or County Borough for a licence or for the renewal of same, but no one shall at any time hold more than one licence.

All applicants for licences will have to fill up a schedule requiring the following information:—

1. Whether application is for licence to drive a motor-car, or to drive a motor-cycle. 2. Whether applicant is less than seventeen years of age; if so, date of birth. 3. Whether applicant holds a licence. 4. Whether applicant has at any time previously held a licence. 5. Particulars of any licence, or licences, previously held by applicant. 6. Particulars of any endorsement on any licence or licences held by applicant. 7. Whether applicant has at any time been disqualified for obtaining a licence; if so, particulars as to the Court by whom, the date on which, and the period for which the disqualification was imposed. 8. Full name of the applicant. 9. Occupation of applicant. 10. Postal address of applicant.

REGISTER OF LICENCE.

A register of licences will have to be kept by the Council stating particulars as to the names and addresses of holders of licences, period of operation, particulars of convictions of holders, particulars of endorsement or suspension, etc. These particulars will be supplied free of charge to licensing authorities under the Act, to police authorities, or to police constables upon application.

Upon application from any court the Council shall give particulars of any conviction of the holders of licences granted by them free of charge to the police authorities for the area in which the holders of such licences reside.

FROM the Cullman Wheel Company, of Chicago, comes a list of the automobile sprockets of which they are now making speciality.

SCHEDULE OF PROPOSED INDEX LETTERS OF COUNTY AUTHORITIES.

Authority.	Index Letter or Letters.	Authority.	Index Letter or Letters.

CONTINENTAL NOTES.

PEACE once more reigns in French automobile trade circles with regard to the team for the 1904 Gordon Bennett race. The way for a solution of the difficulty was to a large extent cleared by Messrs. Panhard and Levassor notifying Baron de Zuylen, the president of the A.C.F., that, while feeling honoured at being awarded a place in the team without trial, they preferred to take their chance with other competitors in an eliminating contest. The all-important question was decided at a full meeting of the A.C.F. committee last week, when, after considerable discussion, the principle of an eliminating trial for all the three places was adopted. The organisation of the con-

speed of 100 kil. (62½ miles per hour); and (3) if it fails to start in the eliminating contest.

ALTHOUGH nothing is as yet definitely settled with regard to the course over which the 1904 Gordon Bennett race will be run, the municipal authorities of Homburg are leaving no stone unturned to secure it for their district. To this end they have just voted a sum of £500 towards the cost of organising the race, while the local hotel-proprietors' association have promised a similar sum.

As briefly reported last week, the track race meeting of the German Automobile Club on the 18th inst. was robbed of its importance by the bad weather which prevailed. The five mile

The start of the 5-mile Race for Cars up to 12-h.p.

The 10-mile Professional Race for Cars over 30-h.p. Ready to start.

THE TRACK RACE MEETING N BERLIN.

test has been placed in the hands of the Commission Sportive. The question now to be decided is as to when and where the trial shall be held.

THE Sporting Committee of the Belgian Club has also definitely decided to hold an eliminating test to select the Belgian team for the Gordon Bennett race, and has chosen the Circuit des Ardennes course for the event. The entry fee for the trial race is 5,000 fr. (£200), £40 of which will go towards the cost of organising the trial, while the balance of £160 will be held as a guarantee of good faith, and will not be returned if (1) the car is not entirely of Belgian manufacture (2) if it fails to attain a

race for cars up to 12-h.p. was won by Gossi on a 7½-h.p. N.A.G., in 11 min. 48 sec. Kruger on a 11-h.p. Durkopp did the distance in 11 min. 26 sec., but was disqualified. A ten mile race for cars up to 19-h.p. brought out a field of nine starters, Mathis on an 18-h.p. De Dietrich carrying off the first place in 19 min. 54 sec. There were also nine starters in the ten mile race for cars up to 30-h.p., the victory in this event falling to A. Ordt on Count Schonborn's 28-h.p. Mercedes (time, 18 min. 15 sec.). There were only four competitors in the ten mile race for cars over 30-h.p.—a 40-h.p. Mercedes and three De Dietrichs, the first named, driven by Pöge, securing a victory in 15 min. 51 sec. The ten mile professionals' race with vehicles

up to 30-h.p. was won by Beconnais on an Opel-Darracq in 19 min. 22 sec.; while in a similar event for cars over 30-h.p. Muller on a 40-h.p. Mercedes made the best time of the day—13 min. 39 sec.

ALTHOUGH little has been heard lately of the Automobile Club of Algeria, its officials have an active programme in hand for the winter season. A beginning will be made on November 22nd by a 100 kilometre road race for cars under 9-h.p. for the Gerin cup, while a further race is to be run off on November 29th. It has been suggested that the eliminating contest for the French team for the Gordon Bennett race should be held in Algeria, where, it is stated, a 500-kilometre circuit could be found in which no neutralisations would be necessary.

THE much-heralded kilometre races on the Dourdan road, organised by "Le Monde Sportif," which should have been held on Thursday last week, were utterly spoiled by the rain, and after a few of the motor-cycle and touring car events had been run off, it was reluctantly decided to postpone the meeting for a fortnight. When the entry list finally closed, it contained the names of no less than 117 competitors. The weighing-in operation took place on Wednesday in pouring rain, and when Thursday

to £320 brought out three starters, Gabreau on a 12-h.p. Boyer being first in 58 1-5 sec., Renaux on a 10-h.p. two-cylinder Peugeot second in 1 min. 9 sec., and De Cardignan on a two-cylinder Bardon with Roussel spring wheels third in 1 min. 31-4-5 sec. Rain now came down in torrents, causing the competitors and spectators to make for shelter, and, as the skies promised no early improvement in the weather, the decision to postpone the meeting until Thursday, November 5th, was hurriedly arrived at.

THERE seems a possibility that official sanction will be given to the annual hill-climbing competition at Gaillon, organised by "l'Auto." The date proposed for the event is November 8th.

M. J. COUTANT, who some time ago was entrusted by the technical committee of the French extra-Parliamentary Commission appointed to inquire into the best methods of dealing with the circulation and control of self-propelled vehicles in France, with the drawing up of a report upon the speed limit, has now finished his task. In his report M. Coutant recommends that on level country roads a speed of 60 kils. (37½ miles) per hour be permitted, and in towns and villages 20 kils. (12½ miles). He further recommends that only types of cars which have been

Madame Clouet and her Knapp Motor-Bicycle.

Sencier on the Moto-Cardan.

THE DOURDAN KILOMETRE TRIALS.

morning broke the prospect was anything but bright. According to the programme, a start should have been made at 8 a.m., but it was not until 10.15 a.m. that it was decided to send off the competitors. Out of thirty-seven entries in the quart-de-litre motor-cycle section, only nine started, the winner being Momo on a Peugeot, who covered the kilometre in 47 1-5 sec. The machine was fitted with a single-cylinder engine 66 mm. diameter by 73 mm. stroke. Lanfranchi, on a similar machine, took the second place with 48 sec. to his credit, while the third place was taken by Sencier on a Moto-Cardan in 49 2-5 sec. This is a novel machine, having a single cylinder engine 66 mm. diameter by 70 mm. stroke, the novelty lying in the transmission. As will be seen from the photograph herewith, the motor is set at right angles to the usual position and transmits its power to the rear wheel through a clutch, universally-jointed shaft, and bevel gearing. One of the motor-cycles, a Knapp, was ridden by a lady, Madame Clouet, who secured the seventh position. The engine of her machine has a cylinder bore of 67 mm. by 70 mm. stroke, and, as will be seen from the illustration, transmits its power to the rear wheel direct.

THE two-seated touring cars costing less than £160 were next sent off, but as the times were not all taken this event will be run again. The class for four-seated cars costing from £160

passed by the "Service des Mines" be allowed to be used on the public highway, and that the Service des Mines be instructed to refuse authorisation to any car capable of exceeding a speed of 60 kils. per hour on the level. He also advocates special licences being issued to competent racing men and special racing cars, and that races under restrictions be permitted, as he considers that it is by this means the steady progress of automobilism will be maintained, and the entire industry benefited thereby. The report has naturally met with the approval of motorists, but it remains to be seen how far the Government will endorse these views when the question is finally dealt with.

THE feat of Capt. Deasy in climbing the Rochers de Naye on his "Martini" car seems likely to be followed by a series of hill-climbing attempts. M. Rougier has opened the ball by establishing a new record up Mont Ventoux on his Paris-Madrid Turcat-Mery racer. His time for the ascent, which was officially checked, was 24 min. 50 1-5 sec., as against the previous best of 27 min. 17 sec. The hill is 21½ kilometres long, during the course of which it rises 1,500 metres. The last 500 metres of the road were covered with thick snow.

FOLLOWING the practice adopted last year of sending one of their 6-h.p. Popular cars on a long tour, Messrs. De Dion and Bouton have just despatched M. Cormier on a similar journey—

this year on one of their new 10-h.p. two-cylinder cars. The itinerary mapped out is through France and Spain, Algeria, Tunis, Italy, Austria, Germany, and Belgium, a total distance of roundly 3,900 miles. Cormier is expected to be back again in Paris in time for the *Salon*.

THE A.C.F. motor-cab and delivery vehicle trials came to an end on Friday last week. Little interest was, unfortunately, taken in them, either by the trade or the public. In the cab

The Collin Avant-Train.

[La Vie Automobile.

section only five cars were entered, and all of them completed the four runs, the lowest consumption of spirit being that of the De Dion car. Briefly reviewing the competing vehicles, it may be mentioned that the De Dion was a 8-h.p. single-cylinder coupe, suitable for doctors' use. The Gillet Forest Company ran a 12-h.p. six-seated omnibus and an 8-h.p. delivery van. A new vehicle was to be seen in the Aries. This follows the now generally adopted lines, being fitted with a 10-h.p. two-cylinder Aster motor and bevel gear transmission. The fifth vehicle—the Collin—was, as mentioned last week, somewhat of a novelty, being an avant-train or motor fore-carriage adapted to take the place of the front wheels of an ordinary cab. The accompanying illustration shows the arrangement with the bonnet removed. It consists of a frame mounted through springs on the two front wheels, which are pivoted in the usual way for steering purposes. The motive power is supplied by a 8-h.p. De Dion engine, which transmits its power through a clutch to a gear box giving three speeds and reverse on one lever. From the countershaft the power is conveyed to the front axle through chain gearing. The main body of the cab is connected to the motor-carriage by eight bolts, so that it can be readily detached when necessary. Its behaviour in the trials marks it as being the most successful avant-train so far introduced. In the delivery vehicle competition only two De Dion cars started on the first day—a delivery van to carry 15 cwt. and a lorry intended for loads up to 3 tons. On the second day a large De Dietrich motor omnibus was permitted to start. As indicated above, little or no interest was taken in the trials, while their value was further diminished by reducing the number of daily runs from six to four, owing to the Dourdan speed trials intervening.

SOME USEFUL NOTES.

It is advisable to always keep a narrow strip of rag wrapped round the vent-holes of an accumulator. This absorbs any acid which may splash out on the road.

WHEN all the essential wearing parts of a car are enclosed in dust-proof cases it would seem to matter little how the dust and mud adhere to the outside of the cases. Yet there are a number of reasons why even the outside of the cases should be protected against dust and splashing mud, and several cars are now made with a special sheet metal protector below the engine and change-speed gear box extending from side to side of the frame. There are always some shafts projecting from bearings in the casings, and precautions to avoid dust working into these bearings cannot be too strongly urged. Besides, remarks an American contemporary, there are the connections for controlling the engine, change-speed gear and brakes, which are not enclosed, and the joints of these can only be properly lubricated and protected against excessive wear if kept free from dust. Finally, any work that is necessary to be done in connection with the engine and gear is much less onerous if these parts are kept clean.

WITH motors of two or four cylinders, one or more of which may be firing badly or not at all, it is not always possible to

Fig. 1.

Fig. 2.

discover the cylinder which is giving trouble without some difficulty. The method is to open the coil box and hold down the tremblers, so that only one cylinder is left in at a time, but in doing this the adjustment of these delicate parts is frequently deranged. In order to avoid this, Messrs. J. Lacoste and Company have produced a small device, arranged to be attached to the dashboard, furnished with push buttons, numbered in consonance with the cylinders. By pressing in any of the upper row of buttons the cylinders in relation can be cut out, and the firing of each verified singly without interfering with the tremblers on the coil. Furthermore to test the spark at the plugs, it is only necessary to push in the lower buttons one by one. The device is, as will be seen, combined with the switch, so the ignition circuit of all the cylinders can be broken at one operation,

Fig. 3.—Diagram of Connections.

as usual, when the car is not in use. The device, as will be seen from Figs. 1 and 2, is made to suit both two and four cylinder engines, the method of arranging it in the circuit being shown diagrammatically in Fig. 3.

MOTOR-CYCLING NEWS.

WHILE much improvement has taken place during the past twelve months in the efficiency of belt-driven motor-bicycles, there is a growing feeling that something more positive is necessary, and judging from present indications new chain-driven machines will shortly make their appearance in increasing numbers. This week we are able to publish an illustration of the

The "Wirral" Motor Bicycle.

"Wirral" chain-driven motor-bicycle, which has lately been put on the market by Messrs. Kelly, Bounphrey and Company, of Birkenhead. As will be seen, the engine is located vertically in a specially designed frame, the latter having a double set of back stays and two top tubes, which gives the rear part of the machine greater strength than is usually provided. The air-cooled engine is of $2\frac{3}{4}$ -h.p., the cylinder being 2 5-16 in. bore by 3 1-8 in. stroke. The inlet and exhaust valves are placed on opposite sides, both being mechanically operated. A spray-type carburettor with float feed and adjustable air-inlet and throttle is employed to furnish the mixture. The usual system of high-tension ignition is adopted, and an exhaust-valve lifter is provided. In place of a belt the power is transmitted by a Renold five-eighth pitch roller chain direct from the engine to the back hub, into which a Bowden friction clutch, already described in the *Journal*, is fitted, this taking up any "snatch" the drive may give and also allowing a free engine when desired. Lubrication is on the splash system, an oil pump being fitted to the side of the tank. These Wirral machines are claimed to be excellent hill climbers and capable of taking fore-carriage, side-car, or trailer with ease.

ON the 1st prox. the Auto-Cycle Club will hold its first annual dinner at the Automobile Club, 119, Piccadilly, W. Mr. M. O'Gorman and Mr. J. Van Hooydonk will provide the solid fare that will follow the dinner.

MR. STAPLEE FIRTH is of opinion that a side carriage fixed to a motor-cycle is not liable to the licence fee that the Inland Revenue authorities in some places are requiring.

FRANK MYCROFT, of Ilkeston, has been summoned for keeping and using a motor-cycle, on August 23rd, without having a licence for the vehicle. Supervisor Goodhind said he would not press for a penalty. The only motive was to notify the public that they must not use motor-cycles without a licence. The chairman said that as it was the first case at Ilkeston, there would be no conviction, but the defendant would be ordered to pay the costs.

OWING to the postponement of the Dourdan race meeting, and to the forthcoming Gaillon hill-climb, the Moto-cycle Club

de France has decided to delay the starting of its 1,000 kilometre motor-cycle reliability trial until next month. The competition will now start on Tuesday, November 10th, and finish on the following Sunday. Entries will be received up to November 5th by M. Berjonpeau, 4, Rue St. Ferdinand, Paris.

TO-DAY (Saturday) the final test for the Edge trophy will take place over the usual 200 miles course in the neighbourhood of Hatfield, under the auspices of the Motor Cycling Club. There are only three competitors left in the contest.

CONSTABLE RYAN summoned Geo. Shackleton, Lucan, at the Naas Petty Sessions, for riding a motor-bicycle on the footpath at Maudlins. The defendant was ordered to pay a fine of £1.

THE Sheffield and District Automobile Club will hold a 40-miles non-stop motor-cycle run to-day (Saturday). The start will be made from the Plumper's Inn, at Tinsley, at 1.30 p.m., and the course will be *via* Maltby, Blythe, Barnby, Bawtry, Tickhill and Worksop. The Lion Hotel will be the club head-quarters at Worksop. If the weather is unsatisfactory the run will be postponed till the following Saturday. The event is purely a non-stop trial, in which pace will not count, and to qualify the rider must go right through without a single stoppage, except where the marshal may certify that the rider is stopped purely for traffic purposes. The pace must be kept at the average of twelve miles per hour, and any competitor exceeding fifteen miles per hour, at any time, will be liable to disqualification.

THE number of medical men using motor-cycles is steadily increasing. One who rides a Phoenix machine says he has covered 5,228 miles on it and has completely abandoned the use of horses in his practice. He attributes his success in a great measure to the methodical way in which he has always put lubricating oil into the engine, he putting one pumpful, *i.e.*, about two ounces, every ten miles. He has never had any ill effects from motoring, and as far as he can judge there is no

Part Sectional View of Bowden Clutch.

particle of evidence that it makes one's hand shake or gives rise to the many small neuroses it is supposed to do. The vibration and jolting is reduced to a minimum by the spring seat-pillar fitted to the machines.

THREE sizes of the Kerry motor-cycle engine will be made for the 1904 season, $2\frac{1}{4}$ -h.p., $2\frac{3}{4}$ -h.p., $3\frac{1}{2}$ -h.p.

THE PRIMAT ALTERNO-ROTATIVE PETROL MOTOR.

ONE of the most interesting exhibits at the Motor-Car Show at the Agricultural Hall in April last was the Primat alerno-rotative motor displayed by Madame Lockert. It is an engine which to all outward appearance is a

Fig. 1.—Right Half of Primat Motor.

Fig. 2.—Left hand Half of Primat Motor.

rotary one, but in which nothing rotates save the connected engine shaft. It consists of two cylinders cast in a ring casting, and having the connecting rods of four pistons attached in pairs to each end of a double rocking lever, from one arm of which depends a short connecting rod rotating the engine shaft proper, which is therefore out of centre with what, for lack of a better term, may be called the engine ring in which the four pistons reciprocate. The engine or cylinder ring is cast in two halves

vertically, and bolted together, an ingeniously cast groove and lip forming a gas-tight joint. The pistons are segmental trunks, and the piston rings have their sides formed on the radial lines of the engine ring.

Referring to the illustrations, Figs. 1 and 2, these show respectively the two halves of the casing detached. The two semicircular cylinders, behind which is provided a water jacket, are seen in Fig. 1, while from Fig. 2 the arrangement of the four pistons can be observed. To facilitate the description, lettered diagrammatic views (Figs. 3 and 4) are added. The connecting rods of each pair of pistons are connected to the ends of a double rocking lever *w*, mounted loosely on the shaft *g*. Pivoted to this lever is a short lever *h*, by means of which the to and fro motion of the rocking arm is converted into a rotary movement, the pinion *i*, to which the lever *h* is connected, transmitting the power to the spur wheel *j* on the central shaft *g*. The arrangement of the valve gear is shown in Fig. 4, two inlet-valves being located at the top at *l*, and two at the bottom; the exhaust valves at *m* and *m'*, and the four sparking plugs at *l'*. The central shaft *g*, on the outer end of which is the fly-wheel, runs at half the true engine speed, owing to the reducing gear wheels *i* *j*, and is therefore additionally employed to actuate the single cam by which all the four exhaust valves are opened at the requisite moment, and the sparking mechanism. The engine works on the usual four-cycle, the sequence being regular—that is to say, as No. 1 piston is on the suction stroke, No. 2 is compressing, No. 3 firing, and No. 4 exhausting.

Fig. 3.—Sectional Views of Primat Motor.

The experimental engine has cylinders 70 mm. by 140 mm. stroke, the true engine shaft on which the pinion *i* is mounted making 900 revolutions per min., the central shaft *g*, which carries the flywheel, and from which the power is taken, running at half this speed. Among the many claims made for the new engine one of the most important is the light weight and the small amount of space occupied, the experimental motor, which develops 12 h.p., weighing only 220 lbs. and measuring but 28 in. in height by 8 in. in width. It is well balanced, while the absence of the costly crankshaft required in the ordinary form of four-cylinder engine is not the least of its striking features, and permits of a little extra outlay on the production of the semi-circular cylinders and the segmental pistons, the manufacture of which is, however, stated not to be such a difficult matter as many engineers consider. In the trial engine no trouble is said to have been experienced on the score of lubrication, while the Longuemare carburettor with two-way outlet furnished mixture for both upper and lower inlet valves without any irregularity.

As will be seen, the Primat motor is a radical and novel departure, and we are looking forward to its practical trial on a motor-car with considerable interest.

HERR PORSCHE arrived in Paris a few days ago with a 15-h.p. Lohner-Porsche combination petrol-electric car, having made the journey from Vienna by road. He followed the course of the Paris-Vienna race, and when he crossed the Arlberg it was covered in deep snow. His net running time for the 1,300 kilometres which separate the two cities was 45 hours.

HERE AND THERE.

THREE motor-cars, a Winton, a Packard and an Oldsmobile, and a motor-bicycle have this year been successfully driven from San Francisco to New York. In a recent issue we gave two pictures illustrating some of the difficulties encountered

The Trans-Continental Run of a Winton Car.—In a "buffalo wallow."

by the Packard, and this week we are able to give a couple of illustrations which indicate the adverse road conditions met with by the Winton on its long journey. The first picture shows the car just being forced from what in the western country is called a "buffalo wallow"—soft, marshy places where a machine will sink in over the wheels. The tourists found it necessary to build a foundation of stone in the bottom of this wallow for a lifting jack, by which the car was gradually forced up. When raised as far as the jack would carry it the wheels were blocked up with planks, stones, or anything else available, and the jack platform, or foundation, built up again to give another hoist, until the car was got out of the wallow. The second illustration shows the car in even a worse wallow than the first one. The photograph from which the picture was reproduced was taken just as the machine was being hauled up by the aid of block-and-tackle and a team of mules. When the mules were brought into use the vehicle was in the middle of a big swamp and buried clear over the wheels and high on the body. Touring under such conditions can hardly be considered a pleasure.

At their garage in Moria Street, Liverpool, on Wednesday next, Messrs. Stanbury and Co. will hold an auction sale of motor-cars, motor-cycles, etc.

JUDGE EMDEN, who, as recorded in our columns last week, finds his experience as a cyclist and motorist useful in deciding questions concerning road accidents, is the owner of an 8-h.p. M.M.C. car.

THE motor-boat movement is making such rapid headway in France that the A.C.F. has decided to appoint a Commission de Yachting Automobile to deal with all matters relating to the new sport.

WILLIAM FRASER, the driver of a motor-car, who was charged at a London police-court with causing bodily harm to a pedestrian by the reckless driving of an automobile, has been discharged. The same result has taken place in the similar charge against J. H. Novis at the Lambeth Court.

MESSRS. JOSEPH LUCAS, LIMITED, have just opened a new London office and showroom at 224, Shaftesbury Avenue, W.C., for the sale of their lamps and motor accessories.

A COMPETITION of carburettors designed to work with ordinary petrolum is to be held in connection with the forthcoming *Salon* in Paris.

BISHOP LENIHAN, one of the leading ecclesiastics in the colony, had his first motor-car trip on the occasion of the recent run of the Auckland (New Zealand) Automobile Association to St. Heliers Bay.

IN response to the demand for a water-cooled Lanchester, the Lanchester Engine Co., Ltd., will put on the market a 12-h.p. water-cooled car for the 1904 season. The air-cooled cars will still be supplied.

A CONFERENCE between representatives of all the automobile clubs in Belgium is to be held on the 19th November, to consider the proposals which should be made to communal authorities regarding the speed of motor-cars, etc.

ALTHOUGH the Duryea cars are built in America, it is well known that for the past twelve months they have been finished in England. This has entailed considerable work being done in Coventry, and the increase of the business has of late been so rapid that with a view to the requirements of next season and the probability of still more of the work being done on this side, the Duryea Company have just acquired over three acres of freehold ground adjoining the canal in Widdrington Road, Coventry, and have commenced the erection of extensive workshops thereupon. The first of these is now rapidly approaching completion, and the company hope to enter into occupation in a few weeks' time.

THE firm of Harry Reynolds, Limited, has been registered with a capital of £5,000 for the purpose of taking over and carrying on the business of motor manufacturers, agents, etc., now carried on by Mr. Harry Reynolds, at Crampton Quay, Dublin.

An Incident of the Trip.

THE Begbie Manufacturing Company, Limited, of Willesden, are removing their business to more central premises, and their address is now 407, Oxford Street, London, W. The Begbie Company have taken up the agency in London for the Coventry Motor Fittings Company's automatic pressure feed lubricators.

A NEW anti-skidding and puncture preventing device for the rear wheels of motor-cars is being put on the English market by Messrs. H. M. Hobson, Limited. It is of Belgian origin, and is known as the "Perfecta." It consists of a band of specially-treated chrome leather, the tread of which is fitted with a large number of leather washers held in place by steel rivets (Fig. 1). It is placed

FIG. 1.

FIG. 2.

round the outer cover, and by means of the tabs, and by special buckles shown in Fig. 2, attached to the spokes. The band is light, and as the leather does not stretch, it is claimed that its use does not affect the resiliency of the tyre, while the dangers of skidding and puncturing are said to be entirely overcome.

THE members of the Automobile Club of St. Louis, U.S.A., are forming an association to be known as the Automobile Club of St. Louis Legal Defence Association. The purpose of the association will be to adjust claims and defend suits against its members on account of alleged damages caused by them to persons or property in the use of their motor-cars.

PROFESSOR H. S. HELESHAW, of Liverpool University College, has been appointed, through the Colonial Office, to organise technical education in the Transvaal and Orange River Colony. The Professor has been granted leave of absence by the University Council until next September, and, we learned some time ago, will take a motor-car with him to facilitate his progress through the new colonies.

THE Speedwell Motor and Engineering Company, Limited, have now got over one of the new 24-28-h.p. Bollee cars. In general arrangement it closely follows the Mercedes, but naturally there are a good many variations in detail. The engine has four cylinders, 105 mm. dia. by 130 mm. stroke, fitted with both battery and magneto ignition. The carburettor is a special one, of which no details have as yet been made public. A combined honeycomb radiator and water tank, fan-cooled, is used, the circulation being maintained by a slow-running pump. Special features are found in the clutch and in the method of suspending the motor, both this and the gear-box having three-point suspension. The great feature of the car is the flexibility of the motor and the extreme quietness when running; in fact, it is extremely difficult to imagine that an engine is in operation underneath the bonnet.

AUTOMOBILES are now admitted free of duty into the port of Lima (Peru).

It has been decided at Washington, U.S.A., that the military motor-cars used in that district, as well as their drivers, must conform to the local regulations with regard to numbering and licences.

MOTOR wagons have now displaced the horse-drawn vehicles which for years have been used to convey luggage to and from the trains in the Pennsylvania Railway station and the ferryboats at Jersey City, U.S.A. The automobiles carry three times the amount of luggage carried on the old trucks.

MESSRS. DE DION BOUTON, LTD., inform us that for the 1904 season they will have four different types of cars, viz., 6-h.p., 8-h.p., 10-h.p. and 12-h.p. The 6-h.p. vehicle will have two forward speeds and reverse, exactly the same as the present model, and will be fitted with 28 in. by 3½ in. tyres and a two or three seated carriage body. The 8-h.p. car is a new model with three forward speeds and reverse, and larger and somewhat heavier than the present 8-h.p. model. The 10-h.p. car is another new model. It will be fitted with a two-cylinder motor. The gear will give three forward speeds and reverse, while interior expanding drum brakes will be provided. The 12-h.p. car was introduced late this season and has proved so satisfactory that no alteration will be made for 1904. It is a larger and somewhat heavier car than the 10-h.p. and is fitted with 32 in. by 3½ in. heavy tyres. In addition to the standard chassis suitable for tonneau and similar carriage bodies, the 8, 10, and 12-h.p. vehicles can also be supplied with longer frames, on which double phaeton, brougham, victoria, and such bodies can be built permitting entrance from the pavement direct to the back seats from either side.

ONE of the special features of the new Napier 18-h.p. car is the novel method of automatically regulating the proportions of petrol vapour and air in the carburettor. It is now very well understood that when a motor is running slowly it requires a larger quantity of petrol relatively to the amount of air admitted to the carburettor than when it is running fast. In other words, the faster the pace the more air is required, and *vice versa*. All users of modern motor-cars also know that the velocity with which the water circulates through the radiators and pipes varies in accordance with the speed of the engine; the faster the engine works the faster the circulation of the water and consequently the greater is the pressure which it

The Napier Hydraulic Air Regulator with Cap Removed to show Diaphragm.

- | | |
|---------------------------------------|--|
| A Water Inlet from circulating pipes. | D Adjusting collar to regulate tension on spring |
| B Diaphragm. | E Spindle of valve. |
| C Spring closing air valve. | F Hot air inlet. |
| | G Hot air outlet to carburettor. |

exerts upon the water gauge. This circumstance has been taken advantage of in arranging the new regulator. The carburettor of ordinary construction is furnished with an adjustable air inlet, and this adjustment is varied according to the amount of pressure exerted by the water upon a diaphragm working in a short cylinder which opens or closes the air inlet orifice in instantaneous accord with the speed with which the water is circulating. Thus the quality of the mixture is constantly kept to the best degree of explosiveness, the result being an exceedingly flexible and silent-running engine.

POWER DISTRIBUTION IN PETROL MOTORS.

It is sometimes a little difficult to realise, without the aid of diagrams, the actions which are taking place simultaneously in the several cylinders of a petrol engine of multicylinder construction, but by the aid of simple diagrammatic illustrations the various actions are presented to the eye most cogently and in such a manner as to assist in the solution of many engine problems which may arise. For instance, the state of things in the double-cylinder four-cycle engine of the twin type, as shown in Fig. 1, in which shaded areas above the diagram repre-

Fig. 1.

Fig. 2.

sent net power developed and shaded areas below represent negative work. In the first stroke of the cycle there is practically no power produced or consumed; in the second stroke the work is negative, the energy being taken from the fly wheel and stored in the compression of the first cylinder's charge. The third stroke of the cycle represents net power developed, but is the difference between the energy produced by the power stroke in the first cylinder and the negative work of compression absorbed by the gas which is being compressed in the second cylinder. The last stroke of the cycle is a power stroke solely, and is represented by the explosion in the first cylinder. It is the most important stroke of the cycle.

Since in a four cycle engine forward strokes are either suction or power strokes and backward strokes are either compression or exhaust strokes, and since (in order to balance moving parts) a forward stroke in one cylinder always corresponds with a backward stroke in the other, the only possible combinations between twin cylinders are suction compression, suction exhaust, power compression, and power exhaust.

In an opposed double-cylinder motor, in order to balance reciprocating parts, both cylinders must make their forward strokes together and their backward strokes together. The suction strokes in one cylinder will, therefore, be simultaneous with the power stroke of the other, and the exhaust stroke of one will correspond with the compression stroke of the other. Representing this condition diagrammatically as in Fig. 2 we have: The first stroke of the cycle is the power stroke of the first cylinder, the second the compression stroke of cylinder No. 2, in which energy is abstracted from the flywheel and added to the charge; that is, the work during the stroke is negative. The third stroke is the power stroke of the second cylinder and the fourth is of negative value, being the compression stroke of the first cylinder. The power distribution in the cycle of an engine of this type is perfectly symmetrical, and, although strokes of positive and negative power value alternate, the result is a very satisfactory torque, demanding less fly wheel capacity than is called for in a motor of the twin type.

In the case of the three cylinder engine with cranks set 120 degrees apart and power impulses 240 degrees apart, the power distribution in the cycle is perfectly symmetrical, but is still somewhat intermittent, although much less so than in the case of the two-cylinder engine. Fig. 3 gives a diagrammatic representation of the action of an engine of this type, and it will be noted that three times in each cycle there is a period of about 60 degrees

duration in which there is no positive power being developed. These three periods are found at the close of a power stroke and while the next cylinder in rotation is finishing the compression of its charge preparatory to firing. In the first 60 degrees of each power area the power is all positive, but in the last 120 degrees the negative work of the next cylinder in rotation has to be subtracted.

Fig. 4 represents the power distribution in a four-cylinder engine, and it is at once seen that there is a continuous production of energy throughout the whole cycle, as the power stroke of a certain cylinder is not completed before the power stroke of the following cylinder begins. At the same time that a certain cylinder is passing through its power stroke its following cylinder is passing through its compression stroke, so that the net work in each stroke of the four is the total power of one cylinder minus the compression work of the next.

The two-cylinder twin engine is not so very much preferable to the single cylinder type as far as regularity of power distribution in its cycle is concerned, and it calls for a very large fly wheel. The two-cylinder opposed engine, while possessed of a symmetrical action, is strongly impulsive in its working. The three-cylinder engine is a decided improvement over the double opposed type in point of uniformity of torque, but it is still manifestly impulsive, as the torque changes from positive to negative three times a revolution, although this is not serious in practice. It is easy to see why the four-cylinder type is so much sought after, as its power production never changes its sign and merely undulates in value four times each cycle. The fly wheel which it requires is exceedingly small, and as there is always a compressed charge in one of the four cylinders its starting is so easy as to give it great popularity.

It is believed, remarks Mr. A. L. Clough, in the "Horseless Age," that these four diagrams constitute rather an interesting study of power production in petrol motors, as they form a regular series, beginning with a very irregular form of power distribution and ending with one which is almost ideal. It should be stated that the forms of the shaded areas representing power are not intended to give any definite quantitative idea of the power produced at every instant, but merely to denote whether the power is positive or negative, and some general idea of its value. Of course, the actual power distribution can be represented only by curves of some complexity. For instance, in a four-cylinder engine in which the power developed would be large toward the beginning of each stroke, especially if early ignition were em-

Fig. 4.

ployed, and would taper off very rapidly towards the end of a stroke as the pressure of the expanding gases under compression increased simultaneously. It is perfectly possible, however, to combine the indicator diagrams of the separate cylinders of a multiple engine in such a way as to get the net power actually being given out. The figures given are purely diagrammatic, and nothing more is claimed for them.

STEAM-ROLLING IRISH ROADS.

ONE of the results of the Gordon Bennett race that are likely to prove of permanent utility to Ireland is the attention that has been drawn to the necessity for the effective rolling of Irish roads. At a recent meeting of the Tipperary Rural Council, the County Surveyor, Mr. E. A. Hackett, estimates that in that district alone no less than £300 has been saved by the use of the steam-roller. So convinced were the councillors as to the value of the work done, that they readily assented to a further expense of over £2,000 on account of steam-rolling the roads.

This will be good news to local motorists as well as to the greater number who make use of the roads. At present not more than a dozen cars are owned in the county, but scores travel through the district owing to its central position between Dublin and the south-west touring districts. A further attraction is the beautiful scenery all along the valley of the Suir.

Some particulars as to the economy effected by steam-rolling will be useful as giving actual experience in the matter and thus inciting other authorities to be equally alert to their own interests. Twelve miles of road in the Clonmel rural district were wont to cost from 4s. to 5s. a perch per annum, or from £64 to £80 per mile for maintenance. The District Council then decided to spend a sum equal to from three to four years' maintenance in steam rolling, paying for the work out of the current year's rates. The result is that the annual maintenance has been reduced to 9d. per perch for the repairs and cleaning necessary. The first of the roads done in Clonmel Rural District has now lasted three years, still holds a perfectly true surface, will last two years more as a minimum estimate, and be a better road at the end than before rolling. The entire cost of steam rolling was 12s. 3d. per perch. At the end of the five years a total sum of 15s. 3d. per perch will have been spent on it, as against 20s. under the former system.

As roads descend in the scale of prices for maintenance from, say, 5s. 6d. per perch to 6d. per perch, the important point arises—viz., at what price will the saving disappear? The cheaper roads, will, of course, last longer, and one formerly in charge of Mr. Hackett, the price of which was 2s. per perch, is now, after being five years rolled, showing little or no signs of deterioration, and will last for another five years. The initial cost of rolling such a road is so great compared with its annual maintenance under the old system that unless the money can be borrowed for a longer term than five years there will of necessity be a loss for several years. With present experience it appears it would scarcely pay to steam-roll any road where the cost of maintenance was less than 2s. per perch, but further experience will probably modify that forecast and enable even cheaper roads to be rolled with economy.

In view of the growing number of automobiles in use in Ireland the subject is worthy the attention of all the leading public men. It is only within the last few years that the importance of the matter has been recognised; the automobile tour in July last brought it further into public prominence, and we shall be glad to know that other counties besides Tipperary are adopting the steam roller not only as a means of economy, but as a friend of the motorist touring in Ireland.

AN interesting race meeting was held on the Bovolento-Padua road, near Padua, Italy, on Sunday last, when the Italian flying kilometre record was broken. The ten-kilometre race on a straight road was won by Florio on a 70-h.p. Panhard in 5 min. 12 sec.; Baron de Caters on a 90-h.p. Mors being second in 5 min. 28 sec. The light car class was won by Borsotti on a Fiat in 8 min. 12 sec. In an attempt on the kilometre record, with flying start, Florio set up new times for Italy, doing the distance in 28 secs.

CORRESPONDENCE.

ACCUMULATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The recent letters on the above subject prove, without doubt, the necessity of more information regarding the construction and maintenance of accumulators. Your correspondent Thos. Halliwell in part hints at the right solution of the problem when he states that sulphating is due to raising the specific gravity through the addition of acid solution when water only is required. The proper specific gravity is usually found printed on a label attached to the cells, and varies according to the construction of the plates.

Some makers specify for the gravity to be as high as 1.230 in a cell fully charged, but it may be taken as a general rule for the gravity to be 1.175 in a discharged cell, rising to 1.215 when fully charged. If the gravity is taken every time the cell is charged, or say every week, and recorded, comparisons can then be made, and this is the best means of ascertaining the amount of charge the cell contains; for, if before sending to be charged the gravity was 1.180 and on its return only 1.190, you would then know that either the cell was not fully charged or else a fault had developed. To keep cells in good condition they should be kept fully charged. Nothing tends more to destroy the plates than partly charging and then discharging them to exhaustion; hence the necessity for the motorist to check the gravity each time the cell is charged. The chief causes of failure are, buckling of the plates and bad

sulphating. Buckling may be caused by too high a charging or discharging rate, also from short circuiting, caused by the active material becoming loose and sticking between the plates, forming a path for the current of lower resistance than passing through the electrolyte. This must be removed immediately it occurs, or the battery will be ruined. Bad sulphating can easily be detected in cells having a transparent case, greyish white patches appearing on the positive (i.e., chocolate coloured plate). This requires careful treatment and is best removed by a long slow charge at about half the usual charging rate. This has the effect of reducing (slowly) the sulphate to a fine powder. Should the charging current be high, this will fall off in scales and bring with it much of the active material, thereby reducing the capacity of the battery.

Referring to H. J. B.'s letter in your issue of the 17th inst., as he sent his accumulators to the makers, and they stated bad treatment, it would be interesting to know the cause. Have these cells always received care in charging? Has the gravity of electrolyte been correct? Is the insulation resistance between wire and motor perfect? Is the secondary (fine wire) winding on coil perfect, both in insulation and continuity? This often breaks down through the points of sparking plug falling across each other, and closing the secondary circuit. The current will then break through the weakest point of insulation in coil and same will quickly burn away.

It is impossible to specify every disease that the ignition accumulator is heir to, in the limited space of this letter, but the importance of understanding a little about maintenance and care of accumulators cannot be over estimated by automobilists. I fear the latter are much at the mercy of those responsible for charging their cells, and I strongly recommend owners who use electric light to do their own charging, being careful first to ascertain that the electric supply is by direct (not alternating) current. I enclose a sketch of a simple means of charging with a table of c.p. of lamps, and the current (approx.) flowing when connected in series with a two-cell battery on a circuit of 100 volts. The voltage required to charge each cell is 2.5 volts, so that with two in series a pressure of 5 volts is required.

Table of current flowing when using a single incandescent lamp as a resistance for recharging cells on a 100 volt circuit:—

Cells.	Candle Power of Lamp.	Approx. Current.
2	8-c.p. lamp	.3 Amp.
2	16-c.p. "	.6 "
2	25-c.p. "	.8 "
2	32-c.p. "	1 "
2	50-c.p. "	1.6 "
2	100-c.p. "	3.2 "

Any number of cells may be charged in series; this will have the effect of reducing the current, when a glow lamp is used as a resistance. Thus if on a 100-volt circuit with a 32-c.p. lamp, six cells are joined in series, the current flowing will be reduced in the ratio of 100, to 100—(6×25) or 100 to 85, therefore if a 32-c.p. lamp takes 1.12 amp. with no battery in circuit, the amount when six cells are coupled in series with it will be .95 amps.

A slight error appears in your "Useful Notes" in your issue of the 24th inst. You state, as regards the condition of the plates, these should be of a deep slate or chocolate colour, according as they are positive or negative. This should read, according as they are negative or positive.—Yours truly,

B. TREVETT.

THE 16-FOOT HIGHWAY CLAUSE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice you ask motorists to be thankful for small mercies, and point to the decision of the Local Government Board to measure the 16 ft. road as from hedge to hedge as a little concession. I do not quite see this. Surely the road surface should be regarded as the limit to be measured, otherwise some strange conflicts may arise.—Yours truly,

A MOTORING M.P.

[The doubt raised by our correspondent can be dispelled on reflection. There are many roads on which the space for traffic is less than 16ft. wide which will remain open now that it has been agreed to measure from the two limits of the highway, but which might have been in the closed category had the authorities restricted the measuring line to the actual surface open to traffic. Those who are familiar with the road leading from Guildford to Winchester will appreciate this point, which is further emphasized in Devonshire and other counties.]

RADIATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to my letter published in the last issue of the *Journal* relating to the little alteration I made in the condenser of my Benz car at the back of the front seat, I now send a sketch of the arrange-

ment. A is the condensing tube that may always be seen behind the front seat of a Benz car. B is the inner tube (air tube) that runs through A. This inner tube—for the purpose of this improvement—is cut in the middle, each piece having a return end attached to it as shown at E. At each outer end of B a bell-mouth bend is fixed as shown at F. The bell-mouths, 5 in. diam., should face the way the car travels. C is the steam escape pipe, but this is of no service now as no steam is ever seen, it is all condensed. The faster the car goes, the more effectual the cooling.—Yours truly,

J. HOPE.

THE USE OF THE ACCELERATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you be good enough to give me a few hints on the use of the accelerator when climbing hills and also when going down hill?—Yours truly,

A NOVICE.

[The accelerator properly so called is simply a device by which the governor is thrown out or retarded in its action, so that the engine is allowed, if it can, to exceed its normal speed. In hill-climbing, it can be used to increase the speed when the engine runs easily on one speed, but fails to take the next higher, but in all cases, particularly when going on first speed, it should be used cautiously, i.e., the engine should not be allowed to race excessively. Going down hill and on the level it should only be used when running on top speed, when its use is simply governed by the pace desired. The only exception is when driving in traffic, when its slight use on lower speeds is sometimes convenient for passing a vehicle without getting on a higher speed. Needless to say it must always be taken off before clutching or applying brakes. Some cars have a miscalled accelerator pedal which is simply a throttle pedal, and must always be wholly or partially depressed when running.]

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have endeavoured to persuade the authorities to allow automobilists, by placing names on their cars, to be relieved from disfiguring them by numbers, the names to be registered opposite the register numbers, so as to give means of identification. I fear that my efforts have failed.

I now venture to propose that we should put names on our cars, and suggest that the use of a name along with the number will make the latter less offensive. It is quite common to have sporting names for "Mobiles" both on sea and land. A boat with such a name as "Rover" or "Bacchante" will be observed as regards its name, and any mere figures accompanying the name will not attract so much attention.

It is already common to use names. My own car and those of several of my friends are known by their names, and where an automobilist has more than one car, distinguishing names are almost a necessity. Thus one of my friends speaks of his cars as "Topsy" and "Mephisto," and such names as "Sea Gull" and "Antrona" are quite familiar, while every reader of motor-car literature knows what is being spoken about when he reads of "Sir Charles" and "Charles the Second."

One of my strong reasons for endeavouring to induce my fellow automobilists to join in putting names on our cars is that it will dissociate us from the ill-conditioned and selfish persons who do so much harm to the sport, for I feel sure that they will not supply more identification marks than the law compels them to do.

Now, the British subject is shy of taking individual initiative. My purpose, therefore, is to invite my motoring comrades to inform me whether they would be willing to join others in putting pet names on their cars. If I can obtain a goodly number I will publish the fact, and every motorist who agrees can then put a name on his car on 1st January without feeling that he will be singular in his action.

Please address postcard to 15, Abercromby Place, Edinburgh.—Yours truly,

J. H. A. MACDONALD.

THE PROPOSED FEDERATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter we recently addressed to the provincial automobile and motor-cycling clubs upon the subject of a proposed "Automobile Federation" seems to have raised, in some quarters, the idea that it is the amount of money demanded by the A.C.G.B.I. which is the greatest drawback to affiliation, and perhaps our letter was not phrased as aptly upon this point as it might have been. The financial question, *per se*, is not really one to be seriously considered, provided always that corresponding advantages be obtained for the sum demanded.

It has also been stated that, were the A.C.G.B.I. properly approached upon the matter, more advantageous terms might be obtained; but, as a matter of fact, each succeeding hon. sec. of ours has approached the parent club with this object in view, but without the desired result.

Again, it has been urged by some that the "Federation" could not be worked on a capitation fee smaller than that demanded by the A.C.G.B.I., but the actual amount of the fee would depend entirely upon the advantages desired. In this connection I may here touch upon the admission of a prominent member of the A.C.G.B.I., speaking upon the subject of affiliation:—

"It is hard, I admit, that practically no return whatever is given for this half-guinea."

Not only is this so, but also, by affiliation under existing conditions, the provincial clubs lose much of their independence, and have to submit in many matters to the dictation of the central and unsympathetic Club. In conclusion I may add that replies, favourable to our suggested scheme, continue to arrive, and these in numbers far in excess of our expectations.—Yours faithfully,

A. E. NEWTON

Hon. Sec., Reading A.C.

WATER HEATING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to H. P. A.'s query in last week's *Journal*, there can be no doubt that one of the pipes which lead from the engine to the cooler in the 8-h.p. Argyll has got stopped. The fact that one of these thermo-syphon coolers ran right through the Thousand Miles Trials without adding water, obviates any necessity for entering into technical explanation. The engine is either heated through too much petrol being used or one of the pipes being choked as suggested.—Yours truly,

B. J.

[Water-heating is very often an accompaniment of the state of things described in the first sentence of the reply, i.e. loss of power, namely leaky valves, valve seats or covers, or plugs. Sometimes a new engine boils badly till it has had a few hundred miles running, owing to imperfect finish of cylinder, probably, and then settles down all right. Another cause is sometimes that mixture cannot be made weak enough, and another air inlet, or a bigger one, will improve matters. It is assumed, of course, that the most obvious cause, namely stoppage in circulating system or deposit in cylinder jacket, is eliminated.]

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Replying to H. P. A., *re* water heating, my car is a 8-h.p. Argyll, thermo-syphon system. I had similar trouble, but now I can run two hours and more and not use a quarter of a pint. The main point is to drive on smallest amount of weakest mixture possible. Make inlet valve so that when lever on steering column is pushed close to stud no vapour can be drawn into cylinder. By this means the smallest volume of vapour required can be found. On the flat, have advance spark full on, uphill, half on. Next, I always run with both doors of bonnet wide open, thus getting a secondary cooling effect on engine. These points have answered in my case, and now boiling water is an exceptional circumstance.—Yours truly,

G. E.

LOSS OF POWER IN MOTORS.—Replying to recent correspondence, there are many causes to which this may be due, but by far the most common is leakage in the neighbourhood of the valves. The first thing that usually occurs to the owner is to grind them in; but before this is decided on as necessary, the joints of inlet-valve seats and that of plug should be tested (a convenient method is with soapsuds) for gas-tightness. With mechanical valves it is, of course, the inspection covers that are most frequently the offenders, and more frequently than either, badly picked sparking plugs. Much power may be lost by this leakage before it amounts to a loss of compression perceptible at the starting handle. Leaky piston-rings, on the other hand, are evidenced by a loss of compression as soon almost as the loss of power is experienced; the cause is sometimes that they are stuck, when a teaspoonful or two of paraffin put in cylinder (when cold) and allowed to stand for some time will often clear them; sometimes that the slits in them have worked round in line, or that they have worn badly, for which the remedies are obvious. Other less frequent causes of loss of power that have come under our notice are: partially blocked petrol pipe (it is seldom that this fails to rapidly eventuate in total stoppage and consequent detection), accidental displacement in throttle-valve connections, so that the latter would not completely open, blocking of gauze covering air inlet to carburettor, and (though it is difficult to understand this failing to have been easily detected) brakes badly adjusted so as to be partially "on" when they were "off."

GOVERNING GAS AND PETROL ENGINES.*

BY DUGALD CLERK, M.I.C.E., F.C.S.

THE governing of a steam engine is a very simple matter compared to the governing of an internal combustion engine of any type. Steam engine governing is confined to two operations only—throttle or cut-off—and all the multitudinous gear which has been invented for controlling the various forms of steam engines differs only in mechanical detail and adaptation to mechanical conditions; but all conform to the two simple principles of throttle and variable cut-off. In explosion motors it was found that the attempt to govern by throttle of gas alone resulted in missed ignitions and the discharge of a large quantity of unburned combustible mixture from the engine. The Lenoir engine (1860) did not succeed on the market, and the first engine to make something of a success was the Otto and Langen, which appeared six years later. This was a very peculiar engine, in which a free piston was shot into the air, a vacuum was produced under the piston, and the atmospheric pressure forced the piston back and engaged a sort of free-wheel clutch arrangement on the fly-wheel shaft. This engine was governed by reducing the number of impulses in accordance with the work required. In time it gave place to the well-known compression engine operating on the Otto cycle, which was invented in 1876 by the late Dr. Otto, and introduced into this country late in 1877. This engine was also governed by missing impulses; that is, the governor operated to either admit the whole gas supply, giving a full explosion, or cut off the whole supply, giving no explosion. This method of governing has, up to now, been found to be the most economical for gas engines of moderate size, and it is the method which is most largely used in stationary gas engine construction. Most of the gas engines built in this country up to about 50-h.p. are governed in this way.

Although this hit-and-miss method of governing, as it has been called, is the best from the point of view of economy in gas consumption at light loads, yet it has been found to be mechanically inferior to other methods of governing when great steadiness of revolution is required. In using gas engines for electric light, for example, it was soon found that governing by this hit-and-miss method required fly-wheels of enormous dimensions to give any steadiness at all at, say, half-load. About 1894 Messrs. Fielding and Platt, of Gloucester, introduced into their electric lighting "Otto" cycle gas engines a method of governing which consisted in throttling both the air and gas supply in such a manner as to admit a gaseous mixture of uniform composition at all loads, so far as the proportion of gas to air is concerned, but allowing the engine to get a smaller and smaller volume of gaseous mixture as the load diminished. By this arrangement the compression in the engine cylinder was reduced as the load became lighter, and the number of impulses were kept up without interruption, and greater steadiness thus resulted. Messrs. Priestman, of Hull, also introduced this method of governing to control their heavy oil engines; and very many of the engines built by them govern in this way.

* Extract from a paper read at the A.C.G.B.I. on October 22nd, 1903.

When Daimler first produced his small petrol engine, he governed by missing impulses. This, of course, was the natural thing for him to do, as he had been engaged for many years with Dr. Otto, at the Deutz Works, near Cologne, in building "Otto" cycle gas engines. It was difficult for him to govern by cutting off the liquid fuel supply in the way that a gas engine cuts off the gas supply. As he had used an automatic admission valve to the engine cylinder, he therefore governed by means of the exhaust valve. He applied the governor to the exhaust valve spindle in such a manner that, when the speed rose the governor pulled out the knife edge opening the exhaust valve, and left the exhaust valve closed. In this way the piston of the engine simply compressed the gases within the cylinder, and compression and expansion went on alternately without opening the automatic inlet valve at all, and the pressure in the cylinder never fell below atmosphere until the exhaust valve was again opened by the fall in speed of the motor, and the consequent operation of the governor. This method of operation proved unsatisfactory, but it was the method of governing which was almost universal until about two years ago. The charge throttle method of governing was introduced a little before that time, and now it may be said to be almost universal. At the Glasgow Reliability Trials in 1901, when I acted on the Judging Committee, I noticed that some of the cars still adhered to the missing impulse type of governing, whereas at the recent Reliability Trials the throttle governor was practically universal. This method of governing has the great advantage of maintaining the full frequency of impulses, and graduating the power of the impulses within practically any required limits. Another method of controlling the impulse now in use consists in varying the moment of beginning the ignition. As a governing method this is an extremely bad one. If an engine be controlled by advance and retard sparking, the consumption of fuel remains practically constant for all loads, and no economy is obtained by running at light loads; and, further, the exhaust valve and exhaust pipe are liable to serious overheating. In order to discuss these matters intelligently, it is necessary to have some idea of the indicator diagram which is given by the petrol engine. To obtain an accurate diagram from a steam or gas engine is, at all times, a matter of considerable difficulty; but in the case of the high-speed petrol engine the difficulties become very great indeed. So great are the difficulties that as yet it cannot be said that we have obtained any really accurate indicator diagrams from high-speed petrol engines.

After giving a sufficient number of examples of the application of the various methods of governing to gas engines, the author said: I will proceed to deal with the petrol engine diagram. Before passing to the petrol engine, however, it is desirable to notice that in all gas engine diagrams, as the charge is reduced, not only does the explosion pressure become less, but the maximum pressure is attained later and later in the stroke. The reason of this is that, although the charge entering the cylinder is kept of constant explosive or combustible proportions, yet this volume is continually diminished. The exhaust products left in the compression space of the engine, however, remain constant in volume and very nearly constant in weight. Consequently, the diminishing weight of combustible charge is added to a constant weight of products of combustion, and thus, although the charge entering the cylinder is constant in proportions, the charge when mixed within the cylinder with the exhaust products becomes more and more dilute. In the Westinghouse, Crossley, Deutz, and Nurnberg engines, the last mixture entering the cylinder passes through a port of considerable dimensions; so that, although the cylinder itself and the combustion space is filled with somewhat dilute mixture, probably imperfectly mixed, yet the port itself always contains a fairly rich mixture. This renders the ignition certain when the hot tube is opened or the electric spark is passed. I may say that, in the really large gas engines of, say, 200-h.p. and upwards, the electric spark produced by magneto machine is almost invariably used now for ignition. The effect of the dilute mixture is to cause the combustion to be slower and slower, consequently in the Crossley diagrams we see the maximum pressure occurring at a longer and longer interval after ignition. In the Westinghouse card, where the engine is running quite light and the compression is only 25 lb., the combustion proceeds so slowly that the pressure practically never rises above the pressure of compression, and the card resembles in some respects the card given by a Diesel engine. In gas engine governing it is obviously necessary, to ensure accuracy of mechanical control, that for any given position of governor, or throttle, or cut-off lever, the impulse produced should be unvarying.

The evil of attempting to control for any length of time by retarding spark is readily seen in any four-cylinder petrol engine. If the engine be run with the throttle full open at a light load for even ten minutes, controlling the speed only by retarding spark, the exhaust pipe rapidly rises to a good red heat; and the exhaust valves, although one cannot see them, must be also red hot. I have observed in some engines, which evidently had been running for long periods with retard sparking, that the metal forming the exhaust valve spindle guide has actually been melted away round the spindle. It is not surprising, therefore, to find that much difficulty is experienced with exhaust valves when engines are run long with retarded spark. The retard spark method of controlling an engine is a most mischievous one, and all petrol engines should be designed so that the full range of controlling can be accomplished by throttling the charge. Variation in the timing of the spark should only be resorted to when it is desired to drop or raise the speed of the motor; and so it is necessary to retard the spark in order to avoid too early or late ignition.

I have taken a brake test from a 5-h.p. Wolsley engine in my possession, and find, although I have not yet indicated it, the actual brake pull requires a mean pressure of 72 lb. per square inch in the cylinder. Assuming

the efficiency to be 80 per cent., this requires an addition of 25 per cent. to 72 lb., which gives the mean pressure in the Wolsley cylinder as 90 lb.

Mr. Dawson has been experimenting with a petrol engine, four-cycle, cylinder $3\frac{1}{2}$ in. diameter, 5 in. stroke, and he has kindly sent me an indicator diagram which he has obtained by means of a special indicator made by himself. This indicator diagram shows a compression of 80 lb. per square inch, and a mean available pressure of 92 lb. per square inch.

Although the method of throttling the total charge is the easiest of application in practice, and perhaps at present the most satisfactory method of governing, yet it seems to me there is another method of operation which is superior to it in many theoretical and practical respects. The fall of compression required by the throttle method of governing results in an increase of petrol consumption per indicated horse-power obtained, and this would be avoided if the compression could be kept constant by admitting the air charge during the whole inlet stroke of the engine, and varying the time of admission of the petrol so as to come later and later in the stroke, as the engine became less and less loaded. Such a method of operation, however, introduces difficulties in maintaining constancy of proportion of petrol to air, and it requires care in shaping the combustion chamber so as to make certain to have mixture of standard strength near the ignition point. For such governing, a somewhat long combustion space is required. In governing of this kind, too, very effective proportioning of petrol to air is required, and a thoroughly effective mixing of the petrol with the air, however small the volume of petrol introduced. Governing of this kind, however, has the advantage that at light loads the mean temperature of the gases filling the cylinder is greatly reduced, and the economy of petrol for equal power would be as good at light loads as at heavy loads. Governing of this kind has been proposed for large gas engines, and an attempt is at present being made to introduce the system, but so far the other type of governing has proved more easy to handle. A governing cycle of this type is that followed by the De Dion engine. In that explosion engine the governing is performed by retaining a portion of the exhaust gases in the cylinder. A very neat arrangement is provided which closes the exhaust valve within limits at any determined part of the exhaust stroke, and so retains a portion of the exhaust gases in the cylinder. By this means the suction valve does not operate on the suction stroke until the exhaust gases compressed in the combustion space have again fallen to atmosphere. By this method the compression is kept up to a very considerable extent, and the volume of admitted charge varied. This control works very well, and gives and maintains impulse every cycle under very light loads. It seems to me, however, to have several objections, in that the hot exhaust gases are mixed with the incoming cold charge, and the mixture compressed is very hot to begin with. This, of course, leads to loss of petrol when running at light loads, as the added heat to produce a diagram area begins at a much higher temperature and therefore requires a larger heat loss.

Although the governing of the petrol engine is now fairly satisfactory, yet there is still much room for improvement. At very light loads throttle governing is apt to be somewhat unstable, and impulse changes occur in the cylinder independently of the movement of the controlling or governing lever. To produce the best possible governing, the first thing required is certainty of the proportion of combustible mixture at all speeds and loads. This is a question, of course, of the carburettor. The second appears to be certainty of ignition within the cylinder, not only as to firing or not firing, but as to firing exactly at the same time, and attaining the same maximum temperature at an equal movement of the piston. This requires good mixing, and at light loads as little mixing as possible of the combustible charge with the exhaust products in the combustion space of the cylinder. In the event of varying the speed greatly, it also requires some accurate mode of retarding or advancing the spark to keep the diagram always rising to a maximum at the compression end of the stroke at all speeds. In most cases this is done at present by a somewhat haphazard hand-operated arrangement. The best governing also seems to me to require constant compression and constant low temperature of the charge before compression. In addition to this, of course, to obtain a governor which does not "hunt," the mechanism of the governor must be arranged for stability, and possibly some dashpot arrangement introduced to prevent the governor acting too quickly. I have confined myself, however, to the heat fluid part of the problem to-night, and do not intend to enter at all into mechanical questions.

THE MOTOR CAR ACT.

IN view of the operation of the Motor-Car Act, several local authorities are suggesting to the Local Government Board the restriction of the speed of motor-cars passing through their area. In addition to those previously notified, the following have been brought to our notice:—

YORKSHIRE.—The circular from the West Riding authority asking the Holmfirth District Council to suggest any restrictions they desired under the Motor Car Act has been considered by a sub-committee, who suggested to the Council that, a restricted speed of ten miles an hour should be prescribed for the following portions of main roads:—Between railway station and Park Head Road (11 feet wide in narrowest place); between Lower Bridge and Prickleden (17 feet wide in narrowest place); and between Lower Bridge and Attorney Lump. The meeting altered the above to include the road from the bottom of Shaw Lane to the

boundary at Holme Banks, and from Ubberton to Attorney Lump. It was agreed to forward the above restrictions to the county authority with the recommendation that danger posts be fixed at dangerous places.

THE BARTON (near Leighton Buzzard) Parish Council has decided to ask the County Council to place a board at the south end of the village warning motorists to slow up when approaching that locality.

THE Portsmouth Corporation is among the few authorities who will place no restriction upon motorists under the new Act. The welcome piece of information was announced last week by Alderman T. Scott Foster, J.P., to a large gathering of motorists assembled at the George Hotel, Portsmouth, under the auspices of the Portsmouth Automobile Club. A resolution was passed on the motion of Mr. Foster, seconded by Mr. Vernon-Inkpen, expressing the thanks of motorists in the borough to the council and the police for their invariable courtesy. A suggestion contained in the resolution was that a caution board should be erected at the entrance to the borough.

HAMPSHIRE.—The District Councils of Eastleigh and Bishopstoke, near Southampton, have advised in favour of a ten-mile limit on all roads under their control.

THE Town Clerk of Liverpool points out that the duty of administering the Motor-Car Act so far as his City Council is concerned will naturally devolve upon the watch committee, and he proposes to include the Act in the duties of the committee when the new standing orders are under consideration. With regard to the licensing and registration of the cars and the licensing of the drivers, this will form part of the work of the town-clerk's department (public office). When the Act comes into operation the committee will probably find it convenient to refer the administration of it to the Hackney Carriages, &c., Sub-Committee.

CLUB NEWS.

MIDLAND.

THE Committee of the Midland Automobile Club have arranged with the manager of the Grand Hotel for the sole use of Room No. 4, as headquarters and club-room. This room will be open to members at any time, according to the hours of the hotel. A lock-up garage for as many as a dozen cars, with special stairway from same to club quarters, has been arranged for and the electrical engineer of the hotel will be in charge.

REPAIRING A MOTOR-CAR.

THE Motor Mart, Limited, has sued Chas. Gold, for £150s. 9d. in the Clerkenwell County Court. The claim was in respect of repairing a 4½-h.p. motor-car, which had been placed in plaintiff's hands for sale. During a trial trip the governor broke, and, at defendant's orders, they supplied a new governor and repaired the car.

Mr. Maynard, the engineer, who, with another man, did the work, said it was necessary to dismantle the whole of the car to get at the governor. Altogether he and the other man spent 16½ hours upon the car, for which they were paid 1s. 3d. per hour. Defendant said the only instruction he gave plaintiff was to put the governor right. This they said would only cost £5. On their undertaking to get the work finished in three weeks he agreed to the terms, but never gave instructions for any other work. Regarding this delay he counter-claimed £10 as damages. The Judge held that plaintiff, having done work beyond what was ordered, must suffer for it. He thought £5 was a reasonable sum for the work, and defendant having paid that into Court, the verdict would be in his favour, with costs. On the counter-claim, the verdict was in plaintiff's favour with costs.

"	"	22	£6, etc.
Alton	W. C. White, Westminster, S.W.	—	40s.

* Indicates Motor-Cycle Cases.

LIEUT. R. L. DAWSON, Coldstream Guards, stationed at Chelsea Barracks, summoned to appear before the magistrates at the Stevinging petty sessions, on Monday, for driving a motor-car at a greater speed than twelve miles an hour and for not stopping when requested to do so by the police-constable who timed him, at Henfield, on October 3, excused himself for non-attendance on the ground that military duties intervened. He sent a letter from a superior officer to that effect. The chairman of the magistrates, however, declared that no military duty could override a summons to appear before them, and that in the event of a like plea being entered in the future a warrant would be issued. A penalty of £10 and costs was inflicted in each case; 31 miles an hour was the speed alleged. The defendant, who had got away from the constables on the 3rd inst., was concerned in an inquiry, which took place on the 6th inst., at Albourne, into the death of a girl who was accidentally killed through a motor accident on the 4th inst., and while there he was recognised by the constable who had timed him. Lieutenant Dawson pleaded "Not guilty" to both accusations.

POLICE TRAPS.

THE Town Clerk of Dover has informed the Dover Town Council that instructions have been given for a measured half-mile to be marked off at two or three of the principal entrances to the town, so that captures of motorists may be made by the police.

STOP watches and a measured quarter of a mile in Heyton Lane, near Prescot, are the latest adjuncts to the police equipment of that district.

At Acomb (York) is a measured distance of 599 yards.

A POLICE trap of 110 yards has been established on the Clapham Road, London, S.W.

BETWEEN Fremington and Tawstock, Devon, is a trap much used by the local police.

THE LIABILITY OF INNKEEPERS.

MR. WORSLEY-TAYLOR, K.C., M.P., and other magistrates have had before them at the Preston Quarter Sessions a case in which Arthur Earle, licensed victualler, surrendered to his bail to answer a charge that he, "being the keeper of a common inn, did, without sufficient cause, unlawfully neglect and refuse to receive as a guest in his house and find victuals and lodgings for one James Todd, a traveller, for which he was ready and willing to pay, at Lytham on June 25."

Mr. M'Nab for the prosecution said that it had long been the law that the keeper of a common inn was bound to provide accommodation for travellers so long as he had that accommodation and so long as a traveller was prepared to pay for it. In this case Mr. James Todd, who was accompanied by three companions, was returning on a motor-car from Rossall. Arriving at Lytham at midnight, they had a breakdown, and Mr. Todd went to the Clifton Arms Hotel, and asked for accommodation for himself and friend for the night. The boots reported to the defendant that two people wanted accommodation for the night, and Earle told him to tell the prosecutor there was no room. That was untrue, because the defendant subsequently admitted there was plenty of room. The explanation afterwards offered was that had Earle known it was Mr. Todd

he would have admitted him. Mr. Todd had taken this action in order that the public and publicans might know that hotels were intended for the accommodation of everybody. It was true Mr. Todd might have adopted another course and brought a civil action against Earle, but this was not a case of money, but of principle.

Mr. Todd gave evidence bearing out counsel's statement. He said that when he went to the hotel he first asked the night porter for a conveyance for the purpose of taking them to Preston. The porter replied that they could not have one, as the yard was closed. He then applied for accommodation for himself and friends. The boots went into the house and then returned and said: "You cannot stay, you cannot have the accommodation." Witness asked for the reason, and the boots made answer, "The house is full." Mr. Todd added that he told the boots to tell his master that he should bring an action against him. Subsequently they obtained a conveyance and drove to Preston.

Mr. A. W. Ladyman, solicitor and clerk to the Preston County Justices, who was with the prosecutor on the night named, also gave evidence. He added that he understood there had only been one such prosecution in Lancashire before.

The defendant said he was the licensee and manager of the hotel. On June 25th it was Lytham Club Day, and he and his staff had, in consequence, been kept exceptionally busy. Between 12.30 and 12.45 a.m. the boots came to the room where he was and said that a couple wanted accommodation. He ascertained that the couple had no luggage, and thereupon he said, "Will you tell them we have no accommodation?"

Ultimately the defendant was found guilty and fined 20s.

CLAIMS FOR DAMAGES.

MARK YEADON, of Bradford, has, at the Bradford County Court, been awarded £5 5s. damages against the Bradford Motor Car Company. He hired a motor from the company for three guineas, but it was alleged that it arrived too late, and would not work properly. Several times on the journey they had to stop and impede the traffic, and the claim was for expenditure caused by the breakdown. For the defence liability was denied.

At the Wakefield County Court, Ernest Bairstow, Earlsheaton, sued Henry Oram, New-street, Barnsley, for £5, compensation for the loss of his bicycle, rendered useless through defendant's negligence; and Oram counter-claimed for £3 10s. for damages to his motor-car. His Honour found for plaintiff for the sum claimed, with costs. The counter-claim was dismissed.

MOTOR-CAR ACCIDENT.

At the Commission Court, Dublin, last week, Richard Grainger O'Callaghan, of Swords, co. Dublin, was found guilty of causing the death of a boy named Brady in Phoenix Park by knocking him down with a motor-car. The boy was riding a bicycle at the time. Sentence of three months' imprisonment was passed.

WHILE Mr. George Turl, manager of a cycle works at Sunbury, was riding a motor-cycle with a trailer attached, in which were his two sons, a cow ran in front of the machine, upsetting the whole party. The boys escaped unhurt, but Mr. Turl sustained injuries that proved fatal. At the inquest on Saturday a verdict of "Accidental death" was returned.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

COMMENTS.

SOME experiments with a new airship, built to the designs of Mr. W. Beadle, have been made at the Alexandra Palace this week. It is constructed on novel principles, and has two propellers, one propelling the airship forward, and the other being fitted in a frame which can be placed in any plane by means of a steering wheel. The capacity of the balloon is so arranged that the hydrogen gas will only lift it about forty feet from the ground, and it then depends on the steering propeller to rise, fall, or turn; by this means no gas is lost when coming down to the ground. The motive power is supplied by a Blake 12-15-h.p. 4-cylinder motor, which has been specially lightened by employing aluminium wherever possible. The framework is composed entirely of steel tubing. The cubic area of the balloon is 26,000ft., the length 93ft., and diameter 24ft. Both steering and driving are operated from a central compartment, which holds two passengers. Mr. Beadle has had excellent results from a model 12 ft. long, driven by india rubber bands, and could make it go in any direction and rise and fall by altering the position of the steering propeller, even when the gas was not sufficiently buoyant to lift the model off the ground, so that the experiments with the new airship will be followed with great interest.

The Scottish Club.

MR. J. WEIR and the Scottish Automobile Club have extracted an apology from the member of the Ayrshire County Council who recently raised his whip against the driver of a car in which Lord and Lady Ailsa were passengers. The incident was recorded in our columns a few weeks ago. Since then the Scottish Club took the matter up, and an apology has now been received from Mr. Inglis, who will probably recognise the rights of motorists when on the road in future. In this connection we would urge the need for all motorists to belong to their local clubs, and also congratulate the Scottish Automobile Club on its action in this matter, as well as on the recent accession of nearly a score of new members to its Western Section's ranks. The annual dinner of this branch of the Club will be held on the 7th inst., with Lord Inverclyde in the chair.

Marine Motoring.

THE topic of the weekly paper at the Automobile Club on Thursday, the 29th ult., was "Marine Motoring," the subject being dealt with by Mr. Bernard Redwood. The paper was a brief *resumé* of the rapid progress that has been made in this country with the new sport of marine motoring and the construction of motor-boats during the past twelve months, pictures of several well-known craft of this type being thrown on the screen. The author considered that the four-cycle petrol motor will supersede those of the two-cycle type, and that it is, in fact, already doing so in America. Owing to the necessity of

keeping the crank case compression tight, the method of construction will always make the two-cycle motor a comparatively heavy one, while the slightest amount of wear in the crank shaft bearings causes leakage and renders the motor inefficient. In concluding his paper Mr. Redwood gave an interesting comparison of the weight of a steam engine and boiler with a petrol engine of equal power, both intended for launch work. The weight of a 20-h.p. petrol engine, complete with reversing gear, batteries, etc., and petrol sufficient to take the boat sixty miles, is nearly 5 cwt. A 20-h.p. double-acting condensing steam engine and boiler complete would weigh about two tons, and coal and water sufficient to last for sixty miles would amount to 1 ton 3 cwt., making a total of 3 tons 3 cwt., or twelve times the weight of the petrol engine and fuel. The gain in weight and space is therefore considerable, and allows of greater comfort, or of a much larger number of passengers being carried.

The Discussion.

IN the discussion which ensued, several speakers, including Mr. S. F. Edge and Lieut. C. Mansfield-Cummings, urged the necessity of an immediate alteration in the rules relating to the Harmsworth Cup race, otherwise foreign marine motorists will be prevented from competing. Mr. Boverton Redwood pointed out that the rules were really only of a tentative nature and that the matter will be taken in hand without delay by the Marine Motor Association. He also dealt at length with the danger of petrol on motor-boats, and more especially auxiliary yachts, unless extreme care were taken in the way of ventilation and of preventing the vapour coming into contact with a light. He even considered it better for the permanency of the motor-boat movement that progress for some time should be slow, rather than that it should become a popular one before the extreme importance of the great precautions necessary were fully recognised.

Narrow Roads.

IT may be well to remind some of the local authorities that are now recommending the closing of certain roads in their area that they may ultimately be called upon to widen them, for by thus advocating the closing of the roads they are acknowledging their unsuitability for modern traffic and proving the difficulties of travel between one town and another. In the days to come the ordinary roads will be the great highways of locomotion, and the present narrow lanes in many country districts will have to be widened out to meet the needs of the time.

Motor Buses at Bolton.

HITHERTO the southern counties and the holiday resorts nearest London have been rather more enterprising than those in the north with regard to automobilism. True, Blackpool was a pioneer, and Lincoln had a line of public service vehicles some few years ago, but they have long ceased to travel and their engines are at rest. Now, however, Lancashire is moving in the matter, and the Bolton Corporation intends to run a motor bus service, the vehicles selected being from the Stirling

works at Edinburgh. It is to be hoped that the Corporation authorities will treat their automobiles intelligently and have them thoroughly overhauled as the railway companies have their locomotives inspected, so that economy in working as well as efficiency in running may be secured. Past failures have generally arisen from absence of care in this respect.

Mr. G. Taylor, the Hero of the Maidenhead Tollgate.

Motorists at the Meet.

THE hunting season having begun, the presence of motorists at meets has again cropped up, and it is evident that the automobile is gradually becoming recognised as a great convenience. Of course, old-fashioned masters of hounds are not likely to quickly accustom themselves to the disturbance of the traditions of the hunting field, and motorists can do much to make their way pleasant by driving carefully and not doing anything to upset the nerves of the hunters as well as of the huntsmen.

The Freeing of Maidenhead Bridge.

ON Saturday midnight the last toll-gate was removed from the Bath Road, the outcome of an agitation conducted by Mr. Gilbert Taylor, of Eton, who two years ago gave the sum of fourpence, under protest, to pass over the bridge. Mr. Taylor, who was successful in freeing Windsor Bridge, forced the hand of the Maidenhead Corporation, and as the result of the inquiry the Corporation were advised to cease taking tolls after the expiration of the lease. This occurred on Saturday night, and the people of Maidenhead celebrated the event by tearing down the toll-gate and throwing it over the bridge into the river. Mr. Taylor, who appeared on the scene at midnight, came in for a great reception, and was the first to pass over the free bridge in a motor-car driven by Mr. J. Fullbrook, of Slough, who has been closely associated with him in the struggle in connection with the Maidenhead toll-gate.

Into the Thames.

THE scene was a memorable one. Shortly after eleven o'clock a great crowd of nearly a thousand people collected. The Corporation had a cart ready to convey the toll-gate to somewhere or other, but just before midnight the people wrenched the gate from its hinges and threw it into the Thames. At midnight an improvised meeting was held,

Mr. Taylor being the chief speaker. Mr. Good, an ex-mayor of Maidenhead, expressed the view that the people of Maidenhead would soon regret Mr. Taylor's action, but Mr. Fullbrook reminded the burgesses that there was a valuable estate attached to the bridge, and that if they looked after the affairs of the town no great burden need fall on the rates.

Subscriptions Wanted.

THE expenses of the agitation have been heavy, and for more than three years the result was in jeopardy. Originally the toll was 2s. for motorists; successive reductions bringing it to 8d., 6d., and 2d., until now it has been abolished. The case of Taylor v. the Corporation of Maidenhead has yet to be heard, and motorists who recognise the good work that has been done are invited to contribute towards the cost. So far, the appeal for funds has produced £35, the Automobile Club, Dr. Bruce Porter, the Hozier Engineering Company, Mr. Mark Mayhew, L.C.C., and Mr. Maurice Egerton being among the subscribers. It is not too late for users of the road to show their appreciation of the work that has been done, and subscriptions may still be sent to Mr. J. Fullbrook, Slough; or Mr. G. Taylor, High Street, Eton.

Private Touting.

A LEADING motor-car firm in the Midlands writes us with regard to a matter upon which comment was made in these columns some time ago, viz., the attempts of individuals to obtain commissions from makers of or dealers in automobiles. We have heard of the ladies who draw attention to something in which they are interested, and, having secured a friend anxious to possess a similar article, make haste to the seller to secure commissions for what they have done. The same bad practice—bad for one's friends as well as for the trade—has crept into the automobile business.

Mr. G. Odell, a well-known American Tenor, who will shortly be seen in a new light opera, in his City and Suburban Electric Brougham.

[The Biograph Studio.

What the Trade should do.

EVERY motor manufacturer knows what a lot of "private touting" there is in connection with his business, and he is continually pestered with private individuals and tradespeople not in any way connected with the motor-car industry, for commissions on sales which are made or can be made on their recommendation. Many firms, wise in their generation, have strongly opposed the practice of allowing discounts or com-

missions to such persons, and they will naturally continue to refuse to do business except through the proper channels. Mr. H. Austin thinks it is quite time that the trade came to a proper understanding on this question, as it is not by any means a new difficulty, or one which it is impossible to overcome. It is also obviously unfair for a manufacturer to publish a net price list, and then take off discounts to individual clients. This is a matter which might perhaps just as well be discussed at the same time, and for which purpose our columns are open.

The Identification Mark.

ONE point about the Local Government Board regulations, a forecast of which appeared in our columns last week, is the insistence upon two marks of identification upon cars. This is generally regarded as contrary to the spirit and scope of the new legislation, and should the present intention of the Board be maintained, the executive committee of the Motor Union will take the matter to the High Court of Justice. It will be bad enough to have to submit to the one mark of identification, and there is certainly no reason to double the irritation. But evidently the Local Government Board regards "two plates" as "one mark."

regard to the erection of sign-posts denoting dangerous corners, etc. It is proposed at a later date to report in detail to the Council with regard to the various provisions of the two Acts, but the Committee thought that in the meantime the Council should decide upon the fees to be charged. The solicitor does not consider it necessary for the licences to be issued under the seal of the Council, as such a course would entail serious delay and inconvenience, and the Committee has accordingly arranged for the licences to be issued by the Clerk of the Council. At the meeting of the Council the report was withdrawn for a week by the Chairman of the Committee (Mr. J. Williams Benn). Asked the reason for his action by Mr. Mark Mayhew, Mr. Benn replied that there was a slight technical error which needed amendment. The report will be again presented next Tuesday.

The Irish Regulations.

ACCORDING to the regulations which the Irish Local Government Board is likely to adopt under the Motor Car Act, only the back number on the car will require to be illuminated—a course more commendable than the probable English requirement as to both numbers being illuminated. Motorists in Ireland will be allowed to obtain their own identi-

The North-Eastern Railway Company's Motor-Bus Service between Beverley and Beeford.—The two Stirling 24-h.p. vehicles at the Railway Station at Beverley. (See issue Sept. 5th.)

Index Letters.

WHILE our forecast of the Regulations may be altered in some minor details, as a result of the discussion of the matter by the committees of the clubs, it will be found that the schedules, etc., will be identical with those given, although the juxtaposition of certain letters in the proposed index signs will cause some amusement. Why the West Suffolk Council should be distinguished by the letters C.C., and that of East Suffolk be designated B.F., does not seem clear. There is a Metropolitan tinge about E.C., but this is given to Cardiganshire. The London County Council will be A. and the County Borough of Leicester, B.A.

The L.C.C. and the Motor Car Act.

AT the meeting of the London County Council, on Tuesday, there was to have been an interesting report from the Highways Committee on the subject of the administration of the Motor Car Acts, 1896 and 1903. The work entailed in registering cars and licensing drivers will, for a time, at any rate, be very heavy, and the Committee thought it was important that the books and forms which will be required for the purpose should be settled with as little delay as possible. It also reported that the maximum fees allowed by the Act should be charged. The Committee have given instructions with a view to ascertaining what action it is desirable should be taken with

fication plates instead of having to purchase them from the registering authority. Otherwise the regulations at present suggested run on much the same lines as those outlined in the *Journal* last week with regard to England and Wales.

The Closing of Roadways.

RUMOURS have been rife in automobile circles during the last few days as to the probability of the Local Government Board ignoring its power of closing roads to motor-cars and allowing the local authorities to do so on their own initiative. We cannot credit such an idea, as it would be clearly against the intention of the Act. The evident idea was, while allowing the local authorities to suggest roads to be closed, to protect motorists from the prejudice and intolerance of bucolic bigwigs. We were at least assured that merely local opposition would not have supreme sway in this matter, and rely upon the Local Government Board exercising a wise and tolerant prerogative in the matter.

The Organisation of Trials.

AT a meeting of the Committee of the A.C.G.B.I. on Tuesday, the following resolution was adopted: "That it is not in the interests of automobilism that road trials should be held except by the Automobile Club of Great Britain and Ireland, affiliated clubs, and recognised bodies, and that no permits be given for any events which disregard this principle, and that all persons taking part in such unauthorised trials be dis-

qualified from Club competitions." The wisdom of such a resolution will be apparent at first glance. The Club has experience, organising facilities, and the prestige of impartiality at its back to add to the value of the trials it arranges from time to time. Road tests under any other auspices must be unsatisfactory both to the public and the trade, and now that the Club intends to disqualify all participants in unauthorised contests from its own trials, the failure of other people in connection with such events is assured.

Progress in Australia.

A SERVICE of motor-omnibuses has been inaugurated at Perth, Western Australia, the Jenolan Caves being the objective point of the run. The idea should be extended, for the adoption of the automobile in Australia should encourage communication into directions where railway building cannot be continued—and there are said to be many such districts—for lack of funds.

Opening up Touring Counties.

THE success that has attended the Great Western Railway Company's motor-car service in Cornwall will probably lead to important developments next season. Already it has been amply demonstrated that the automobile is particularly useful in connection with touring work, and the combination of railway and motor-car by the companies serving popular holiday districts will increase their revenue in more ways than one. Already the G.W.R. has been inundated with applications for motor-car services in districts through which their line runs, and a great forward movement in this direction will give further prosperity to the motor-car industry. It is freely rumoured that the company has decided to place twenty-five motor vehicles into public service next season.

The Club Discussions.

MR. E. H. COZENS-HARDY is to give some criticisms of the rules and organisation of the recent speed and reliability trials in a paper to be read at the Automobile Club on the 10th prox. It is to be hoped that there will be a good attendance of members of the trade and of observers who participated in the events of September last, so that the discussion may be productive of some useful hints to the committee for future guidance. It seems a pity that these meetings do not commence until 9 o'clock and end at such a late hour as to make it impossible for those who live at a distance to attend. Why not commence an hour or two earlier and thus invest the proceedings with more of the practical and less of the post-prandial character?

Teaching the Police.

THE case of Mr. R. G. O'Callaghan, tried for the manslaughter of a boy by running over him with his motor-car in the Phoenix Park, Dublin, which resulted in a sentence of three months' imprisonment, suggests some points worth noting. It was made evident at the trial that the constable on fixed point duty in the middle of the road, seeing the car coming on at a high rate of speed, became concerned for his own safety and, stepping quickly to one side, got in front of the boy, who was obliged to swerve outwards in front of the motor, lost his head, and, failing to clear the car, came to his untimely end. To any motorist aware of the facts it will be evident that the constable was never in the slightest danger and need not have stirred an inch. No man accustomed to fixed point duty where motor-cars are in the habit of passing would have felt the least alarm, but seeing what did occur we strongly advocate the desirability of some training for constables likely to have the control of traffic in which motor-cars may figure. Occasional exhibitions might be given before the men in suitable places. These quickly teach them what a motor-car can do and how much under control it really is.

International Races in the United States.

THE second annual Winter Race Meet on the Ormond-Daytona Beach, Florida, will take place from January 25th to 30th, 1904, under the management of the "Automobile Magazine," with the patronage of the Florida East Coast Automobile Association. The Ormond-Daytona Beach is the most unique speed course in the United States, as it is completely level and is so hard that a large twelve-passenger bus with solid tyres leaves only the slightest impression on the surface. It is twenty miles in length, is as straight as an arrow, and at low tide is nearly 100 yards wide. English and Continental drivers are invited to take part in the forthcoming races, and all particulars in regard the tournament, which will be run purely as an amateur sporting event, can be obtained from Mr. J. Morgan, 1, Maiden Lane, New York.

The Floods.

THERE is no need to remind readers of the watery condition of roads and skies alike during recent days. The photograph on page 666 of our last issue depicted a familiar scene on the Great North Road during the last few weeks. The floods were particularly severe between Sandy and Biggleswade, where the road was impassable, and travellers had to make a detour of some miles *via* Caldicote.

A Legal Expense Fund.

ON a previous page we have referred to the intention of the Motor Union to take the opinion of the High Court as to whether the suggestion that motor-cars should carry two plates is in accordance with the Motor Car Act. We now learn that a special fund has been opened for the purpose of meeting the legal expenses which will be incurred in settling this and a number of doubtful points which will arise in connection with the administration of the Act. Any automobilist desirous of contributing to this fund should write to Mr. W. Rees Jeffreys, Administrative Secretary, A.C.G.B.I., 119, Piccadilly, W.

The Views of a Trade Association.

THE committee of the Automobile Mutual Protection Association, Limited, has forwarded some observations to the Local Government Board with reference to the Motor Car Act. They suggest that only one mark is desirable on cars, and that the provision of two plates was not contemplated in the Act. Further, that the identification mark should only be placed behind the car. Exception is also taken to some of the fees to be charged. With regard to the clause affecting traders, the committee urge that the keeping of a record of each occasion when a motor-car is taken out is impracticable. Other points of amendment are also proposed, but, the copy of the letter only reaching us at the moment of going to press, we are unable to give them in detail.

THE Taff Vale Railway has inaugurated a service of motor-coaches on some of its tracks.

MR. T. SILVER is making a long tour through South Africa on a 3-h.p. Quadrant motor-cycle.

THE Bishop of Winchester has been making a pastoral visitation through the Isle of Wight on a motor-car.

THE first annual dinner of the Motor Volunteer Corps will be held on Tuesday, December 8th, at the Trocadero Restaurant, W.

A MOVEMENT is on foot to form a Berkshire Automobile Club. Colonel Waring, J.P., Reading, and Mr. Shrapnell Smith, Lavender Cottage, Easthampstead, Bracknell, are the leading spirits in the movement.

IN THE FENS.

AUTOMOBILISM is being strongly supported in Lincolnshire, and from the premier baronet of England, Sir Hickman Bacon, who resides at Gainsborough, to the most hard-worked country practitioner a general movement in favour of the motor-car is going on. In encouraging this trend the Lincolnshire Club has been an important factor, but unfortunately the agricultural depression—relieved in some districts by attention being given to the growing of potatoes and market garden produce—has lessened the demand for cars somewhat. Then, too, the bad weather of the earlier part of the season proved restrictive to the local industry, and complaints as to the absence of actual orders have been common, although there have been hundreds of unproductive inquiries and scores of hopes of orders unrealised. Still the public opinion in favour of cars is so general that only a return of prosperity is necessary to make the county of Lincolnshire an important customer to the British trade.

But with the discussions now taking place at meetings of the local councils in the county with regard to the Motor Car Act that will come into force next year, those engaged in the automobile industry in Lincolnshire are somewhat fearful. The other day the matter of prohibition by the Local Government Board of motor-cars going along roads of less than sixteen feet in width was considered by the Roads and Bridges Committee of the Hol-

cars therefrom. Already the Rev. Howard Hopley, the vicar of one well-known parish has been pleading that footpaths should be provided at the side of all roads for the safety and convenience of pedestrians, and that is a subject to which study will have to be given in the near future. In his district there are several roads four or five miles long which intersect one another and which have no refuge for the man on foot. Seeing that the market town is not far away and that historic scenery is within walking distance, it may easily be imagined that motor-cars are numerous visitants in his locality. Surely the local authorities should be persuaded to provide a path for the pedestrian, so that motorists and drivers of horse-drawn vehicles may know the limits of the legitimate roadway for their service, and that those who journey on foot may do so with the minimum of annoyance.

Of course, the new section of the Motor Car Act with regard to the 16 ft. roadway gives added interest to the subject. Had the Local Government Board decided to measure only the roadway under Clause 8, it would have been very easy for local authorities to have absolutely prohibited cars from the highways by merely widening the footpath to the restriction of the road for vehicles. But fortunately the question as to what constitutes a 16-ft. road has been determined and that the measurement is to be between hedges is a matter of supreme importance. Recently, in the Fen district of Lincolnshire, we found a state of things which is typical of much of our country. The width of the actual surface available for-

The Meet of the South African Automobile Club at "Groot Schuur." Dr. Jamieson's 22-h.p. Daimler in the Mile Speed Trial.

land. (Lincolnshire) County Council. Several prejudiced remarks were heard, one facetious gentleman declaring that he would want a notice board put up at every fifty yards' interval in his neighbourhood. Mr. Upsall quoted the case of the northern farmer who is reported to have put a bullet into a motor-car tyre, and added, "That is the only way to stop a motor-car driver." Fortunately such a prejudiced view is not general throughout the Fenslands, where both clergy and doctors are recognising the utility of the automobile.

One leading motoring firm in Boston believes that the result of the 16 ft. clause will affect many of the country doctors who use their vehicles solely in a professional way, and may, in fact, compel them to abandon motoring altogether. On the other hand, a Lincolnshire clergyman informs us that there is scarcely likely to be any difficulty in connection with this matter, as the feeling against motorists is extremely limited. "I give the North Holland and other local authorities in that part of the country the credit," he says, "of believing they are too sensible to suggest closing any of the roads. In that corner of Lincolnshire there are many motorists, and they have had nothing from the police and local authorities but kindness and courtesy. This is because, thanks to the Lincolnshire Automobile Club, the spirit of tolerance and courtesy to other users of the road has been fostered, and none of our members ever forget to be gentlemen."

We shall hear much during the next few months as to the width of country roads and the desire of many people to keep motor-

pedestrians and vehicles is about 14 or 15ft. On one side is a grass-grown bank sloping down to a dyke, beyond which is a hedge. On the other side of the road, a drain about 10ft. in width, separates the roadway from another hedge—the distance from hedge to hedge being about 30ft. Such a road cannot, by the provisions of the Clause in the Act relating to the 16ft. road, be prohibited, but had the roadway been regarded as the line of measurement it would undoubtedly have been closed.

THE Automobile Club has decided to take over the whole governance of non-stop runs, an official record being kept by the Technical Secretary.

WE learn that Messrs. Moseleys, Ltd., of the Chapelfield Works, Manchester, have put down a plant for the repair of motor-tyres, and are now in a position to undertake repairs to all kinds of tyres at short notice.

A NEW acetylene headlight for motor-cars has been put on the market by Messrs. J. Bartlett and Company, of South Tottenham. The lamp, which is known as the "Bartlite," is claimed to possess a number of advantages, chief among which may be mentioned that the generation of gas can be stopped at once, thus preventing waste of gas; and, if the charge of calcium carbide has not been exhausted, the lamp can be put on one side for a week or a month, and relighted when required without recharging. It has no gas-bag or rubber connections, and will burn for twelve hours on one charge of carbide and one of water.

CONTINENTAL NOTES.

THE 1904 Gordon Bennett race continues to be the principal topic of conversation in motoring circles on the Continent. It would seem that the course in the Homburg district is likely to be adopted, seeing that Prince Henry of Prussia, the Kaiser's brother, went over it last week in a 45-h.p. car and reported favourably upon it. The Belgian Club has decided that its eliminating contest for the Belgian team shall be held a month before the big race and be over a distance of 500 kilometres. The three fastest cars in the trial will, it has been decided, represent Belgium in the contest. The Italian Club has already selected the drivers for the Italian team; they will be Signors Storer, Lancia and Felice, and each will drive Fiat racers of 70-h.p.

M. Rougier on his Turcat-Mery Car at the Summit of Mont Ventoux. (See last issue.)

FOLLOWING the example of Belgium, Austria, and Italy, it is possible that next year Holland will make its first appearance in the great international event, for it is announced that the Dutch Automobile Club will probably be represented by a Spyker car of novel design. It is stated that the vehicle will have a six-cylinder engine of about 60-h.p. Baron de Crawhez is spoken of as likely to be its driver.

THE result of the town and suburban motor-vehicle contest of the A.C.F. has now been announced. In the town vehicle competition De Dion gets a gold medal for the coupé, Gillet-Forest a gold medal for both the omnibus and the delivery van, Collin a silver medal for his *avant-train* or motor fore-carriage illustrated in the last issue, and Aries a bronze medal for the limousine. In the suburban vehicle contest De Dion secures a gold medal for the delivery van and a silver medal for the lorry, while a gold medal is awarded to the De Dietrich omnibus.

AN important proposal is just now occupying the attention of the members of the A.C.F. The Marquis de Dion and other members, with a view to alleviating the dissatisfaction with which a certain section of the public regard motorists, have conceived the idea of instituting a kind of espionage over *chauffeurs*. They have been moved to take this step because the police are powerless to prevent furious driving. The idea is for every member of the Club, when he sees a motor-car proceeding at too rapid a pace in dangerous places, to take the number of the car, and send it to a special committee of the Club, which will first of all administer a reprimand, and, in case of a second offence, exclude the owner of the car from the Club. If it is a very bad case, the committee will be given power to denounce the offender to the police. Although the scheme is conceived in the interests

of automobilists as a body, it does not commend itself to every member of the Club, and consequently it has given rise to an animated discussion.

It is definitely decided that the Gaillon hill climb shall take place on Sunday next. The hill is about a kilometre long, the average gradient being about 9 per cent. There will be the usual categories for both touring and racing vehicles, which will make the climb with a flying start, on a 500 metre level stretch. The entries so far include four Serpollets, two De Dietrichs, a Tony-Huber, a Boyer, a Mors, a 50-h.p. Wolseley, and a Vinot-Deguingand. It may be added that last year the event was won by Le Blon on a Serpollet steamer, who made the ascent in 30 secs.

It was reported some weeks ago that Gabriel was severing his connection with the Mors Company, and that he would in future be seen piloting Renault racing cars. The report proves to have been somewhat premature, as it has just been definitely announced that this well-known *chauffeur* has entered the staff of the De Dietrich Company, whose cars he will drive in future races. It is stated that he will take part in some of the American track races early in the new year.

MADAME LOCKERT, who is back again in Paris after her trip to St. Petersburg by road on the 14-h.p. Tony-Huber car, has kindly given me a brief account of her experiences. No great difficulties were encountered as far as Berlin, but after leaving the German capital, not only did the weather prove unkind, but much delay was caused owing to the trouble in obtaining supplies of spirit and lubricating oil. Arrived at the Russian frontier, Madame, although provided with passports, was refused admission on the ground that her papers did not permit of her entering the country by road. Fortune, however, favoured her the next day, for a lieutenant-colonel in the Russian army became interested in the trip, and after some delay the local chief of the Customs was prevailed upon to allow the car to enter, not, however, until a sum of 302 roubles had been paid. Slow but steady progress was made across Poland towards the Russian capital, and, notwithstanding the bad roads and the snow, only one puncture was experienced in a journey of 500 miles. Madame Lockert,

The Benz Public Service Vehicle.

while not being prepossessed with Russia, considers as a result of her journey that an excursion—not a race—from Paris to St. Petersburg is quite feasible, provided that the cars employed are not too heavy nor yet too speedy.

AMONG the firms which have recently taken up the construction of public service vehicles is Messrs. Benz and Company, of Mannheim. The above illustration shows a sixteen-seated vehicle lately completed by this concern for a service between Bitterfeld and Düben, a distance of twenty-six kilo-

metres. The car, which has to make two round journeys per day, is driven by a 16-h.p. horizontal double-opposed cylinder engine. The transmission is by a single belt, gear, and chains.

THE battle between the burgomaster of Brussels and motorists in that city has taken a new phase, and this time victory lies with the burgomaster. On appeal, the Correctional Tribunal of Brussels has reversed the decision of the police-court judge, who held the burgomaster's regulations limiting the speed of motor-cars in certain thoroughfares to five kilometres per hour to be illegal, because made *ultra vires*, and dismissed all cases brought against *chauffeurs* under it. The Correctional Tribunal, in upholding the burgomaster's regulations, imposed a fine of five francs on each of the motorists, against whose acquittal at the police-court the Procureur de Roi had appealed. It is hardly likely that the matter will be allowed to rest, and the action of the A.C.B. on the subject is being anxiously awaited.

THE awards in the reliability trials held by the Dutch Automobile Club have just been made known. The maximum number of marks was 1,450, and the following five cars went through without losing a single mark:—A 4-h.p. Daimler, two

A GERMAN motor-car concern—the Berlin Motor-wagen-fabrik Tempelhof—is reported to have just completed an order for no less than sixteen petrol cars for use by the Royal family of China between the summer and winter residences in Tientsin. Three of the cars, those intended to convey the King, Queen, and the Ex-Queen, are most sumptuously fitted up; the remaining thirteen, which are intended to carry the Royal suite and attendants, are arranged as omnibuses. The vehicles are driven by double cylinder petrol engines and have cardan shaft transmission and solid-tyred wheels.

SOME interesting experiments in connection with the regulation of the speed of motor-cars were carried out on Monday morning before members of the extra-Parliamentary Committee in the Bois de Boulogne, Paris. On a wet and slippery road, whilst a cab and a two-horse brougham, travelling at the rate of $7\frac{1}{2}$ and $11\frac{1}{2}$ miles an hour, could only pull up in an average of 40 ft. and 49 ft. respectively, the motor-cars were able to stop in the first case within 10 ft., and in the second in 18 ft.

MESSRS. R. AND H. LANE, High Street, Peckham, S.E., have a plant for re-charging motor-car batteries.

The Cudell Racing Car "Torpilleur," which took part in the recent track races at Frankfort-am-Main. [Allgemeine Automobil Zeitung.]

12-h.p. Darracqs, a 7-h.p. Panhard, and a 20-25-h.p. Peugeot. A good many cars lost marks owing to punctures, which were somewhat numerous.

MESSRS. DE DION AND BOUTON have at last brought out a four-cylinder motor, a car fitted with it being seen in Paris the other day. The engine has separate cylinders 100 mm. dia. by 110 mm. stroke, mounted on a large crank case, and is stated to develop 32-h.p. The new engine is apparently not yet out of the experimental stage, and will probably not be put on the market for some time.

ON Sunday next the Moto-Club de Marseille is holding a touring competition for motor-cycles of all kinds. The course is over a distance of about 100 kilometres. The speed of the machines has not to exceed thirty kilometres nor be less than twenty-five kilometres per hour.

THE Russian Postmaster-General is reported to have just given out an order for twenty-four special motor-cars for use in connection with the postal service. The cars will not only be employed in the delivery of letters, but will also collect parcels in all parts of the Russian capital,

AMONG new members of the Motor Union we notice the name of Mr. W. S. Ross, of Melbourne, Australia.

WE hear that the Humber Company are bringing out still another new car—a $7\frac{1}{2}$ -h.p. two-cylinder vehicle to carry four persons.

At the annual meeting of Joseph Lucas, Limited, at Birmingham on Tuesday, Mr. H. Lucas said the profit made on the year's business was rather more than in the preceding year, and this was the more satisfactory because during the year the company had been developing a new branch of business, "motoralities," and were now getting the thin end of the wedge into the motor trade.

THE employees of the Hoxier Engineering Co., Ltd., makers of the "Argyll" car, held a successful supper and dance on Friday of last week. Probably the most interesting feature of the function was the speech made by one of the workmen in proposing the continued success of the company, in which he asserted that the failure in a number of the trades was due to the fact that the masters had not supported the men in providing them with the most up-to-date tools. He called on all British employers to provide the British workmen with the best tools, and he asserted that Britain would then be sure to maintain its supremacy.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

—◆—

CAPE TOWN, October 7th, 1903.

A LINE of omnibuses will shortly be started in the district of Simon's Town. I understand that the 'buses are Milnes-Daimlers. The company is known as Kommetjes Limited, Kommetje being a place near Simon's Town.

A PUBLIC service of motor-cars has recently been started between Durban and the suburb of Stamford Hill, the distance being about four miles. Two Germain cars are at present on the service and I hear that they are giving every satisfaction, and that although only built to carry eighteen passengers, they nearly always have double that number, and with this load make the journey in twenty minutes. As will be seen

Railways, and for this level crossing they made, Mr. Garlick at the wheel and the mechanic in the tonneau. Owing to the road crossing the rails at an angle, they could not see that the gate on the far side of the track was shut, and before anyone could dismount to open it the Johannesburg night mail for the north came roaring around the curve only a few yards away. Before the reverse could be thrown in, the locomotive struck the near side of the car with a tremendous impact, hurling the occupants in all directions, the vehicle itself being thrown a distance of forty yards. The driver and mechanic picked themselves up, bruised and shaken, but not seriously injured; matters had gone worse with Mr. Markham, who was found insensible, with his left hip crushed. Together they picked him up and were about to carry him to a house near by, when Messrs. Menzies, Adams and Kingswell drove up in a Panhard, and helped to convey him to the Somerset Hospital, where he now lies in a precarious condition. The fact of the

The 15-h.p. Germain Public Service Car at Durban.

from the photograph, the "body" of the vehicles is on somewhat different lines, so far as motor-cars are concerned. The motive power is supplied by a Germain 15-h.p. four-cylinder engine, four speeds forward and reverse are available, the maximum being about twelve miles per hour. The front wheels have solid rubber tyres, while those on the hind wheels are iron. The extreme length of the vehicles is 17½ ft., while the tare weight is 2 tons 13 cwt.

I HEAR that Mr. George Wilson, Deputy Commissioner for the Protectorate of Uganda, is bringing to Africa a 25-h.p. car which he proposes to utilise on his tours of inspection throughout Uganda.

NOTHING of much interest to the trade has occurred since the last meet of the South African Automobile Club.

AN accident in which a motor-car was involved occurred at Maitland, near Cape Town, last week. A mechanic took the 24-h.p. Darracq belonging to Mr. J. Garlick for a run, intending to go as far as Durban Road. From Mowbray to Maitland the road crosses the main line of the Cape Government

railway people leaving a level crossing not only half open and half shut, but utterly unattended, is a state of affairs which would not be tolerated in any civilised country.

THE Cape Town Metropolitan Fire Brigade have received their petrol motor hose truck from Messrs. Merryweather. It is fitted with a 12-h.p. Aster engine, and on its trial trip proved itself eminently efficient, carrying 1,200 feet of hose up the steepest incline in Cape Town with ease. It is in charge of an old Daimler hand.

It has been decided to form a Northern Districts of Natal Automobile Club. The gentlemen chiefly interested are Messrs. F. Coppen, D. Grove, A. V. M. Suter, O. S. Challenor, A. von Levetzow, Edridge, Hollingsworth, Morgan, Edley, Obermayer, and W. E. G. Gould, who has been appointed secretary *pro tem*. The new club will be founded with 1,500 shares of £1 each, 1,000 of which are to be paid up, no member being allowed to apply for more than ten. A provisional committee has been appointed, and Mr. Calthrop, the honorary secretary of the Automobile Club, will be asked to act as honorary consulting engineer. The headquarters are at Vryheid.

DOGS AND CARS.

DOGS are disappearing items so far as many households are concerned; and motorists are being regarded by their fond owners as canine murderers. The impeachment must be acknowledged in many instances, although the cases of alleged dog destruction are greater than the actual assassinations. But what is the motorist to do? He is proceeding with due regard to the preservation of human life, when suddenly, without warning, a small quadruped rushes from the pathway and its shrieks and its carcass become mixed up with the throb of the engine and the details of machinery. That is the end of the dog; but not the conclusion of the matter, for the owner comes along with exalted views of the value of the animal, whose lifeless form is a mute appeal to the hearts of the jury.

Motorists do not destroy common dogs. The owners always declare their pets to have had exceptional points and, with a certain class of dog, their loss to be irretrievable. Money only can assuage their wounded feelings, although it cannot restore the pieces of their deceased doggies to a homogeneous whole. A friend was once motoring in Scotland when he inadvertently ran across a dog that lay still as though in the last long sleep. The owner rushed up to the driver and demanded recompense. The animal was worth anything between ten and twenty guineas; but ultimately a five pound note seemed to afford a solace to the apparently dogless owner. The car drove on, the dog recovered consciousness, and not until some days later was it clear to the motorist that the object of his solicitude was alive and well. The question arises—to whom does the dog now belong, the man who compensated its owner, or the man who took the money under the impression that the animal was dead? Verily the ways of canine owners are as peculiar as the antics of their pets are distressing.

The Local Government Board issues regulations regarding motor-cars; the Board of Agriculture is supposed to be responsible for the behaviour of dogs in our public streets. That department muzzled them some time ago; cannot it provide for their proper control at all times? Dogs are a nuisance; they are a positive danger when allowed to frolic at their own erratic will on the highway, and stern repressive regulations will have to be enacted in the near future. For motorists are not the only complainants. Cyclists have vainly declared a paper war upon them for years, and some have attempted to ride with determination over their worrying forms—with dire results to the venturesome cyclists. But with the advent of the motor-car the owners of dogs have become almost as annoying as their animals themselves. And yet there should be no feud between the respective parties, for when properly trained to the automobile dogs are as docile as when in the kennel. A thought of the Reliability Trials with Mr. S. F. Edge's sweet creature on the Marshal's car, or Mr. F. F. Wellington's "toy" spaniel mounting guard on his vehicle, will confirm this view.

It might be suggested to students of natural history that the effect of motoring on canine intelligence should be studied, even unto the third and fourth generation. It has been noticed that small birds lingering too long in the roadway often take flight from the oncoming motor-car too late to escape a blow from the bonnet. And similarly dogs have not yet become accustomed to the speed of automobiles. As these come more generally into use men and animals will have to quicken their appreciation of motor-car speed, and unless the coming generations of both realise that, the destruction of the human and canine races may be at hand. Seriously, however, the subject is within the pale of motor politics, and the position of the dog fully defined. Will the Motor Union consider the matter? Surely it is unfair to make motorists responsible for the wanton excursions into the roadway of untrained quadrupeds which are no respecters of motor-cars.

W. H. B.

THE "CHELIN" ACCUMULATOR.

A NEW accumulator, known as the "Chelin," has lately been brought under our notice by Mr. R. Melville, of Brussels. It is stated to be especially suitable, not only for ignition purposes, but also for electric traction, and where a minimum of weight, combined with a maximum of power, is concerned, together with small volume and easy upkeep. The inventors claim for it, amongst others, six distinctive improvements; absolute prevention of short-circuiting, considerable reduction in weight and volume, increase of capacity and staying power, ease in handling, and preservation of the charge for an indefinite time. The accumulator consists of two electrodes (Fig. 1 representing the active, and Fig. 2 the negative), the active terminating in four (or more, according to size required), upright leads encased in and isolated by square ebonite cells, the walls of which are perforated with numerous small holes, while the negative culminates in lead cells (corresponding in number with the upright ebonite encased leads of the active electrode) the walls of which are also perforated with small holes. By means of this arrangement of perforated isolating

Fig. 1.

Fig. 2.

covering of the active electrode and of the perforated lead cells of the negative electrode the generating acids have free access and communication, while the perforated holes are too small to admit of the passage of any solid matter which might create a direct current between the electrodes, thus preventing the possibility of short-circuiting. Indeed, the holes are so small that only the minutest particles of solid matter could pass. Furthermore, the square perforated ebonite coverings of the positive leads are provided at each corner with a wing or shoulder of the same isolating material, and these shoulders alone come into contact with the perforated lead chambers of the negative electrode and then only at the four corners. With a view to reducing the time necessary for the formation of, and to increase, the electro-chemical reactions, the lead of the two electrodes is worked up chemically to an extreme porousness, which, together with the novel mechanical arrangements, constitutes, the inventors claim, a considerable advance over other systems of accumulators. We understand that the Chelin battery has been submitted to exhaustive tests, and that, as a result of the same, it has been adopted by one or two large builders of motor-cycles in Belgium.

THE Czar of Russia made a number of trips in a 14-h.p. Adler car last week in the neighbourhood of Frankfort-am-Main.

THERE is a law in Germany to the effect that drivers must not approach too near the hedgerows, but must leave a distance of two feet clear for pedestrians.

C

The "Robertson" Steam Wagon.

Fig. 1.—General View of Wagon.

WE are this week able to give an illustration and some brief particulars of still another heavy steam wagon of British manufacture. It is the production of Messrs. James Robertson and Son, of Fleetwood, Lanc., and is designed to carry a load of five tons. A feature of the vehicle to which the firm has given special attention is the boiler, which is of a patented multitubular fire-tube design. As will be seen, it is located in the fore part of the wagon; it is built of mild steel with seamless steel tubes, and is centrally fired; gas coke is used as fuel, the carrying capacity being sufficient for a run of about 30 miles. The boiler is constructed for a working pressure of 200lbs. per square inch and tested by hydraulic pressure to 400lbs. per square inch. The grate area is 2.6 sq. feet and the heating surface 80 sq. feet. The design of the boiler is such that all the tubes are completely under water and are fixed radially between the fire box and the outer shell. The latter being almost completely enclosed by the smoke box casing, the boiler is practically all heating surface and at one uniform temperature both inside and out, the arrangement also ensuring a supply of dry steam to the cylinders. The outer casing is easily removed and all the tubes can be readily got at for cleaning or for repairs. The firebars, with the ashpan, are slung by wire ropes or chains under the boiler, and are raised or lowered as required for lighting and cleaning purposes by suitable worm gearing. This arrangement eliminates the fire door with its objec-

tions and facilitates cleaning fires, etc. The feed water heater is of special design with aluminium body, brass tube plates and Row tubes, and is capable of heating the feed water to 190 deg. Fah., the condensed steam being filtered and returned to the tank. The main feed pump is situated alongside the engine casing and is driven by the crankshaft through gearing enclosed in the engine box and running in oil. Although it is amply sufficient for supplying the boiler, a separate auxiliary feed pump is provided, having separate steam and water connections.

Fig. 2.—Part Cross Section of Boiler.

The engine is of the horizontal compound reversing type with cylinders 4 in. and 7 in. dia. by 5 in. stroke, and runs normally at 435 revolutions per minute, developing 25 b.h.p. It is enclosed in an oil-tight box, thus ensuring constant and thorough lubrication of all parts. The crankshaft is of forged steel, the balanced cranks and eccentric sheaves being solid with the shaft and all machined together. The engine can be run independently for boiler feeding purposes by moving the change speed lever by the driver's seat to the middle position. An auxiliary cock is also fitted admitting live steam to the low pressure cylinder, giving additional power when required for getting out of difficult positions. The gearing is of steel with machine cut teeth, the ratios provided being 10 and 17.8 to 1. The crankshaft outside the engine box is of square section, on which slides a steel double pinion, moved into mesh with the steel

wheels on the differential gear shaft by a lever. The second motion shaft carries the differential gear, and from this shaft, with a sprocket wheel at each end, the power is transmitted to the large sprocket wheels by specially large roller chains with hardened steel bushes. The large chain wheels are carried by steel brackets attached to the felloes of the driving wheels. The differential gear can be locked by a steel clutch which is moved

an efficient brake is provided, worked from the driver's seat. A water lifter is fixed direct on to the water tank, and is fitted with thirty feet of hose with strainer attached. The water tank has a capacity of 190 gallons, and is provided with three trial cocks and hand-filling attachment.

Messrs. Robertson's first wagon was turned out in February last, and since then has been and is still working between Fleetwood and Blackpool, a distance of about eleven to twelve miles. The roads in the district are noted for being soft, very little metal having been used in making them, and in the wet weather of the past season they have been exceptionally heavy. Notwithstanding this, we are informed that the wagon has travelled fully 6,000 miles with loads varying from 4 tons to 5 tons 5 cwts., often doing two journeys each way per day. The special boiler has been found to give every satisfaction, no difficulty having been experienced in steaming in any or every sort of weather.

THE "BIJOU" LIGHT CAR.

AN interesting little two-seated car named the "Bijou" has lately been introduced by the Express Motor Co., of Liverpool, with a view of meeting the demand for an automobile at the popular price of about £100. The motive power is supplied by a 5-h.p. water-cooled single cylinder engine, having the usual accumulator and coil ignition. The cylinder cooling is on the thermo-syphon system. The brass water-tank of about 2½ gallons capacity serves both as a bonnet, tank and radiator, as it is pierced from front to back by a number of brass tubes through which the air is driven when the car is in motion; it is claimed that the loss of water does not exceed one quart in a 100 miles run. Two speeds are provided by separate expansion clutches operated by pedals, intermediate speeds being obtained by manipulation of the levers on the steering standard, which control the sparking and the air inlet to the carburettor.

From the clutch shaft the power is transmitted by chain gearing to the rear live axle. The makers state that the car will carry two passengers seated comfortably side by side at an average speed of from 16 to 20 miles an hour, and that it will easily mount ordinary hills. We may add that the engine is arranged to be started from the seat and that it is exceedingly steady in operation, little or no vibration being experienced by the passengers. The car is comparatively powerful, light though strongly built, simple, and easily managed, and will therefore appeal to the large class of would-be motorists who have been debarred from the sport of motoring not only by the initial price of a car, but by the cost of running and upkeep.

Fig. 3.—Sectional Elevation of Boiler.

into position by a small steam cylinder operated from the foot plate.

The approximate dimensions of the vehicle are:—Total length 18 ft. 9 in., over all, width 6 ft. 5 in. The wheel base is 9 ft., and the wheel gauge (centre to centre of driving tyres) 5 ft. 8 in. The platform, which is of the ordinary lorry type, has a useful area of 78½ sq. ft., the length being 13 ft. 4 in. and the width 6 ft. 5 in. The driving axle is of a special design and is constructed of rolled mild steel of girder section, with forged steel ends accurately machined and rivetted at each end, and it is held in position by strong radius rods attached to the steel pedestals of the second motion shaft. The back part of the vehicle is carried on strong laminated springs, the ends of which work in steel shoes having hard brass liners. The forward end is carried by the front axle, which is guided by steel horn plates, the weight being taken in the centre by a strong laminated spring, thus giving to the whole framing a three-point support which relieves it from any undue twisting strains. The front axle is a mild steel forging specially designed with long bearings and hardened pins. The road wheels are of the artillery type, having ash felloes, oak spokes, with steel or cast malleable naves, with hard gun metal bushes and weldless steel tyres 5½ in. wide on the front wheels (2 ft. 9 in. diam.), and 7½ in. wide on back wheels (3 ft. 3 in. diam.). The steering gear is worked on the Ackermann principle, and actuated by a vertical screw. In addition to the reversing lever

SOME USEFUL NOTES.

THE storage of a motor-car is a serious problem to many private owners, especially those living in large cities and towns where the nearest garage may be a mile or more away from their residence. In the country automobiles are usually kept in a

Fig. 1.—General View of Motor-Car Turntable.

stable, but this is not advisable, and special "automobile houses" are frequently erected. Unfortunately these houses are not always large enough to permit the necessary manœuvring of a car. A device which cannot fail to commend itself to owners of motor-cars desirous of economizing space is the Elliot turntable, illustrated herewith, and which will accommodate any vehicle weighing up to 26 cwt.; it is made in three sizes, 10, 11 and 12 feet in diameter, and its total weight is 750 pounds, exclusive of the plank platform. The manufacturers, the Gibbs-Brower Co., of New York, find that it is necessary to supply the iron work only, as the wood platform can be fitted by any carpenter. The use of the turn-table renders a large automobile house unnecessary, for the car can be driven directly on to the table and the whole turned round during cleaning or when it is desired to drive out.

ACETYLENE lamps are now so largely employed in connection with motor-cars that a few remarks on their use may not be out of place at the present time. The first and principal condition on which an acetylene lamp will consent to work is cleanliness, and unless it is suitably attended to after, rather than before, every period of use, trouble is likely to ensue. There are, however, lamps and lamps, and the principal sources of disorder in

Fig. 2.—Sectional Elevation of Turntable.

them may be separately considered, most of these being far more evident in small lamps than in large ones.

IN the first place, the burner has necessarily a very small aperture, and is therefore very liable to obstruction, the materials for which are plentifully provided by many systems of generation. This may be conveniently cleaned by the fine hard brass wires sold for hypodermic syringes, while the larger bore often terminating the jet should be cleaned out by a drill that

fits it. Air apertures in the burner, if present—for some of the best jets act on the principle of a miniature pair of Bunsens—equally require to be kept free from obstruction.

CLOGGING of the burner occurs to a very variable extent with different lamps, several causes contributing to it. First, the reaction between calcium carbide and water generates heat, often sufficient to cause polymerisation of the gas, with consequent production of benzine and similar compounds. Some of these are of a tarry nature, causing an adhesive deposit in the burner. Generators like the Bleriot, in which the water rises and falls round the carbide according to the consumption of the gas, would be liable to this, were it not avoided by the use of "acetylithe," which is a calcium carbide made partially "water-proof" by treatment with some water-repelling material. Hence it is comparatively unaffected by the moist atmosphere inside the apparatus, unless directly in contact with water. The action is thus rendered more gradual, and the liability to overheat diminished. Soaking ordinary carbide in heavy paraffin oil has a similar effect, but is apt to mess up the generator.

THE action between the carbide and the water is always accompanied by the production of lime, some of which, especially in "drip" generators, is carried over with the gas in the form of a fine powder, which would rapidly choke the burner were it not filtered out. The filter for this purpose, usually a pad of cotton-wool in a tube or chamber, requires occasional renewal. This pad also serves to retain moisture, unless there is a special carbide filter for this purpose. If a lamp of the "drip" type is allowed to burn itself out, the pad will probably get wetted, and cease to work. Few lamps will bear turning down much without smoking and consequent clogging, and hence, if the generator works unevenly and there is no rubber bag to equalise the pressure, the effect is similar, and troubles occur. If a burner has once got thoroughly dirty, it seems to have a great tendency to do so again after cleaning, possibly owing to the material of the jet absorbing some of the tarry products, and it is best in such cases to substitute a new one.

THERE are not many lamps that will burn well after being turned out for some time, without recharging, as the used portion of the charge—in addition to retaining moisture often sufficient to decompose the unused part during disuse—also shields the latter from the water when turned on. It is often an advantage with such lamps to intersperse a few strips of porous material—such as blotting-paper—with the charge, but, except with the lamps using "acetylithe," it is always advisable to clean them out after every time of use. With "drip" generators the used charge is apt to become hard and difficult to remove, unless this is done while a partially used charge of ordinary carbide continues to give off gas, which acts by no means beneficially on the brass parts of the apparatus. For this reason, and also on account of gritty lime particles, the taps of lamps are very apt to become leaky, unless well greased. It is always advantageous that the passage from generator to burner should be as long and tortuous as possible, thus assisting the gas to deposit impurities; and with some of the smaller lamps that have a rubber connection between the two, improvement will follow the adoption of a longer piece of tube.

A POINT that should not be forgotten is that carbide expands very considerably during decomposition, and generators must therefore not be over-filled. Where there is any likelihood of recharging being necessary during a drive, it should be attended to before the old charge has got thoroughly wet, and the flame begins to fall off. At this stage the used charge can be shaken out in a fairly dry state; but if it is soaked, the insertion of the new one into the damp generator will be a wasteful and aromatic process.

WHEN frost is feared, brine can be substituted for water in the lamp, but it should be made, if possible, from pure sodium chloride, free from magnesium chloride, the latter acting on metals, and being often present in common salt.

AUTOMOBILISM IN GUERNSEY.

RECENTLY, in seeking fresh sources of taxation, the States of Deliberation, the insular legislative assembly, decided to impose an annual tax of £1 on motor-cars and motor-cycles, and 2s. 6d. on ordinary bicycles.

Guernsey, the second largest of the Channel Islands, is, in relation to its size and population, the most commercially flourishing of the group, and there are a considerable number of motor-cars and especially of motor-bicycles in the island. Owing to its hilly nature motor-bicycles are superior to the bicycles propelled by foot power; the island, too, is intensely cultivated, and the rural districts contain many groups of glass houses for growing tomatoes, grapes, and other market produce for exportation to England, and this and other insular industries explain the increasing use of motor-cars and motor-cycles in getting about the island.

by an efficient driver, experimented with the car in the town and country.

One difficulty which local motorists have to face is the existence of a local law, made before motor-cars were introduced, restricting the quantities of mineral and vegetable oils that may be kept in stock by one individual. In consequence of this restriction at least one local enthusiast, who imports large supplies of petrol, has to keep his stock in reduced quantities in different parts of the island. One advantage of this system is, however, that he can charge his petrol tank at any of his stations without returning home. This law is now undergoing revision, largely at the initiative of motorists, so that even the restriction that now exists to the complete liberty of the motorist in Guernsey is likely soon to be removed.

Besides being used for commercial purposes, several motor-cars are used by private residents, whilst Dr. H. P. D'Elsey Benson was the first medical man to adopt this new form of

(La France Automobile.)

M. Gaste, on the 20-h.p. Automotrice Touring Car, on which he won the 2540-£1,000 class in the Deauville Speed Trials.

Although the insular authorities have decided to tax motor-cars and motor-cycles, this cannot be regarded as a conservative move in the direction of placing restrictions upon the use of these up-to-date methods of locomotion, for the legislation locally adopted some time ago for the regulation of this new form of traffic shows a welcome toleration of the innovation and a true appreciation of the commercial advantages of motoring in the island.

The local ordinance, framed in 1902, restricts speed to four miles an hour in certain narrow and steep streets of St. Peter-Port, but with respect to the other thoroughfares of the island the only rule laid down is that motor-cars shall not be driven at excessive speed in a manner that might imperil others on the road or be to the common danger, under a penalty of a £10 fine. Lamps are also required at night and motor-cars may not be left in the public roads unattended. Finally, each motor-car must be numbered, a registry being kept by the constables of each parish for purposes of identification.

When this ordinance was being framed the local magistrates who formed the Committee hired a motor-car, and, accompanied

locomotion, and he and Mr. A. L. Davis, the manager of the Guernsey (Electric) Railway Company, may be described as the pioneers of motoring in Guernsey. Dr. Benson has travelled upwards of 21,000 miles on his Singer motor-bicycle. Their examples were quickly followed by others, and automobilism is now progressing rapidly.

IN the course of a case at the City of London Court last week, Judge Lumley Smith said that apparently there is no law as to what two vehicles ought to do when proceeding along cross roads. In his opinion the man who reached the middle spot first was entitled to go on, and the other must wait for him.

WE are reminded of the progress of the automobile movement in India by the arrival of a well-got-up catalogue of motor-cars and automobile accessories from Messrs. Turner, Hoare and Company, of Bombay. The list comprises nearly forty pages, and includes petrol, steam, and electrical cars, of both English, Continental, and American construction.

MOTOR-CYCLING NEWS.

THE final round of the Motor Cycling Club's contest for the Edge trophy was to have been run off over the 200-mile course in the Hatfield district on Saturday last, but had to be again postponed as there was a lack of checkers, while one of the three competitors overslept! The officials present at Hatfield decided to postpone the actual test for the trophy until to-day (Saturday), but Jones (De Dion tricycle) and Milligan (2½-h.p. Bradbury motor-bicycle) elected to carry out the run as a reliability test simply, the distance to be 100 miles, concluding at mid-day. This they did successfully, making a non-stop run.

THE Lion Cycle Company, of Lowestoft, have recently introduced a new brake for motor-cycles, as shown in the accompanying illustration. It is termed an expansion brake and is designed for use on belt-driven motor-cycles furnished with a driving rim secured to the back wheel of the machine. The system consists essentially in arranging within the driving rim a large shoe of steel or other suitable material, the shoe being made the same shape as the driving rim, lined with leather, and made flexible either by a spring or a joint. The brake is secured to the two back stays of the machine, and by means of a lever controlled from the handle-bar it can be expanded so as to bring the outer surface into contact with the inner periphery of the driving rim. In this manner an extremely large brake surface is secured. The

makers inform us that they have fully tested the device and proved that it will securely hold a motor-cycle and fore-carriage, with two heavy riders, on the steepest of hills.

MR. J. VAN ZWIETEN, one of our South African subscribers and an enthusiastic motor-cyclist, writes us as follows:—"As a constant reader of your useful journal I would like to interchange experiences with British cycle sportsmen, in the line of motor-cycling, especially as regards the side-car attachment. I will give mine in a few lines, and I hope that I may get some useful advice in the matter. I purchased a new and I dare say a very good motor-cycle, and, although I had no previous experience whatever of motor-cycling, I judged that, with my machine converted into a tricycle by the side-attached little carriage, nothing serious could occur, and consequently I obtained one. I went off like a shot, had my motor well in hand, and by slowing speed turned round sharp corners to the right, and to a nicety, the attachment being to my left. I mention this as, when I wished to turn to the left, my machine, with its new side vehicle, objected; instead of answering to the steering, it rushed against a tree to the right and turned over, sending me spinning on to the pavement. I came off all right and so did my obstinate bicycle with side carriage. Not to be beaten, I made another attempt to turn to the left, but with worse results (perhaps because I gave it a little more speed)—bicycle attachment and self made a combined somersault such as would be worth seeing in a circus! I did not come off so badly, but my

cycle broke down so much that I had to wire for a man from the makers with new parts and tools. I would like to know if this is a peculiarity of these side attachments—i.e., its objection to turn to the left, or say inward? Can it be that the horizontals by which the vehicle is attached to the machine are inclined to bend, springlike, inward and out at right angles with the machine? I must say that I like the attachment very much, but it ought to obey orders. I had no passenger with me at the time—thus no weight in the basket seat—for the simple reason that I did not like to risk anyone's head besides my own. Would a solid tyre to the wheel of the attachment not improve its capability of turning round left hand corners?"

THE cause of Mr. Van Zwieten's trouble would appear to be due to his riding the motor-bicycle with side-carriage without a passenger in the basket. When the side-carriage is fitted to a motor-bicycle it is naturally intended to be used by two riders; if used by one rider, ballast should be carried in the basket to prevent the same tilting. After a little practice it will be found quite easy to sit and steer from the basket.

TOWARDS the end of the month the Motor Cycling Club will hold a dinner at the Royal Hotel, Slough, the intention being that the guests will travel down by road after meeting at the Marble Arch.

THE police in the Aldershot district have lately been unusually vigilant concerning the speed of motor-cycles and also against those who ride their machines on the footpath.

A 25-KILOMETRE motor-cycle race for the championship of Austria was held by the Automobile Club of Austria on the Bubur track at Prague last week. The first three places were secured by the Laurin and Klement machines, the winner being Herr Wondrich, who covered the distance in 22 m. 22 3-5 sec.

THE Sheffield and District Automobile Club's motor-cycle non-stop run was successfully carried out on Saturday. Eleven competitors started from Tinsley to follow a course by Barnby Moor, Bawtry, and Tickhill to Worksop, a distance of about forty miles, and out of the number the following eight completed the course without a stop and qualified for the club certificates:—Messrs. J. Lee, 2½-h.p. Broomhall; A. T. Dewhurst, 2½-h.p. Lloyd; W. James, 2-h.p. Fairfield; J. T. Thompson, 3-h.p. Quadrant; P. H. Dodds, 2-h.p. Minerva, and W. B. Davy, 2½-h.p. Minerva (motor-bicycles); and J. Thompson, 2½-h.p. De Dion, W. S. Gilder, 2½-h.p. Royal Enfield (motor-tricycles). The competitors were divided into three sections, with a marshal car to observe each section. Messrs. E. F. Coupe, E. H. Pickford, F. G. Smith, P. R. Thompson, B. Hind, J. E. Evans, James Barber, and J. R. Wade officiated as marshals.

WITH reference to the proposed regulations of the Local Government Board given in last week's *Journal*, the Motor Cycle Trades Association suggest that (1) the expression "motor cycle" shall include any vehicle running on three or less wheels and the weight of which shall not exceed 2½ cwt. (2) That the best place for the plate to be fixed is at the rear of a cycle, the plates not to exceed three inches in height nor five inches in width, the corners to be rounded to prevent injury to the rider. (3) That to illuminate the identification plate of a cycle is impracticable and dangerous. (4) That as the Motor Car Act does not instruct the Local Government Board to charge for identification plates, it is respectfully suggested that the registration fee include the plate without further charge. (5) That it should be made absolutely clear that the holder of a motor-car licence is at liberty to also drive a motor-cycle.

DURING the past financial year the Caledonian Motor Car and Cycle Co., Ltd., of Aberdeen, sold fifty-three motor carriages, and the results of the year's working were a total turnover of £21,557 and a profit of £369, permitting a dividend of 5 per cent. on the capital of the company after allowing for depreciation, etc.

HERE AND THERE.

GUERNSEY has imposed an annual tax of £1 on motor-cars and 2s. 6d. on bicycles, reference to which is made on another page.

THE London and District Westrumite Company, Ltd., has been registered with a capital of £50,000.

Mr. T. Lloyd, of Bowden, on his 8-h.p. Peugeot.

THE New Zealand Customs authorities have decided that steam motor-wagons imported into the colony must pay a duty of 20 per cent. *ad valorem*.

THE Cape Town Fire Brigade have supplemented the motor steam fire engine which they possess already by a petrol motor hose wagon built by the same firm—Messrs. Merryweather and Sons. The new machine has a steel frame, mounted on horizontal springs and wrought iron axles. The engine is a double-cylinder, with battery and coil ignition, located in the fore part of the frame under a bonnet, in front of which is placed the radiator for water cooling. Pump circulation is provided, and the engine drives through a clutch to a gear box which gives three forward speeds and a reverse, the rear wheels being driven from the countershaft, which carries the differential gear, by chains. The road wheels are of the artillery pattern, with steel rims and solid rubber tyres. The machine has been designed as a chief officer's buggy and hose carrier. It provides seats for four men and standing room for two more on the footboard at the rear. Behind the driver's seat is a large rotating reel carrying over 1,000 feet of hose for use with street hydrants or steam fire engines. Standpipes and branch-pipes are also carried, as well as two hand chemical fire engines for putting out small fires, and a pair of light scaling ladders. The whole apparatus has been built to serve as a "first aid" fire appliance, able to turn out immediately on an alarm, and to travel at speeds up twenty-five miles per hour.

MESSRS. J. C. FULLER AND SONS, of Bow, E., have just issued a new edition of their booklet dealing with the Fuller batteries and accumulators. Special attention is devoted to the Fuller mercury-bichromate battery intended for use in connection with the charging and ignition accumulators, and complete instructions are given for setting up and operating the same. Volt-meters, induction coils, and a useful test lamp are also included in the electrical accessories dealt with in the booklet.

MR. ARTHUR J. HERSCHMANN recently made a proposal to the Automobile Club of America for the holding of a winter contest for commercial vehicles, urging as his reasons that vehicles of this kind, to be really successful, must be able to cope with all kinds of weather conditions, and must carry a

reserve of power sufficient to enable them to sustain a contest with the elements for an almost indefinite period of time.

THE Wolseley Co. have just completed a 10-h.p. tonneau for the Earl of Sandwich.

THE usual quarterly 100 miles non stop trial of the A.C.G.B.I. will be held on Friday, the 13th inst.

MR. S. F. EDGE suggests entries for the Harmsworth Cup race for motor-boats should be allowed up to February 1st. Challenges should be sent to the A.C.G.B.I.

A SERVICE of electrical omnibuses taking current from an overhead conductor, similarly to electric tramcars, is about to be started at Monheim-am-Rhine by the municipal authorities of the town.

THE Highway Commission of Massachusetts has granted 3,806 licences to individuals to run automobiles or motor-cycles in the State, and has issued 3,201 licences for motor-vehicles.

LADY WINNINGTON, whose accident while motoring was chronicled recently, is the mother-in-law of Mr. Andrew Fletcher of Saltoun, the winner of the Mayor's cup at the Southport automobile race meeting.

MESSRS. WILLIAM STEPHENS AND COMPANY, of Wood Street, E.C., who are making a speciality of motor goggles, and also of masks, veils, and hoods for the use of lady motorists, have sent us copies of circulars in which a large variety of these useful articles is shown. It may be of interest to add that Messrs. Stephens undertake the repair and reglazing of motor goggles.

WITH reference to the report that Messrs. Schneider and Company, the great French gun-building firm, were taking up the construction of motor-cars, it appears that, while the report is correct, they are not building them on their own account, but for a new company which has been formed, to be known as La Société des Automobiles Eugene Brillié. The cars will be built at the Havre works of the Schneider Company.

THE Mayor of Ripon (Councillor Moss), Aldermen Spence and Lee, Councillor Hall, and the Town Clerk (Mr. Kirkley)

The Motor Hose Wagon for Cape Town.

have visited Beverley for the purpose of inspecting the new motor-car service introduced in Holderness by the North-Eastern Railway Company. Accompanied by Mr. T. Tennison, chief passenger agent, Mr. Newton, station master, and Mr. Kirby, deputy mechanical engineer, they rode to Leven and back. The visitors' impressions of the buses, which are illustrated on page 683, were highly satisfactory.

THE Coventry Motor Fittings Company, which is devoting much attention to the manufacture of motor fittings, such as lubricators, tanks, radiators, has lately introduced a neat and compact automatic pressure lubricator, of which we give an illustration herewith. The apparatus, which is actuated by means of a branch pipe from the exhaust, is made with either aluminium or brass reservoir. It is constructed in several sizes,

and with any desired number of oil outlets from 2 to 12, while, where required, a small paraffin compartment with pump for cylinder cleansing purposes can also be fitted. As will be seen, the lubricators have a neat and compact appearance, and care has been taken in their manufacture to prevent any annoying leakage of oil.

THE charge against a motor-car driver for driving backwards was heard at Beaconsfield on Saturday, when Mr. Percy Brennan was fined £10.

FOR allowing his motor-car to remain for more than an hour outside the historic Guildhall at Exeter, Mr. A. Hummell, of Bristol, has been fined 20s. and costs.

In the side slip competition organised by the Automobile Club, the first prize will be £200 and a gold medal, a silver medal being awarded as second prize.

A CYCLE and motor show is to be held in the Engineers' Drill Hall, Claypit Lane, Leeds, from Friday, January 15th, to Saturday, January 23rd, 1904, inclusive.

AN international automobile exhibition will take place from March 19th to the 27th, 1904, at Frankfort-on-the-Main, under the auspices of the Frankfort Automobile Club.

A MEETING has been held at Southampton to start an Association of all those interested in motor vehicles, with a view to taking measures to protect the interests of motorists, as affected by the application of the new Act. The hon. sec. is Dr. John E. Ransford.

THE Reading Baseball Club, of Reading, Pens., is having built a special motor car to accommodate fourteen persons, and has placed an order for it to be fitted up on the same plan as a Pullman sleeper, for the purpose of transporting the club members from place to place.

THE County Chemical Company, Limited, have lately introduced a new puncture-proof device for motor tyres. The arrangement, which is known as the "G.B.," consists of an ingenious application of electrically-cured mule hide to the inner lining of the outer cover. The hide possesses great resistive qualities, and as two sections of it have to be punctured before the inner tube is reached, punctures are reduced to a minimum. The device adds about eight ounces to the weight of each tyre, and is easily applied, no vulcanising being necessary.

WHEN nearing Withington, on Saturday, Mr. Owen Griffiths and Mr. Robert Macdonald, in avoiding a lorry overturned their motor-car, and the two gentlemen and the driver were thrown into the roadway, sustaining serious injuries.

THE Griffon Motors, Limited, has been registered with a capital of £1,000 to adopt an agreement with the Star Motor Agency, Limited, for the purposes of acquiring the benefit of an agreement between Mr. P. Surleau and the said Star Motor Agency, Limited, whereby the last-named parties were appointed sole agents for the United Kingdom for the sale of Griffon motor bicycles and parts, and to carry on the business of dealers and agents, etc.

Now that the duller lights of winter drive the photographer from P.O.P. to gaslight papers, the little volume on "Bromide Printing" with which Messrs. Hodder and Stoughton's series of photographic handbooks opens is particularly *apropos*. The Rev. F. C. Lambert and other authorities write easily and explicitly of the various processes by which good results can be obtained, and the editor is to be congratulated on the appearance of the initial volume of what should be a very useful series.

DR. H. NELSON JACKSON, who recently made a trip across the American continent on a Winton car, favours an annual endurance run from ocean to ocean. He says in regard to the idea:—"Such a race would be the greatest thing that has yet happened in automobilism. Its progress would be watched by the whole world during the thirty days or less I estimate the run across the country would take. The prize should be raised by subscription from makers, clubs and individuals. It should be a cash prize of not less than £6,000. I should favour the race being from New York to San Francisco, for the reason that the cars would have a clear run to Omaha. Each car should carry two people and each competitor should be allowed to choose his own route."

MR. A. W. KING, of Maywood-Hackensack, N.J., U.S.A., has lately introduced a new sparking plug, of which a sectional illustration is given herewith. It is known as the "Non-Stop," and has been designed to eliminate the necessity for removal of the plug while on the road, for ridding it of any foreign matter which might form a bridge from one terminal to the other, rendering the plug inefficient. The insulated terminal of the plug is surrounded by a protecting chamber which at the same time constitutes the opposed or earthed terminal. The sharp edges of the button-shaped inner terminal are located at an equal distance all round from the interior wall of the surrounding chamber, leaving but a 3-64 inch space, this having been found the most suitable for the production of a good spark. Should bridging or short-circuiting ever occur in the plug owing to it becoming sooted the vent cock attached to the chamber is opened, when the contents of the cylinder are forced through the spark-gap to the exclusion of any other passage, tearing loose and ejecting through the opening of the vent cock any obstacle which may have lodged between the terminals. The vent-cock is intended to also be employed as a compression relief cock, to insure

clean terminals from the start and without recourse to any other means. A pressure of from sixty to ninety pounds per sq. in. is stated to be a most efficient means for clearing away obstructions from between terminals. When it is desired to remove the inner terminal, the chamber with the vent cock may remain on the motor and the inner terminal alone detached.

THE WINTER USE OF MOTOR-CARS.

THE commencement of settled cold weather is the signal for "turning out to grass" a very large proportion of all self-propelled vehicles. Wheels are jacked up, tyres deflated, tanks drawn off and a canvas cover thrown over the retired vehicle, not to be removed in many cases until the spring overhauling. The noble army of winter users deserve credit, for they are helping to create a public belief in the all-the-year-round usefulness of the motor-car. If stored in heated stables, one may say with confidence that almost all automobiles are capable of giving good service all winter.

The technical difficulties of operating a motor vehicle during cold weather are, remarks Mr. A. L. Clough in the "Horseless Age," four in number:—1. Difficulty of securing correct "mixture" at low temperature. 2. Irregularities of lubrication due to increased viscosity of oils at low temperature. 3. Danger of freezing of pipes, jackets, tanks, etc.; and 4. the alleged increased tyre troubles due to changes in resilient qualities of rubber when cold, and other causes.

The capacity of air for petrol vapour at low temperature is small. The lower the temperature of the air the less petrol vapour it will hold, and a point is finally reached when it will absorb so little as to render the mixture imperfectly combustible. When it is attempted to operate a petrol engine at such a temperature it is found impossible to secure proper explosions. However, at almost all temperatures commonly met with in this climate, petrol is sufficiently volatile to give practical results, especially if the air be heated artificially before entering the carburettor. Petrol cars for winter use should have some provision for heating the air used in forming the explosive mixture. This is accomplished ordinarily by making use of the heat of the exhaust. The air intake pipe may be jacketed by a portion of the hot gases from the exhaust or the vaporizing chamber may be jacketed in the same way. A carburettor so provided will furnish a proper mixture to its engine after it is fairly in operation, but it is sometimes difficult to secure the first explosion of a motor which is cold and taking air at a low temperature. It is obvious that the heat necessary to vaporize the petrol for the first explosion must all come from the metal of the carburettor or from the surrounding air, and when both are in a cooled condition there is little tendency for a proper evaporation of the liquid, which is chilled by contact with the cooled metal. After the carburettor does give a good mixture it may, under some conditions of low temperature, be condensed in the cold cylinder, and if the air happens to be warmer than the engine, moisture may be condensed upon the sparking plugs and even affect the sparking. An engine which cannot be started on account of the cold can sometimes be made to operate by filling the water jacket with hot water and by pouring hot water over the carburettor, air inlet pipe and the mixture pipe, or by laying cloths wrung out in hot water upon these parts. Such treatment is generally successful. After the car has been in operation for some time it may be left standing out of doors for a considerable period with the engine shut down and still no difficulty will be found in starting it up. If the water and the metal have been quite thoroughly heated they part with their heat slowly. One can say, in general, that there is no difficulty in keeping a petrol engine which is suitably supplied with warmed air in continuous operation at any winter temperature, after it is once started, and that there is no difficulty in starting an engine, no matter how cold it may be, if the procedure recommended be followed.

There need be no very serious trouble in the lubrication of an automobile kept in a heated stable, because the vehicle starts out with its lubrication normal, and under all ordinary conditions the heat developed by the engine prevents the chilling and stiffening of the lubricants. With the mechanical lubricators now so much used the thickening of the oil due to cold is of comparatively little moment, for about the same amount of lubricant is fed in a given time, whether it is thick or thin. With the sight-feed cups, however, the amount of oil flowing depends entirely upon its thickness. The automobilist who has no

heated stable will have a sorry time with his cylinder lubrication. The oil in the various bearings will be so thick that the engine will work with difficulty, the oil in the engine base will be something like vaseline, and the cylinder oil cups if adjusted to feed properly in their cold condition will flood the cylinder when the engine becomes warmed up. On the whole, it may be said that a motor-car equipped with a system of forced lubrication, if kept in a heated stable (which is the *sine qua non* of the winter use of automobiles) and oils of the proper character are made use of, there should be no serious troubles with lubrication.

The season has arrived when the users of petrol cars should be substituting for the cooling water in their tanks some anti-freezing solution, but there will probably be unfortunate and belated individuals who will neglect this until on some sharp night their radiators freeze and crack, or—what is infinitely worse—the water in the engine jacket freezes and splits the cylinder casting, necessitating an expensive renewal of the damaged part. Fortunately we have means to make Jack Frost a harmless foe as far as the cooling systems of petrol motor-cars are concerned. Calcium chloride is a cheap chemical product, but it is variable in respect to the amount of water of crystallization which it contains and also somewhat variable as to its neutrality, and it is thus a little hard to tell what one is getting when calcium chloride is called for at the chemist's. It is plain, from accounts which have been published, that some so-called chemists have deceived their customers into taking chloride of lime instead of chloride of calcium—two compounds which are hardly more alike than chalk and cheese. Calcium chloride is generally marketed in the form of the fused salt and is of a dirty white colour, with a fracture somewhat resembling marble. It is generally very moist and covered with its own saturated solution. If the calcium chloride be slightly alkaline, as it should be, there will be no danger of the corrosion of the metals with which it comes in contact. The quantity of the salt that should be used per gallon of cooling water depends upon the amount of water of crystallization that the particular grade of chloride contains. The probable amount required will be from three to five pounds per gallon, but one may have to do some experimenting unless the quality of the salt be exactly known. While there may be no fear of corrosion when the salt is properly used, it is possible that some trouble may be experienced in the lubrication of the circulating pump when calcium chloride is used. If the lubricant employed be animal oil or grease and the cooling solution can come in contact with it, the result will be a formation of a lime soap which will destroy the lubrication. If graphite or other purely mineral substance be used for the lubricant, there should be no trouble from this source. It would be for the benefit of all concerned if users of the calcium chloride cooling solution would send us the results of their experience.

There is a generally credited belief that rubber is more subject to deterioration when used in cold weather than in warm. Probably this is true, but one would like to know upon what experimental data the belief rests. One thing is certain, that the frozen ground upon which tyres are required to run during the winter season brings about excessive wear. A run over country roads with their frozen ruts is equivalent in point of tyre wear to many times the same distance during the summer season.

"Is my Bonnet on straight?"

CORRESPONDENCE.

ACCUMULATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Thos. Hallowell's letter in yours of the 24th ult., he is perfectly correct in most of his statements, but the following experience may be useful. When an accumulator is exceedingly well charged, and has sufficient current in it to give its fullest capacity of discharge, the plates are then in such good condition that the voltage after charging will be at its highest, 4.5 to 4.6 volts.

Accumulators should certainly be charged once in six weeks, if possible, but a good accumulator will do useful work for three months, though you must not expect to get the full capacity out of it; it is quite correct to only add distilled water to make up loss in electrolyte, as the effect of charging splits up the water into hydrogen and oxygen, and it is only water, which consists of these gases, that is required.

You cannot get much more into an accumulator after it starts to boil, unless the boiling is due to an excessive charging rate, or unless you greatly reduce the charging rate, and continue to charge at a very low rate of current.—Yours truly,

AN EXPERT.

Chapter 1.

Chapter 3.

cardan transmission, but with a Richard carburettor and accelerator. I want this car to travel at from 15 to 24 miles up inclines of 1 in 10 to 1 in 8.

Can this be done? And if so, would you kindly tell me the name of a likely firm who would undertake the job.—Yours faithfully,

L. M. LILLY.

Lisbon.

[We have had no experience with a Richard carburettor and accelerator in conjunction with a De Dion two-cylinder engine, and we should not feel inclined to experiment in this direction.]

THE LIGHTING OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One among the many points requiring elucidation, and which to my mind will be a source of danger created by the new Act, is that lamps will require to be fixed so that the plates on the car shall be illuminated in a way sufficient to secure the letters and figures being legible in front and behind the automobile. One knows too well the importance of proper lights to rule the traffic of the roads by night, but

Chapter 2.

[Dus Schnauffer], Munich.

A GUY FAWKES STORY IN FOUR CHAPTERS.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the new Act coming into force, I would suggest that those who wish it should be able to submit their cars for examination by the authorities, and, on their being satisfied that the gearing will not allow the limit being exceeded in driving, those cars should have a distinguishing mark placed on them in a conspicuous position, so clearing them of police interference. It is also possible that, in these cases, the dimensions of the number plates might be reduced from the sandwich-board size at present suggested.

Having been trapped twice in one week, I am anxious to be free from worry, and twenty miles an hour is quite fast enough for—Yours truly,

A TOURIST.

CARBURETTORS FOR DE DION CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a regular reader of your paper I take the advantage of consulting you on the following:—I should like to have a two-seated car with a De Dion two-cylinder engine, De Dion's system of gearing and

the introduction of other lights will surely tend to make confusion worse confounded.

May I say I agree with your correspondent "J. H. A. Macdonald" in his suggestion that we should name our cars, as some small compensation to the needless, ugly, disfiguring identification plates to be attached.—Yours truly,

CHARLES J. E. SPARKE.

ACETYLENE MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in sending you some particulars of the experiments that I have recently been making in connection with acetylene motors. I have, at last, been entirely successful in using acetylene gas as fuel in explosive engines. I started with motor-bicycles and the results have been surprising. In the first place no vibration is felt, and secondly, it not being necessary to find the right mixture, the engine starts off instantly, and there are no pannes to fear on account of carburation troubles. The carburettor is replaced by a doseur-mélangeur, or quantitative measurer of air and gas, which forms

the principal feature of the system. The gas generator takes the place of the petrol tank, and also contains the accumulator and the oil pump. There is, subsequently, no change in the form of the machine. One kilogramme of carbide is sufficient for a run of 100 kilometres, and even more. The generator is charged with carbide cartridges, which can easily be replaced when they become exhausted; the manipulation of the machine is, therefore, very clean. For motor-cars, the form of the gas generator will be on practically similar lines, but the working is simplified, the generator being of larger dimensions and more easy to work than those of motor-bicycles.—Yours truly,

A. BOUCHET.

St. Cheron, France.

WET AND DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers be good enough to give me their opinion of the relative merits of wet and dry batteries for ignition purposes on a 2½-h.p. De Dion engine? I am using the latter, but they appear to run down quickly.—Yours truly,

L. H. H.

[We would recommend our correspondent to try accumulators, instead of dry batteries. The great advantage of secondary cells over dry cells is the constant, or practically constant, voltage. Of course an accumulator on no account should be "shorted" with a wire across the terminals to see if they are charged, as permanent injury may in this way be done to the plates. Accumulators will run practically as long as any dry cell, and, instead of being thrown away, can be recharged at a small cost.]

IGNITION TESTING.—Answering several correspondents, the ignition testing device and switch illustrated in our last issue can be obtained from Messrs. J. Lacoste and Co., 176a, Shaftesbury Avenue, W.C.

ALUMINIUM WIND SHIELDS FOR MOTOR-CARS.—We have an enquiry for the names of makers of aluminium wind shields for motor-cars. Will manufacturers of such articles communicate with us?

A CORRESPONDENT asks if there is any means of repairing the water jacket of a petrol motor cylinder which has become cracked. He has been recommended a method of rusting together the cracked portions by means of sal ammoniac and iron filings. While this has been found satisfactory to a certain extent, there is still a slight leak.

DIMENSIONS OF INSPECTION PIT.—Replying to W. Corbett, who enquires as to the dimensions of an inspection pit, we would recommend the following:—Length, 6 ft.; width, 2 ft.; and depth about 4 ft. It should be furnished with a cover of stout boards fitting into a ledge, so that it can be closed flush with the floor when not required. If the pit is out of doors, or water is otherwise likely to penetrate, a drain should be provided.

THE MOTOR-CAR ACT.

YORKSHIRE.—At a meeting of the Settle Rural District Council, suggestions have been considered from the representatives of the various townships for the restriction of the speed of motor-cars. The Council eventually decided that on certain roads the speed should be limited to ten miles an hour, and in passing through villages to eight miles per hour. It was recommended that danger-boards be erected at a number of places.

The Selby Rural Council decided on Monday not to seek to prohibit motor-car traffic on any of their roads, but to have the speed of cars limited on going through villages and past schools.

WILTS.—The Westbury Rural Council has decided to put up sign-boards warning motorists at "Bratton Bash," near Bratton, on the Devizes road.

HEREFORDSHIRE.—Mr. H. G. Morgan points out that there are many roads in Herefordshire the macadamised portion of which is under 16 ft. wide, but very few of which are under 16 ft. from hedge to hedge.

CLUB NEWS.

HEREFORDSHIRE.

THIS club arranged to have a Reliability trial to Shrewsbury and back on Thursday week, but the weather which has been experienced of late curtailed the entries considerably, and it was thought of postponing the interesting innovation. However, Thursday morning opened favourably and the more ardent motorists assembled at headquarters in Broad Street, Hereford, and decided to make the run. About thirty took part, and on arrival at Shrewsbury luncheon was enjoyed. The return journey was commenced at 3.15, Hereford being reached about 7.30 at night. With the exception of a drawback at Leominster, where the cars were compelled to go through two feet of water, the run was a very pleasant one. The machines kept strictly up to scheduled time, breakdowns were at a discount, and everything was thoroughly satisfactory.

SOUTHPORT.

A MEETING of the Southport Automobile Club has been held, at which Mr. Frank Hough (secretary) read a letter from the Reading Club re proposed automobile federation of provincial motor clubs. It was resolved that the Secretary write stating that the club viewed with the greatest satisfaction the action of the Reading Club, and hoped they would be able to bring the proposed automobile federation to a successful issue. They also promised to give the Reading Club every assistance that lay in their power. The Secretary was instructed to write to the Automobile Club asking why Mr. C. H. Threlfall should be suspended. It was stated that while Threlfall was suspended for changing over his machine another competitor in the same race was allowed to do the same thing, and they also wished to know why the matter was given to the Press before the general committee had sat and considered the subject. The meeting protested against the action taken in respect of Mr. Rignold, of New Brighton, who entered for the Lancashire Handicap, and whose case was treated in committee and disposed of at Southport without intimation to the secretary. The Secretary stated that there were now forty-four members on the books of the club, and there was a sum of nearly £30 in hand.

THE SPEED OF TRAMCARS.

At the West London Police-court on Saturday four drivers in the employment of the London United Electric Tramcar Company appeared to answer the adjourned summonses taken out by Mr. Moffat Ford for driving their cars at a speed exceeding ten miles an hour, the limit laid down in the Board of Trade Regulations.

At the first hearing Mr. Ford said that he timed the cars over a measured distance of a furlong, and he found they were travelling from 15½ to 17 miles an hour.

Mr. Muir, who appeared on behalf of the company, suggested that an independent test might be made by the Board of Trade. An adjournment was ordered for that purpose, and when the hearing was resumed Col. M. H. Purcell, of the Royal Engineers, said he was the officer nominated by the Board of Trade to make the tests. He posted an assistant at the generating station, and Mr. Parker, of the London Athletic Club, took the times. He measured off a distance of one furlong at Goldhawk Road, and then tested the cars; watching the driver who had charge of the vehicles.

With a flying start the following times were made by the cars:—No. 272, first trial, 34 3-5 secs.—13'006 miles an hour; second trial, 34 4-5 sec.—12'93; third trial, 32 secs.—14'06. No. 75, first trial, 34 2-5 secs.—13'08; second trial, 32 2-5 secs.—13'47; third trial, 36 secs.—12½. No. 60, first trial, 35 1-5 secs.—12'78; second trial, 36 3-5 secs.—12'29. No. 173, first trial, 33 3-5 secs.—13'39; second trial, 30 2-5 secs.—14'8. Those figures showed the highest speeds attained by the cars. Mr. Ford came up soon after the first test was taken, and he said that unless the car was in exactly the same condition—number of passengers, etc.—it was no test at all. Mr. Ford then withdrew. The statement that Mr. Ford was not admitted to the test was untrue. The witness also tested two other cars that came along, and the highest speed was 14-5 miles.

After other official evidence the magistrate said his difficulty was that evidence had been given as to the speed, which was over the limit.

Mr. Ford then obtained permission to call Colonel Crompton, as an expert, who said that, seeing there was no instrument on the car he was in to test the speed, he advised Mr. Ford to withdraw. He had tested the cars on other occasions, and they had exceeded the figures given. Mr. Evershed, an electrical engineer, of Chiswick, was of opinion that after he passed Young's corner on the day the tests were made the voltage was abnormally low, and the next day he communicated with Mr. Ford, whom he had not previously known. He judged by the speed and the lights. An adjournment was then ordered.

Two electric car drivers in the service of the London County Council were summoned at the Lambeth Police court on Tuesday by Inspector O'Sullivan for driving their cars furiously. In the first case Police-sergeant Gunn stated that at five minutes past ten o'clock on the morning of the 19th ult. he was in Camberwell New Road, when he saw an electric car being driven at a furious rate. With a stop-watch he timed the car over a measured distance of 110 yards, and found that it covered the distance in 15½ seconds—equal to a speed of fourteen miles and 908 yards an hour. In regard to the second case, Sergeant Gunn stated that a car covered a measured distance of 110 yards in the Clapham Road in 13 4-5 seconds—equal to a rate of 16 miles and 125 yards per hour. Mr. Hopkins ordered each of the drivers to pay a penalty of 5s. and 2s. costs.

MOTOR-CAR ACCIDENT.

AN inquest was held by Dr. W. Westcott, at Hackney, with regard to the death of Thomas Alliston, of Mildenhall Road, Clapton, who died from the result of injuries caused by being knocked down by a motor-car. Police-constable Crayford said he saw the deceased leave the kerb at the corner of Cornthwaite Road, and walk a few yards in the road, evidently with the intention of passing a tramcar which was going in the direction of Clapton. As he stepped out from behind the tramcar the

witness heard the motor-car horn blow and several persons shout. It was travelling about eight miles an hour. A verdict of "accidental death" was returned, the jury exonerating the driver of the motor-car from all blame.

* Indicates Motor-Cycle Cases.

CLAIMS FOR DAMAGES.

IN the King's Bench, Dr. Alfred Grosvenor, of West Hampstead, has been awarded £150 damages against the Kannenbeer Supply Company, Limited, one of whose motor-vans had frightened his horses and caused his brougham to be wrecked. Counsel for the plaintiff said that on each side of the van was a huge dummy jar or jug. It made a noise like the rattling of jars and the rumbling of machinery. It was a weird and untamable vehicle. The Judge, in summing up, remarked that the noise made by the motor was different from anything that he had ever heard before, and he left it to the jury to decide whether it was a nuisance, and whether there had been negligence on the part of the defendants. The jury found in favour of the plaintiff on the first question and awarded the damages stated.

AT the Portsmouth County Court, the South Hants Motor Company have brought an action against Mr. F. T. Jane. On their behalf Mr. Blagg explained that his clients were the patentees of a motor bicycle, and during last summer employed a man to ride it about the town for purposes of advertisement. While it was being ridden along Osborne Road, the defendant's car swerved quickly round and collided with the bicycle, throwing the rider to the ground and doing damage to the machine to the extent of £5 10s., which was the amount claimed. After hearing the evidence, his Honour intimated that he was satisfied that the defendant's car was not going at an excessive speed, and the only other suggestion of negligence was that it was on the wrong side. He

believed that plaintiff was going at an excessive speed under the circumstances. He therefore gave judgment for the defendant with costs.

EARL EGERTON OF TATTON has claimed damages in the Altrincham County Court from Mr. H. V. Kilvert, a magistrate of Ashton-on-Mersey, for the negligent driving of a motor-car by the defendant and for injuries caused to a horse and trap. It was stated that on the morning of July 1st defendant and two fellow justices were going to Knutsford in a motor-car for the purpose of attending the Knutsford Quarter Sessions, when they met a young horse attached to a trap belonging to his lordship, in charge of a groom. The groom held up his hand as a signal to the driver of the motor-car to stop, but with the exception of slightly slackening, it was alleged, they went straight on. The horse became restive, and started to kick. One of its legs got over the shaft, with the result that the animal fell over, and the vehicle was overturned, doing considerable damage.

For the defence, it was contended that the car was going at about twelve miles an hour all the way, and as soon as the signal to stop was observed Mr. Kilvert slackened, and ultimately came to a dead stop within twenty-five yards of the trap. He stopped there for about one and a half minutes, and as there was no further signal he took it for granted that the driver of the trap wished him to pass. He restarted the car at about two miles an hour, and when he got opposite the trap the horse began to get restless on account of the roughness of the grass at the side of the road on which the trap was.

Judge Bowen Rowlands gave judgment for the defendant. He considered that the motor-car had stopped, and also that the groom should have made further signals for the car to be stopped if he had wished it to do so.

LIABILITY IN HIRING CARS.

AT Marylebone County Court, on Monday, Mr. G. M. L. Keham brought an action against Automobilia, 532, Oxford Street, W., claiming £12 12s. in respect of alleged breach of contract of warranty. The plaintiff stated that he had hired a motor-car explaining that he must be driven to Chalfont St. Giles' by half-past twelve noon. There was great difficulty in getting the car to start, but worse troubles followed. After running on only one cylinder for a while, and being pulled and pushed about all over the road, the car landed them at Hayes, about three miles the London side of Uxbridge. Plaintiff was then so disgusted that he sent on to Uxbridge for another car. As this car could not take them beyond Uxbridge, he was obliged to hire a carriage, and he and his friends were six hours late. Mr. Albert Mansell, secretary to the defendants, explained that the Automobilia was a French syndicate, duly registered according to French law. When the plaintiff hired the motor-car no contract was given. When sending out motor-cars, it was impossible to give such a warranty. The judge: It was a contract of hiring, and in that there is an implied condition that the thing hired should be reasonably fit for the purpose for which it is hired. The driver of the car stated that he ultimately discovered that one of the oil taps had become loose, and that was the cause of the whole trouble. The judge eventually found for the plaintiff for five guineas with costs.

THE CONSUMPTION OF SMOKE.

A TEST case has been heard in which the London County Council issued a summons against Mr. Earp for driving a light locomotive which did not then consume, so far as practicable, its own smoke, and the summons was taken out under the Locomotives Act of 1878.

The contention of the County Council was that as smoke was emitted from the locomotive, it could not come within the definition of the Light Locomotives Act of 1896, and was therefore subject to the penalties laid down by the Locomotives Act of 1878, which applies to traction engines and steam rollers.

Mr. Staples Firth appeared for the defence, and pointed out that the smoke was emitted from a temporary or accidental cause, and that the car was so constructed as not to emit visible vapour or smoke, and he called evidence on the question of construction. The magistrate dismissed the case.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notices will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, NOVEMBER 14, 1903.

[No. 245.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A MOTORING resident having been asked to be local correspondent for the Motor Union at Epsom, quickly got in touch with the Urban Council and arranged to take the members with their surveyor and clerk round the local roads at any speed they might wish in order to see if any regulations under the new Act were necessary for the public safety. Cars were kindly lent by Messrs. H. J. Mappin (14-h.p. Daimler), W. Marden (16-h.p. Clement), E. H.

Renton (12-h.p. Darracq), A. S. Harrison (7-h.p. Panhard), and G. T. Langridge (11-h.p. Clement), and they duly met at the Council's offices on Saturday afternoon, when fifteen passengers besides the drivers and their friends embarked. Three of the cars were driven by their owners, and two by engaged drivers. About forty-three miles were covered in a little more than two hours, including the High Street (several times) and many other very narrow and tortuous roads. A large amount of traffic was encountered—as might be expected on a Saturday afternoon—including several young thoroughbred horses and the Surrey Stag-hunters, but all were safely passed. From the general expressions gathered afterwards, it would not appear that any unreasonable restrictions will be asked for at Epsom. The absolute control the cars were under, and the acute angles they so easily negotiated, surprised many of the voyagers. It is to be hoped that in other districts motorists will endeavour to do their duty in a like manner and save the local rates from the unnecessary expense of notice boards, and themselves from undue and irrational restriction of speed.

Progress in Hampshire.

THE Southampton and District Motor Union is the full title of the association of local motorists which was established at the well-attended meeting at Southampton referred to in last week's *Journal*. Col. Frank Willan, J.P., was elected to, and has since consented to accept, the position of president, the remaining members of the executive committee being Drs. Norman E. Aldridge and J. E. Ransford, Messrs. S. Tebbutt, A. Hendy, C. F. Keller, hon. sec. (ex-officio), car owners; Messrs. C. P. Trippe, Webb and Wride, motor-cycle owners. Colonel Willan, Mr. W. G. Beatty, and Dr. Aldridge have been selected as delegates on the executive of the Hampshire County Motor Union, recently formed at Winchester. Since writing the foregoing we learn that the County Council have decided not to schedule any roads under Section 8 of the Act.

Legal Dicta.

JUDGES and magistrates seem incapable of hearing cases in which the automobile figures without expressing their views on the motor-car. Recently, Judge Emden testified to the value of his experience as a motorist in deciding cases dealing with street accidents and the like. Now Mr. Rose, at the West London Police Court, declares that he has never

travelled in a motor-car—an omission that ought to be remedied without delay—nor has he ever suffered any inconvenience from such vehicles. Mr. Justice Bigham, too, has been making confessions. He does not like motor-cars; he does not drive one; and he does not enjoy being driven in one. Really the legal gentlemen belonging to the A.C.G.B.I. ought to see to the motor-education of the Bench.

The Proposed Federation.

THE discussion on the proposed Federation of the Automobile Club has now been fully launched, and while the circular letter sent out by the Reading Club has been warmly approved in many quarters, it has elicited a sharp answer from the Nottingham Club. It is, perhaps, unfortunate that already considerable heat has been introduced into the question, and we would deprecate any utterances likely to discourage free discussion with a desire to do the best that is possible for the welfare of the movement generally.

Motors and Voters.

MOTOR-CARS have become so indispensable at election times that their presence is not usually recorded in our columns, but, in connection with the bye-election in the Chorley division of Lancashire last week, an incident occurred which is significant of the universal interest in automobilism. Rumours were afloat a few days before the election that there was to be a great number of motor-cars, and the result was that in the mining districts many men refused to go to the poll unless they had an opportunity of testing this new method of locomotion. In the afternoon a horseman galloped into the party headquarters from Coppul Moor with the information that fifty miners threatened to abstain from voting unless a motor-car was provided for them. They were subsequently accommodated, and appeared to enjoy their experience.

Damages after Accidents.

ON a later page we report a trio of claims for damages resulting from accidents in which motorists have been interested parties. Actions against motorists secured damages of £200 and £250 respectively; that in which the motorist was the plaintiff, and the defendant a driver of horses, was followed by a verdict for £35. Motorists exercise reasonable care as a general rule, but it is evident they cannot be too solicitous as to the way in which their vehicles are negotiated through traffic, for the lawsuits that may follow any mishaps are a substantial addition to the expense of the pastime.

Dogs and Cars.

FOLLOWING the contribution in our columns last week with reference to dogs and cars, a suggestion from Capt. Kenneth Campbell seems *apropos*. This is to the effect that riders of motor-cycles should carry snuff or pepper to dust on the heads of dogs that worry riders. This is a remedy he has usually found efficacious, but one which the editor of the *Field*

deprecates as being likely to blind the animal, and only a little less dangerous than the use of diluted ammonia. Evidently the most humane solution of the matter has not yet been found.

Fair-Weather Vehicles.

THERE are many critics of motoring who regard automobiles as fair-weather instruments with limitations of usefulness to business or professional men who would try to substitute them for horse traction. The critics, though not quite correct, have still some grounds for their objections, and it remains for designers to go more thoroughly into the matter of producing vehicles which will give constant satisfaction in such a variable climate as ours. Cars provided with electric ignition always run a certain amount of risk in wet weather owing to the chances of short circuiting or some other electrical trouble, which is very difficult to locate in a downpour of rain when stranded by the roadside. Users of pneumatic tyres have ever the bogey of sideslip before them, while many drivers after a few thrilling skids have not nerve to face the roads on a greasy day. Solid tyres, though much less prone to skidding, are still far from being free from it.

Mr. Windsor T. White on the White Steam Car which acted as Pilot in the Recent American Reliability Trials.

Faults and Remedies.

THERE is no doubt that many motorists have painful feelings on this matter which the actual dangers really do not warrant. A properly built car can be driven slowly over the greasiest surface without extreme risk if the driver knows his business and understands the dangers of improper use of the brakes. Still the fear exists, and it is quite enough to dissuade a nervous man from motoring on a wet day. Furthermore, a motor-car driven in bad weather picks up an immensity of dirt, and, if the owner has no servant to help him in cleaning, he finds that the job involves a great amount of time, and becomes tedious if it has to be performed frequently. We have heard of a man who at first started out with the intention of motoring every day, but after a few rainy weeks the task of cleaning became such a constant and tedious one that he relinquished the idea of keeping up the game daily. He was rather irrational in his objections, of course; for if he had a pony and trap he would most likely have got a boy to do most of the cleaning up work. He also forgot that in motoring one is tempted even in wet weather to pursue a higher average of speed than in horse driving; and on a muddy day every increase of pace adds to the amount of mud flung up. Makers should study this matter carefully, and, by a better system of protecting the working parts from mud and wet, render the operation of cleaning as simple as possible. No doubt in time we shall come to

such improvements in tyres as will make the motor-car quite reliable on grease; and then—if it is not too near the millennium to have critics about—there will be no one dissatisfied about the rough weather capabilities of the automobile.

Cabs.

VARIOUS causes have contributed to the present discontent among the London cabmen. It is, however, freely suggested that the growing popularity of motor-cars has been one of the factors in reducing the number of "fares," and there is no doubt that the competition of "tubes," etc., and the adoption of the motor-car by the aristocracy, has told heavily upon a class of men who have rendered considerable service to the community, to say nothing of their enrichment of the ordinary work-a-day vocabulary. But where are the motor-cabs!

Track Racing in America.

THERE is much that is mysterious in regard to racing cars now in course of construction. Providing all the mysterious reports be true, remarks the "Automobile," there will be seen in America next season a great aggregation of American and European racing cars, and programmes containing so many entries in each class that a number of heats will have to be run for each event. Closer racing and faster racing is certain to result. Several American makers are known to have in process of completion some wonderfully fast and very powerful cars. Doubtless many of the new racers will be seen at the Florida race meeting at Daytona and Ormonde Beach early next year.

On the side of the Police.

EVIDENTLY dismissals of cases against motorists are not popular with everybody, and we learn that Major J. C. Gant, of Chiddingfold, has suggested that the Lewes police should take a case they have lost to the quarter sessions. Should they do so he will contribute £10 towards their expenses, and if it should be necessary to carry it to the High Court he will give £20. The defendant was driving Mr. E. E. Robb, who is now mayor of Tunbridge Wells, and Mr. Boot, the electrical engineer of the borough. According to the police they travelled over a measured furlong in eighteen seconds—a pace sufficient to take them outside the favour of the Chief Constable, who allows motorists to go twenty miles an hour in the district. But the defendant and his witnesses assured the Bench that their speed was not more than twelve miles an hour, while it was also shown that when the electrical engineer wanted to test the timing apparatus employed it would not work. Naturally the Bench decided to dismiss the case; hence the wrath of Major Gant.

"An Act of God."

A CURIOUS claim was made at the recent meeting of the Carmarthenshire County Council. Mr. W. J. Maybery, of Llanelly, put in a claim for £74 17s. 6d. for damages to his motor-car caused by the subsidence of the main road near Llandefeilog Hill. Mr. Mounsey, the Surveyor, stated that he did not know of the subsidence until four days after the date of the alleged damage to the motor-car. It was caused by water from the adjoining fields completely flooding the road. The thoroughfare had since been closed. He did not consider that the accident was due to anything but an "act of God." Mr. J. Johns said he knew the surveyor had received similar letters, and he moved that the clerk (Mr. Nicholas) reply that the Council were sorry for what had occurred, but that the circumstances were due to the weather, for which the Council could not be held responsible, as it was an "act of God." Dr. R. L. Thomas seconded this, and the motion was adopted.

A Motor Wagon for Westminster.

THE City of Westminster is about to adopt motor wagons for the collecting of refuse, and Mr. J. W. Bradley, the engineer to the Council, has issued an outline of the proposed specification, from which we learn that the vehicle to be tendered for is to be petrol driven, to have three forward speeds of four, seven, and ten miles per hour, and one reverse at about three miles per hour. The net load to be carried is not to be less than two tons, but may occasionally be up to three tons. A b.h.p. of fifteen will have to be developed at a maximum speed of 800 revolutions per minute. The tyres will have to be of solid rubber and the car is to be gear driven, and not by belt or chain. Alternative tenders are being invited (a) for the supply of one motor van on these lines, (2) for the supply of not less than six vans, and the maintenance of the same for seven years, the vehicles working an average of 125 hours per week.

"A Stand By."

IN connection with the latter requirement of the Westminster City Council the contractor will be required to keep on the Council's premises during the continuance of his contract a car of similar design as a "stand by," so that should any one of the cars get out of order its place may be

Aero Club have been invited. The Aero Club now numbers nearly 200 members, and premises have been taken at 110, Piccadilly, W., which will be ready shortly.

Ingenious but Impossible.

AN interesting suggestion comes from a well-known medical man in the West End of London. He queries whether anyone could read the identification plates to be put on the car, if above or below the plates were fixed Bleriot lights to shine in the daytime. The idea is ingenious, but we are afraid the police would, in such a case, manage to find some excuse for hauling the enterprising motorist before the magistrate for attempting to drive his motor-car through the Act of Parliament.

The Motor Car Act.

THE education of local councillors with regard to automobile matters should be rapidly pressed forward by owners of cars in every part of the country. As will be seen from our reference to the last meeting of the Barnstaple district council, on another page, representatives of the public on local bodies have not yet got over their fears with regard to motor-cars, and prejudiced views are likely to be

A Group of "Star" Cars at Bridgnorth, on the occasion of the Wolverhampton Automobile Club's Hill-Climbing Competition.

taken without delay, the said car remaining the property of the contractor and being kept in working order at his expense. Other regulations will have to be borne in mind, and, altogether, it is very clear that the City Engineer of Westminster is determined to look after the interests of his Council.

The Aero Club.

THE monthly dinner of the Aero Club took place on the 3rd inst. Among the members present were Mr. Roger Wallace, K.C., Mr. Graham, M.P., Mr. Frank Butler, Mr. C. F. Pollock, Mr. Schneider, Mr. Martin Dale and Mr. E. O. Pope. On the 21st inst. and the succeeding Saturday two balloons will leave the Crystal Palace at 1 o'clock precisely, open to members of the Aero and Automobile Clubs and Motor Volunteer Corps. Prizes will be given to those automobilists who first succeed in a capture by touching the balloons in their descent. The third annual dinner of the Aero Club and the anniversary of the Santos Dumont dinner will take place at the Carlton Hotel on November 25th. Several prominent members of the French

taken where a little knowledge would secure to motorists some liberty of action, consonant, of course, with common sense.

Motor-car Imports and Exports.

THE imports of foreign automobiles into this country show a further tapering off. The number of cars and cycles imported last month was 301, the value of the same being returned at £98,570. The value of the "parts thereof" is given as £21,495, so that we get a combined total for October of £120,065 as compared with £160,279 in September last and £102,817 (representing 293 cars) in October, 1902. Some of the imports were of only a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised 45 vehicles, amounting in value to £14,989, bringing down the net imports in October to £105,070. For the first ten months of the year, the net import of motor-cars, cycles, and parts stands at no less than £1,656,150 (representing roundly 5,410 vehicles), practically double those during the same period of 1902. As regards the exports of automobiles of home manu-

facture, the shipments during the past month amounted to 100 vehicles, of a value of £24,999. Of parts the exports attained a value of £3,335, making a combined total for October of £28,334, compared with £15,619 (representing 38 vehicles) in October, 1902. To the end of October, 723 vehicles of British manufacture had been exported this year, these, together with the "parts," representing a sum of £283,302.

Steel Tyres for Racing Cars.

WHY not use steel tyres for racing machines, asks a St. Louis motorist in one of our American contemporaries, who points out that the recent numerous fatalities on the track, caused by overloaded or defective tyres, are evidences that something better is required than the present pneumatic tyres for high speed work. The same gentleman remarks that "pneumatics have given excellent results upon low-powered machines, but when it comes to cars of 80 or 100 horse-power and running faster than a mile per minute upon a curved track, they are dangerous unless more carefully made and fitted to the wheel. Even then they are liable to burst if pumped up too hard. Most drivers of heavy machines keep their tyres pumped so hard that they would favourably compare in hardness to a steel tyre, so far as effect on the road and vehicle is concerned." The suggestion he makes is that all high-powered racing machines should be fitted with flat steel tyres with quite a wide face, depending upon the weight of the machine. "A steel tyre could be securely bolted in position and could not possibly fly off the wheel, no matter how high the speed might become. Another advantage of the steel tyre would be its flat surface, as it would not cut into the track like round tyres do. If necessary, the tyres might have their edges flanged inwardly in order to present round surfaces at the edge, but they should have a large flat bearing surface between their edges. There is no reason why the speed of an automobile should be limited by its tyres, so that steel tyres, such as I have above described, and the application of sufficient power to the vehicle, would necessarily cause the vehicle to exceed the recent world's record of 125 miles per hour attained by electric cars in Germany." What have our readers to say to this?

Headgear.

NOT only are fashionable tailors realising the changes that are taking place in the raiment of the people, but hatters are complaining with even more bitterness of the decline of the silk hat. Motoring is said to be responsible to a considerable extent for the rapid fall in the use of the tall hat. "Many people," says Mr. Wilson, of the firm of Messrs. Glyn and Co., of Bond Street, W., "come to town in their cars, and transact their business in a tweed suit and a motor cap. There are some, however, who drive up to Bond Street, walk into their hatter's, and call for their silk hat, which is always kept ready for immediate wear. Underneath the heavy motoring coat they wear a frock coat. In an hour or so they return, and the silk hat is put on to the shelf until the owner comes to town again. No wonder," laments Mr. Wilson, "the hat never loses its glossy appearance or its shape, it never gets a chance."

Post Office and Place Names.

PASSING through villages, the pleasures of the journey are often minimised by the difficulty of ascertaining the exact location. Sometimes a local tradesman may identify his hamlet with himself, and across the front of his premises may boldly proclaim the name of the village or little town. But often the sense of location which is so finely developed in the motorist is the only assistance available for the traveller. In Surrey most of the post-offices are sufficiently clearly indicated to avoid confusion, but in many counties the geographical aids are among the sins of omission rather than of commission. If the new Postmaster General wants to introduce a necessary, harmless and

unobjectionable reform, he might issue an order that all post-offices have the name of their village or town plainly painted in a conspicuous position.

A Motor-Wagon Users' Association.

ELSEWHERE we give a synopsis of the paper on heavy motor traffic read by Mr. Shrapnell Smith at the A.C.G.B.I. last week. During the discussion that followed two important announcements were made: one to the effect that Mr. Long had expressed his willingness to appoint a departmental committee to inquire into the weight question; the other that the time had come for the formation of a Heavy Motor Wagon Users' Association. The appointment of such a committee would be welcomed not only by the makers of vehicles, but also by the users, while the necessity for the latter to combine to protect their interests is becoming increasingly apparent in view of the growth of the traffic.

Some Experiences.

ON the invitation of the Chairman, Lieut.-Col. Mayhew opened the discussion on the paper—the leading points of which deserve serious thought—and expressed the view that it would be a long time before the ordinary labouring man of the south would become an expert driver of a motor vehicle. Only experienced men should be engaged. Very few makers of lorries had been able to put a good tractor wheel on the market. He, as a commercial user, wanted a wheel that would last at least a year without repair. The tare weight was the fulcrum of the problem. As to fuel, there was nothing like using the best. Mr. Douglas Mackenzie's experience was that 240 working days per year was the limit for a motor vehicle. Heavy motor transport was largely a question of management and supervision. In conclusion, Mr. Mackenzie hoped an association of motor-lorry users would be formed.

In Praise of Petrol.

MR. G. H. BURFORD put in a plea for the petrol lorry, and thought it would be used in connection with the heavy motor transport of the future; and Major Lindsay Lloyd endorsed his view. It had been made clear to the military authorities that the internal combustion motor was the engine of the future for military purposes. Of course there were difficulties in the way, but they hoped shortly to get an engine using ordinary petroleum available in any country. Mr. Roger Wallace, K.C., in moving a vote of thanks to Mr. Smith, referred to a recent decision of Mr. Justice Grantham with regard to the ugliness of a motor-lorry, and said it ought to be upset. In seconding the motion Mr. Rees Jeffreys made the interesting announcement with regard to a Motor Van Users' Association and the departmental committee already referred to.

Mr. Smith's Reply.

REPLYING to the discussion Mr. Smith dealt with the points raised by the various speakers. With regard to the petrol motor it had to be remembered that the internal combustion engine had not reached the stage where it could be universally adopted, and they had to deal with heavy motor traffic as it existed to-day. The difficulties of the hiring business were great indeed compared with those of firms employing their own vehicles. There was encouragement in the fact that the military authorities were giving attention to the subject, and they could thus materially benefit the commercial world. One point of detail mentioned by Mr. Smith was with respect to obtaining water for motor-wagons when on the road. Speaking generally this was not a troublesome matter, but it is one of those things in which the influence of a Users' Association could be well directed.

HILL-CLIMBING AT GAILLON.

THE annual hill-climbing contest on Sunday over the classic Gaillon course, organised by the "Auto," was unfortunately preceded by two fatal accidents. The attempt to lower the record for the kilometre with a flying start up the famous hill had attracted no fewer than eighty-eight entries. The start had been fixed for 9 a.m., but, as at that hour a dense fog prevailed, it was decided to postpone the trials until it disappeared, which it did about an hour or so later. Although urged by the authorities not to go over the course in the fog, a number of competitors immediately set out to take advantage of the postponed start to make a trial spin over the course. Among those who adopted this very injudicious proceeding, as the thick fog made it impossible to see more than a few yards ahead, was Danjean, who on his Georges Richard car did so well at Dourdan last week. He went up and down the hill without accident, but when he was ascending it for the second time he suddenly saw another car ahead. In order to avoid crashing into the automobile in front, Danjean swerved off to the side, and in endeavouring to pull the car round again, struck a mound of earth, which caused the vehicle to turn over with Danjean and his mechanic Chocholle beneath. Both were seriously injured, and Danjean expired about an hour afterwards. The mechanic was quickly conveyed to the hospital, and according to the latest reports is in a serious condition.

Just about the same time a second accident occurred a few miles away at Bonnières. Six foremen of the Serpollet works had obtained permission to attend the trials in a 15-h.p. Serpollet, and were making their way to Gaillon. Just before reaching Bonnières a sharp turn had to be encountered, and unfortunately until too late the driver did not see a large

automobile trials and races, experts agree that in both cases it was sheer foolhardiness to be attempting anything like speed in a mist which, although the sun was just visible (two hours later during the contest it was as clear as midsummer), made it impossible to see any object a few yards in front of them. Neither accident occurred during the course of the trials themselves, which indeed were carried through without the slightest untoward incident.

Rigolly on the Gobron-Brillie Car which made the best time at Gaillon.

The event of the trials was a repetition of the success of the Gobron-Brillie cars, Rigolly making the best time, climbing the hill in 33 3-5 sec., or equal to over 65 miles per hour, and beating last year's record by 2 2-5 sec. Duray took second place in the same heavy car category and in the general classification, on a similar vehicle in 35 1-5 sec. The third place was secured by Pelzer on a Serpollet steamer, in 36 4-5 sec. In the racing section Wagner on a Darracq won the voiturette class in 40 sec. Tavenaux on the Passy-Thellier being second in 58 1-5 sec. The light-car class proved a victory for M. Clement's new Bayard car, driven by Hanriot (time 38 sec.), Osmont on a Darracq coming next on the list in 43 sec. In the motor-bicycle class Demester on a Griffon, and Carreau on a machine of his own make, both made the climb in 41 sec. In the tourist section the winners were:—Cars the chassis of which cost less than £160, Eachet on a 6-h.p. Boyer, 2 min. 37 4-5 sec.; cars between £160 and £320, Menager (8-h.p. De Dion), 2 min. 12 sec.; cars between £320 and £480, Pelzer on a new 15-h.p. Serpollet steamer, 1 min. 2 3-5 sec.; cars between £480 and £720, Renaux (16-h.p. Peugeot), 1 min. 36 3-5 sec.; cars between £720 and £1,000, De la Rochette (Georges Richard), 1 min. 36 2-5 sec.; cars over £1,000, Heath (60-h.p. Panhard), 49 4-5 sec.; 16-seated omnibuses, Sorel (De Dietrich), 3 min. 15 2-5 sec.; and motor-bicycles, Momo on a Peugeot, 1 min. 2 4-5 sec. For about 600 metres the hill has an average gradient of 9 per cent., followed by a stretch of 10 per cent., and finishing with a piece averaging 7 per cent.

The only "foreign" car entered was a 36-h.p. Wolseley, which met with bad luck. The conditions of the contest permitted the cars to have 500 metres in which to "get up speed," and they were then timed for the flying kilometre up the hill. The Wolseley car, which was started last but one, had the misfortune to break the chain which transmits the power from the motor to the gear box after traversing 300 metres from the point of departure.

Notwithstanding the fact that a spare chain was at hand and could have been fitted in a very short time, the officials in charge refused to allow the car to compete again. Even if this decision was in accordance with the regulations, under the circumstances—particularly as the Wolseley was the only foreign car competing—we certainly think the authorities might have relaxed them to such an extent as to allow the vehicle a second trial.

Danjean's Car after the Accident.

wagon loaded with hay standing at the turn. In endeavouring to quickly steer the car round the vehicle, it struck a tree and collapsed. Two of the passengers, Cultin and Alek, were found to be dead, while of the others, one is seriously injured, and three met with slight injuries. While the accidents are unfortunate and regrettable, and may be expected to once more raise a cry on the part of the public for the suppression of

THE RELIABILITY TRIALS, A.D. 1953

A PROPHETIC REPORT.

EIGHT a.m. was striking on the nearest electric clock to the Crystal Palace Parade, as, in the capacity of Hon. Observer, I took my seat on the great 20,000-h.p. automobile for its first trip to New York and back in eighteen hours. As I looked along its glistening length of steel and aluminium I could hardly realise that its great engines were running, so still and free from vibration was it. The driver soon appeared, and while awaiting the signal to start saw that everything was in order. Five other monsters had already departed, and in a minute or two we were speeding after them. So I opened my record book and noted that, in passing through towns and villages, the motor was to rise in the air to avoid the traffic; also that failure to maintain an average speed of 200 miles an hour on the road and 300 while in the air might lead to disqualification.

In this year of grace all makes of cars had become standardised as to shape, which was something like a huge torpedo. Petrol as a motive force still held its own against all comers, experiments with electricity having proved abortive (a few Americans still held to steam). It was only in the engines and transmission gear that inventors had any scope for originality. To enable the car to rise in the air at will, huge fans were driven with enormous velocity, and came into action automatically when a given speed was exceeded (the police regulations forbid a greater speed than 100 miles an hour even on the special motor roads which spread all over the country) and as nearly all the cars could run at a good 400 miles an hour when required. This novel method had been adopted to enable motorists to gratify their taste for speed and avoid the attentions of the "Man in Blue." The whole of the mechanism of the great car was controlled by a few stops, arranged like those of an organ, on a board by the side of the driver.

The arrangements for dispatching the cars were very simple. By the use of a radiograph the starter could see at a glance the position of each car over the entire journey and constant communication could be kept with each competitor by means of Marconigrams. My book informed me that 150 miles an hour was to be the limit for the first twenty miles of our journey, which would take us well clear of London, so on receiving the signal to start the driver pulled out the stop marked "150 forward." Before we had run the length of the parade the speed indicator showed we were travelling well over 100 an hour and the car at once rose gracefully in the air and we were off on our 6,000 miles journey. I should have mentioned that each car was compelled to carry one of these indicators, which registered up to 500 miles an hour and marked on a tape the actual speed at any given point of a journey.

Lord Sarum's house at Hatfield was the end of the control, and was passed in seven minutes from the start, and as the next stage—Hatfield to Londonderry—was timed at 250 miles an hour, and might include several descents to the road level as tests (we were to be liable to these at any moment when not in the controls), the driver pulled out the "400 miles" stop and the hum of the engines at once took on a deeper note, while the hand of the indicator steadily crept round the dial until it pointed to 400, when the motor was at once automatically governed. The speed of the flying car was most exciting and delightfully free from vibration, and after a few minutes we sighted some of the competing cars and overhauled them rapidly. Just as we were about to pass the foremost and could feel the vortex of his whirling fans a Marconigram from headquarters ordered us to descend to the road and travel the next ten miles at 97 miles an hour as a test. We had just passed Marlborough as we dropped down to the road level and crawled over the ten miles at just under 100 an hour. Once in the air again we soon regained our former speed, but the competing cars had gone too far ahead for us to catch them unless something unforeseen happened. For the next hour or so we hummed along uneventfully, taking a diagonal route across Wales, and presently the Irish Sea was beneath us. I should have mentioned that our eighty foot road

wheels were fitted with great fans which expanded as we rose in the air and became like big paddle wheels, while our double sprag developed into enormous twin screws working on a universal joint and acting as a rudder. This last was a special patent and in use for the first time. Most of the other cars had sail rudders.

We passed over Londonderry two minutes ahead of time, the engines running grandly, and our progress had elicited the wireless signal "Well done!" from headquarters. For our 2,500 mile burst over the Atlantic there was no speed limit, so the driver gave a quick pull at the stop marked "Full speed forward." The needle of the indicator quickly pointed to 500 and then stopped useless, but our speed still increased until the noise of the whirling screws and wheels sounded like a shriek. The wind pressure was enormous, but encased in our house made of "Asmath," a new substance, tough as glass and quite as transparent and capable of resisting enormous strains, we made light of it.

About 200 miles from the American coast we sighted a flotilla of cars sent out to escort us to New York by the A.C.A. (Automobile Club of America) and as we were well ahead of time and had received warning from headquarters that we were travelling too fast, we slowed down to about 300 miles an hour. It was a beautiful sight to see the escorting cars describe a wide curve and form up behind us. Half an hour after this we were close to New York, so we slowed down and dropped towards mother earth. We took to the road again at the Battery and ran through the crowded streets to Central Park, where the trial cars were taken charge of by officials of the American Club. We had done the journey in 7 hours 12 minutes from London, and were none the worse for the trip.

A compulsory stop of one hour gave us time for a welcome luncheon at the Waldorf Astoria. Feeling much refreshed we watched some speed trials got up in our honour by the American Club, and then at 4.15, in company with the other competing cars, started again for England, home, and beauty. We were accompanied for the first 100 miles or so by a few of the American cars, but as most were steam driven, they were unable to keep up with us for any distance; so, playing a few bars of the "Star Spangled Banner" on our hooters, we bade them good-bye, and were soon travelling a steady 600 an hour over the vast Atlantic. The run home was uneventful save for one of the cars, No. 17, getting his rudder jammed when half-way across. We slowed down to render assistance, and stood by until one of the 150-knot Cunarders coming up he dropped quietly to the surging billows and was taken in tow by the big ship.

So far our run had been non-stop, but when about 200 miles from the Irish coast we noticed that our speed was steadily decreasing until the indicator stood at 170. A moment's examination showed that only fourteen of the twenty cylinders were working, and we came in for a torrent of chaff as the other cars rushed by us. But a few moments' suspense and we were running as strongly as ever, and could only conclude that oil had leaked on to the sparking plugs. A message from headquarters told us that we were seven minutes before time, so the driver ran very cautiously until certain that all was going well again, when we once more got up our speed to just over the 350 mark. The Club now signalled to us to make a detour round Glasgow and home over the Midlands, as a police trap had been discovered by one of the scouts near Bristol and three cars caught. We were allowed twenty-five minutes' extra time for this, but were still well within our normal time of eighteen hours as we passed over Birmingham. Our great search-lights cut a wide path through the darkness as we rushed along at 400 an hour. My record book was nearly blank, so devoid of incident had the journey been, when the glow of the lights of the Metropolis appeared in the distance.

Just as we passed over Barnet I told the driver to slacken speed. He tried to do so, but as he altered the stops there was a terrific explosion; a fearful burst of flame; I felt myself falling, falling, falling through darkness towards the earth—and woke up to find myself in bed at my hotel, the room almost dark, and

the boots hammering on my door and shouting "Five o'clock, sir." I sat up and rubbed my eyes, the memory of my strange dream still with me, and it was some minutes before I realised that I was still in A.D. 1903 and due to journey to Eastbourne and back at less than 20 miles an hour according to present-day notions.

W. F. HICKS.

SOME USEFUL NOTES.

A CORRESPONDENT in the "Automobil Welt" describes a novel circulation indicator he has fitted to his car, which is shown in the sketch herewith. A represents a portion of the water tank, to which is secured the casting B, serving as a connection piece for the pipe through which the water returns from the cylinder jacket and also to receive the filling cap C. The latter is drilled centrally to receive the rod D, to the lower end of which is attached a perforated tin cup E. To the upper end of the rod is fastened a metal ball F. When the water is not circulating the rod is held in a certain position by a light coiled spring surrounding it just below the cap C. The ball F is then at a certain height above the cap C. When the water is being

circulated in the system it returns through the pipe connecting to the casting C and flows into the cup E and through the perforations into the tank. As the perforations are small, there is always a certain amount of water in the cup, which compresses the spring and draws the ball F nearer the cap C. The stronger the circulation the greater will be the amount of water in the cup and the lower the position of the ball.

WHEN terminal nuts are found to be set with corrosion do not use force to undo them. By so doing, the terminals may be twisted off the plate inside the accumulator. To loosen the nut, wrap around it a rag dipped in hot water, and keep the rag as hot as possible by repeated immersion. After a quarter of an hour or more, according to the degree of corrosion, the nut will come away fairly easily, but the lower part of the terminal should be firmly held with pliers as a precautionary measure whilst the nut is being unscrewed.

CONSIDERABLE damage is done to the inner tubes of pneumatic tyres by the nipping of the same owing to faulty attachment of the outer cover. Although, if proper care is taken, no difficulty should be found in putting the cover in position properly, the Continental Guttapercha and Caoutchouc Company state that, on the average, 48 out of every 100 tubes sent to them for repairs have been nipped and burst owing to faulty attachment. There are two different ways of nipping, either between the edges of the cover and the rim (Fig. 1), or between the edges of the cover and the studs (Fig. 2). In both cases the tube is subject, when the car is being driven, to friction which it cannot stand for any length of time, and finally is bound to burst with a loud report. Special care should therefore be taken to place the tube properly in the rim.

THE best way to ascertain whether the inner tube is properly put in is to push the studs, before their nuts are

tightened, inside the tyre and then pull them back again. If this can be done easily, it shows that the tube is in its right place. If, on the contrary, there is some resistance to the stud, it is a sign that the tube has been nipped or the cover improperly put on (Fig. 3). This can easily be remedied by slightly lifting the edge of the cover, whereupon the cover or the tube, as the

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

case may be, can be put in the right position. If these precautions are neglected, one runs the risk of having a tyre accident whilst on the road. It is, therefore, better to make sure that everything is all right immediately after putting on the cover, and in case of some defect, to remedy it at once before it is too late.

It frequently happens that the tube is nipped by the lever by which the outer cover is detached. When taking off or putting on a cover, special care should be taken not to push the lever too far under the tyre, as otherwise the tube may get under it and be nipped between the lever and the rim as shown in Fig. 4. The correct way of using the lever is shown in Fig. 5.

A VERY useful combination accumulator test lamp and search light has lately been introduced by Messrs. John C. Fuller and Son, of Bow, E., and of which an illustration is given herewith. This lamp affords a reliable test of the state of the accumulator, because it is constructed to take a heavy current, and the filament being under view against a dark background, its colour is a guide to the voltage and vitality of the cell. This is indicated as follows:—The lamp wires are connected to the terminals of the accumulator, and the filament is examined after a lapse of about a minute. If the light is still bright—not yellow, but white—the accumulator is well charged up. If the light is yellow the cell is "fair," and would be safe for a short journey. If the light is red, the accumulator is nearly exhausted, and requires charging. Sometimes on connecting the lamp the light is at first bright, and then rapidly drops away in brilliancy. This is an indication that the accumulator requires charging. The cell in this case would probably have given a good reading on a voltmeter, but after a mile or two would have given up

altogether. The filament is examined against a dead black background, and can be used equally well in the day time or at night. The lamp can be used as a searchlight by covering the side "window" with the thumb and projecting the light from the end. The apparatus is fully protected against mechanical injury, and can be carried without risk in the tool bag or in the coat pocket, while another advantage is that no unscrewing is required to bring it into action.

MOTOR CYCLING NEWS.

THE Auto-Cycle Club is asking the President of the Local Government Board to have it made perfectly clear that the limitation of the speed of a motor-cycle drawing a "trailer" will not remain in force after January 1st. Other recommendations include the desirability of defining a motor-cycle as being any motor-car designed to travel on three or less wheels, and which does not exceed, unladen, 3 cwt. in weight; the inclusion of the charge for the plate forming the identification mark in the registration fees; the reduction of the size of the identification plate for motor-cycles to one quarter the size of that for cars; that the position for the number be at the rearmost part of the cycle, and that an illuminated stencil plate be carried in front of the front lamp, so placed as to clearly show the number. The Club also asks that the license to drive a motor-car should give power to the holder to also drive a motor-cycle.

FOR the 1904 season the Minerva Company are adopting a float feed spray carburettor made under licence from the Longuemare Company, and in which a number of modifications have been introduced. A sectional view of the apparatus, which is

Section of Minerva-Longuemare Carburettor.

- | | |
|----------------------|---------------------|
| A—Float chamber. | J—Spraying tube. |
| B—Float. | K—Copper funnel. |
| C—Cham. | L—Throttle lever. |
| D—Needle valve. | M—Air regulator. |
| E—Weights. | N—Head. |

| H—Cleaning plug. | R—Exit for mixture. |
| I—Spraying cone. | |

known as the Minerva-Longuemare, is given in the accompanying illustration. The petrol flows from the tank through the pipe G and channel F into the float chamber above. As the float B rises, the needle valve, by means of the levers E, falls, and so shuts off the supply of petrol. The latter is thus always kept at a constant level in the float chamber. From the latter the petrol is drawn into the opening J and up through the nipple I into the mixing chamber. Warm air is sucked from around the engine through the pipe P, and drawn through orifices at the base of the mixing chamber. The air is intimately mixed with the petrol as the latter is sprayed through the nipple, the mixture thus formed passing to the engine along the pipe R, in which is a throttle valve controlled by the lever L. The quality of the mixture can be varied by admitted extra air through openings in the adjustable sleeve M. In the pipe F wire gauze serves as a filter for the petrol. The carburettor is

made so that it can be readily taken to pieces for cleaning purposes. The cap C can be removed to give access to the float and float chamber, while the air inlet pipe can be detached by removing the nut O. To prevent dust being carried to the interior of the mixing chamber the mouth of the hot-air tube is fitted with fine gauze. The carburettor is made in two sizes—one for 2 and 2½-h.p. engines and the other for the 3½-h.p. motor.

THE final contest for the Edge trophy took place on Monday over the usual 200 miles course at Hatfield, under the auspices of the Motor-Cycling Club. The first trial was held on June 27th, when thirty competitors started. That and subsequent trials have resulted in a gradual weeding out until last Saturday, when only three—Cowles, Jones, and Milligan—were left in the contest. Cowles broke down on Saturday, leaving Jones and Milligan to settle the matter on Monday. Jones on his De Dion tricycle experienced a punctured tyre, Milligan, on a 2½-h.p. Bradbury, alone completing the journey without an unofficial stop, and therefore becomes the first holder of the trophy.

UNDER the name "Strictor" Messrs. Salsbury and Son, Limited, have recently brought out a new driving belt for motor-cycles. It is made in two qualities, the best being of four-ply buff coloured leather with one row of copper stitching. It is exceedingly soft and pliable. The second quality is in black leather, three-ply, metal stitched. Both qualities have been submitted to independent tests by Messrs. David Kirkaldy and Sons and have shown some noteworthy results. For instance, the tensile strength of the best quality was shown to be 6,616 lbs. per square inch, while that of the second quality came out at 5,801 lbs., both figures being much higher than is usually obtained. Anyone interested in elongation tests of motor-cycle driving belts will find the tabulated results of Messrs. Kirkaldy, issued by Messrs. Salsbury, worthy of close study.

THE 1,000 kilometre reliability trial of motor-cycles organized by the Moto-Cycle Club de France started on Tuesday. In the *quart-de-litre* category there are twenty-two entries, and in the *tiers-de-litre* class thirteen competitors. The trial is divided into six daily runs, and will come to an end on Sunday next. No English machines are competing.

THAT motor-cycling is making headway in Germany is indicated by the announcement that the German Motor Cyclists' Union, which was only formed five months ago, has already over 1,000 members.

THE French firm of motor-car manufacturers, Gobron-Brillié, whose 100-h.p. car holds so many records, have decided to place motor-cycles on the market, and have selected the Minerva motor to fit to their machines.

THERE is no firm engaged in the motor-cycle industry that has shown a greater confidence in the future of the motor-bicycle than the Rex Motor Manufacturing Company, Limited. They were one of the first companies to arrange for a large output of this class of machine. Up to the present they have marketed four successive models, starting from 1½-h.p. to the 3-h.p. of the past season. Following the tendency of the times, the horse power for next season is to be increased to 3½. In the new model the front forks are of an improved design to give increased strength with the additional weight of the machine. The engine is placed in a vertical position in a registered design of cradle. The wheel base has been slightly lengthened, and the weight of the rider is now distributed in a way that the makers claim will obviate any tendency of the machine to side-slip even on the greasiest of roads. Another new feature is the air draught device incorporated in the cylinder design, giving a clear passage between the exhaust port and chamber and cylinder wall. It is claimed that the air passage mentioned will keep the engine perfectly cool under all conditions. In deference to the demand for handle-bar control, as far as possible, the new Rex is fitted with an exhaust valve lift lever, entirely independent of the ignition lever, manipulated from the handle-bar.

CONTINENTAL NOTES.

THE event of the week is the interest the Kaiser has evinced in the 1904 Gordon Bennett race. In the course of a conversation with Freiherr Baron de Brandstein, general secretary of the German Automobile Club, at Homburg last week, His Majesty recommended the greatest care in organising next year's Gordon Bennett Cup race, and referred to the arrangements of the English Automobile Club in Ireland as a model for preventing accidents. His Majesty suggested that a series of contests should be held independently of the Cup race, one of which should be confined to motor-cars using alcohol as fuel, and he offered to present a prize for this event. So far no definite route has been selected, but the one most favoured is that in the Homburg district, starting from and finishing at Saalburg. From this town the circuit passes through Oberursel, Koenigstein, Esch, Idstein, Neuhoef, Limburg, Weilburg, Usingen,

cess, both in the way of organisation and in the speeds attained, new official times for the flying kilometre being set up by Duray on the 100-h.p. Gobron-Brillie, of which I send you a photo. The motor-cycles weighing less than 50 kilos. (110 lbs.) were sent off first, there being close upon twenty competitors. The first two places were secured by Griffon machines, and the third by a Peugeot, the winner being Lamberjack, whose time for the flying kilometre was 34 1-5 sec., or equal to over 64 miles per hour. The light-car class was a fight between the Georges Richard and the Bayard cars. The former secured the two first places, and M. Clement's new vehicle the third position. The winning car was driven by Danjean, who, unfortunately, met his death three days later. His time was 30 4-5 sec. The voiturette class proved a victory for Wagner, who on a Darracq car covered the kilometre in 34 4-5 sec., beating Tavenaux on a Passy-Thellier car with Gobron engine, depicted in one of the accompanying illustrations. Tavenaux was second in 36

Duray on the Gobron-Brillie Race.

Three of the Motor-Cycle Competitors.

The Tony Huber Racer.

Tavenaux on the Passy-Thellier Car.

THE DOURDAN SPEED TRIALS.

and back to Saalburg, a distance of 137½ kilometres. The circuit would thus have to be traversed four times. A 140 kilometre course between Bielefeld and Paderborn has been pointed out by the Westphalian Automobile Club and the "Radmarkt" as being more suitable, and this is being inspected by the authorities of the German Club.

In motoring circles in France the question is being asked as to what America intends doing with regard to the 1904 race. Under the rules of the competition, the entries close on December 31st, and so far nothing has been heard from the United States. Neither the Automobile Club of America, which must issue the challenge, nor the makers on whose behalf it must be tendered, appear to have betirred themselves or evinced the slightest interest in the matter.

THE postponed kilometre races at Dourdan were run off on Thursday last week in splendid weather, and were a great suc-

cess, both in the way of organisation and in the speeds attained, new official times for the flying kilometre being set up by Duray on the 100-h.p. Gobron-Brillie, of which I send you a photo. The event of the day was the speeding of the heavy-car class, Duray, as already mentioned, putting up new figures for one kilometre—26 2-5 sec., equal to a speed of 85 miles per hour, Le Blon being second in 27 3-5 sec., and Jeandré on a Mors third in 29 3-5 sec. In the touring-car section Roy on a Roy car won the less than £160 chassis class in 1 min. 26 2-5 sec.; Pelzer on a Serpollet the £320 to £480 class in 40 4-5 sec.; Gasté on the Automotrice illustrated in the last issue the £700—£1,000 class in 1 min. 9 4-5 sec. It is not generally known that Duray when he broke the record was using alcohol as fuel.

BRIEF details of the 1904 models of the leading French builders are gradually leaking out. Messrs. Rochet and Schneider will make a feature of 16-h.p. and 24-h.p. cars which will be fitted with a new type of carburettor and improved brakes. The

chassis will be of such a length as to permit the fitting of carriage bodies with side doors. The Georges Richard Company are building 8 and 12-h.p. two cylinder cars, and 16, 24, and 40-h.p. four-cylinder vehicles, and have on the stocks for the *Salon* a 12-h.p. double phaeton and a 16-h.p. limousine, with entrance at the side. For 1904 this concern is adopting the mechanically-operated inlet valve. Renault will make a feature of 7-h.p. single cylinder, 10-h.p. double cylinder, and 14-h.p. four-cylinder cars. All three types will be fitted with a new and improved form of change-speed gear.

BARON HENRI DE ROTHSCHILD has just presented a new cup to the Automobile Club of Nice for a kilometre race with flying start. It will be contested under similar conditions as that which he previously presented, and which was won outright by M. Leon Serpollet. The race will take place on the Promenade des Anglais during next year's Nice week.

AT the meeting last week the committee of the French Automobile Club decided to take steps towards the organisation of an excursion from Paris to St. Petersburg. The question of drawing up rules, etc., has been left to the Sporting and Touring Committees of the Club.

Mr. H. S. Harkness on his 120-h.p. Racing Car.

[L'Automobile.]

THE forthcoming *Salon* in Paris is to be made the occasion of a brilliant fete in honour of the visiting delegates from foreign automobile clubs. It had been intended to hold this fete at the time of the automobile congress in June last, but owing to the Paris-Madrid disaster it was found desirable to postpone it. It can hardly be expected that a fete in the depth of winter will be so picturesque or of so varied a character as in June, when it would take place out of doors, but the gala which has been decided to hold at the Opera on the 17th December will nevertheless add pleasure to the business of attending the shows. The fete will be preceded by a banquet at the A.C.F. club-house in the Place de la Concorde.

A PROPOSAL to follow the example of England in forming a motor volunteer corps has been brought before the Austrian Automobile Club by Count Pötting, who, in addressing the members, referred to the splendid work done by the British corps in the recent manoeuvres. The idea was well received, and already a large number of names of would-be members of the projected corps has been received.

A Moscow engineering firm has just completed a special motor coach for use on the railway between St. Petersburg and Zarskoe-Selo. The vehicle, which has been built for the Hereditary Grand Duke of Russia, is fitted with a Panhard 24-h.p. petrol engine. It has accommodation for ten passengers,

and in the trials to which it was subjected attained a speed of forty-four miles per hour.

NEXT year's automobile week at Spa will be held from the 25th to the 30th July, under the auspices of the Automobile Club de Spa. The programme will comprise a hill-climbing contest, a driving competition, and motor-boat races.

As a result of the reliability trial held in September last by the Berlin Automobile Union, a committee has been appointed to arrange for a similar event in April or May next. It is proposed that the distance shall be 500 kilometres.

No route in the neighbourhood of Paris sees more traffic than does the famous road joining Versailles to the capital, and none is more favoured by automobilists. Passing through charming scenery, it forms the initial stage of numberless delightful excursions, and therefore rejoices in a continual stream of pleasure-seeking motorists, while the *chauffeur* intent on business frequents it by reason of its hilly character, so admirably adapted for carriage testing purposes. Throughout its length, some fourteen miles in all, there hardly exists a quarter mile stretch of level ground, and the hills of Suresnes and Picardie are capital tests of a motor-vehicle's ability. The latter hill is particularly notable

worthy, for down its long slope have rushed into Versailles the competitors of many historic races.

THE strange-looking vehicle shown in the accompanying illustration was seen in Paris a few days ago. It belongs to Mr. H. S. Harkness, a well-known American motorist, and was built to his designs with the view of competing in the last Gordon Bennett race. Unfortunately it was not ready in time, so Mr. Harkness took it over to France to put it through its paces on the excellent roads of that country. As will be seen, the car is built exceedingly low, its total length being 15 ft. The motive power is furnished by a four-cylinder engine, said to develop 120-h.p. The inlet valves are arranged to work automatically or mechanically, while both magneto and accumulator ignition are provided. The motor is located about the centre of the frame. Three speeds forward and a reverse are provided, the drive on the top speed being direct. The frame of wood and steel is suspended below the axles. Mr. Harkness is stated to have made the journey from Bordeaux to Paris in the car in seven hours and to have attained a speed of 88 miles per hour. The vehicle was only in France a few days and was shipped back to America last week. It is rumoured that Mr. Harkness intends to enter it for the eliminating contest for the American Gordon Bennett team, if the United States decided to participate in the 1904 race.

HERE AND THERE.

THE motor-omnibuses plying at Hastings are fitted with patent Buffer tyres.

MESSRS. FRISWELL, LIMITED, have decided to hold all special sales on Tuesdays; the periodical sales every Thursday will be continued as before.

One of the M.M.C. 10-h.p. 12-seated Public Service Cars running between Folkestone and Hythe.

THE Twentieth Century Manufacturing Company have opened a London depot at 114, Fore Street, E.C., where a large stock of the "20th Century" automobile lamps will be found.

A NEW Technological and Scientific Dictionary in fortnightly parts is being published by Messrs. George Newnes, Limited, in which motors and motor-car manufacturers will have prominence.

MESSRS. FRANK F. WELLINGTON, LIMITED, have been appointed sole London agents to the Pick Motor Car Company, Limited. They have examples of the 6-h.p. and 10-h.p. cars in their Wardour Street showrooms and can give immediate delivery

MESSRS. H. G. KETTLE AND COMPANY, of Lower Brook Street, Ipswich, are recommended by Mr. H. S. Winter, of Hoylake, as a practical firm able to render good assistance to motorists in distress. Mr. Kettle answers summonses for help at any time of the day or night.

LAST week Mr. J. C. Dennis, of Guildford, was married. The bride and bridegroom drove to the church in a motor-car, accompanied by two other cars containing friends. Mr. R. Dennis acted as best man. After the ceremony the happy couple drove away to Bournemouth in a 20-h.p. Dennis car, while the honeymoon will be spent in travelling through Devonshire and South Wales by automobile.

MESSRS. GEORGE BRAY AND COMPANY, LIMITED, have sent us samples of their special burners for the acetylene lamps of motor-cars and motor-cycles, together with a copy of their list of acetylene burners. In the latter catalogue particulars are given of no less than seven different types, each of which are made in several sizes. Special attention is drawn to the "Elta" double-flame burner, which is claimed to be the only one which can be turned high or low like coal gas burners, without carbonising. The tips are made of "enamel," which is stated to surpass steatite for the purpose, while a further advantage claimed is that the fine gas apertures will not stop up so readily as is the case with the usual type of burner. We may add that the Bray burners can be made to suit the fittings of any country, but unless otherwise ordered, they are sent out with English taper screw.

A MOTOR fire-engine has just been added to the equipment of the Fire Brigade at Cologne, Germany.

A PRACTICAL work on Gas and Oil Engine Management, by Mr. M. Powis Bale, has just been published by Messrs. Crosby, Lockwood and Company.

THE first of the Great Western motor-cars intended for the Penzance, St. Just, Newlyn, and Marazion services had a trial run over the ground last week, and it proved most successful.

MR. CHARLES SCARISBRICK, of Southport, who has just been knighted, is the father of Mr. T. T. L. Scarisbrick, the enthusiastic motorist to whom much of the success of the recent Southport meeting was due.

MESSRS. JOSEPH LUCAS, LIMITED, have sent us a copy of a reprint of a series of articles by Mr. Henry M. Wells on "Cylinder Oil and Cylinder Lubrication," which contains a large amount of useful information on this important question.

MR. F. S. DIMMICK, of Bridgetown, Barbados, has sent an enquiry to an American contemporary for a steam omnibus and a steam wagon for service in the West Indies. The 'bus must seat from 14 to 20 passengers, and the wagon carry loads up to 10 tons. Both vehicles must use paraffin as fuel.

ONE of the Robertson steam wagons illustrated in our last issue has just been delivered to Mr. Thos. Riley, of Fleetwood, a large contractor now doing work at the Government Buildings at Lichfield. The lorry is employed in carting building materials from the railway goods station to the site, a distance of three miles, the loaded journey averaging half an hour.

THE Lancaster Engineering Company, Limited, has been registered with a capital of £2,000 to take over all or part of the business carried on at Loveday Street and Bailey Street, Birmingham, by Mr. W. Russon, and to carry on the business of manufacturers, factors of, and dealers in motor-cars, motor-cycles, carriages, cycles, etc.

THE Enfield Cycle Company, Limited, have now equipped an entirely separate factory for the production of motor-cars and motor-bicycles, and are bringing out two cars for the 1904 season of 10 and 6-h.p. respectively. The 10-h.p. car will be fitted with a double cylinder engine of the company's own manufacture, while the 6-h.p. vehicle will be equipped with a De Dion engine.

A 12-h.p. Ader Touring Car outside the Fortified City of Avila, Spain.

MESSRS. A. L. DYKE and G. P. DORRIS have compiled, and the A. L. Dyke Automobile Supply Company of St. Louis, U.S.A., have published a very useful work on the Diseases of a Gasolene Automobile and How to Cure Them. The book is compiled mostly from periodical automobile literature, and contains a considerable amount of useful matter in the way of the troubles likely to be experienced by users of petrol motor-cars, and the methods to be adopted to overcome the same. Unfortunately the "diseases" are not dealt with in any systematic order, and we would strongly recommend the publishers, should a second edition become necessary, to add an index.

A PROPOSAL to form an Italian Motor Volunteer Corps is under discussion at Turin.

ONE of Messrs. Salsbury and Sons' latest productions is the "motoring knife" illustrated herewith. As will be seen it comprises, in addition to a screw-driver, pricker and a cork-screw, a trembler gauge and a sparking plug gauge and cleaner. To adjust the trembler of the De Dion and similar type engines, the cam being out of action, the plain part of the trembler gauge is inserted between the platinum point and the disc of the spring; screw up the point until the gauge (plain part of the blade) is held between same and spring tightly enough to pre-

vent it falling out by its own weight; then tighten set screw. To clean trembler points, give two or three slight movements with end of trembler gauge, which will brighten the contacts, and the trembler is then ready for work. To clean sparking plug, insert end of corresponding gauge between points, draw backwards and forwards two or three times whilst pressing the points together with finger and thumb. Set plug points to the plain part of spark plug gauge so that there is no play between the points and the blade. The pricker will be found useful in cleaning oil holes and the vent holes in acetylene lamp generators.

THE German Daimler Company has promised a prize of 2,000 francs (£80) in connection with the Paris-Rome reliability tour to be held in March next.

MOTORISTS bringing cars from the Continent *via* Harwich will be interested to know that Messrs. C. F. Bevan and Sons, 62, Church Street, Harwich, stock petrol.

MR. A. W. GOODALL has taken the premises at 172, Pentonville Road, London, N., where he is opening an agency for the sale and exchange of cars, etc.

MESSRS. PETO AND RADFORD, LIMITED, have now brought out a new accumulator filled with the special Peto-Cadett electrolyte and adapted for use on motor-cycles.

At the annual meeting of Bayliss, Thomas and Company, Limited, at Coventry, on Monday, the chairman, Mr. B. Rose, said the improved condition of the company's affairs was due to the development of the motor business.

At Reading, Albert Chandler has been summoned for neglecting to allow proper passage on the highway at Sulhamstead. The evidence showed that the defendant, with a van, obstructed a motor-car. He was fined 6d. and 4s. 6d. costs.

MESSRS. VAN RADEN AND COMPANY, LIMITED, are removing to a very spacious and well-equipped factory in Foleshill Road, Coventry, where several additional modern tools have been installed for the manufacture of electrical ignition devices of all kinds.

THEIR 1904 catalogue has just been issued by the Automobile Components, Limited, of Islington, N. This is concerned mainly with the component parts of cars supplied to makers for assembling. Several pages are devoted to a light set of components for a car to carry two persons and luggage. The Company's No. 3 set has been thoroughly revised and will be found serviceable in the construction of cars of 6 to 8-h.p. with tonneau bodies or to carry two persons. Other pages deal with motors, axles, gears, etc., motor-launch sets, motor-cycle sets, etc., and the whole catalogue is got up in a style which reflects credit on Automobile Components, Limited.

ON Saturday, two motor-cars, driven by Mr. E. A. Livit and Dr. Longinotto, both of London, collided at Hickstead, near Brighton. Neither was going at a great pace at the time of the mishap, and fortunately no one was hurt, although the front parts of both cars were much damaged.

FOUR firms, in addition to the Cannstatt Daimler Company are known to be building cars to compete for places in the German team for the 1904 Gordon Bennett race. These are Benz and Company, of Mannheim, the Adler Company, of Frankfurt, the Neue Automobile Company, of Berlin, and the Protos Company, of Berlin.

THE Automobile Club of America, in response to suggestions by Mr. Arthur Herschmann and others, has decided to promote a mid-winter commercial vehicle test. It will be held some time in the latter part of February. The idea is to encounter winter conditions of snow, ice and mud to show the capacity of the machines as all-the-year-round vehicles. No details have as yet been determined upon.

A NEW carburettor for either petrol or paraffin is being introduced by the Cremorne Motor Manufacturing Company, of Lots Road, Chelsea, S.W., the main features of which we hope to describe in an early issue. The same company are also interested in the "Cremorne" liquid fuel burner, in which any heavy oils can be utilised. This is made in various sizes, and is proving of value in the Colonies as well as at home.

WE are always glad to welcome any addition to the manufacturing strength of the motor industry in this country, so that it is with pleasure we notice the announcement which is made this week that the Duryea Company, of Coventry, will henceforth manufacture their Duryea Power Carriages entirely in England, instead of importing them from the United States as hitherto. The well-known engineering firm of Willans and Robinson, Limited, of Rugby, are to be responsible for the construction of the engines and machinery of the new cars, which will contain many novel features.

In a recent issue we referred to the Samson-Hutchinson non-skidding unpuncturable bands, which have lately been put on the market for use in connection with motor tyres. The

bands are made of specially treated hardened chrome leather covering the whole tread and sides of the tyre to which they are permanently solutioned. To this band, along the tread, is rivetted another narrow leather band, the rivet heads, with washers, projecting slightly above the uppermost band. By the use of the bands it is claimed that the bugbear of side-slip is removed and the chances of puncturing considerably reduced. They are made in various sizes for the tyres of motor-cycles and motor-cars and can be fitted to either new or old covers.

LONDON TO RETFORD.

THE day was Thursday, the 29th ult.; the place was the Beaufort Motor Company's, in Baker Street, London, W.; the car was a 14-h.p. Beaufort, and the time of departure was 9.15 a.m. The roads were heavy with the rain which had fallen all night and up to eight o'clock the same morning. Mr. Clark, the motor repairer, of Retford, was installed in the front seat, the mechanic was planted in the tonneau, with instructions to make himself as comfortable as possible. Mr. H. Beaumont, of Honley, Yorks., took charge of the wheel.

Being in the hands of a careful driver, to whom the streets of London were not familiar, the car was started and driven on the second gear past Regent's Park, through St. John's Wood, and into Finchley Road, where the top gear was slipped in on the rise, and not changed down again for any gradient the whole of the journey through with the exception of Great Gonerby Hill, north of Grantham. Owing to the exceptional rains, the roads were covered with water in several places for a few inches deep, but the car slid merrily through until about two or three miles out of Biggleswade, when there was a miniature lake of about 18 inches deep.

Not realising the depth and consequent weight of water which had to be displaced, as the car buried itself over the axles, Mr. Beaumont dashed her boldly into the lake and pulled up the engine. The mechanic tried to start her up from the top of the front wheel springs, but could not get the requisite pull on the starting handle. Just as there was a discussion as to who should strip and wade, a kindly waggoner with an eye to business came along, and with the aid of a rope fastened to the back of the wagon towed the car on to dry land. A few miles further another sheet of water was encountered about 15 ins. deep, but, warned by previous experience, the low gear was put in and the car splashed through without any more trouble.

The next stop was Stamford for petrol and light refreshments. The time of arrival was 12.55, thus 89 miles was covered in 3 hrs. 40 mins. Retford was reached at 3.55. Total mileage 145 miles in 6 hrs. 40 min., including the 3-hour stop at Stamford and about 10 minutes lost when the water caused the involuntary stop. The splendid manner in which the engine pulled up Barnet Hill, Stevenage, Alconbury, Norman Cross, Wansford, the twenty hills from Stamford to Grantham, and Tuxford Hill, between Newark and Retford, was a revelation of the merits of the car.

THE Birmingham Motor Express Company, Limited, are running a service of cars from New Street to Fountain Road.

MAIDENHEAD tollgate, thrown into the flooded Thames after the freeing of Maidenhead Bridge at midnight on Oct. 31, has been found by the lockkeeper at Boveney, near Windsor.

A HANDICAP race was held by the Moto Club Anversoiois on the road between Putte and Hogerheide, near Antwerp, on Sunday last, the distance being 16 kilometres. The car class was won by L. Eskamp on a Gobron-Brillié car in 15 min. 46 sec., while Verstrepen on a Minerva headed the motor-cycle section, covering the distance in 14 min. 45 sec.

EDWARD WHITEHEAD, motor-car driver, of 10, Lexham Mews, Kensington, W., has been charged before the Wigan county justices with the manslaughter of a five-year-old boy named Tonge, near Wigan, on the 26th September. After hearing evidence the Bench was of opinion there was not sufficient evidence to warrant the justices sending prisoner for trial. Whitehead was then discharged.

THE president of the Surveyors' Institution thinks that the making of roads is now the question of pressing importance. Mr. Buck advocates that the great highways should be under the jurisdiction of county highway boards, and that certain roads of more than county importance should be regarded as national roads, and maintained out of imperial funds. Automobile developments are making the whole question of acute importance.

THE JACKSON COVERT CAR.

UNDER the name Jackson Covert, Messrs. R. Reynold Jackson and Company are introducing a new light car into this country. It is of American construction and comprises, as will be seen from the accompanying illustration, one or two special features in design. The frame is constructed of channel steel, in the front part of which is located a vertical water-cooled single cylinder engine of the De Dion type which develops 6-h.p. It has two internal fly-wheels,

Fig. 1.—Plan of Car.

and attached to the crank case is an additional aluminium case containing the combined brake and clutch, Fig. 2. By pressing a pedal slightly the clutch C is disengaged from the fly-wheel B, which is secured to the motor shaft, and by pressing the pedal still further the leather band on C is brought into contact with the drum A, thus acting as a brake. A spring is fitted which causes the clutch to return to its place immediately the pedal is released. This spring also takes up all end thrust of the driving shaft. The cardan joint D is fitted with ball-bearings that reduce to a minimum the end thrust of the clutch. As will be seen from Fig. 1, the power is conveyed through a longitudinal shaft and bevel gear to a live axle. The gear box is placed

Fig. 2.—The Combined Brake and Clutch.

at the rear near the bevel gear; the change gear is of the sliding pattern, giving two speeds forward and a reverse. It drives direct on the high speed, while the slow speed has a ratio of $2\frac{1}{4}$ to 1 to the high speed. In addition to the combination clutch and brake, a band brake on the differential drum is also provided. The petrol tank, which holds six gallons, is placed underneath the seat, while the water tank, holding four gallons, is attached directly to the dashboard.

THE Southern Motor Club will hold a series of Sunday runs during November as follows:—15th, to Brighton; 22nd, to Southsea; 29th, to Westcott.

CORRESPONDENCE.

CRACKED CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having failed to rust the crack in the water-jacket of his engine with sal ammoniac and iron filings, I would recommend your correspondent to try the remedy of painting over this with a little red lead mixed with gold size, and allow to thoroughly dry, giving two or three coats. If this should fail, a small "patch" of sheet metal may be put over the crack, fixed with small screws. A little of the red lead and gold size, mixed in a paste, should be placed between the patch and the jacket. This repair can be made very neatly if fixed with small round-headed screws.—Yours truly,

T. J. H.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A correspondent enquires about a cracked water jacket on his engine. I have tried the sal-ammoniac and iron-filings dodge. It will hold sometimes on some jobs; but I have never found it to answer on a motor-car engine. I have stitched cracked water jackets with copper that have lasted for years, and are still as sound as ever. I have mended some cracks as long as 6 in. and 8 in. in length —Yours truly,

J. SUGDEN.

Four Generations in a Motor-Car.

[Motor Age.]

PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to know if there is such a thing as "stale petrol"; if it deteriorates at all by keeping, say, six or more months in unopened airtight cans? Also, if a car is not in use for, say, a month with its tank full of petrol, has that petrol lost any of its explosive power, and what would be its effect on the engine—different, if any, to "fresh" petrol? Am I right in concluding that petrol is petrol, so to speak, in every respect, like paraffin, whether exposed to the air or not and whether "old" or "new," and just as effective when used through a carburettor to drive the engine of a motor-car? If I am not right, will you (or perhaps the distillers will) please explain to me—and others—what results we may expect from an engine if driven with petrol termed "stale"? and the difference, if any, between stale petrol and "old" petrol kept in unopened "cans" for, say, six months when a large quantity is stocked?—Yours faithfully,

B. J. W.

[Petrol is a mixture of the lighter paraffins, and should consist chiefly of that one of the series known as "heptane" C_7H_{16} , which has a boiling point between 98 deg. and 99 deg. Heavier and lighter members of the same series are, however, always present, such as hexane, C_6H_{14} , which boils at 70 deg., octane C_8H_{18} , 124 deg., and their isomers. American gasoline, a lighter product, is said to consist chiefly of hexane and isohexane. It is therefore evident that petrol is not homogeneous, and is liable to part with its lighter constituents by evaporation sooner than its heavier ones, increasing its specific gravity in the process, which ends in what we know as "staleness"; while the better the quality of the petrol, i.e., the less the proportion of these heavier and lighter constituents to those of medium density, which form the bulk of the spirit, the less is its liability to staleness. It follows that petrol undergoes no change of any importance when kept in a closed vessel, whether a can or the tank of a car, if this is airtight, and is none the worse for age *per se*. Stale petrol—petrol from which the lighter constituents have fled—gives trouble in surface carburettors

owing to the remaining constituents vaporising less easily; it is, however, really slightly better in fuel value, and in well-designed spray carburettors, which give a finely comminuted spray, has no ill effects, and we are inclined to believe that it is far too often made an excuse for poor running due to quite other reasons.]

OVERHEATING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps some of your correspondents could help me to overcome chronic overheating in my motor (De Dion). The pump is efficient, and throws a stream over 10 ft., but, nevertheless, after travelling about three miles at fast speed the engine invariably stops from heat, though the water in the tank never boils. These symptoms came on suddenly about two months ago. I have tried the following unsuccessfully:—(1) Complete repairs to pump; (2) new coil and auto-trembler; (3) new piston-rings and cleaning cylinder; (4) scraping the radiator; (5) new joints throughout the circulation. The mixture is perfect, and so is the pump. I begin to think that the defect must be due to "furring" of the cylinder jacket, though there is only a thin coating of rust visible.—Yours truly,

"OPOSSUM."

[We think "Opossum's" trouble from overheating is due to the "furring" of the water jacket, or, failing this, a stoppage in the return pipe from the radiator to the tank. This would cause steam to generate in the head of the jacket, and so in turn cause enough pressure to prevent the pump from keeping up the water supply. We should advise our correspondent, in the first place, to take off the cylinder, remove all the plugs, and scrape away all possible sign of furring, more especially around the valve chamber. In the event of this failing, the inside of the water tank may be found "furred" or choked around the return pipe from the radiator; this in all probability is the cause.]

A COMPLAINT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One Sunday, about two months ago, a gentleman called at my house for petrol, saying he had lost part of his horn, and had been stopped by the police. Could I sell him one? Not having one for sale, I lent him the horn of my own car, which he promised to return the next day. That horn has never come yet, and is likely doing service to the gentleman who was riding a motor-cycle.—Yours faithfully,

WILLIAM DUNN.

Newcastle-on-Tyne.

IN A TRAP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow me to put my case before your readers? On Sunday last, while out riding with a friend, we came upon a police trap a mile outside Uxbridge. My friend was about 50 yards in front of me. The police signalled for him to be stopped. I was pedalling my motor-cycle, as it would not fire through a short circuit. When I came to the police they stopped me. I was not going more than seven miles an hour, as your readers will know, pushing a motor-bike, 120 lbs., with exhaust valve closed, slightly up-hill. The constable asked for my name and address, which I refused to give, because he did not know how fast I was going until he saw the one at the beginning of the trap. Some gentlemen were there whom I have got addresses from. The constable has found my address to-day, and is going to charge me with furiously driving a motor, which I was not doing, as I was pedalling it; also with refusing my name and address, which I did not give on the grounds that I had not committed any offence. Would any reader advise me in this matter? I was summoned at Chertsey and fined some time back for "towing" a gentleman, who was riding by my side. My advice to motorists now is to walk beside their car or cycle through a trap, and not to walk too fast and not too slow, or else the police will have the victim up for loitering.—Yours truly,

ARTHUR P. TYLER.

PRIVATE TOUTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—All *bona fide* traders are indebted to Mr. Austin, of the Wolseley Company, for his letter on this subject. We have long known of the nuisance referred to, and our only course where no redress could be had was to cut adrift such firms as "tout" to private persons. The business is not, from a dealer's point of view, a lucrative one. We have stock to keep, and it may very likely happen by the end of the season that that stock has dropped so much in value that any profit we have made is lost in this other direction. Often at the end of the season prices for stock have to be accepted much below value, and if makers wish to do business through the *bona fide* trader, they will have to give them better support than they have done in the past.

Makers and dealers, before quoting to any firm or individual, should satisfy themselves that they are dealing only with those who are in the business, and by that we mean firms who keep stock and a thoroughly-equipped repairing shop. A list of these traders or agents in Scotland

can be had from the Secretary of the Scottish Motor Manufacturers and Traders' Association. It has been our misfortune, and no doubt others as well, to find, on introducing a particular make of car, that our client has bought it through a small cycle agent, less 5 per cent.

The dodging and scheming tried by "touts" to secure business would be amusing if it were not so serious. It remains for the makers and dealers to say if it is to continue. As dealers we shall expect to know from the makers, either by letter or advertisement, who are, and who are not, the friends of—Yours truly,

BONA FIDE TRADERS.

MOTOR-CYCLE SIDE CAR EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter from me which you published in your motor-cycling column last week, I hasten to say that the whole incident, which might have caused a serious accident, occurred through my steering handle being loose. No one, neither the makers of the side car nor of the motor-cycle, were to blame in any way. I shall be very much obliged to any of your readers who will relate their experience with side car attachments. Seeing the double weight attached to motor-cycles I would like to know if the ordinary brakes provided can be relied upon. I intend to proceed to South Africa shortly, where roads are up and down hill. Is there anything to be suggested or have any improvements been made?—Yours truly,

J. VAN ZWIETEN.

THE TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is very little doubt that the expense and worry of pneumatic tyres prevent a large number of people from becoming purchasers of motor-cars. The expert motorist, as well as the inventor, is always looking for a tyre that cannot be punctured, but no one has really produced a tyre absolutely proof against punctures or collapse in some form or other. The greatest objection, in my opinion, to the best pneumatic tyre is its uncertainty. It is very little use telling customers that this tyre has travelled 1,000 miles, more or less, without a puncture, or without requiring pumping up. I may use this identical tyre and get it punctured in less than 1,000 yards, and there is no guarantee against such failures, which are known, without exception, to every motorist and to the public generally; apart from the worry and expense, there is the continued uncertainty of the occupants of the car not knowing what is going to happen next and where they may be stranded, which no foresight on their part can prevent. This is where the pneumatic tyre differs from the general mechanism which the public now realise in most high-class cars is perfectly reliable, and that it is simply a question of tyres as to whether they adopt the motor-car in preference to the carriage or not. If they felt that the tyres were as good as the motor-car, we should have no difficulty in doubling the number of motorists in a very short time.

Some of the manufacturers boldly say that their cars run as well on solids as on pneumatics—those manufacturers appear to be doing the largest business, simply because they are meeting the public demand, and I venture to suggest that the solution of the problem lies in adopting a good solid tyre that is comfortable and reliable at high speeds, and that such a solid tyre, in conjunction with a properly sprung car, is what the carriage users require.

Far more attention ought to be given by the manufacturers of motor-cars to springs; it is not a question of length of springs, but a question of length and flexibility and position, and an excellent addition would be a rubber-lined shackle, as used, for instance, on carriages and hansoms. Motor manufacturers are a long way behind the builders of horse-drawn vehicles in respect to springs, for the latter can make a carriage run with every comfort on iron tyres, and the only reason why some carriages are fitted with rubber tyres is because of the silence in running; the springs are so good in some cases that there is little or no difference in vibration whether solid rubber tyres or iron tyres are fitted. Motor-car manufacturers should combine with well-known carriage spring manufacturers and carriage builders with regard to the matter of resilient springs, and the position they should be fitted on a motor-car to give the best results. A car properly sprung would run better on solid tyres and the upkeep would be less, and the comfort and absence of worry more pronounced than with the best pneumatic tyre yet produced, and all that bouncing over holes in the road and level crossings would be done away with. This is one of the greatest objections a carriage user finds; he is generally a man of ease who prefers to be driven at a moderate pace and not to be swayed to and fro and bounced up and down on pneumatic tyres, but he wants a reasonable amount of resiliency from his springs and tyres.

In advocating the abandonment of pneumatics in favour of solids a great deal of opposition will be met by those interested; but if motor car manufacturers who are not interested in pneumatic tyres will only realise what the public want, I feel sure they will produce a reliable and comfortable car, and overcome the prejudice worked up by some motorists against solid rubber tyres, and do the largest business by supplying what the public want in the way of a comfortable and reliable car fitted with a good solid rubber tyre. I notice firms who are working in this

direction are progressing most rapidly both in England and Scotland.—Yours truly,

A MECHANICAL ENGINEER.

SILENCER.—J. E. A. asks for advice as to a really efficient silencer. At the present time he has one about six inches in diameter, running lengthways of the car. There is not sufficient room for one of a larger size in the same position; the only place it could be fixed is under the back of the car cross-ways.

GOODWIN AND Co.—The engine you refer to is probably the Aster, full particulars of which you will get from the Begbie Manufacturing Company, Limited.

ALUMINIUM WIND SHIELDS.—Mr. F. White writes:—"With regard to the enquiry in your issue of the 7th inst., I may say that having dealt with Messrs. F. Braby and Company, aluminium merchants, Euston Road, N.W., in wind shields, bonnet guards and bodies, I have always found them to be very satisfactory, and one can depend on an order having prompt attention. I might mention I have no interest in the above firm." Mr. W. T. Edwards, carriage builder, Ashford, also writes that he makes aluminium wind shields.

HEAVY MOTOR TRAFFIC.*

By E. SHRAPNELL SMITH.

It is proposed that this paper shall deal with some phases of the application of self-propelled vehicles to the conveyance of goods on common roads. The strict meaning of the word vehicle—i.e., a carrier, but not a tractor—will be observed. This branch of automobilism has had an interesting life, though an acquaintance with the factors which limit its scope, and with the records obtained during the past six years, provides occasion neither for regret nor despondency. The history of the revival of the light locomotive, or motor-wagon, is brief, its leading stages in chronological order being:—

1895. *December 10th*.—Resolutions adopted at Cannon Street Hotel, under chairmanship of Sir David Salomons, Bart., to form the Self-propelled Traffic Association.

1896. *October 1st*.—Presidency of Liverpool Self-propelled Traffic Association formally accepted by the Earl of Derby, K.C.B., at Liverpool Town Hall. *October 26th*.—Inaugural address to L.S.P.T.A., at the Liverpool Royal Institution, by Sir David L. Salomons, Bart. *November 14th*.—Locomotives on Highways Act, 1896, came into operation.

1896–1897. *November to March*.—First session of Heavy Motor Traffic papers at Liverpool Royal Institution.

1897. *June 10th*.—Royal Agricultural Society of England Trials at Crewe produced one competitor—a Leyland van.

1898. *May 24th–27th*.—First Liverpool Trials of Motor Vehicles for Heavy Traffic. Four vehicles competed—Leyland, Lifu, and Thornycroft (2). *December 14th*.—Fusion of the L.S.P.T.A. with the A.C.G.B.I.

1899. *July 31st to August 2nd*.—Second Liverpool Trials of Motor-vehicles for Heavy Traffic; six vehicles competed—Clarkson, D. Coulthard, Leyland, Straker, and Thornycroft (2).

1900. *December 3rd*.—Inaugural address of fifth session L.S.P.T.A., at St. George's Hall, Liverpool: "Heavy Motor Traffic in France" (with lantern and cinematograph illustrations), by M. Georges Forestier.

1901. *March 15th*.—Resolution in favour of increased tare weight passed at annual conference of the Associated Chambers of Commerce of the United Kingdom. *May 31st to June 8th*.—Third Liverpool Trials of Motor-vehicles for Heavy Traffic. Eleven vehicles competed—Coulthard German Daimler (2), Leyland, Mann (2), Musker (2), Simpson and Bibby and Thornycroft (2). *December 4th–21st*.—War Office Trials of Motor-vehicles for Military Purposes, at Aldershot. Five vehicles competed—Foden, German Daimler, Straker, and Thornycroft (2).

1902. *January 8th*.—Liverpool Fire Insurance Committee approved use of motor-wagons at Liverpool Docks and warehouses, including cotton sheds, without additional premiums.

The principal distinguishing feature is that the motor-wagon is generally employed without a trailer, and never with more than one. This limitation not infrequently renders the motor-wagon less economical than the traction engine and its three or more trucks, e.g., where regular loads of 20 tons or more per trip are available, and particularly in the absence of back loads.

The three Liverpool Trials advanced the motor traffic movement in this country to a stage where a commercial test became necessary. Steps were taken, after the reception of the judges' third report, in October, 1901, to form a private syndicate to make a preliminary experiment to secure data for later operations. The scheme was, naturally, unattractive from the financial standpoint, for the majority of those who were invited to subscribe anticipated being sacrificed as pioneers. In any event, £20,000 was put up, principally in Liverpool, by February, 1902, when ten steam lorries were ordered for the work. This number was subsequently increased to fourteen. These machines, then, were brought into service gradually between August and December, 1902, the makers giving late

* From a paper read at the Automobile Club on the 5th inst.

They do not recommend the Local Government Board to prescribe a ten-mile limit, as they are of opinion that under the enactments of the Act (independently of Section 9) adequate protection is given to the public. Favourable consideration is to be given to the applications of local authorities for the erection by the County Council of caution boards at the entrance to towns or villages, and also at dangerous corners or curves on main or district roads.

FORFAR.—The Forfar County Council have agreed to the scheduling of a list of roads about fourteen miles in length.

DEVON.—At the last meeting of the Barnstaple District Council a sub-committee recommended that the County Council should schedule all their district roads at places on which cars should not travel more than ten miles an hour. These highways were narrow and most of them steep. They also recommended that the same rate should apply to all villages and hamlets, and all roads where there was not a breadth of 16 feet, and also to such places as might hereafter be designated as dangerous places. Another recommendation was that in passing every single cottage the rate of motor-cars should not be greater than ten miles an hour, but on consideration the Chairman of the sub-committee did not think this a practical arrangement. It would involve notice boards being so frequent that a heavy expense would have to be incurred, and, apart from that, familiarity with the boards would lead to persons disregarding them. It would be better to leave this matter to the common law, which said that a person should not drive to the danger of the public. Ultimately the recommendation was adopted with the elimination of the proposal to slow down on passing single cottages, and the addition of forbidding cars to travel on the road from the Blue Bull, Countisbury, to Lymouth Bridge.

Co. DOWN.—The Down County Councils have approved of the motor-car regulations proposed to be issued by the Irish Local Government Board.

The Cycle and Motor Trades' Association has suggested to the Local Government Board the advisability of amending their proposed regulations in the direction of insisting upon only one identification-plate being illuminated; of reducing the fees for re-registration; of supplying the plates free, and with regard to the record book to be kept by manufacturers in connection with vehicles used on the public highway in accordance with Clause 14.

THE MIDLAND AUTOMOBILE CLUB.

THE results of the official hill-climbing handicap, held by the Midland Automobile Club on September 12th, have just been issued as follows:—

Entry No.	Name of Driver.	Car.	Weight of Car.	Weight of Passengers.	Cylinder Dimensions.	Time of Ascent.	Result.	Points.
					S. D.	Min. Sec.		
8	H. Luff Smith	10-h.p. Wolseley.	2072	532	5 x 4½	1 27 2/5	Gold Medal 1st.	33
12	Harvey du Cros.	12-h.p. Ariel	2212	616	3½ x 3½	1 22 4/5	Silver Medal 2nd.	35
3	H. A. Holder	16-h.p. Dietrich.	2520	616	m m 120 x 104	1 11	3rd.	36
4	C. W. Dixon	10-h.p. Lancaster.	2408	644	5 11/16 x 5-25	1 58 1/5	4th.	37
6	M. A. Lawrence.	10-h.p. Lancaster.	2380	700	5-7 x 5-25	2 2	5th.	39
7	E. J. Hartenfeld.	10-h.p. Lancaster.	2408	616	5 11/16 x 5½	2 1 2/5	6th.	40
10	A. E. Crowdy	20-h.p. Wolseley.	2912	532	5 x 4½	1 16	7th.	44
1	J. A. Holder	24-h.p. Panhard et Levassor.	2436	616	5½ x 4½	1 9 4/5	8th.	54

POLICE TRAPS.

THE well-known traps at Send, Ripley, and Shottermill have lately been in active operation, Sergeant Jarrett being in charge of that at Ripley.

THERE is a police trap about a mile the other side of Uxbridge from London.

THE Bagshot and Sunningdale districts should be negotiated carefully by the motorist not desirous of being trapped.

A NICELY devised police trap has been laid on the road into Beaconsfield from the Metropolis.

CLAIM AND COUNTER CLAIM.

A CASE has come before Mr. Justice Channell, sitting without a jury, in which the plaintiff was Mr. Paris Singer (trading as the City and Suburban Electric Carriage Company), who sued the defendant, Mr. J. F. Ochs, to

recover £194, balance of an account for work done and materials supplied in the repair and alteration of an electric Surrey motor-car. The total amount of the plaintiff's bill was £253, but £59 had been paid on account, leaving the balance sued for due. The defendant denied indebtedness, and counter-claimed the return of the £59 paid on account, and damages for the detention of the car from February to August, 1902. After hearing counsel on both sides, his Lordship gave judgment for the plaintiff on the claim for £189, and for the defendant on the counter-claim for £150, and as he said the bulk of the costs had been caused by the counter-claim, he allowed the defendant his full costs and limited the plaintiff's costs to £40.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED. M. P. H.	RESULT.
London :	Miss Levitt, New Burlington St., W.	—	£5, etc.

Steving	F. E. Charles	—	£5, etc.
"	H. S. Westcott	—	10s., etc.
"	R. Polgate	—	£5, etc.
Farnham	A. Dickinson	24	£2, etc.
Swainsthorpe	H. Winch, Westminster	—	5s. etc.

IN the cases heard at Knaresborough the police confessed to taking the time of motorists on the measured distance by ordinary watches.

MOST of the defendants at Marlborough Street (London) police court were summoned for exceeding the twelve mile speed limit with their motor-cars in Hyde Park. They admitted this but declared that their speed did not reach twenty miles an hour.

AT Mansfield, A. F. Houlton was charged with furiously driving a motor-car on the night of the 21st of October. Superintendent Hensley deposed that on the night in question about 10.15 he was driving along Mansfield Road, in the parish of Sutton-in-Ashfield, in company with P.C. Dennett, when he heard something coming along at a rapid rate behind them. He drew his trap up to within a foot of the left side of the road, when someone in a motor-car rushed past between the trap and the hedge. The car went towards Mansfield. When in Mansfield witness caused inquiries to be made, as the result of which he was satisfied that the person driving the car was Mr. Houlton. Mr. C. E. Lucas called the defendant, who stated that he left Sutton at 10.15, and was in Mansfield Market Place at 10.34. It therefore could not have been his car that passed Superintendent Hensley. The Bench stated that they were not satisfied with the evidence, and therefore dismissed the summons.

THE magistrates in attendance at the Fareham Police Court (Colonel H. R. Farquhar, Colonel R. H. Martin, C.B., C.M.G., and Mr. J. Sandy) have had before them a case in which Mr. T. Mattison, of Southsea, was summoned for driving a motor-car at an excessive speed in the Havant Road, Cosham, on the 18th October. P.C. Stockwell said that on the day in question he saw defendant driving a motor-car at the rate of 22½ miles an hour. Defendant gave evidence and said that no expert could get more than 16 miles an hour out of the car on the second speed with two people up. On this occasion the car had five occupants. An independent witness named Albert W. Palmer, of Portsmouth, said that he and a friend were out cycling on the day in question and he saw a car stopped on the Havant road. It was not going any more than twelve miles an hour, and it was stopped within three or four yards of the constable. Harold Kemp, of Southsea, corroborated this evidence. The Bench, however, considered the case proved, and fined defendant £2 including costs.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, NOVEMBER 21, 1903.

[No. 246.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE watchfulness of the railway companies with regard to automobilism shows no sign of slackening. Now we learn that the North Eastern Railway Company have introduced an innovation in their parcels department in the shape of a petrol motor delivery van, which, with the exception of the tyres and a few small parts, has been constructed entirely at the company's own carriage works at York. It is at present being subjected to vigorous tests, and if it comes out satisfactorily the idea will be extended, and these vans will be built for parcels delivery and collection, not only in York, but in Newcastle, Darlington, Stockton, Leeds, and other large towns served by the system.

Motor Vans.

FROM passenger 'buses to motor delivery vans is a natural step, and now that a northern railway has led the way many of the others are certain to follow. When once the great railway concerns realise the part that the motor-van can play in the economy of business the success of the movement is assured. Evidently such a time is coming nearer. Meanwhile other companies are awaiting the results of the delivery van trials to be organised next year by the Automobile Club.

Cylinder Capacity.

FOLLOWING a paper which bore signs of hurried preparation, there was an interesting discussion at the A.C.G.B.I. on Thursday of last week. Elsewhere a summary of Mr. Crawley's views on cylinder capacity is given, and in initiating the conversation Mr. Lyons Sampson, who was in the chair, reminded us of that busy day at Naas when the competing cars in the Gordon Bennett race were "weighed in." As the clerk of the scales, Mr. Sampson was responsible for a very onerous piece of work, and he confessed that the limit of maximum weight with the cars unladen did not work out with the sweet simplicity that had been anticipated on paper. There was great difficulty and delay in ascertaining the weight—a delay partly due to the fact that all calculations had to be made on the spot, nothing having been previously prepared. One thing and then another had to be taken off, and one car that was weighed without its mud-guards raced with them on.

On Racing.

MR. H. AUSTIN, of the Wolseley Company, was the next speaker, and was originally against the weight limitation, but could not see a better way. The object was to eliminate freaks; but had that been secured? At the same time the limitation of the cylinder capacity would not achieve the result desired. He asked if it was a good thing for the Club to foster racing; that was a matter which should be left to the trade,

unless the trade element was eliminated and it was made obligatory that owners should race their own cars and be unconnected with the trade.

The Club Discussion.

AFTER Mr. Bircham had pleaded for private owners as well as makers to have a chance in racing, Mr. H. Sturmeay urged the necessity of securing closer conditions of rating. This, he did not think, would be the result of the proposals made by Mr. Crawley, and suggested that possibly cars might be classified on the brake test, this to be made before the engine was put into the car. Mr. M. O'Gorman referred to the various proposals made, and thought cylinder capacity the least satisfactory of all. Mr. S. F. Edge threw out the suggestion that a number of gentlemen should get together and agree as to the design of a racing car, inviting makers to tender for its manufacture. He criticised the figures in the paper as to the weight of the body suggested for the chassis. Colonel Crompton closed the discussion, remarking that they should obtain the definite relation of road speed to piston speed; then the rating of cars would become a simple matter. On the motion of the chairman, seconded by Sir Hickman Bacon, Bart., a hearty vote of thanks was accorded to Mr. Crawley, whose reply closed the proceedings.

The Gordon Bennett 1904 Team.

REVERTING to Mr. Austin's remarks on racing we would here give publicity to a suggestion he makes with regard to the eliminating contest for the next Gordon Bennett Cup team. "By all means," he says, "let us try to get back the Gordon Bennett Cup, but at the same time let us be sensible enough not to waste capital, which in itself is bad for the industry, by building an unnecessary lot of cars for a competition among ourselves as to who should represent us in this International contest. I still feel most strongly that the safest, the most economical, and the best results could be obtained by the Club if they were to nominate three of our leading manufacturers to build one car each, under the supervision of a small committee to be appointed by the Club. To have any chance of winning next year's Gordon Bennett we shall have to build a car which will be quite useless for anything but a speed contest; and we ought to do as little of this as possible if we are to husband our resources."

The Hampshire Motor Union.

THE Hampshire Motor Union is taking advantage of our advertisement columns to bring itself to the notice of motorists within the area of the county. There is no doubt that the early coming into operation of the Motor Car Act will establish a necessity for local activity, and it is gratifying to know the first of these county organisations should have such an experienced motorist as the Hon. J. Scott Montagu, M.P., as a member of its executive committee, others associated with him including Colonel Willan, Admiral Sir John Fullerton, Dr. Aldridge and Mr. J. Bonham Carter, and Mr. J. C. Warner, of

Winchester, as secretary. The Union will establish a defence fund to protect its members from the consequences of police persecution and magisterial prejudice, and also bring its influence to bear upon local authorities for the improvement of the roads and other matters which appeal to motorists, in common with all users of the highways. Every motorist in Hampshire should lose no time in associating himself with this hopeful movement.

Colonel Astor.

THE suggestion of the Lord Chief Justice Clerk of Scotland that motor-cars should be named as well as numbered finds illustration in the United States as well as at home. Colonel J. J. Astor has a garage with ten cars comfortably housed therein at his residence at Rhinebeck-on-Hudson, and all

Col. J. J. Astor on his Mercedes.

the vehicles have their pet designations. The car used for station purposes is the "Ark," and others include the "Tub" and the "Go-cart." At his city garage the Colonel has accommodation for another half dozen vehicles, the whole being under the supervision of B. Morgan, who obtained his automobile experience in the old country. Just now Colonel Astor is busying himself in a movement for the construction of a motor-car track near the golf links at Newport, U.S.A.

To Midland Authorities.

THE Wolverhampton and District Automobile Club have issued a circular letter to all local authorities within a radius of about forty miles, in which they submit that adequate protection is already given to the public by the Common Law and by the provisions of the Motor Car Act, 1903, by which Act all motor-cars are required to be numbered and registered, without the Council exercising the powers which will be conferred on the Local Government Board under the new Act, and requesting the Councils not to suggest imposing further restrictions upon the drivers of motor-propelled vehicles. If, however, the Council is of opinion that the travelling public are not sufficiently protected, then the Committee request the Council not to recommend the closing of any roads to motor-cars or the reducing of the speed limit at which they will be permitted to travel under the above Act, until an opportunity has been given to the members of the Wolverhampton Club to drive councillors over the roads which they consider should be closed to motor-cars, or upon which, in their opinion, the speed limit should be reduced, and to demonstrate the ease and safety at which motor-cars travel over narrow and tortuous roads, and how apparently difficult and dangerous places are negotiated without danger to other users of the highway.

Recognition from the War Office.

THAT the Motor Volunteer Corps is known to the War Office is apparent from the fact that for the first time in the history of military examination papers a question has just been set in the Topography paper for Promotion Examination for Captains, in which it was stated that a motor-car was available for reconnoitring purposes. By the way, the annual dinner of the Motor Volunteer Corps will take place at the Trocadero, London, on the 8th prox.

18 Miles an Hour.

OUR list of cases of alleged furious driving has suffered a little owing to the variability of the weather, and the scantiness of the list is not due to any lessened police vigilance. A reference to the cases shows a peculiar magisterial vision in view of the early legalising of a speed of twenty miles an hour. In only one case was the defendant charged with attaining a speed of more than thirty miles an hour, and that was "not proven." In four other cases the speed was estimated by the police themselves at not more than eighteen miles, while in three instances speeds of twenty miles an hour were alleged, and in three others only one mile above that was stated. After January 1st most of such cases will be dismissed—if taken into court—and it is clear from the many summonses issued in connection with speeds of about a score of miles per hour that the line between conviction and innocence will be a very fine one. It is to be hoped it will not be unduly strained by magisterial prejudice.

One of eight Leyland Steam Wagons for South Africa. (See page 729.)

An Important Secession from the A.C.G.B.I.

THE decision of the Manchester Automobile Club to cease association with the A.C.G.B.I. at the end of the present year is important, especially as it follows an energetic effort to federate the clubs with a central union in which legislative matters will not be mingled with social functions, and the publishing business. There is no doubt that the Piccadilly club is attempting too much, and the heavy fees which have hitherto been extracted from the provincial organisations have proved a drain on the resources of active societies. For instance, the Manchester Club has offered £100 as the price of affiliation—an offer refused by the Club, which wanted a separate fee for each member. As a result of such an attitude, the central organisation casts away an important section, to say nothing of the financial

loss that is incurred. But probably the Manchester Club will be able to utilise the money thus retained in popularising the pastime and in promoting the motor education of its members in the County Palatine.

Is there Preferential Treatment?

MEANWHILE the letter from the hon. secretary of the Reading Club, published on another page, suggests the question as to whether preferential treatment is not meted out to certain clubs by the central body. The idea is an unpleasant one, but the statement he makes as to the terms upon which the Nottingham Club holds its association with the A.C.G.B.I. will probably require some explanation in Manchester.

In the Early Days.

IN view of the Manchester decision and other matters that seem ripe for discussion, the question is being asked, has disintegration set in at Piccadilly, W.? We hope not. The A.C.G.B.I. has been of immense service to the industry, and the tremendous amount of work wisely initiated in the old place at Whitehall Court revealed the enthusiasm of pioneers. But the movement has become something more than the hobby of a few; it is being decentralised and its votaries are found in every town. When they, in their turn, become clubmen, they will not want to sink their local identity. Affiliation, to be popular, must allow for liberty of local action and a certain latitude in policy

Engineers and Motor-Cars.

THERE is no doubt that the motor car industry is becoming one of very great importance, and firms of the best standing in the engineering world are now turning their attention to the development of the automobile. Thus in England we have, to mention a few that occur at the moment, Vickers, Son, and Maxim, Armstrong, Whitworth and Company, Peter Broherhood, Willans and Robinson, are practically interested in the business, and abroad the great firms of Krupp and Hotchkiss have recognised the future of the motor-car by laying down special plant for its construction. The fact that such experienced engineers are now connected with the industry will not only assist the automobile towards a state of perfection, but it will give the public increased confidence in the vehicle itself.

Out of Proportion.

SOME idea of the inconsistency which prevails at London police courts was seen the other day at the South-Western Court, when a motorist driving at between eighteen and nineteen miles an hour was fined 40s. and costs. A few minutes later, in the same court, a carman, driving a horse and van at a furious

The King of Italy, who has paid a brief visit to England this week, is, like King Edward, an enthusiastic motorist. Above we reproduce two snapshots of His Majesty in his Fiat Car at the recent Italian Manœuvres.

[La France Automobile.]

generally. In the development of county unions such as that which has been inaugurated in Hampshire—a county we have had to speak of with severity on more than one occasion—there is much hopefulness. One thing is certain, that, whether affiliation is to be the burning question of discussion or not, automobilism is not likely to delay while contestants discuss.

The Medical Aspect of Motoring.

So many medical men now use the motor-car in their daily practice that there should be available a large fund of information with regard to the effect of motoring on health. This is an aspect of the matter to which less attention has been given than might have been expected, and we are glad to hear that the Western Section of the Scottish Club has secured a promise of a paper on the subject from Professor Hugh Galt. This should provoke a useful and practical discussion. Meanwhile the experiences of readers might elicit some points upon which the professor could give authoritative information in his paper.

rate, was fined one-fourth of this amount, although it was said in evidence that he nearly knocked a woman down, and also struck a man's foot. The relative danger in these two cases will be appreciated by all acquainted with the road, and it does seem as though there should be some judicial review of magiserial decisions when such glaring cases of inconsistency are recorded.

A Scotch Reminiscence of the Irish Tour.

IN a lecture before the Scientific Society of Glasgow Mr. Alec Govan has been setting forth the essential points of modern automobiles and discussing some of the problems associated with the mechanical aspects of automobilism. Speaking of petrol, he told a good story which occurred when the route for the Gordon Bennett race was being discovered. One of the officials was detached from the main body of the party and wired that he could not join them as he was unable to start the engine of his motor-car. They knew the gravity of the spirit he was using, and immediately wired to him to try hot fomentations, with the result that he was not long in appearing

before them with his car. With a lucidity of expression that secured a comprehension of the points by his audience, Mr. Govan then went on to describe the carburettor, ignition systems, and the engine, making some interesting comparisons of surface speed between the modern locomotive and a motor-car fitted with petrol engine running at 1,500 revolutions per minute.

Mechanical Matters.

REFERRING to the objections to the high speed engine on the ground of excessive vibration, Mr. Govan mentioned that with the latest devices when the car is in motion on the top gear the vibration from the engine transmitted through the frame is practically nil, the speed of the car acting as a fly-wheel. In hill climbing on the low gear this action is decreased, with the result that the vibration is felt. The best remedy for this would appear to be the multiplication of cylinders—a point incidentally touched upon during the discussion on Mr. Crawley's paper at the Automobile Club last week. Already some makers have placed six-cylinder cars on the market to meet the demand from a certain class of customers. In practice Mr. Govan finds that good results can be obtained when the stroke is $\frac{1}{2}$ inch greater than the bore. Even with the length of the stroke beyond this satisfactory results can be secured, the speed of the engine being maintained by opening the exhaust valve early. Unfortunately there is no exact data available to show if there is any gain in making the stroke much longer than the proportion indicated; but as a general rule it may be taken that the longer the stroke in proportion to the bore the earlier the exhaust valves must be opened. Still, as the stroke is increased within limits greater advantage can be taken of expansion.

Reliability Trials v. Touring Conditions.

HAVING dealt with other technical points, the author went on to more general reference to the subject, and his criticisms, which we publish on another page, will doubtless be read with interest by members of the trade. We are glad to notice the attention he drew to the conditions of the public trials that have been held. By deducting marks for the time occupied for cleaning and minor adjustments which every owner would regard with equanimity, several excellent cars appeared to a disadvantage, as it is well known that vehicles may perform badly through minor temporary defects which, if attended to in time, would result in no trouble whatever. Of course the achievements of those that secured non-stop runs appear all the brighter in comparison, but the fact remains that a few minutes' allowance for cleaning would not be regarded with ill favour by the public, while giving a greater chance to the cars by approximating the conditions under which they are run to those of actual touring experience.

Distinguished Visitors at the Shows.

IN France the authorities have always been lavish in their patronage of automobilism, and the consent of M. Loubet to open the Automobile Salon on the 10th prox. is in keeping with precedent. On this side, too, there is a growing desire to help the movement, and the visit of the Prince of Wales to the Agricultural Hall Show last year gave a decided impetus. It is also anticipated that Royal favour will be again bestowed on the International Motor Car Exhibition at the same hall next year, King Edward VII. having, we understand, been approached in the hope that he will attend on one of the days the exhibition is open.

Outside Schools.

JUST as town councils give preferential treatment to churches in the matter of wood paving, so the Forfar County Council is seeking to enforce a restrictive policy with regard to the roads in proximity to schools. Where schools or school play grounds are on the side of roads, it is proposed

that the rate of speed for 100 yards on each side of the schools shall be limited to ten miles an hour. The intention of the Council is excellent; but the plan by which it hopes to secure its aim is open to question. Had a caution board to be placed at each end of such a stretch of road, we should have had no criticism to offer, but every motorist knows that a speed of four miles an hour is just as dangerous as twenty when children are rushing across the road. While motorists must exercise caution in such circumstances, teachers and parents should enjoin the youngsters to be equally chary of making the public road their private playground. Roads are for the serious business of pleasure, rather than places for the pleasant capers of juveniles.

Hooded Vans.

THE London County Council's proposed bye-law with regard to hooded vans should have no difficulty in securing confirmation, for it is becoming an absolute essential to the safety of those who travel on the roadway. Since 1891 the accidents in London in which hooded vans have figured have increased by 118 per cent. as compared with an increase of about sixty-four per cent. from other causes. This is significant, and unless firm steps are taken to secure that drivers of vehicles have a better outlook on either side the evil will tend to grow rather than diminish.

The Quarterly 100 Miles Trial.

ON Friday, the 13th inst., the quarterly 100 mile trial of the A.C.G.B.I. took place the route including Dashwood Hill, the scene of earlier activities of the club. The entries comprised a 6-h.p. Siddeley car, a 6-h.p. Pick, two Chenard and Walckers of 18-h.p. and 12-h.p. respectively, and a 12-h.p. Cremorne steam car, which unfortunately broke down on the return journey owing to a broken eccentric strap. Of the other cars the Siddeley made a non-stop run; the Pick, which was entered by Messrs. F. Wellington, Limited, had one stop to replace broken sparking plugs; the 18-h.p. Chenard and Walcker had to stop in Southall to take in water, owing to the belt of the fan breaking, while the 12-h.p. of the same type had three stops for ignition troubles. The speeds in all instances were up to the legal limit, and, having regard to the heavy and greasy state of the roads, the performances of the cars were really very creditable to the entrants.

DURING the next few days the regulations of the Local Government Board under the new Motor Car Act will be issued.

WE regret to learn of the somewhat sudden death of Mr. R. Venner, who for about twenty years had occupied the position of secretary to the Royal Agricultural Hall Company, Islington.

ON the Canning Town track, on Wednesday, Ernest Newman made a new fifty miles motor-cycle record, covering the distance in 61 min. 48 4-5 sec., or over 6 minutes less than the previous best.

SUBJECT to ten entries from firms in this country, it is proposed by the Automobile Club to hold trials for electrical vehicles in May, 1904. Draft conditions have been prepared and full particulars can be obtained by intending competitors from the Technical Secretary of the A.C.G.B.I.

WE understand that at least five entries are likely to be received for the Eliminating Test to select the British team in the Gordon Bennett Cup race of next year. This preliminary trial will take place in April next, and further entries will be received by the A.C.G.B.I. up to December 31st of this year.

THE report of the directors of the Daimler Motor Company, Limited, for the year ended September 30th, 1903, states that the manufacturing account shows a gross profit of £27,641, and, deducting from this commercial and general charges and depreciations, there remained a net profit of £15,362. If from this be deducted interest on debentures, £2,319, and £5,000 which the directors have decided to write off the debenture issue expenses, the profit is reduced to £8,043.

SOME NEW BOOKS.

MOTORISTS know more of the country than any other class, and there is no better companion for the half-hour after dinner at a strange hotel than the sociable company of a pleasant guide book—especially a volume telling of the history of the country passed through, and the associations of that to be traversed on the morrow. A series that will be appreciated by motoring tourists is that of the "Little Guides," published by Methuen and Company, and in which all the counties of England are being brought under review. The plan has been to secure as the author of each book someone who to accuracy of knowledge adds some sentiment of local pride in the story he has to tell. Hence the enthusiasm with which the general scheme has been carried out by the individual writers adds a charm which makes the pages thoroughly readable. "Cambridge and its Colleges," by Mr. A. Hamilton Thompson, of St. John's College, is a good specimen of the series, and its illustrations by Mr. Edmund H. New are artistic as well as accurate. Each college is described and its architectural features illustrated in due order, the references to authorities enhancing the value of the book to students.

But the volume on Norfolk, by Mr. W. A. Dutt, will appeal even more to the motorist. Sussex, Cornwall, Surrey, Buckinghamshire, Hertfordshire, and other counties are included in the series, and the accompanying illustrations by Mr. S. C. Boulton are typical of the many to be seen in the volumes. According to the author the Norfolk main roads are well made and maintained, although the by-roads are not so good, and in the north of the county even worse. Still they compare

The Old Toll House, Yarmouth.

well with those of the eastern counties, particularly Suffolk. All the villages and towns are dealt with in alphabetical order, the space devoted to each place being well proportioned. Thetford is one of the oldest towns in the county, and naturally comes in for notice, the Elizabethan Bell Inn being specially

mentioned as one of the quaintest old houses, and as having been famous in the coaching days. Although Yarmouth is modern enough to be a popular resort, some of its buildings are sufficiently ancient to rank among the oldest houses in the county. The Old Tollhouse, in a street running parallel with

THE BELL AT THETFORD~

the South Quay, is known to have been in existence in 1362, and is now given up to the utilitarian purposes of a local exhibition. A good map of the county accompanies each of the "Little Guides," upon the publication of which Messrs. Methuen and Co. are to be congratulated.

Major Matson has collected a series of papers he wrote for a monthly magazine under the title of "The Modest Man's Motor," and these have just been published by Messrs. Lawrence and Bullen, Limited. The book extends to about a hundred and fifty pages, and very early in the volume the author sets down what he regards as the "essentials" in a motor-car for a man of modest means. These include a single cylinder motor of from 6½ to 8-h.p., with the inlet valve opening by ordinary atmospheric pressure; a slow-running horizontal engine; thick solid rubber tyres; a frame made of wood reinforced by steel plates, and belt transmission. In thus making public his views Major Matson should provoke the "old hand" at motoring to discussion, although he enjoyed a pleasant novitiate on such lines. The book is chattily written and does not lay claim to technical pretensions.

THE motor-cyclists in Prague have just formed the Union of Bohemian Motor-Cyclists.

LORD CLAUD HAMILTON will take the chair at the first annual dinner of the Norfolk Automobile and Launch Club on the 11th prox.

THE Earl of Derby will take the chair at a lecture to be delivered on Saturday, the 28th inst., by Professor Hele-Shaw at the University, Liverpool, on the "Pedrail."

CONTINENTAL NOTES.

THAT the date of the opening of the French Salon is fast approaching is indicated by the announcement that the Grand Palais in the Champs Elysées, Paris, will be closed to the public after Sunday next, and that on Monday workmen will take possession to prepare the building for the annual show. I have been able to gather brief details of the 1904 models of a few more of the leading concerns. The Bardon Company will, I understand, next season devote attention to a delivery van capable of carrying a load of from 2½ to 3 tons. Messrs. Cottureau, of Dijon, will next season make a feature of a new 12-16-h.p. three-cylinder car, which is stated to be exceedingly quiet in operation. It will have a stamped steel frame, mechanically-operated inlet valves, water-cooled brakes, etc. As regards the Darracq cars, the success achieved by the 1903 vehicles has decided the firm to continue the 8-h.p. single, 9-h.p. and 12-h.p. double cylinder, and 24-h.p. four cylinder models. A new four-cylinder car of 15-h.p. is being introduced, this, like the 12-h.p. and 24-h.p., having a stamped steel frame.

Gordon Bennett course in the Bielefeld district before the German Club. The wish was also expressed that the final selection be made before the end of the year, in order that no time may be lost in starting to make the necessary arrangements. M. Rene de Knyff has been invited by the German Club to go over the proposed courses and give his opinion as to the most suitable one.

THE German Club has recently proposed to the A.C.F. that Rule 9 of the regulations for the Gordon Bennett race should be altered so that drivers of the cars need not be full members of the competing clubs, but may be "persons commissioned by the clubs." The reasons alleged for making this proposal are that the German Club has always adopted the principle that no professional drivers are to be admitted to membership. As this rule does not prevail in the case of other clubs, it might happen that a professional driver was qualified to drive a car for another country, while not being qualified to drive a German car. The German Club also seeks to reduce the minimum distance for one circuit of the course from 150 kilometres to 125 kilometres, owing to the difficulty of providing

An Austrian Motorist amusing the Youngsters.

[Allgemeine Automobil Zeitung.]

So little interest was taken in the recent motor-car and delivery vehicle contest in Paris that it was evident that the time had come for a change in the arrangements of such trials. The matter came to a head at a meeting of the Technical Committee of the French Automobile Club last week, when the Marquis de Dion brought forward a proposal that next year a trial should be organised for such cars in which the vehicles would not make daily runs from the A.C.F., but should journey from town to town until a distance of 750 miles had been covered, records being taken of the regularity of working of the vehicles, the consumption, the condition of the motor and mechanism at the end of the trials, etc. The committee approved the suggestion and decided to take the organisation of a trial next year on such lines into serious consideration.

THE question as to which course shall be selected for next year's Gordon Bennett race is not settled. At a meeting of the Westphalian Automobile Club on Wednesday last week it was decided to once more bring the advantages of the suggested

a course of 150 kilometres once round for next year's race. The A.C.F. has informed the German Club that there seems no reason why these proposals should not be accepted. They will, however, require to be put before the other clubs that intend to compete ere they can be finally adopted.

THE Lebaudy airship made a highly creditable trip from Moisson to Paris, a journey of forty-five miles, on Thursday of last week. M. Juchmes, who was in charge, was accompanied by a mechanic named Rey. The airship is about fifty-six metres in length, ten in breadth, and has a volume of nearly 2,300 cubic metres. The frame below it is twenty-one metres long and six metres in width, and the car is nearly five metres in length and about a metre and a half broad. There are two sets of steering gear and two screws worked by a 40-h.p. Mercedes petrol motor.

THE Marquis de Dion, as president of the Chambre Syndicale de l'Automobile, has just made a report to the Technical Committee of the French Parliamentary Commission regarding

automobile speed regulations. The Marquis says "to limit speed" limits existence through limiting activity, which in itself is the measure of vitality." In his conclusions he urges:—That the speed regulations in crowded districts be applied intelligently, with rigour in cases of accidents due to carelessness, and with tolerance in cases where no real danger exists; that all ideas of rules based on the mechanical (theoretical) force of motors be abandoned; that the types of automobiles be registered by the Service des Mines, as at present; and that there be established a permanent automobile committee, specially charged with adjusting the differences between the Service des Mines, whose functions will not be changed, and the constructors of motor-cars.

new 40-h.p. Bayard Racer, which made the best time in the Light Car Class at Gallon.

ON Friday last, Baras on a Darracq weighing only between 12 and 13 cwt. succeeded in establishing a new record for light cars over the flying kilometre. The trials were made on the road through the Forest de Senart, near Montgeron. Messrs. Tampier and Gaudichard, the official timekeepers to the A.C.F., held the watches; Baras made two attempts and succeeded in covering the distance in 29.25 sec., which is 1.25 sec. less than the previous best.

THE De Dietrich Company are apparently going in strongly for racing next season. As I recently reported, they have secured the services of Gabriel, who hitherto has driven Mors cars. I now learn that Kirchheim, who has for some time been connected with the Eisenach Fahrzeugfabrik, is joining the De Dietrich Company as from the 1st January next. Kirchheim has taken part in a number of motor races in Germany, and in the Paris-Vienna race last year he was the first German *chauffeur* to reach the Austrian capital.

THERE was a pleasant little gathering at the "Salons de Margeury," in Paris, on Saturday last, when a number of well-known French motorists gave a banquet to Madame Lockert in honour of her recent success in making the journey by road from the French to the Russian capital. Among those present were Messrs. A. Peugeot, Chenard, Tony Hubert, Longuemare, Lacoste, Dubrulle, Georges Prade, and Stern. M. Armand Peugeot proposed the health of the *vaillante chauffeuse*, who, in responding, gave a humorous account of her trip.

FOR the approaching visit of the English members of Parliament to France the full programme has now been prepared by M. d'Estournelles de Constant and the other members of the French International Arbitration Group. The visitors will reach Paris on Wednesday, the 25th inst., their stay lasting four days. An interesting item of the programme will be an automobile trip to Versailles on the 28th inst., after the party has been "received" at the A.C.F. As showing the number of French Parliamentarians who own motor-cars, it is interesting to chronicle that over a hundred automobiles will be placed at the disposal of the visitors.

THE French Automobile Club has just adopted a recommendation of the sporting committee with regard to the competition rules of the Club, which are to be altered to the effect that any manufacturer or agent of automobiles or pneumatic tyres, etc., who, subsequent to a race or competition of any sort, publishes announcements in connection with the results which are notoriously false, with the object of misleading the public, will be subjected to the clauses of the Club rules which disqualify from taking part in any events organised by the A.C.F.

THE "Velo," the enterprising Parisian daily, has undertaken the expense of tarring the surface of the Avenue de la Grande-Armée. As is well known, this is a leading artery of the French capital much used by motorists and cyclists, by whom the experiment will be watched with the keenest interest.

THE Parisian police are just now devoting considerable attention to those motorists who have occasion to cross the bridge at Suresnes. The other day no less than sixty were stopped and had their names taken, some for excessive speed, some for having no plates on their cars, and others for not having their *permis de conduire*.

M. PAUL MEYAN, of "La France Automobile," is just back from a visit to England, where he was much struck with the large number of motor-wagons he saw in use. "I met them," he says, "in London, I met them in Liverpool, and even on the roads near Chislehurst," and he urges that more attention should be given to this class of vehicle in France.

"LE MONDE SPORTIF" is pushing on with the arrangements for the two competitions it intends to hold before the Salon opens its doors. The first is Le Criterium de l'Electricité, and, as the title implies, it is a trial for electrical vehicles. The programme provides for four daily runs from the 26th to the

The Club House of the German Automobile Club.

29th inst. inclusive, the runs ranging from 90 to 132 kilometres. The second is the Criterium de Régularité, a competition based on the lines of the recent reliability trial of the A.C.G.B.I. The distance to be covered is 1,200 kilometres, spread over six days from the 30th inst. to December 6th.

THE ROUSSEL SPRING WHEEL.

A PROMINENT feature at the recent speed and hill-climbing competitions in France has been Count Cadignan's 12-h.p. Bardon car fitted with the Roussel spring wheels. Many attempts have been made at different times to devise a spring wheel which would give to the riders of the vehicle all the advantages in the way of smooth running and freedom from vibration of pneumatic tyres without their disadvantages in the way of punctures, need of inflation, etc. As the Roussel wheel is now being turned out on a commercial scale, it is fair to assume that it has got beyond the experimental stage, so that the following brief description of it will no doubt be read with interest by those motorists who have suffered from tyre troubles, and more especially from large tyre bills.

The rim, which it is said cannot be bent out of shape, is made from a block of steel, pierced when hot, and hammered out to the desired diameter. It is then trued up and turned to the requisite thickness on the lathe. The hub, turned up from a single piece of steel, is provided with a bronze bush, in order to reduce friction and to prevent the hub "seizing." The springs of which the wheel is built are made of a special quality of steel and vary

Fig. 1.—The Roussel Spring Wheel.

in size and thickness corresponding to the diameter of the wheel and to the load to be carried; they are made on templates, so that they are interchangeable. The springs take the form of broken rings, one end being bolted to the left hand flange of the hub and the other to the right hand flange, the central portion of the spring ring being attached to the wheel-rim by a bridge piece, the connection being such that lateral stability of the wheel is assured. In the case of the rear wheels of chain-driven cars, these are provided with a steel disc, to which the chain wheels and brake drums are attached. The wheels are shod with solid rubber tyres, these being used not with the object of reducing vibration or jolting, but merely to obtain a quieter-running car than is possible when steel tyres are used. A car fitted with the Roussel spring wheel successfully took part in the Paris-Madrid tour, and more recently in the starting and stopping race at Deauville.

At Petworth (Sussex) petrol can be obtained from Messrs. Rapley Bros., of Heath End.

THE Cardiff Motor Garage, Limited, has been registered with a capital of £3,000, and offices at 51, Queen Street, Cardiff.

THE Grappler Pneumatic Motor Tyre Syndicate, Limited, has been registered with a capital of £5,000 to carry into effect an agreement between the New Grappler Pneumatic Tyre Company, Limited, and Mr. Robert Gardner, as liquidator thereof, of the one part, and the Grappler Motor Tyre Syndicate, Limited, of the other part. The only director of the company is Mr. T. P. R. Bradshaw, of 30, Bachelor's Walk, Dublin.

THE QUESTION OF POWER IN THE PETROL MOTOR.

THE question frequently arises "why do internal combustion engines of the same dimensions differ so much in power?"

Too often it is answered by the statement that it all depends upon the mixture of petrol vapour and air. In truth, however, a good mixture is by no means the only requirement, and too much stress is laid upon this feature, so much so, in fact, that other equally important matters are overlooked. In order to secure the best power from a petrol motor one must begin at the bottom, or, in other words, with the design itself. If the engine is to be of a certain horse power, the speed at which the motor is to run and the number of cylinders must be decided upon in order to determine the bore of the cylinder and the stroke of the piston. In deciding upon the number of cylinders, particularly for an automobile engine, the designer should consider the space at his disposal in the car and the cost of construction. If the engine is to be a vertical one, the number of cylinders is determined principally by the vertical height; that is, the height from the centre of the crankshaft to the top of the cylinder head, and if this is limited, the number of cylinders must be increased in direct proportion to the power of the engine. If expense of construction is the principal consideration, it should be remembered that increasing the number of cylinders increases the number of parts to be machined, and hence the cost. However, a two-cylinder engine will run much more smoothly than one with a single cylinder, and a three or a four cylinder engine will give a steadier power than one with two cylinders.

One of the mistakes most frequently made by designers is the assumption that an engine of a certain bore and stroke will give a certain power, and no consideration is given to the speed at which the engine will run. Another erroneous assumption is that a motor of a certain bore and stroke requires a certain sized inlet and exhaust pipe, and that the question of speed does not enter into these proportions. This is the principal reason why so many petrol motors fall short of the power that should be obtained from them at the speed at which they are to be run. The question of the proper compression for a petrol engine is also one that is not thoroughly understood by designers, and here again the matter of speed is too often left out entirely. Mr. E. W. Roberts, writing in the "Cycle and Automobile Trade Journal," states that his experience is that very few designers are aware that the speed of the engine has anything at all to do with the determination of the compression pressure.

The question of engine proportions can be no better illustrated, perhaps, than by the formulæ which Mr. Roberts uses for his own designs. For the inlet valves and passages he has obtained very satisfactory results by limiting the speed of the ingoing gases to 100 feet per second. For the exhaust passages, calculating their areas upon the assumption that the gases are driven through the passages at atmospheric pressure solely by the motion of the piston, very good results may be obtained by basing the formula upon a speed of 85 feet per second. Hence, if the piston is moving at 600 feet per minute, the area of the inlet valve and the inlet passages should be one-tenth of the area of the cylinder. Should the speed of the piston be doubled, however, the area of the inlet valve and the passages should be two-tenths of the area of the cylinder. Similarly, the areas of the exhaust passages should be 12-100 of the area of the cylinder at a piston speed of 600 feet per minute, and 24-100 of the cylinder area at 1,200 feet per minute. The reader should note carefully that areas and not diameters are here considered.

Take for example a 5 by 6-inch engine running at 600 r. p. m., or at a piston speed of 600 feet per minute. The area of the cylinder is practically 19.6 sq. in. The area of the inlet passages should be 1.96 sq. in. and that of the exhaust passages 2.35 sq. in., or approximately 1½-inch and 1¼-inch diameter respectively. Doubling the speed of the engine or running it at 1,200 r. p. m. would double the size of the passages, the required

areas being 3.92 sq. in. for the inlet and 4.47 sq. in. for the exhaust, or approximately $2\frac{1}{2}$ -inch and 2 $\frac{7}{16}$ -inch diameter, choosing the next largest diameter that will not give too minute a fraction. These formulæ may seem to the automobile engine designer to give abnormal results. They are, however, founded upon some of the best stationary practice both in Europe and America, and have been found to give excellent results in automobile engines.

Particular attention should be given to the form of the inlet passages, and where sharp bends are unavoidable an increase of area will be found helpful. Care should be taken that the passages are not choked in any way except by the throttle or in the carburettor, where it is necessary to reduce them in order to atomise the petrol. Similar precautions should be taken with the exhaust passages, and the silencer should be designed that it will give ample egress for the gases so as to give as little back pressure as possible. The principal features in the silencer design are to allow the gases to expand before reaching the atmosphere, and to divide the exhaust into a great number of small streams. A silencer should have an expansion chamber equal to $4\frac{1}{2}$ times the piston displacement, which, resolved into a convenient formula, would give the volume of the silencer equal to 3.5 times the diameter squared, multiplied by the length of stroke.

If wire gauze or perforated metal screens are placed in the

results, maximum pressure should be reached just as the piston starts on the expansion stroke. Therefore, to get full inflammation, the igniting point should be further from the end of the compression stroke as the speed of the engine increases.

Since the lead of the ignition should be increased with the increase of speed, it follows that the compression may safely be increased with the increase of engine speed. Since an engine gives more power for the same dimensions with the increased compression, it follows that to get the best results a high speed engine should have more compression than one operating at a low speed. Engines controlled by throttling the charge may be safely given a compression suitable for their highest speed under working conditions, since throttling the charge reduces the compression pressure by lessening the volume of gas that enters the cylinder. A pressure of seventy-five pounds per square inch may be safely reached before ignition takes place, and such an assumption may be used as a basis for calculating the compression pressure as related to the speed of the engine and the corresponding lead of the ignition.

The advantage of high speed is that with the same mean effective pressure in the cylinders the power increases directly in proportion to the speed, and therefore an engine running at 1,200 revolutions should give double the power of an engine

Fig. 2.—A 12-h.p. Bardon Car, fitted with Roussel Spring Wheels. (See page 726).

inlet passages for any purposes, the surface of the screen should be large enough to give the sum of the areas of the openings equal to from one and a half to two and a half times the area of the main passage. The finer the screen the greater should be this ratio. This is because the column of gas passing through an opening is subject to friction, which increases as the area decreases. Valves that are operated by the vacuum produced during the suction stroke should be as light as is conducive to good working, and their springs should be no stronger than is necessary to return them to their seats at the end of the suction stroke when the engine is working at its maximum speed. The designer should note carefully that the higher the speed of the engine the stronger must be the spring in order to bring the valve to its seat before the beginning of the compression stroke or immediately thereafter.

It is generally known that advancing the lead of the ignition device gives better results than working the engine at a constant lead. This is because, under the same conditions of compression and mixture, the time from the moment the spark occurs until the flame has reached every portion of the mixture and maximum pressure is attained is the same, no matter what the speed of the engine. It is generally considered that, to get the best

running at 600 revolutions. With an engine carefully proportioned for the higher speed this result will be generally approximated in practice, hence it is possible by using a higher speed to get a great deal of power in a small space. The disadvantages of high speed are that considerably more friction results, and hence more heat is generated at all the bearings. There is also a greater strain upon the moving parts, particularly the connecting-rod and the bearings at its ends.

Both the connecting rod and the crank shafts of an engine should be made considerably stronger for a high speed than for a moderate one, and greater precautions should be taken to prevent the bearings from getting loose. A high speed engine should be more carefully balanced than one running at low speed, and in multiple-cylinder engines care should be taken that the pistons and the connecting rod are very closely of the same weight throughout. The connecting rods should also be swung as pendulums on a knife edge, the bearing point of which should correspond with the position of the axis of the piston pin, and they should be timed so that they give very closely the same number of swings per minute. In assembling a number of engines it is quite easy to find connecting rods and pistons that will pair off in this way.

MOTOR-CYCLING NEWS.

THE 1,000 kilometre reliability trial for motor-cycles organised by the Moto-cycle Club de France was concluded on Sunday last. The trial consisted of six daily runs from Paris, each day's run being different, the distance varying from 70 to 120 miles. Thirty-six machines were entered and thirty-five started for the first day's run. The competing machines were divided into two classes according to cylindrical capacity---(1) a quarter of a litre; (2) one-third of a litre. On the first day twenty-six completed the run inside the official time, the withdrawals being chiefly due to ignition troubles. On the second day twenty-six started and twenty finished. On the third day, out of nineteen starters only one failed to get back within schedule limit. On the fourth day eighteen started and seventeen finished within schedule limit, while on the fifth day sixteen out of seventeen made the trip successfully. The final day's run was to Corbeil and back, fourteen riders finishing out of the sixteen who started. The successful competitors were Tarian (Bonnet machine), Holley (Bruneau), Firmin (Chantemede), Soupé (Chantemede), Kuhling (Gobron-Minerva), Castagnié (Knap), Canem (Lamaudiere), Coudert (Lurquin and Coudert), Mauxion (Mauxion), Cuillery (Motosacoche), Dussot (Paillard), Dufaux (Motosacoche), Schweitzer (Pecourt), and Bonnard (Werner). Monday was devoted to a critical examina-

The French Motor-Cycle Trials.—The Two Georgia Knap Machines.

tion of the machines and their engines by the judges, whose report is expected to be issued in a few days.

MINERVA MOTORS, LIMITED, have issued a well-got-up handbook dealing fully with the 1904 models of the Minerva cycle engines. Clear illustrations are given of these, as also of the improved carburettor, silencer, and other details, these being supplemented by a large amount of information which will be found useful by riders of machines fitted with Minerva motors.

HEREWITH we illustrate the new combination motor-bicycle and fore-carriage made by the Lion Cycle Company, of Lowestoft. The motor-cycle is of the firm's standard type, and is fitted with a 2½ h.p. engine. The fore-carriage is made of wood and upholstered, it is supported on C springs, the spindles for the wheels are brazed in, while the lugs which receive the springs are brazed to the axles, no clips being employed in attaching the fore-carriage to the bicycle. An interesting feature of the machine is the provision for carrying a child of from three to six years of age, thus rendering it quite "a family affair." It will be seen that a detachable frame made of tubing is attached to the front of the fore-carriage; this is fitted with a saddle on which the child sits without inconveniencing the front passenger, while the small hand wheel serves to hold the child in

position, and at the same time affords amusement by causing him to think he is steering. In sending us the photograph, the Lion Company write: "At first we had our engine geared five to one, but while we found this would do very well for level roads, when we came to the slightest hill or head wind the engine required assistance. We then altered the gear to 7½ to 1, and although this would not do for racing, we can average

fifteen miles an hour. The engine does not overheat, and we believe 8 to 1 for a machine with fore-carriage a splendid gear for winter work with heavy roads."

A NOVEL system of assisting the cooling of air-cooled petrol motors has lately been introduced by the Steel Ball Company, of Chicago, who utilise the exhaust for this purpose. The arrangement, which is illustrated herewith, comprises a coil of pipe connected into the exhaust system with small holes at frequent intervals along the inner side of the coil. This coil surrounds the cylinder, and the exhaust in passing through the coil forces jets of burned gases out through the small holes and

against the cylinder, the velocity of this circulation being sufficient, it is claimed, to set up an appreciable cooling effect. The system has been used for some time in connection with a fixed air cooled engine in the Steel Ball Company's works, and it is said that, though the engine has never been subjected to any exterior draft, there has never been any trouble experienced in keeping it cool during hours of steady running.

HERE AND THERE.

THE latest production of the Wilkinson Tyre and Tread Company, Limited, is the Wilkinson upper-cover, both plain and non-skidding, which can be fixed on the outer cover by the motorist himself. It is held to the outer cover by the inflation of the latter, and is kept in position by special upper rims. By the use of these upper covers and rims it is claimed to be impossible for the outer covers to be blown off the rims or for them to burst at the sides, whilst the treads make the outer

covers very secure against cuts and punctures. The Wilkinson Company are also making, in addition to their non-skidding tread, which is vulcanised to the outer cover, and of which we give an illustration herewith, a motor tyre embodying the features which enter into the construction of the Wilkinson tyre covers and treads.

THE Poole and Sandbanks Motor Car Company, Limited, has been registered with a capital of £2,000.

MR. E. T. BIRDSALL, the manager of the Standard Automobile Company of the United States, is coming to Europe on a business trip.

MESSRS. MERRYWEATHER AND SONS, LIMITED, are building a motor tender and hose cart for the fire brigade of Port Louis, Mauritius.

At the annual meeting of the Hozier Engineering Company a dividend of 10 per cent. was declared, and it was reported that contracts for the 1904 pattern Argyll had been booked amounting to upwards of 50,000l.

DURING the month of September the exports of automobiles and parts from the United States attained a value of £28,703, and during the nine months ending September of £238,565. The corresponding figures for 1902 were £12,369 and £169,597.

At the statutory general meeting of Westrumite Limited, Mr. T. T. Cowell, the chairman, said that the company is contenting itself with the role of licensors, granting the right to manufacture to sub-companies, specially formed for the purpose.

BARON DE CATERS on his 90-h.p. Mors car has just established a new Italian flying kilometre record, covering the distance on the road between Empoli and Ponte la Motta in 28.25 secs. He was timed by the official timekeepers of the Italian Automobile Club.

IN view of the early operation of the Motor Car Act, the Star Motor Agency, Ltd., of 16, Upper St. Martin's Lane, W.C., have brought out a small pocket edition of the law on the subject, conveniently arranged and bound in a neat leather cover. This little booklet they are supplying to motorists.

WERNER FRERES, LIMITED, is the title of a company registered with a capital of £120,000 to adopt an agreement

between Mr. J. Hendricks of the one part and Mr. J. Smith (for this company) of the other part, for the acquisition of the business carried on as Werner Freres in Paris, and at Levallois-Peret (Seine), France.

THE Lancashire Steam Motor Company, Limited, have recently completed no less than eight steam wagons to the order of Messrs. Edmund Nuttall and Company, of Capetown, for Government contract haulage work. The vehicles, one of which is shown in the illustration on page 720, are of the company's standard 4-ton Colonial type. We may add that in addition to steam wagons the Lancashire Company are constructing vehicles fitted with internal combustion engines for municipal freight, and passenger service. Two standard patterns are being made—one a two-cylinder 15-h.p. and the other a four-cylinder 30-h.p.

THE accompanying illustration depicts a new apparatus for use in connection with petrol motors which has been devised by Mr. J. Cooke, and which is being put on the market by Messrs. Cooke and Wade, of Cutlers' Hall, Sheffield. The device has a threefold object:—(1) As an air regulator. (2) As an economiser. (3) As a pneumatic brake when descending gradients. It consists of a valve fixed upon the end of the intake pipe, and connected with the induction valves. The valve box is cylindrical in form with an opening at one side, covered by a lid or covering of wire gauze, through which cold air is admitted to the valve and cylinders. In the valve box is a suitable rotary valve which (when open for the supply of mixture to the engine) closes the gauze covered air inlet, so shutting off the supply of cold air. The device is operated by a lever or arm keyed upon a spindle on the valve, the lever being actuated by the driver by a cord or levers from the dashboard or steering column. A slot or notch in the valve flange through which passes one end of a spring, regulates or determines the traverse of the valve, the spring returning the valve, upon its release, when it is desired to shut off the cold air. With the use of this device Mr. Cooke claims to be able to reduce the size of the water tank, as less water for cooling purposes is required, economise the fuel, improve the mixture, simplify the control of the car by dispensing with throttle valves, and allow the car to run silently on low speeds. Also when descending a gradient the gas may be shut off and the cooling device put in operation, so causing a current of cold air to pass through the induction valves, cylinders, and their connections, to the exhaust, thoroughly clearing same of all exhaust gases and leaving them

Fig. 1.

Fig. 2.

Fig. 3.

pure for the incoming charge, which allows the engine to pick up in a much better manner. Further, on large cars with four or more cylinder engines two or three of the cylinders can be run, when their power is not required, on cold air, thereby cooling and quietening the same to an appreciable extent. Referring to the illustration, Fig. 1 shows the barrel sections with gas and air inlets; Fig. 2 the rotary valve with slot cut out, giving a range either of gas or air from zero to maximum, and Fig. 3 the apparatus fitted to the end of the intake pipe close to the cylinder head.

THE Earl of Guildford has become a convert to automobilism.

MR. T. C. CLARKSON has promised to read a paper on steam motor-vehicles at the Society of Arts at a date yet to be fixed.

THE Booth Motor Syndicate, Limited, has been registered, with Messrs. F. Hulbert and S. Bramley-Moore as the first directors.

MR. STANLEY B. CORRY is about to open a motor-car depot at 8, Donegall Passage, Belfast. Mr. Corry has been appointed agent for the Cottereau car.

FOR not stopping his motor-car when requested to do so by the driver of a restive horse, Arthur Caddy, of Kirriemuir, has been fined £4 at Forfar, N.B.

THE Cross Keys Bridge, at Sutton, which carries the main road connecting Lincolnshire and Norfolk over the river Nene, has just been declared free from tolls.

THE engineering section of the Manchester Chamber of Commerce is considering what support it can give to the delivery van trials to be organised next year by the A.C.G.B.I.

THE Launch Motor Company, Limited, has been registered with a capital of £3,000 and offices at the Devonshire Boat House, Chiswick.

MR. H. C. REYNOLDS, Norbury, has sued the Firefly Motor and Engineering Company for damages for injury to a cab caused by defendant's motor-car. The Recorder of London found in favour of the plaintiff, and awarded him £10 17s. 3d.

THE rules for dealing with petroleum spirit in India, which were made at a time when motor-cars were not considered or even thought of, are now undergoing revision. From Messrs. Turner, Hoare and Company, of Bombay, we learn that the Government of India have expressed their intention of modifying the rules, so that ordinary facilities can be given for the transport and storage of the spirit for use in motor-cars.

THE accompanying illustration represents a plan view of the chassis of the 6-h.p. Swift car, one of which took part in the recent Reliability Trials. The feature of the vehicle is the ingenious arrangement of the change speed gear, which gives two speeds ahead and one reverse, within the case which surrounds the bevel gear on the rear live axle. In the recent trials the

Plan of Chassis of "Swift" 6-h.p. Car.

WITH registered offices at 3, Sidney Street, Brighton, the Sussex Cycle and Motor Company, Limited, has been registered with a capital of £1,000. Mr. F. C. Lusher is governing director.

THE Securitas Motor Tyre Company, Limited, has been registered with a capital of £50,000 to acquire from Mr. A. Tobler and Mr. H. Samuel the benefit of some inventions with regard to tyres.

MOTORISTS visiting the north will be pleased to know that Messrs. Frank Little and Company have opened showrooms in High Bridge, off Grey Street, Newcastle-on Tyne, where they will undertake repairs, and supply oil, petrol, or accessories.

FROM the Ordnance Survey Office we have received a copy of their map of the Woking district, drawn on a scale of two miles to the inch. The features of this series are already well-known to motorists, and the present map is no exception to their excellence.

AT the South-Western Police Court, an application made by Mr. Moffat Ford, for ten summonses against the London County Council for driving their tramcars along South Side, Clapham Common, at a speed in excess of the legal limit, has been granted

car came through very creditably, making five non-stop runs out of a possible eight. Two stops were occasioned by punctures, the only stop resulting from mechanical troubles being that in which it was necessary to change an inlet valve. In the hill climbs the full load of passengers was carried, whilst in the Bexhill Speed Trials a speed of twenty-two miles per hour was attained.

A FURTHER accident took place during the track racing meeting at Brighton Beach, near New York, on the 31st ult., when the Gray Wolf of the Packard Company, illustrated in a recent issue, came to an untimely end. The accident occurred in a race in which, in addition to the Gray Wolf, a 30-h.p. Renault and a 40-h.p. Darracq took part. The Packard Co.'s car was being driven by the ex-racing cyclist, Champion. As he was rounding the turn into the home stretch, at about the roughest part of the course, he ran into a deep rut. In wrenching the steering wheel to extricate himself the steering knuckle broke and the machine dashed into the inner fence, carried away through posts, and hurled the driver forward. Champion sustained a compound fracture of the thigh, being thrown against the steering wheel. After lying unconscious for some time the injured man was taken to the hospital, where he now lies.

THE NEW PALMER "CORD" TYRE.

THE Palmer Tyre, Limited, have just brought out a motor pneumatic tyre, in the construction of which quite a new departure has been made. For reasons connected with the foreign patents full details are not yet available, but it may be stated that the tyre will be constructed of a patent "airless" rubber and thread cord, and that no canvas will be employed either on the tread or the side walls of the outer cover. Experiments have been in progress for some years at the India Rubber Works, Silvertown, where the Palmer tyres are made, as a result of which it was early found that tyres made with strong approximately straight threads or cords proved greatly superior in every respect to tyres made with woven canvas linings, but the difficulties connected with the manufacture of such cord tyres in commercial quantities appeared to be insurmountable. As a result of persistent experiments, however, a plant is now in operation at the Silvertown Works producing tyres differing from anything of the kind hitherto made.

In the earlier experiments in building up tyres with cords, it was found that when the round cords were placed close together at the bead or anchorage, considerable spaces were left between the cords on the tread or larger circumference of the tyre, and it was necessary to fill each of these spaces with a shaped piece of rubber when building up the tyre. This difficulty is overcome in the new tyre in a very novel manner. Instead of employing the cords in their natural round shape they are flattened to an oblong or oval form. At the anchorage or smaller circumference of the tyre the cords are arranged with their wider surfaces together, and as they approach the tread or larger circumference, each cord is given a quarter turn so that the narrow surfaces or edges are together as shown in Fig. 1. By this simple means a uniform fabric is made without filling pieces. Furthermore, it is claimed that the tyre is easier to build and that it is fully 50 per cent. stronger than if the cords were employed in their round condition; that is to say, about 50 per cent. more of the flattened cords can be built into each layer than would be the case if round cords only were employed. Each cord is entirely insulated throughout, each separate strand being coated with pure rubber gum before being built into the cord proper. All motorists know by experience there is sometimes a vast difference in the life of canvas-lined tyres supplied by the same firm. This is easily explained. The most experienced tyre builder cannot possibly arrange that the threads warp and welt in the different layers of canvas shall be of equal tension

Fig. 1.—Showing Method of Building Tyre with Flattened Cord.

everywhere. He may by chance make a tyre in which the slack and taut threads are fairly well distributed, and which will probably last a considerable time, and the same tyre builder may, whilst using equal care, make a tyre in which the tensions are concentrated at one or more places, and which would probably soon give out. When a canvas-lined tyre is flattened by contact

with the road the alteration of shape at the side walls changes the disposition of the canvas in such a manner that the major portion of the strains is thrown on the outside layer, while the other layers become slack in various degrees, just at the time when they are most required to transmit the motive power to the road. For the purpose of comparison it may be assumed that a tyre having five layers of canvas contains ten layers of wavy threads, that is to say, five running in each direction. In the new Palmer tyre only two layers are employed, one in each

Fig. 2.—The Two Layers of Cord Fabric.

direction, as shown in Fig. 2. The shape of the side walls will naturally be altered by the tread making contact with the road, but the strength of the cord fabric is not reduced. By reason of the uniformity of the tension in the new tyre there are no idle threads; it is therefore claimed to be possible to make the tyres very much thinner in the fabric than a canvas lined tyre and yet very much stronger. In order, however, to ensure a great reserve of strength the new cord fabric is made much stouter than is absolutely necessary.

A FRENCH motorist complains that in several localities in France he has been the victim of unscrupulous dealers who sold him cans of water instead of petrol.

PRINCE ALBERT of Belgium recently paid a visit of inspection to the motor-car works of the Germain Company, and has placed an order for a 35-h.p. car with this concern.

ON May 1st last, between 9 a.m. and 9 p.m., 16,576 vehicles are said to have passed along Piccadilly, 17,768 along Regent Street and 12,581 along the Strand—a moderate insight into the extent of London's traffic.

At Camberley three cases of automobiles being driven on the footpath have resulted in fines being imposed in each instance. Several similar summonses have had a like result at the Newbury County Petty Sessions.

MR. ROBERT TODD presided at the dinner of the Stanley Club in celebration of the opening of their show at the Agricultural Hall, London. About three hundred guests were present, including many well-known motorists.

THE Cambridge University Automobile Club is proving an active organisation. The other day it organised a hill-climbing competition at Offley Hill, near Hitchin, when, of eight competing cars, two—a 20-h.p. M.M.C. and a 12-h.p. Lucas—tied for first place.

THE Motor Traction Company, Limited, have lately brought out a new form of silencer known as the "Stanley." The chief object is to provide a silencer through which the exhaust gases will be discharged freely at a steady and practically uniform pressure and without the usual explosion sounds. One or more tubes or pipes are employed, through which the exhaust gases are caused to pass in a circuitous manner, being at the same time broken up into small streams by striking or impinging against studs or projections in the tubes, the gases being at the same time cooled, so that when finally reaching the atmosphere they are practically at normal or atmospheric level. The studs are arranged along the tube in the form of a spiral of an appropriate pitch, and pass diametrically across the tube with a convenient distance between them. The gases are caused to pass from the exhaust pipe of the engine into one or more pipes having studs as above described, and are afterwards delivered into an expansive chamber, from which they pass into one or more studded tubes before escaping to the atmosphere.

CORRESPONDENCE.

THE WINTER USE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with a great deal of interest your little chapter bearing the above title, and feel sure that it has been instructive to many of your readers. The crucial point, however, for all motorists who cannot manage to keep their cars warm at nights is the question of the water circulation. I have tried glycerine diluted with water. You want a 20 per cent. mixture at least; water with a dash of glycerine is no protection whatever, and my experience is that within two or three weeks every rubber joint, which previously held water all right, begins to leak. As regards calcium chloride (not chlorinated lime, as our friend wishes to intimate was supplied by some poor chemist), which is a neutral salt, and is met with commercially in the anhydrous or dried form, containing no water of crystallisation whatever, it is in porous friable masses, similar in appearance to white pumice stone, and has to be kept in airtight jars to prevent absorption of moisture from the atmosphere, and consequent deliquescence. Now, I have not found it altogether a success. Under the influence of the heat in the cylinder jacket there is a tendency to dissociation, a slight precipitate of a basic calcium carbonate which is deposited as a sort of rusty furring; also, at the same time, a consequent liberation of hydrochloric acid, which cannot be good for the "innards" of motors. Why will not brine made with common salt do just as well? It is used for just the opposite purpose, viz., in the coils of freezing machinery. It is a fact well known to chemists, that strong or saturated solutions of almost all salts will not freeze, except the temperature be reduced a long way below 32 deg. Fahr.; but, at the same time, such solutions will not part with the heat absorbed nearly so rapidly as pure water, hence many will find that, although the atmosphere is cold, their radiators do not act so well.—Yours truly,

CHEMIST.

PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to your correspondent's ("B. J. W.'s") inquiries, our standard petrol of 700 specific gravity may be kept for any length of time without the slightest deterioration in quality, provided it is stored in strong cans, like those we usually send it out in, and these cans are properly closed. That this is a fact we have often been told by customers who have put aside cans of petrol for many months, and then, much to their surprise, have obtained quite as satisfactory results as from petrol recently distilled. We have confirmed this by many laboratory experiments, which have conclusively proved that under the conditions named petrol does not alter in composition nor deteriorate in quality. Petrol may also be kept without deterioration in the tank of a car, but it is necessary to make sure that the tank is quite air-tight. If, for instance, the screw plug which closes the filling hole is not air-tight the lighter portion of the petrol will evaporate, and the petrol will then become what may be described as "stale" petrol.

In the case of our standard petrol, even if it has been exposed to the air and so become heavier, owing to the evaporation of the lighter portions, it will give better results than a less homogeneous spirit even of the same specific gravity. The efficiency of a motor spirit depends more on the way it has been distilled than on its specific gravity.

It is difficult to answer the question as to the relative efficiency of "stale" petrol and standard petrol, because this must naturally depend upon the extent to which the "stale" petrol has deteriorated owing to exposure to air. On the other hand, old petrol, if properly stored, is quite as good as new.—Yours truly,

CARLESS, CAPEL AND LEONARD.

THE TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—All practical motorists who are not millionaires must endorse a great many of the remarks made by "A Mechanical Engineer" in his interesting letter appearing in your issue of the 14th inst. I believe that many of the leading motor-car manufacturers recognise that the short-lived, extravagant, and treacherous pneumatic tyre is seriously checking the development of mechanical traction, which, until this tyre problem is solved, will be unable to evolve itself from the stage of what another of your correspondents terms "mechanical toys." What is required is a resilient, non-puncturable, long-lived tyre, and this will doubtless sooner or later arrive.

In the meanwhile I presume we motorists with modest purses will have to put up with the equally unsatisfactory but more reliable solid tyres on our rear wheels. But I think your inexperienced readers ought to be warned as to the extreme danger of using solid tyres on the front wheels of a high speed car, however delicate the carriage springs may be. The perpetual vibration is certain, sooner or later, to affect the metal of that part of the steering gear which lies under the carriage springs, and probably end in a disastrous accident.

I myself have had actual experience of an accident of this kind, which fortunately took place as we were slowing up to pass a restive horse. Had the accident occurred five minutes earlier it would certainly

have resulted in the maiming, if not instantaneous death, of all those on the car.—Yours truly,

A PRACTICAL MOTORIST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On page 704 of the last number of your *Journal* I noticed a paragraph re iron tyres. This suggestion comes from America, but it could just as well be suggested here in England as far as the troubles of tyres coming off rims and becoming dangerous is concerned.

I would like to point out that such iron tyres as are suggested are impossible for motor-cars of high speeds. In the first place, as we know iron-tired wheels now, the engines could not stand them, and, secondly, no one would have them. And it might be said that any advantages found in such a tyre are wholly offset by the fact that the life of the wheel would be seriously limited. The fact of the contention is, the trouble found in the unmechanically-attached pneumatic tyre which has been forced on us. Such suggestions would not be made if these people stopped to think that there are tyres on the market that cannot come off their rims. There is a tyre being put on the market, the Nadall, of which little at present is known in the United States, that is proof against this fault. Also it is a mechanically-attached tyre.

Also there are one or two other good tyres that are not of the principle whereby the air within the tube is depended on to secure the cover to the rim, and, it might be added, to some day cause the breaking of the motorist's neck. A perfected non-skidder, and a mechanically-attached pneumatic tyre that will not come off, to be sold at a fair price, is all that is required. Yours truly,

H. BARRINGTON OLDS.

THE PROPOSED FEDERATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We duly received the Nottingham Club's letter as published in your last issue, to which we replied as follows:—

"We have read your letter of the 6th inst., and have come to the conclusion that it calls for no detailed reply direct. It is not criticism you present, but irrelevant abuse."

Taking the letter verbatim, they open by dilating on the amount of the affiliation fee, and quote a sentence from the letter we sent round to the provincial clubs at the commencement of the movement now on foot. They are careful, however, to rob the sentence of its context. We have said that the financial aspect is not one to be seriously considered, provided that corresponding advantages are obtained for the sum demanded. The cost of federating will depend entirely on what the members of the Federation want. The point is, that the Federation will be a perfectly independent and representative body, and as such can have anything it likes, and do anything it likes, provided that it is prepared to pay for it.

The Nottingham Club states that such a scheme as we propose "will require both brains and money," but I go further than that and say that it will not only require these necessities but will have to use them, which is a totally different matter. The Nottingham Club says it early recognised the splendid work done by the A.C.G.B.I. (and who did not?). It gladly welcomed the chance of becoming affiliated after it had arranged favourable terms for itself, by which its fifty odd members were affiliated on payment of an acknowledgment fee of £10. It appears that this lack of large-heartedness on the part of most of the provincial automobile clubs is what the Nottingham Club so sorely deprecates. It also states that it has a voice on the Executive Committee of the A.C.G.B.I. If this is the case, it will readily be seen that preferential treatment has been meted out to this club, and, therefore, it is not in sympathy with the clubs to whom this treatment has not been extended.

With regard to the term "provincial automobilism," to which it takes exception, what else can this mean but "the use of the motor-car by members of provincial automobile clubs, and others, who are not members of the A.C.G.B.I."? It is these users of motor-vehicles that the Federation would embrace and cement into a body which would have a far more reaching influence, both in the provinces and in Parliament, than any existing organisation of automobilists.

The Nottingham Club says:—"We have in the parent club an organisation capable of enormous good; etc." No one, to my knowledge, has ever disputed its capabilities. It is not a question of capability; for instance, the Nottingham Club has not grasped the meaning of "Federation," but I do not suggest that it is incapable of grasping it.

In conclusion, I can say that fifteen provincial automobile clubs have already definitely decided to take part in the formation of an Automobile Federation, and that a conference to discuss same will be held in London early in December.—Yours truly,

ALBERT E. NEWTON,
Hon. Sec. Reading Automobile Club.TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue there is a letter of self-adulation from the Notts Automobile Club, in which appear some impertinent and altogether uncalled for remarks concerning the Lincolnshire Automobile Club. As a member of the latter club's committee, will you allow me to suggest to the Notts Club that they should give their opinion on the

Federation question without seeking to disparage any other club, whose members may conceivably possess as many brains as themselves.

The Notts. Club take unto themselves great virtue for the support they have so unanimously given to the parent club by paying the affiliation fee, but doubtless they have forgotten the excessive amount they drew back last year for payment of fines and legal costs, whereas the poor abused Lincolnshire Club, with a larger membership, required and received nothing.

Truly the Notts. Club may say "we are keen as decency will allow in getting full value for money and in making arrangements which will be most beneficial to ourselves."

The Lincs. Club will shortly give its decision on the affiliation question, and in the event of its members deciding to affiliate I am sure the last thing they will look for from the parent club will be the payment of expenses incurred through careless or incompetent driving.

In conclusion, I think I can speak for the Lincs. Club when I say we have an idea that by behaving as gentlemen on the roads, by showing every consideration to other users of the roads, by using conciliation whenever possible, we can do as much to advance the best interests of automobilism as our Nottingham neighbours, whose superior acquaintance with the police courts requires such substantial support from the parent club.—Yours truly,

W. R. PENNELL.

OVERHEATING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Opossum's" letter with regard to overheating, in your last issue, it is just possible that after the pipe to the cylinder has been released to see that the water is circulating properly, the cylinder becomes either air or steam bound. In the latest types of cars this cannot happen, inasmuch as the water circulates directly from the top of the cylinder into the top of the water tank. In the older patterns, the water pipe was conveyed from the top of the cylinder to the bottom of the radiator. In this case a lock was caused in the circulation by either air or steam in the pipe between the cylinder and the radiator. The water can be put into circulation again by releasing the union nut at the top of the cylinder, and allowing any air or steam there may be in the pipe to escape. The springs of the valves may also require renewing. I myself have not experienced any trouble in regard to the furring of the cylinder jacket, and think some other cause for the heating should be looked for.—Yours truly,

MAGNETICUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—It is difficult to diagnose "Opossum's" complaint without seeing the patient, but it is most probable that something is still impeding the circulation. A washer in one of the water-joints may have swelled so as to choke the pipe; or it is possible that there may be a leak or porosity in the cylinder end or the plug closing it, allowing burnt gases to escape into the jacket; a very slight one might be enough to cause an air-lock. If fur is the cause, there can be no mistake about it, as it requires a quite perceptible amount to have any effect, and it seems very improbable that this is the case. Does the engine give its normal power prior to heating? If so, an undetected obstruction in the circulation is most probable. In any case, it would be wise to make sure that an over-rich mixture is not the cause.—Yours truly,

C. V. J.

MOTOR-CYCLE SIDE CAR EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter of Mr. J. Van Zwieten in your issue last week, I am strongly of the opinion that for a side-car or fore-carriage something more is necessary than the ordinary brakes. In the case of my own tricycle with fore-carriage, I have band brakes on the two wheels in front, a strong Bowden brake on the driving wheel, and I have also recently had a back-peddalling brake fitted. This last is a new invention, and has been brought out and patented by Mr. Cocks, of the firm of Wass and Cocks, Ealing Dean. It acts on the belt rim of the driving wheel; it is quite simple in construction, very reliable, and exceedingly powerful.

On dry roads it is most useful, both for checking speed down steep hills, and also as an emergency brake. It may be put out of action at pleasure. I feel sure that for his South African requirements Mr. Van Zwieten will find it a most useful addition to his equipment.—Yours truly,

(REV.) EDWIN NOYES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We were much interested in Mr. J. Van Zwieten's letter in the last issue of the *Journal* re "side-car" attachment. We would like to be allowed to point out to your correspondent that, recognising the difficulty in riding with a side-carriage unoccupied, and the peculiarity of the steering wheel in use (occupied or unoccupied) we have devised a simple method of steering, whereby the "side-car" wheel moves in unison with the front wheel of the motor-cycle, thus preventing the roll and drag upon the tyre inseparable with the ordinary model.—Yours truly,

MILLS AND FULFORD.

INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the recent inquiries ament the most suitable dimensions for an inspection pit, I would venture to suggest, in view of the increasing wheelbase of cars, that the length of the pit should be at least 7ft. It is with some vehicles not easy to get into a pit 6 ft. long when a car is standing over it. I think, too, the width might advantageously be made 2½ft. Steps at one or both ends of the pit will also be found useful not only in giving access thereto, but enabling the user to adjust himself, as it were, to any particular job.—Yours truly,

F. G. WILSON.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice on page 699 of the *Journal* that you report that at a meeting of the Settle Rural District Council it was decided *inter alia* that in passing through villages the speed of motor-cars should be limited to eight miles an hour.

Now, Sir, in deciding this, surely the District Council were acting *ultra vires*, as the new Act plainly says, in Sect. 9, ss. (1) (after setting the top limit at 20 miles an hour), "and, within any limit or place referred to in regulations made by the Local Government Board, with a view to the safety of the public on the application of the local authority of the area in which the limits or place are situate, a person shall not drive a motor-car at a speed exceeding ten miles an hour."

In face of this I fail to see how the Council can set a limit of eight miles an hour, as by this section a motorist is allowed to go ten miles an hour in the restricted parts.—Yours truly,

FAIR PLAY.

SILENCERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to J. E. A.'s enquiry in your last issue I think he will find the form of silencer shown in the accompanying sketch very effective. The exhaust gas passes in at A through the perforated plate B and out

through the small tubes C. The number of these tubes depends upon the size of the engine, but for one of 6-h.p. four tubes about 3-8 in. dia. would be sufficient, with small holes drilled as shown. The size of J. E. A.'s pre-ent silencer is sufficiently large in diameter for an engine of 12-h.p.—Yours truly,

NORWICH.

DIFFICULTY IN STARTING MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers kindly advise me in the following trouble? I have a 2-h.p. Beeston tricycle with electric ignition, wipe contact, trembler coil, and surface carburettor. I adjust air valve, etc., but have great trouble in starting the motor. When I get it into operation, however, it works all right. Not requiring it for three or four days, or perhaps a week, I have the same trouble to get it to start—for perhaps an hour or two. Would a spray carburettor or any other means make it more reliable? I keep the carburettor corked up during the time it is not wanted.—Yours truly,

ANXIOUS.

[The difficulty in starting engine may be due to several causes. In the first place, it is necessary to examine sparking plug, as this is likely to get a slight moisture on the porcelain after standing for some time unused, which will cause short circuit. The spring of inlet valve may be too strong, which would prevent getting full charge unless running at high speed. Failing these, a little petrol squirted into the cylinder through compression tap with a small oil can may be tried; this would enable engine to make several explosions and so warm the motor and petrol slightly, and in all probability overcome the difficulty experienced. A spray carburettor would undoubtedly give less trouble in starting.]

CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have considerable difficulty in having the batteries on my car recharged, as there is no electric supply company in the neighbourhood, and was therefore much interested in the account given by a corre-

spondent, in a recent issue of the *Journal*, of his experience of the Boron battery, and have been waiting for the further particulars which he was going to give when some photographs of the apparatus had been printed. Can you tell me if this battery is to be recommended for charging storage batteries for ignition purposes, and if it is reliable and simple in its work, and how many cells I should require to efficiently deal with a four-volt storage battery of the ordinary type?—Yours truly,

C. B. CAVE-BROWNE-CAVE.

A. AND CO., FEUERTHALEN, SWITZERLAND.—The makers of the Millenium motor-car lifting jacks and other similar implements are Messrs. Lake and Elliott, Braintree, Essex.

PARAFFIN CARBURETTOR.—A correspondent signing himself "Lotus" asks if any motorist who has tried the Trusty carburettor, said to work with either petrol or paraffin, will send particulars of the success he has achieved with the same.

MOTOR LAUNCHES.—We have an enquiry for the names of makers of motor-launches which can be worked with petroleum residuum instead of petroleum. Will makers of the same communicate with us?

PUNCTURE GUARD.—"G." writes: "Can any of your readers give reliable information, based upon actual experience, of Wheelodon's puncture guard for motor tyres? It is claimed for this guard that it stops punctures and skidding. If this is really true, and there are no disadvantages to its use, surely the guard ought to be widely known, as its price is so reasonable."

THE LIMITATION OF CYLINDER CAPACITY.*

By C. W. S. CRAWLEY.

THE Gordon Bennett Fortnight brought two things home to most of us—first, that "racer" racing would be seldom, if ever, practicable in the future except over a short special track; and, secondly, that, of all deadly dull things to watch, handicap racing for touring cars was only one degree better than that dismal amusement, racing singly against the clock.

Several people have vaguely suggested limiting the cylinder capacity, but vague generalities lead to nothing, and the best way to bring the matter to a head is, I think, to subject some definite scheme to a discussion. The actual figures I have taken are not suggested as being exact; they are round numbers, taken as near as may be for illustration. The final figures could only be settled by conference with the makers. The nominal *raison d'être* of racing—horse, cycle, or motor—is "the improvement of the breed."

The present racing conditions are "get as much horse-power into a ton as you like," and under them the Gordon Bennett and other races have been run and have thoroughly justified their existence. They have improved the breed magnificently. Engines, frames, gearing, wheels, tyres, in fact nearly every mechanical part of the car, could never have approached their present state of excellence by any other means.

Let us look at what we want to arrive at and try and frame some racing conditions which will give it us, and give us good sport at the same time; that is essential.

Weight.—Many of our present cars are too heavy; a "30 cwt." is more than most of us can afford tyres for. I would put an ideal heavy car at not more than "20 cwt."

Speed.—We can give our constants any value we like; but I would suggest that they should be taken to give somewhere about 30 miles per hour on the level; it is as high as we want for the road at the moment.

Power.—Fifteen h.p. should give us about this speed on the level, and yet get us up most reasonable hills on the third; but to limit horse-power would be an error. We should lose a means of improving the breed, so we must get there another way.

Cylinder capacity.—I have worked out the cylinder capacities of all the cars in the Reliability Trials from the data given in the programme and, though there are a few which differ widely, yet I think that we shall not be far wrong if we take it that 10 cubic inches represent about what is called a horse-power.

Now, by limiting cylinder capacity we not only have every maker trying to get more power out of his engine, but also improving his transmission gear, so as to get more of that power on to his wheels.

Body and Weight.—In a real car there is a considerable weight of body and passengers; in a racing machine there is a minimum of both. Given a "20 cwt." car in use on the road, the weights will be roughly, say:—

	Cwt.
Chassis, with every working part, including petrol and water for 150 miles	15
Body...	5
Tools, lamps, aprons, skid chains	1
Four passengers (including driver), wrapped up	7
Spare, including chain and two tyres and tubes	1

We are not definitely settling the figures, but let us say, for simplicity's sake, chassis 15 cwt., other weight 15 cwt., h.p. (at 10 cubic inches per h.p.) 15.

We shall then get a perfect handicap for all cars about "20 cwt." By handicap I do not mean that all cars of all makers will finish a 20-mile race under a handkerchief, but mean racing conditions such that,

whatever the make and weight of the cars, they can be raced under standard conditions, and the car best suited to our wants will win. Incidentally we get rid of bringing price into the handicap, which is to the good. The conditions are extremely simple. For every ten cubic inches of cylinder capacity, first, the chassis must weigh at least one cwt.; and secondly, a further weight must be carried of at least one cwt.

The result will be, I think, not to make the racing car resemble a touring car, but to make every touring car a racer which its owner can enter in any race and run on level terms against any other car. He will have to meet no cars in which use is sacrificed to speed, and if he is beaten badly it will be because his is the worse car, or himself the worse driver. If such were the conditions generally accepted for racing we should very shortly find all cars built to them, as they allow every latitude for making them comfortable, strong, and roomy, without in the least impairing their powers of winning.

I have spoken only of cars of close on 20 cwt., but we need not confine ourselves to these. A "15-cwt." car requires a little more power in proportion than a 20 cwt. one, and a 10 cwt. one a little more still; but this is easily allowed for in the conditions if we want to race all together in one class; and, by the way, there is nothing to prevent our present cars running, knowing the cylinder capacity and weight of chassis and body; it is merely a question of weight to be carried.

Now, let us look at the matter from the manufacturers' and purchasers' point of view. Besides making racing more useful in improving the points we want improved, it makes the winning of a race so much more an index of what the purchaser wants to know. He will order a duplicate of the car that won or was well placed in a race, and will know that it can do certain speeds and generally behave itself, whereas at present if he goes to a manufacturer whose car has just won a race, it is for a totally different machine. The maker has no doubt learnt a good deal by building the racer, but it means that the best brain power of his works have been devoted for months to quite a different problem to that of improving the car the user wants.

Now as to some objections. Limiting the cylinder capacity will tend towards faster running engines. This is bad. But I think we may prevent any ill effects by stipulating that on the fourth, when the wheels are revolving at forty miles per hour, the revolutions shall not exceed, say, 1,200. This gives us 900 revolutions at 40 miles, which is about present practice. It will tend towards higher compression. I don't know that this is very bad—at any rate, not worth legislating against. It will tend to all kinds of little dodges to get advantages on the part of manufacturers. So much the better. If they are improvements, it is what we are aiming at.

And now as to the greatest objection which will be raised—speed. There is undeniably a great pleasure in running at a higher speed than we are accustomed to, but that has nothing to do with the pleasure of racing, that is a separate sensation altogether. What makes sport is the fact of a good man, or a good horse, boat, or yacht, trying to beat another man on equal terms, and trusting to his own skill and nerve to do it. Mere speed has nothing to do with it, so long as you are squeezing the last ounce out of your car in a level race. It would certainly mean racing at a maximum of, say, thirty-five miles next year instead of eighty, but we should do it ourselves; and which is the better sport for those who love it for its own sake? Is it to watch other people's paid professionals ride a flat race for you to look at, or to ride your own horse in a hunt steeplechase, owners up?

CLUB NEWS.

YORKSHIRE.

THE fourth annual dinner of the Yorkshire Automobile Club will take place at the Great Northern Hotel, Leeds, on Friday, the 4th prox. Several prominent automobilists have been invited to be present, including Mr. Jenatzy, and there is every prospect of a very good muster. Intimations of probable attendance should be sent to the hon. treasurer.

SCOTTISH.

MR. J. M. ROSE will introduce a discussion on the Ideal Touring Car at a meeting of the Scottish Club (Western Section) at the Windsor Hotel, Glasgow, on Monday next, the 23rd inst.

WOLVERHAMPTON.

A PAPER Chase has been arranged by the Wolverhampton Club for to-day (Saturday). Messrs. W. Owen and Walter Evans will act as hares, and start from the Top Green, Tettenhal, at 2.30 prompt. Confetti will be thrown from their respective cars to mark the course traversed. Ten minutes later the remaining members of the club present will follow as hounds and endeavour to overtake their quarry before reaching the rendezvous, the Barley Mow, Newport, at 4.30, at which hotel tea will be provided at 5 o'clock.

MANCHESTER.

AN extraordinary general meeting was held at the Albion Hotel, Manchester, on the 10th inst., Mr. Frederic Smith in the chair, to consider the affiliation agreement presented by the A.C.G.B.I. The Chairman, in opening the meeting, reminded the members that at the last extraordinary general meeting of the members of the club the Committee were empowered to make the best terms possible with the London Club. Some correspondence had taken place with the London Club and an offer had

* From a Paper read at the Automobile Club on November 12th, 1903.

been made to fix a maximum contribution at £100, approximately equivalent to a payment on a membership of 200, any increase in membership not to be subject to a payment. This suggestion, however, was somewhat curtly declined. The Committee felt that it was a reasonable one and might fairly have been entertained by the central body. There has been a growing feeling on the part of members against affiliation, and especially in view of an agreement that has been recently sent setting forth the terms of the relationship. By this agreement the Manchester Club would be bound for at least fourteen months from this time, and possibly for two years. There is also an objectionable clause limiting freedom of action in automobile matters. The Committee, therefore, did not care to undertake the responsibility of signing it without having another meeting of the members of the club. A number of clubs had signed it, among which were the names of the best known; still there were a number which had refused to sign.

The Committee itself was divided on the subject, and for the resolution which Mr. Lee put before the meeting there were seven of the Committee for it, and four against it. The following resolution was then proposed by Mr. H. Lee, and seconded by Mr. L. Schwabe, "That the London Automobile Club be informed that we have decided not to sign the affiliation agreement, and consequently our connection with them ceases at the end of the year." Mr. Henriques and Mr. Bone supported the resolution. Mr. Seddon expressed his opinion that the club ought to remain affiliated with the central body. He was strongly in favour of having a club house in Manchester, where members could meet. Mr. Grace supported Mr. Lee's resolution and reminded Mr. Seddon of the efforts made to come to terms with the London Club, and intimated that not the slightest effort had been made to meet their wishes. He was of opinion that it would be found necessary ultimately to separate the social part of the London Club from its political and general organisation. Further discussion took place, during which Mr. Rowcliffe intimated that in his opinion the club would be bound for two years if the agreement was signed. He expressed also his surprise at the feeling which existed against affiliation. After some further discussion, which was joined in by Mr. A. Morris, Mr. Herbert Bright, Mr. O'Neill, and Mr. Whittaker, the resolution was put to the meeting and carried by a large majority.

THE MOTOR-CAR.*

By ALEC GOVAN.

ON many important points no reliable scientific data can be found, and it may be said that the modern motor-car is the result of experience and experiment. This would appear to be the way in which many of our large industries have been built up, and therefore it need not alarm us. For example, it can only be approximately ascertained by the amount of vibration and shock that is absorbed by the springs and pneumatic tyres. Further, the road surface continually varies, and it is sometimes necessary to run over very rough roads with holes in them quite 6 inches deep. To be strong enough to stand this, and also light enough to carry four or five people at an average speed of twenty miles per hour, is a marvel to many engineers. The secret is found in the weight per horse-power. Many pleasure cars are now built which only weigh 1 cwt. for every horse-power given off by the motor. As the power required to climb hills increases in a direct ratio to the weight of the car and load, an enormous advantage is gained by keeping the car light. Of course, the reliability must not be sacrificed, but special materials of the most suitable quality must be used; aluminium wherever possible, and steel of different mixture best suited for the various purposes. The speed at which the engine shaft is running when giving off full power practically determines the weight of the whole car. It is therefore of the greatest importance that every encouragement and assistance should be given to the development of the high-speed engine.

The weight of the car per horse-power determines its efficiency as a hill-climber, and it also determines the cost of running per mile for tyres. There can be no doubt that where the mechanism is properly looked after the tyre bill is one of the biggest items.

At present improvements would appear to lie along the line of acceleration of engine speed and reduction of weight. These two factors demand simplicity. Any of the known systems of two-cycle engines, with their complicated valve gear and compression devices require such heavy plant that there does not appear any hope for them ever being adopted in motor-cars.

More weight does not mean reliability, and it is certainly disastrous to efficiency. A combination of reliability and efficiency can only be found when every part is designed in the simplest possible manner and the metal distributed to the best possible advantage; also a careful selection of the most suitable material for the purpose must be made; further, the car must be considered as a whole in order to get a proper distribution of strain and vibration. On the top of all this a very high standard of workmanship is absolutely required. Engineers complain that motor-cars are too light; it is a very easy matter indeed to make the parts heavy. In doing this the efficiency is destroyed. All the experience of designers has been concentrated in an effort to obtain reliability without sacrificing efficiency.

The gearing of the car sometimes is objected to, but when it is remembered that four times the power is required to take a car up hills met with,

it would appear that the gearing is preferable to such an increase in the size of the engine.

The advertised horse-power of cars is at the present time no guide to the purchaser. While makers have arrived at this factor in different ways, still, if only the brake horse-power was given, it would not be a reliable guide, as the efficiency of transmission and the weight of the car would still require to be taken into account. Results in public tests are also to some extent misleading, as excellent cars sometimes perform badly through a minor temporary defect. This fact was clearly demonstrated in the Thousand Miles Reliability Trial recently held, where marks were lost for every minute occupied in cleaning or making adjustments to the car, with the result that many of the cars were not seen to the best advantage, especially in the speed and hill-climbing tests.

If a quarter of an hour is given to the car before starting in the morning, there is now very little fear of even a slight stoppage in a day's run. Of course, cars that ran through those public tests well deserve all the credit they get.

Through discussions in societies, such as yours, the science of the motor-car will be evolved and one day written. No industry has ever made such rapid strides. It is difficult to realise that it is only four to six years ago since the early types of the well-known cars were built in this country. At first the public sneered and showed no belief whatever in the movement. As cars became better, cries were heard that they should again be abolished, and to-day we hear very little sneering at breakdowns, and have the satisfaction of knowing that the majority of the public recognise the fact that the motor-car has come to stay. Credit for this is due, in the first place, to the men who have mastered the mechanical details and placed the motor-car as a useful vehicle practically beyond reproach, and in the second place, to the organisers in the Automobile Club who have never wearied in their endeavours to show its possibilities to the public.

THE MOTOR-CAR ACT.

SCOTLAND.—At a meeting of the Langholm District Committee, it has been decided that the roads in the district shall be recommended for scheduling at a speed of only ten miles per hour, with the exception of that part of the road from Carlisle to Edinburgh passing through the district, which is to be an open one, i.e., a maximum speed of twenty miles an hour will be permitted along that particular stretch.—A meeting of North Ayrshire Council has been held at Kilwinning. The meeting expressed the opinion that the rate of speed in populous places should not exceed six miles an hour.—At the Eastern District of Stirlingshire Committee meeting an interesting discussion took place on the Motor Car Act. Mr. Salvesen, of Lathallan, Polmont, objected to the limiting of speed to ten miles an hour on certain roads. It would be a hardship to close certain bye-roads to motorists. The Committee agreed to recommend that, instead of prohibiting the use of some roads, these might be opened, provided that the rate did not exceed six miles.—At a meeting of the Brechin District Committee of the Forfar County Council, a list of the roads in the district and their widths and suitability for motor traffic was submitted, and led to a lengthy discussion. The Chairman pointed out various roads and portions of roads less than 16 feet wide, and also where, owing to sharpness of curves or steepness, motor traffic would be dangerous, and moved that these be scheduled, so that motors would be limited while passing over them to a speed of ten miles an hour. He further moved that where schools or school playgrounds were on the sides of roads that the rate of speed for 100 yards on each side of the schools should also be limited to ten miles an hour. The two motions were agreed to.

SURREY.—Application is to be made by the Highway Committee of the Kingston Town Council to the Local Government Board to

A Prospect of the Future: What may happen in the Highlan s.

* From a paper read before the Glasgow Scientific Society.

secure that motor-cars shall not proceed through the borough at a greater speed than ten miles an hour.—In regard to the Local Government Board's regulations, the Highway Committee of the Richmond Town Council believe that many highways in the borough are not suitable for motor-cars, and having regard to the narrowness of the highways generally, and to the heavy traffic, are of opinion that the speed should be restricted to ten miles an hour.

BUCKS.—The Beaconsfield Urban District Council is applying to have that portion of the main road from Oxford to London between the twenty-third and twenty-fourth milestone declared an area over which automobiles shall not travel at a speed of more than ten miles an hour.

ESSEX.—Mr. Percy Sheldon, the County Surveyor of Essex, has circularised all the surveyors of local authorities within his area, explaining that the expression "16 ft. in width" should be taken to mean that where sufficient space exists between hedge and hedge to admit of the roadway being enlarged to 16 ft. (should that space not already metalled or made up), the road, or section of road, should not be scheduled, irrespective of other considerations.

THE Thames Ditton Surveyor has suggested the placing of warning signposts at the following points:—St. Leonard's Road, Thames Ditton (approaching Portsmouth Road); the Cross Roads, Ditton Hill (near the Post Office); Woodstock Lane (near the Church); top and bottom of Red Lane, Claygate; the corner of Ember Lane, High Street, Esher (at the top of the hill); Lammas Hill; Cato's Hill and the railway arches, Thames Ditton station. This has been agreed to by the local Council.

At Marlborough Street (London) Police-court seven motorists have been summoned, before Mr. Denman, for exceeding the 12 mile speed limit on their motor-cars in Hyde Park. Most of them expressed surprise at the speed at which their cars went, the police putting the rate at an average of 23 miles an hour.

At Lewes, Mr. Alderman Robb, of Tunbridge Wells, was summoned for driving his car on the Lewes road in excess of the legal limit. The defendant, who was defended by Mr. Marx, called evidence to prove that the electrical timing device employed by the police was faulty, and the chief witness was Mr. Horace Boot, consulting and resident engineer to the Tunbridge Wells Corporation, who produced plans showing the arrangement by which the police time motorists. The Bench showed considerable interest in the point, as the electrical arrangements had never been contested before. The police alleged that the car was travelling at 25 miles an hour, but the Bench dismissed the case.

At Marlborough Street (London) Police Court, R. H. Wilding, of Dalwhinnie, Highland Road, Bromley, Kent, and Frank Rolfe, Cranbury Road, Fulham, were summoned for driving motor-cars at a greater speed than twelve miles an hour in Hyde Park. The cases having been proved, Mr. Sheil fined Mr. Wilding, who was summoned for two occasions, penalties amounting to £8 4s., with costs, and Mr. Rolfe £3, with 2s. costs.

CONTRADICTORY evidence was given in the case of Mr. F. D. Taylor at the Neston, near Liverpool, Court. The police declared that the measured mile was covered at the rate of twenty-five miles an hour, while the defendant, who was following a couple of cyclists, did not think he was going at more than half that pace.

REFERRED TO ARBITRATION.

In the Birmingham County Court reference has been made to the action brought by Dr. A. R. Badger, Wheleys Road, Edgbaston, against Mr. F. A. Powell, of the Birmingham Motor Mart, for the recovery of £50

damages for alleged fraudulent misrepresentation in regard to a motor-car. The case was opened by Mr. McCardie, but it was decided, owing to the technical questions involved, to refer the matter to an arbitrator. On the second day counsel said that it was only fair to all concerned that the charges of fraud he had made should be withdrawn. Mr. Hirst, on behalf of defendant, agreed that it was perfectly fair on the part of Mr. McCardie to withdraw the charges. His Honour thought that the decision of the parties to refer the matter to an arbitrator was a wise one, for it would have been a very difficult thing for the jury to deal with. It was agreed, on the suggestion of Mr. McCardie, that the case should be adjourned *sine die* instead of being struck off the list.

POLICE TRAPS.

At the Otley Police Court the plan of a police trap on the Bradford road between Menston and Burley has been explained. The method of timing is by means of an ordinary watch. When the signal by handkerchief is given, a constable touches the sergeant's arm, and the sergeant takes note of the period from that second to the time of a further touch indicating that the test quarter has been covered.

MOTOR-CAR ACCIDENTS.

BEFORE Sir Alfred Cooper, at Kingston-on-Thames Police Court, on Monday, Mr. Rupert D'Oyly Carte, of the Albany, Piccadilly, was charged with wantonly and furiously driving a motor-car and knocking down Theodora Franklin, aged three, thereby causing her bodily harm. Mr. G. Sillar stated that he was passing along the Portsmouth road at Long Ditton, on Sunday afternoon, when he saw a motor-car driven by Mr. D'Oyly Carte approaching. It was behind three others, and was travelling at a high rate of speed. After going a short distance the car suddenly swerved to the left, and immediately afterwards pulled up. The witness thought the car swerved to escape a dog, but ascertained that a child had been knocked down. Constable Smith said the motorist pulled up immediately after the accident. The defendant was remanded on bail for a week, and his solicitor on his behalf expressed great sorrow at the accident.

HENRY GIBBINGS, aged thirteen, of Wimbledon, was struck in the back by a motor-car, whilst walking on the footway near the local Free Library, the car being driven by Mr. Walter White, of 35, King's Street, Regent Street, W. It is stated that Mr. White tried to avoid running over a woman who was crossing the road, and that the machine swerved on to the pavement, catching the boy, who was dragged along some yards.

At the South West London Police Court, Frank Colliard has been remanded on £100 bail. He was charged with furiously driving a motor-car and causing bodily injury to Henry Headhouse, a milk carrier, in the service of a Tooting dairyman.

CHOCOLLE, who was the mechanic on Danjean's car which met with the serious accident on the day of the Gaillon hill-climb, has succumbed to his injuries.

THE Glasgow to London non-stop trial for 1904, organised by the Western Section of the Scottish Automobile Club, will take place on the 19th and 20th May. The rules and conditions of the trial are being considered by a special committee.

THE South Eastern and Chatham Railway Company have agreed to issue railway tickets at reduced rates to members of the A.C.G.B.I. and their friends who go to Paris for the automobile exhibition, which opens on the 10th prox.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, NOVEMBER 28, 1903.

[No. 247.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN issuing their regulations to the councils of counties and county boroughs the Local Government Board point out that the term motor-cycle is not defined in the Act, but that they regard it as "limited to motor-cars designed to travel on not more than three wheels and weighing, unladen, not more than three cwt." It is not thought desirable that numbers consisting of more than three figures should be assigned, and the Local Government Board will be prepared, if desired, to assign a fresh index mark to any Council that may require to

start a fresh series of numbers under a new mark. When applying for the registration of a car the owner will be required to notify the positions on the car on which it is proposed to place the plates, and these will have to be satisfactory to the council before the registration takes place. The idea of the public inspection of the register has wisely been abandoned.

The Licensing of Drivers.

THE licence to drive a motor-vehicle must be produced by any person driving a motor-car, when demanded by a policeman. Under the new law the driver of an automobile is under considerably more statutory restraint than heretofore, and he incurs a much more serious liability if he fails to observe the conditions imposed upon him. One interesting point has been settled with regard to paid drivers. By section 13 of the Act, a male person employed to drive a motor-car is deemed to be a male servant for purposes of licence duty. The Inland Revenue Commissioners, however, do not propose to require the payment of male servant licence duty in respect of servants employed to drive motor vehicles which are properly inscribed with the owner's name and address and are used solely in such a way as to come within the scope of the exemption from carriage licence duty conferred in favour of trade carts.

The New Regulations.

ELSEWHERE we give a review of the Regulations, and although they show some variation from the original draft, as published in our issue of the 31st ult., it is clear that the first scheme has been adhered to in the main. Still the concessions demonstrate that the views of the various trade associations, the clubs, and the automobile press received full consideration from the Local Government Board, and, on the whole, Mr. Walter Long appears to have acted in a very generous spirit in framing the Regulations. It is evident, too, that our early publication of the intentions of the Board has been of great service to the movement, thus securing a wide discussion and giving everyone interested prompt opportunity of criticism. These criticisms have been carefully considered by the Local Government Board, and the reasonableness of some of the new Regulations may be traced to newspaper correspondence.

The Gordon Bennett Race.

A MORE widespread interest is being aroused in the Gordon Bennett Cup Race this year than ever before. While the largest number of countries represented in any previous Cup race was four, it is now tolerably certain that next year will see at least six teams in the field. The national clubs of Great Britain, France, Belgium, Austria, and Italy have all either already sent in their challenges to the German Club or are preparing to do so. In the United States, remarks the "Horseless Age," there seems to be less enthusiasm about entering the race this year than last. Aside from the fact that Barney Oldfield recently expressed a wish that he might be a competitor in next year's race, no manufacturer seems yet to have volunteered to represent the colours of the American Club, which has just sent out an invitation for entries to all its members and to the manufacturers, in which it is stated that entries will be received until December 15th, and that they must be accompanied by a deposit of £120, which will be returned if the car starts. It is most likely that America will be represented by at least one starter; but our contemporary considers it doubtful whether it will have a full team in the field.

A 100-h.p. Racer for the English Team.

WE understand that work has been commenced on the construction of a six-cylinder racing car of no less than 100-h.p., intended for the eliminating race for the English Gordon Bennett team. We are not at liberty to give the name of the gentleman for whom it is being built, but may mention that, although he has not hitherto competed in the Cup races, his skilful handling of a 60-h.p. Mercedes during the past season has won for him a prominent position in the racing world.

The "Pedrail."

IN our issue of January 3rd last, we gave a description of a new system of heavy goods transport on common roads, illustrating the same with a view of Mr. Diplock's "Pedrail" mounting an obstacle. On Tuesday last we were invited to a cinematograph demonstration of the Pedrail engine in motion. In our illustration the Pedrail was shown with the front wheels working on feet, and the back wheels similar to ordinary traction wheels. In the later form, however, all four wheels are built alike, being driven by one motor, each wheel acting as a steerer. There are sixteen feet on the front wheels and fourteen feet on the rear ones, and when the cinematograph started, the vehicle was shown trailing six laden lorries, a later view showing the Pedrail unloading by means of the crane which is a part of the system. The vehicle then travelled backwards and forwards, and passed over obstacles, with one and both wheels, nine and ten inches high. Generally it seems not only a most ingenious vehicle, but one that is likely to revolutionise work in agricultural districts, being capable of carrying many tons of produce to the railways, thereafter unloading by means of the crane. It is claimed that very little damage is done to the roads, but as the system is still somewhat experimental, time alone will prove whether this is so.

B.

It is possible that one of the vehicles will be seen in the south in March next. Meanwhile it is to be the subject of a paper to be read this (Saturday) evening by Professor Hele Shaw at Liverpool.

The American Reliability Trials.

THE executive of the National Association of Automobile Manufacturers, after discussing the report on the New York-Pittsburg endurance run, rendered by a special committee, decided to award a first-class certificate to the makers of each car that reached Pittsburg, and gold medals to the manufacturers of certain cars whose performances were particularly meritorious. The special committee found that from Thursday, October 8th, to Saturday, October 10th, inclusive, the road conditions were of such a character as to completely annihilate the possibility of conducting the run upon the plan originally outlined in all its details. When it is taken into consideration that for thirty-six hours railway trains were delayed, and in many cases

Mr. Webb Jay on one of the successful White Steam Cars in the American Reliability Trials.

abandoned, and that it was impossible to send goods out of New York for forty-eight hours, it will be easily understood that the road conditions were abnormal. The fact that, despite all these difficulties, twenty-four of the original thirty-four starters, in addition to two pilot cars and two accompanying tourists, reached Pittsburg, is, in the opinion of the committee, the finest testimonial of the stability and practicability of the American automobile it would have been possible to have obtained in any manner. The cars to which first-class certificates are being issued are as follows:—Class A—Retailing for 1,000 dollars or less.—2 Ramblers, Fredonia, and 2 Oldsmobiles; Class B—1,001 to 1,500 dollars, inclusive.—Pierce, Fredonia, Knox, two Franklins, Haynes-Apperson, and St. Louis. Class D—1,501 to 2,000 dollars, inclusive.—Toledo. Class D—2,001 to 2,500 dollars, inclusive.—Two White steamers, Pierce Arrow, Packard, two Knox cars, and Haynes-Apperson. Class E—2,501 to 3,000 dollars, inclusive.—Stearns. Class G—Selling for more than 3,500 dollars.—Two Columbias, Toledo, and Locomobile.

The Herkomer Trophy International Touring Competition.

Automobile Club. The rules, as will be seen, are fairly stringent,

On another page we print a summary of the regulations which have been drawn up in connection with the international touring car competition for the £500 trophy Professor Hubert von Herkomer recently offered to the Bavarian

but, having regard to the experience of the recent Reliability Trials in this country, are not such as should prove onerous for modern reliable touring cars. The first contest is to take place in Bavaria in August next, the A.C.G.B.I. having the right to enter sixteen vehicles. There is no doubt that keen interest will be shown in the contest by German and French motor-car builders, and it is to be hoped that British makers will endeavour to be worthily represented in a competition which is likely to prove of considerable benefit to the industry in general.

A Yorkshire Trap.

LOOSENESS in police methods is not confined to the south, and the way in which the police work a trap on the road from Bradford to Menston calls for comment. In a case before the Otley West Riding magistrates against a well-known Brighousesolicitor, Mr. Arthur Bastide, the police-constable said there was a measured quarter of a mile. At the beginning of this distance stood another constable, who, when the car passed him, signalled with a handkerchief to witness, who immediately touched Sergeant Kelly, who held the watch. When the car had reached the end of the measured distance he touched Sergeant Kelly again, the sergeant being about a hundred yards from the finishing point. The watch by which the speed of the car was timed was an ordinary silver watch, and evidently the Bench recognised the inadequacy of such arrangements for accurate timing, for they dismissed the case without delay.

Independence on the Bench.

SUCH independence of view deserves commendation, for unfortunately it is somewhat exceptional. The partiality of magistrates in accepting police evidence without demur has been so noticeable as to seriously disturb the respect which many law-abiding citizens previously entertained for the Bench. We have little quarrel with legislation regarding motor-cars, the main objection hitherto raised having been almost wholly concerned with the spirit and tone of the method of administration. That has generally left much to be desired.

Social Gatherings.

THE last days of November have been full of interest to motorists by reason of the cycle shows, in which automobilism now has a conspicuous place; the early days of December will be equally full owing to the many social functions that will take place. On the 1st prox. there will be the annual dinner of the Auto Cycle Club; on the following evening the dinner of founder members and members of the club committee of the A.C.G.B.I. will take place; on Thursday next M. Forestier's paper will attract a goodly number to the house dinner of the club; on the 7th the Scottish Club will have its annual dinner; on the 8th the Motor Volunteers will dine together, and then all the trade will rush to the Paris Salon. With reference to the visit of M. Forestier, many motorists have pleasant recollections of a previous paper he read to the Liverpool Self Propelled Traffic Association, and doubtless the event will have many of the features of a happy re-union.

Closing Devon Roads.

CONSIDERABLE indignation is felt at Lynton at the decision of the Barnstaple Rural District Committee to advise the closing of the Countisbury Hill from Blue Ball to Lynmouth to motor-cars. The most dangerous part of the hill is at the bottom, and the speed might well be limited there to four or even to two miles per hour. But this is not the only dangerous hill in this lovely district, and the danger exists for the four-horsed coaches as well as for the motor-car. The remedy would, says the "Western Morning News," appear to be to widen and

improve the roads in every way possible, and not to "bottle up these lovely twins," and take off part of their "feed," i.e., summer revenue. The Lynton people are very poor, and cannot afford to quietly contemplate such action as the closing to motorists (a largely increasing factor) of the only direct coast route from Minehead to Lynton and Ilfracombe and the West.

Alternative Routes Wanted.

THIS raises a point which should be carefully noted by every motorist who has influence with local councillors in any part of the country. To suggest to close roads to motorists and still allow four-horsed coaches to go their way appears inconsistent; but, seeing that the legislature gives this power to the Local Government Board, it is idle to complain. Still we do suggest that the duty of the local authority does not end with the recommendation to close the roads. Alternative routes must be suggested, and signposts fixed some distance from the entrance to such barred highways giving particulars of

likely to be required. The change speed gear box the differential gear box and the clutch should be so placed that they can be readily seen. Mr. Ross made a strong point of the brakes with which the car should be fitted, and held that on a touring car the absolute efficiency under all circumstances of both brakes was essential. In dealing with tyres, in which respect he indicated a preference for pneumatics, he mentioned that every touring car, if to be used in all weathers, must carry some non-slipping device. Mr. Ross then dealt with the shape of touring bodies, which he thought should be "tonneau." The accumulators should be in a box on the step at the driving side, and the whole space under the seat should be reserved for carrying coats and luggage. He advocated facilities for carrying a reasonable amount of petrol either in a spare tank or by fitting a box beneath the car, which would be removable, to hold four or five tins. The car should have special attention paid to minor details of construction, such as the use of more crown nuts and split pins, so that the worry and trouble to the owner would be the least possible, that chains should be run in gear cases, and that some means should be provided whereby, when a car is left

The Durkopp 18-h.p. Public Service Vehicle (see page 751).

the road to be followed. Otherwise motorists may have to retrace their tracks a few miles in order to get on to the roadway to their destination. This is a matter that must be insisted upon, otherwise the trials of patience and of temper that will take place may be too much for human nature to silently endure.

The Ideal Touring Car.

A MEETING of the Scottish Automobile Club (Western Section) was held in the Windsor Hotel, Glasgow, on Monday, Mr. John Adam, the chairman of the Section, presiding. Mr. John M. Ross read a paper on "The Ideal Touring Car." He thought a touring car should be fitted with an engine sufficiently powerful to give an average speed of twenty miles per hour on an ordinary give and take road, and which would climb hills at a good speed. This latter was more important than the ability to make high speeds on the level. It should also be able to climb any hill on its low gear, and to be possible of being driven slowly on the highest gear. The engine should be easy of access, more particularly those parts where adjustments are

standing, the change-speed gear handle, switch, petrol tap and lubricators could be so locked as to render interference with them impossible.

The Yorkshire Club.

THE Club Room of the Yorkshire Club is now in full swing at the Great Northern Hotel, Leeds, and may always be seen occupied by some of the club motorists. On Tuesday, the 8th prox., Mr. Herbert A. Jones, of Bradford, will read a paper entitled "The new Motor Act and its Effect on Motorists." There will be a large number of sample speedometers, new regulation lamps, etc., exhibited for inspection. The annual dinner of the club will take place on the 4th prox.

Solids v. Pneumatics.

MR. JAMES BURNS, speaking at the Scottish Club meeting, thought it was an advantage that a checking tendency should be placed upon speeds by the inability of cars to take hills at the same speed as on the level, and he thought an essential feature of an ideal touring car was that it was in-

capable of encouraging any tendency to scorch. He was strongly of the view that solid tyres were, until a more perfect pneumatic has been invented, the more suitable for touring purposes. Mr. Burns related some personal experiences of six years' motoring without any expert assistance of any kind, and stated that, while he had had petty troubles, he had had none that could in any sense be called serious, and he had formed the conclusion that breakdowns of cars arose, not from the fault of the cars, but from the lack of knowledge and inexperience of those in charge of them.

Motor Volunteers.

UNDER the presidency of Lieut.-Col. Mayhew, a meeting was held at the A.C.G.B.I. on Thursday of last week to hear a paper by Mr. J. F. Ochs on "Motor Vehicles at the Manœuvres." This proved an interesting history of the movement, from the early part of 1901, when General Sir Redvers Buller used a motor-car in the Cavalry Manœuvres, to the recent successful experiences on Salisbury Plain. At present the Motor Volunteer Corps consists of twenty-four officers and eighty-nine members, besides the adjutant and permanent staff. In the last manœuvres forty-three cars and thirty-one motor-cycles took part, the former having an average b.h.p. of twelve. During the four days of the manœuvres, 1,200 gallons of petrol were supplied by the Government. Mr. Ochs was enthusiastic as to the good service rendered by the motor volunteers, and having given some interesting experiences, added a few words as to the car required for military purposes.

The Military Motor Car.

SUCH a car should, in the first place, stand from the ground as high as possible, for naturally, in going over rough roads and over fields, there were many obstacles met with in the middle of the road or elsewhere, and there was not always room to steer round them. Then, again, the car should be of high power, but able to run on its low speed without weakening the engine. This is a very serious point, because it was very often necessary to run at the rate of four miles an hour for miles and miles. Then, again, the tonneau should be a roomy one where possible, for commanding officers generally preferred, if possible, to keep their staff with them in their own car, rather than have them following in a second car, for fear there should be any breakdown in one or other of them. Of course, if cars could be built narrower than they are at present that would be an enormous advantage, and Mr. Ochs believes that this is a technical possibility.

Heavy Oil Motors Wanted.

The discussion on the paper was opened by Major Lloyd, who said it would have been impossible to have carried out the manœuvres as they were arranged without the assistance of the motor-car. The whole scheme of the manœuvres, indeed, was based on the motor-cars doing the work expected of them without any hitch, and the fact that the manœuvres had not broken down was enough to show that the work had been done. At one of the "pow-wows" six or eight cars were taken into the middle of a stubble field where the meeting was held, and over which there was no road, this showing that cars, if carefully driven, could get to places where one would scarcely expect them to go. One great point made by Mr. Ochs had been that the cars should be built higher off the ground. He quite agreed with that. It would be absolutely necessary, when they had to get the real fighting officer over rough ground, that they should be able to do so without fear of knocking off an exhaust box, bending an axle, or running against a snag. The two great things necessary for the military motor-car were proper clearance from the ground and the ability to use ordinary heavy oil, such as was obtainable anywhere. That car was going to come when they were able to get more perfect combustion of fuel, and he hoped all manufacturers would work towards its evolution, as

they would never get a satisfactory car for use in warfare so long as they had to carry petroleum spirit. They must be able to use the comparatively safe heavy oil obtainable in countries where the actual fighting had to be done.

The Experiences of a Volunteer.

INTERESTING experiences having been contributed by Mr. N. B. Kenealy and Major K. R. Balfour, Mr. Ernest Polden presented what he rightly termed the other side of the picture in a speech which convulsed his audience. Even those who were shocked at the way he rode roughshod over their ideas of military decorum were forced to relax into smiles as he told his tale of woe. After having his car three days and three nights in a damp meadow, it was used for carrying officers' baggage and champagne—a kind of Carter, Paterson's job. At Cosham there were four cars, all broken down because of the treatment they had received. It was a great mistake that there should be any distinction as between officers and privates, and he held that they should all be called members of the Motor Volunteer Corps. Being a lover of horses, he had caused one of the umpires to remonstrate with one of the combatants who had stopped some of the Transport Corps on a hill, causing needless trouble to the horses—and the umpires had got into trouble for interference. Altogether, Mr. Polden did not like motor volunteering, and, after a series of misfortunes, he had to expend £85 to get his car put right.

Essentials.

CAPTAIN CAMPBELL having advocated the use of cars for scouting purposes, the Hon. C. S. Rolls—to whose enthusiasm Major Lloyd had referred in his speech—gave his views as to the most suitable type of cars for military purposes. This should be absolutely reliable, every attention being paid to the ignition. It should be capable of being started rapidly and turned quickly, as it might have to travel for miles among horses. Very low gears were necessary, and the vehicle should not be built too low. Lieut.-Colonel Mayhew, in concluding the discussion, said that the Corps was a military organisation, and all military organisations had officers to lead and control the regiment. A hearty vote of thanks was accorded Mr. Ochs, who briefly replied.

The Aero Club.

THIS growing organisation held its annual dinner on Wednesday, at the Carlton Hotel London, Mr. Roger Wallace, K.C., in the chair. The proceedings passed off with éclat, the company including Comte de la Vaulx, who holds the record for ballooning. It will interest our readers to know that at the Ninth International Motor-Car Exhibition, to be held at the Agricultural Hall in the spring, the Aero Club will be represented by an attractive exhibition in the north annexe. In view of the developing public interest in the locomotion of the air, this new feature should prove a welcome addition to a display of automobilism that bids fair to excel anything of the kind previously held in this country.

A NUMBER of automobile clubs in the United States propose to organise club tours to the St. Louis Exhibition next summer.

THE French Touring Club has decided to put up a warning notice board at the turning at Bonnières where the Serpollet car recently came to grief.

THE Mayor of Annonay, Ardeche, France, has issued a regulation restricting the speed of motor-cars through the town to six kilometres per hour.

AT the moment of going to press we learn that M. Forestier will be unable to read his paper at the A.C.G.B.I. on Thursday next, and that his place will be taken by the Hon. C. S. Rolls.

MAINLY owing to the lack of entries our contemporary, "Le Monde Sportif," has postponed both the Criterium d'Electricite and the Criterium de Regularite, which were to have been held this week.

THE MOTOR-CAR ACT.

REGULATIONS OF THE LOCAL GOVERNMENT BOARD.

IN accordance with the Locomotives on Highways Act of 1896, and the Motor Car Act of 1903, the Local Government Board has power to make Regulations with regard to the registration of cars and licensing of drivers. Motorists generally have anticipated with considerable interest the scope and tenor of these Regulations, a forecast of which was given in our issue of the 31st ult.

REGISTRATION OF CARS.

The Regulations, which have just been issued officially provide that the Councils of all counties and county boroughs shall establish and keep a Register of Motor-Cars.

So far as motor-cars are concerned, this will have to give the following particulars:—

1. Index mark and number on identification plate. 2. Name and address of owner. 3. Description or type of car. 4. Type or colour of body of car. 5. Weight unladen. 6. Whether intended for—(a) private use; (b) trade purposes; (c) as a public conveyance. 7. Date of registration. 8. If cancelled, date of cancellation. In the case of motor-cycles all these particulars will be required except the fourth.

Owners of cars, desirous of registration, will be required to forward to the Council of the County or County Borough the necessary particulars to be specified in the Register of Motor-Cars, together with 20s., in the case of motor-cars, or 5s. for motor-cycles. The Council will then register the vehicle, giving it a number. The owner will be furnished with a copy of the entries in the Register of Motor-Cars relating to his own vehicle.

Should the ownership of a registered car be changed, the new or the old owner must give notice to the Council with whom the car is registered, and an application be made either to cancel the registration or to continue the registration under the new ownership. The new owner may continue the registration on payment of a fee of 5s. for cars and 1s. for motor-cycles.

IDENTIFICATION MARKS.

The mark to be carried by a registered motor-car shall consist of two plates conforming to the Regulations or a design, painted or otherwise, shown upon the car—provided this also is in accordance with the Regulations. Rectangular plates with a black ground and letters and figures in white will be required. These must bear the index mark of the Council and the number assigned to the car, the letters and numbers being in a continuous row, thus—

AB 242

or the letters above the figures, as in this alternative example—

**AB
242**

The letters and figures must be three and a half inches high—those in our examples are $\frac{3}{4}$ inch—every part of every letter and

figure must be five-eighths of an inch broad, and the total width of space taken by every letter or figure, except in the case of the figure 1, must be two and a half inches. The space between adjoining letters and between adjoining figures must be half an inch, and there must be a margin between the nearest part of any letter or figure and the top and bottom of the plate of at least half an inch, and between the nearest part of any letter or figure and the sides of the plate of at least half an inch. Should the first example be adopted the space between the letters and the figures must be one and a half inches; in the second case the space between the upper and lower line must be three-quarters of an inch.

In the case of motor-tricycles or motor-bicycles of a weight, unladen, not exceeding 3 cwt. each of the foregoing dimensions must be halved, and the shape of the plate need not be rectangular so long as the minimum margin between any letter or figure and the top, bottom, and sides of the plate is preserved.

These plates are to be fixed, one on the front of, and the other on the back of, the motor-car, in an upright position, so that every letter or figure on the plate is upright and easily distinguishable. When another vehicle is attached to a motor-car either in front or behind the plate required to be fixed on the front or on the back of the car, or a duplicate of such plate shall be fixed on the front or on the back of the vehicle attached.

The supply of the plates is optional with the owner of the car or the Council. The Council with whom the car is registered may, if they think fit, supply to the owner of the car, if he so desires, the plates forming the identification marks making the necessary change. Or the owner may obtain the plates for himself.

Whenever the vehicle is used on a public highway, between one hour after sunset and one hour before sunrise, lamps will have to be kept burning, so that the plates on the car shall be illuminated (by means of reflection, transparency, or otherwise) in a way sufficient to secure the letters and figures being easily legible from in front and behind the automobile.

THE TRADER'S MARK.

In Section 2 of the Act of 1903 provision is made that the Council might assign to any manufacturer of, or dealer in motor-cars for use in connection with motor-cars on trial after completion, or on trial by an intending purchaser, a general identification mark. This the Local Government Board will require shall consist of two plates, each bearing the index mark of the Council and some other distinguishing letter or letters. The colouring of the plates will have to be different from that used for the plates forming the ordinary identification mark. The manufacturer or dealer will be required to keep a record of the distinguishing numbers placed on the identification plate when the cars are used, and of the name and address of the driver. This will be open to inspection by the Council, some superior officer of police, or authorised constable.

DRIVING LICENCES.

With regard to the licensing of persons to drive motor-cars or motor-cycles, the applicant shall furnish the Council with particulars as to name and address, etc., together with the fee of 5s. provided for by the Act of 1903. Anyone not resident in the United Kingdom may apply to the Council of any County or County Borough for a licence or for the renewal of same. All applicants for licences will have to fill up a schedule requiring the following information:—

1. Name. 2. Address. 3. Whether application is for licence to drive a car or motor cycle. 4. Whether applicant is less than seventeen years of age, or in the case of an application limited to driving motor-cycles whether he is less than fourteen years of age. 5. Whether applicant holds, or has held, a licence. 6. Particulars of such licence. 7. Particulars of any endorsement on any licence which the applicant holds. 8. Particulars of any disqualifications the applicant may have incurred.

In the case of applications made before January 1st next, the particulars under the first four heads only need be given.

In calculating for the purpose of these Regulations the weight of a motor-car or motor-cycle unladen, the weight of any water, fuel, or accumulators used for the purpose of propulsion will not be included.

THE CARE OF MOTOR-CARS.

IN a lengthy and extremely varied personal as well as professional experience with automobiles I cannot recall anything, remarks Mr. V. J. Kelley in the "Automobile Magazine," in which the users of motor vehicles are so unanimous as they are in the variety of their opinions about the same make of vehicles. Take ten owners of any given make of car and ask each one of them what he thinks of the vehicle he uses, and you will get ten different opinions, running the gamut from "the worst ever" to "the only vehicle in the world." Granting that each of the ten is honest, and there exists no reason for him to be biased, there can be only two explanations why this wide divergence of opinion exists.

Either cars of the same make and identically the same model vary greatly in their performances and their stability, or some of their owners handle them more intelligently, hence less injuriously, than others. Where vehicles of the same construction and virtually the same age vary widely in the way they meet practically the same demands, no other valid explanation of this variation than the inequality of their drivers can be found.

In nine cases out of ten neglect, ignorance and downright abuse of the vehicle are the causes of almost every difficulty the man possessed of ordinary common sense experiences with the automobile he owns. Taken as a whole even the accidents resulting from the causes named are never very serious, and, although they may appear at the time of their occurrence very annoying to the novice responsible for their happening, a better acquaintance with the vehicle and its construction causes later on only a laugh when the misfortunes of the owner's first experiences are brought to mind.

In all this it should not be forgotten that not one novice out of a hundred really knows anything about the vehicle he buys, the acquiring of an education being left to his early matriculation at the University of Experience. The seller cannot afford to supply a teacher free for any very extended period of time, nor will the buyer pay for an instructor a moment longer than it is necessary for him to acquire the merest smattering of information about the car. The results are unfortunate for all concerned; but they could not be different from what they are.

Of course, before the owner cuts loose from the instructor he has been told by him perhaps a hundred things which are nothing in themselves—and attention to which soon becomes absolutely automatic—but which become so jumbled up in the mind of the new owner that they mean absolutely nothing to him when the occasion for their remembrance eventually arrives.

Generally, all goes well with the novice, and by the time any adjustments to the car are required the tyro is fairly well up in his subject. But there are exceptions, and notable ones, in which it may happen that some undetected carelessness on the part of a workman before the vehicle left the factory will cause a derangement to occur early in the novice's career. On the other hand, it may happen that failure to run is due to some ridiculous omission on the part of the owner. I have known cases where an expert has travelled 150 miles to see what was the matter with a new vehicle, only to find that the switch had not been turned on, or that the petrol tank was empty! These cases were extremes, of course, but they are by no means infrequent.

I believe that, given only a moderately efficient car, not to say a really good one, most of the difficulties experienced by beginners are due to over-driving, unduly violent starting and stopping, neglect of adjustment, and lack of thorough lubrication. I have seen many automobiles disassembled after various periods of running, and I believe all who have had practical experience will agree with me that the most common cause of excessive wear is neglect of lubrication. The motor itself may be perfectly well lubricated—in fact, it is too often decidedly over-lubricated—but every other part of the car is left alone. I have seen gears ruined for lack of oil, combined with violent changing, and axle-bearings seized simply because they had been run dry for long periods.

DILLON WILLOUGHBY has been committed for trial from a London police court charged with stealing £169 received on account of a motor-car.

THE HERKOMER TROPHY INTERNATIONAL TOURING CAR COMPETITION.

AS stated in these columns in August last, Professor Hubert von Herkomer, the well-known artist, has offered a trophy of the value of £500 to the Bavarian Automobile Club for an international competition of touring cars. The rules and regulations under which the contest will be held have now been drawn up and are briefly summarised below. The trophy, which will be in silver, the work of the Professor himself, must be competed for annually, and, although a challenge trophy, will become the property of any national club which wins it three times in succession. In accordance with the donor's wishes the first year's contest is to be held in Bavaria, the second in England, and subsequent competitions in the country holding the trophy. The touring car is described as a vehicle which in construction and operation is capable of covering long distances over all classes of roads at a relatively rapid pace. It must be of pleasing design and com-

Three of the eight days will be devoted to short pleasure runs, three to touring work, one to special tests in the way of consumption, brakes, and hill-climbing capabilities, and one to kilometre trials with flying and standing starts. A minimum speed of 25 kilometres per hour, and a daily run of at least 300 kilometres, will be expected of the competing cars in the touring contest. At the conclusion of each day's run the vehicles will be placed under lock and key and only handed over to the driver five minutes before the time to start on the following morning. An observer will accompany each car.

The selection of the winning vehicle will be made by means of points, the one having the least to be the successful car. The cost of the cheapest chassis entered will form the basis, and every £12 10s. above this will mean one mark against the vehicles. (2) Fuel consumption—1 litre per twelve kilometres will form the basis, and for every 1-10 litre more consumed during that distance ten marks will be allotted. (3) Brake tests—three marks for every metre covered beyond the signal to stop, and 150 marks if more than 40 metres are taken in which to pull up. (4) Speed (a) Kilometre trial on the flat with standing start. (b) the flying kilometre—and (c) hill climbs, one mark for each second occupied in making the kilometre in each event. (5) Weight—

Madame Lockert visiting the Cathedral of St. Isaac, at St. Petersburg.

[Le Chauffeur.

BY AUTOMOBILE FROM PARIS TO ST. PETERSBURG.

fortable. The first contest is to be held in the early part of August next, starting from Munich. The English, American, French, and Austrian Clubs may enter sixteen cars each, and the Bavarian, Belgian, German, Danish, Italian, Dutch, Russian, and Swiss Clubs not more than eight vehicles each. The Bavarian Club has power to decide whether the contest shall be held, if there are not more than forty cars entered, and to restrict the number to eighty competitors. An entry fee of £24 has to be paid in respect of each car three months before the contest takes place. Any club entering at least eight cars can appoint a delegate to the central committee, who may act as a judge.

All competing cars must be entirely manufactured in the country in respect of which they are entered, except so far as regards the tyres, and no one firm may enter more than two cars. The contest, which will extend over eight days, is one of reliability and not of speed, although the programme will provide for kilometre speed trials and hill-climbing contests, these being each divided into three classes—cars up to 15-h.p., vehicles from 15 to 30 h.p., and cars over 30-h.p. No restriction is placed on the horse-power of the competing cars, which are to be equipped with two brakes, sprag, mud-guards, two lamps, etc., but the weight limit is fixed at 1,100 kilog.

all cars weighing the full limit of 1,100 kilog. will have 200 marks allotted, one being taken off for each 10 kilog. below the limit. (6) Pouring capability—any car taking more than 14 hours for 300 kilometres will get 100 marks. Marks ranging from 30 to 300 can be given by the judges in respect of any competitor who fails to follow instructions, police regulations, etc. Points will also be awarded in Section 2 in respect of comfort, convenience for luggage, quiet running, and simplicity, the advantage in this case being to secure as many marks as possible, they being deducted from those above specified in deciding as to the winning car.

THE Thomas Motor and Engineering Company, Limited, has been registered with a capital of £5,000.

By the consent of the donor, entries for the Harmsworth International Cup for motor-boats can now be received by the A.C.G.B.I. up to February 1st, 1904.

THE Car and General Insurance Corporation, Limited, has gone to allotment, and the company is now in a position to accept insurances.

CONTINENTAL NOTES.

THE Committee of the A.C.F. has issued the regulations with regard to the eliminating test to be held to select the French team for the 1904 Gordon Bennett race. The race will be over a distance of between 550 and 600 kilometres, and will be held about a month before the Cup contest. No more than three cars can be entered by any one firm, the entry fee for each car being £200. The first three cars in the eliminating race will form the Gordon Bennett team, and in the Cup race will have to be driven by the same persons and be fitted with tyres of the same make as in the selection trial. The three cars chosen will, between the dates of the eliminating contest and the Cup race, be under the control of the Sporting Committee of the A.C.F. The maker of each car selected will be required to place a second one at the disposal of the Club in case of accident or damage before the big race. The cars in the eliminating trial will be sent off at two minutes' intervals, the places being balloted for. The De Dietrich Company have already entered three cars.

M. RENE DE KNYFF and Henri Fournier have this week been over the proposed course in the Homburg district. Unfortunately, heavy rains prevented a trial of the road under speed conditions.

IN spite of the reports that three or four Belgian motor-car builders had announced their intention of entering cars to represent Belgium in the 1904 race, when the entry list closed it

The Scene Outside the French Automobile Club on the Appearance of a New Car.

was found that only one firm had fulfilled the promise, viz., the manufacturers of the "Pipe" car.

IN the death of Count de Chasseloup Loubat, which occurred at Cannes last week, the French motoring world has lost an ardent and enthusiastic supporter. The deceased, who was only thirty-seven years of age, had taken an active part in the development of the automobile movement in France, especially in its early days. The contests between him and M. Jenatzy for the kilometre record in 1899 will also be remembered.

AT a meeting of the Sporting Committee of the Belgian Automobile Club, last week, the dates for next year's various races and competitions were fixed. The Circuit Nationale and the Circuit des Ardennes will be held in May, while the races and hill-climbing competition at Namur will take place in the first week of July. The Ostend Meeting will extend from the 10th to the 20th June, and that at Spa from the 10th to the 31st July. Altogether the months of May, June, and July give promise of great activity in Belgian motoring circles.

THE dust question is no less serious in France than in England, and for a long time isolated efforts have been made in various parts of the country in the way of experiments with tar and petroleum to overcome the nuisance. With the view of

taking the matter more seriously in hand, Dr. Guglielminetti and a number of other gentlemen interested in the subject have just organised an association to be known as the "Ligue contre la Poussière," with headquarters at the A.C.F. club-house in Paris. The objects of the League will be to afford those desirous of taking steps to lay the dust in their districts all the necessary information as to the most suitable material to use, etc. A strong committee has already been formed, including many gentlemen well known in French motoring and medical circles.

ONE of the chief requirements, especially in touring, is that calcium carbide of suitable grain for acetylene lamps may be obtained at supply stations along all the main highways. The question was discussed at a recent meeting of the German Acetylene Society, when it was decided to request the Carbide Syndicate to open negotiations either with the Vereinigte Benzin Fabriken, or directly with the individual suppliers of petrol, to arrange that carbide of suitable grain be kept on hand at all of these depots and sold at definite prices, and also that empty carbide cans be taken back in exchange for the new cans.

IT is stated that the Vereinigte Benzin Fabriken, of Bremen, have at present in operation nearly a thousand depots throughout Germany where petrol is stocked, and it would be a great convenience to motorists if carbide could be obtained at these at a uniform price.

A NUMBER of electrical motor-vehicles are being built for the use of the postal authorities at Munich, Germany, for the transport of mails between the various post offices. They are of a small type intended to carry a load of only 2 cwt. at an average speed of nine and a half miles per hour. They will be equipped with a small battery of Tudor accumulators, while two spare sets will be kept at the charging station, one of which will be always ready charged so that it may be quickly substituted for the discharged battery.

THE Italian Government has recently appointed a Commission to enquire into the existing regulations with regard to automobile traffic in the country. Neither motorists nor motor-car builders are represented on the Commission, and the Italian Automobile Club has sent in a protest urging that, in view of the growing importance of the movement and industry, due regard should be had to the protection of the same in any alterations that may be suggested in the present regulations.

ALTHOUGH not much has been heard lately of the combination petrol-electric car, it is rumoured that quite a number of such vehicles will be seen at the forthcoming Salon. Among others, it is reported that such class of cars will be exhibited by Messrs. De Dion, the Electrogenia Company, the Krieger Company, the Germain Company, the De Dietrich Company, and Messrs. Panhard and Levassor, the latter being of the Lohner-Porsche type.

AT various times projects for the construction of a motor-racing track near Paris have been mooted, but so far nothing definite has been done. The latest scheme is for a track at Juvisy, which, it is stated, would be 10 kilometres long and 20 metres (65 ft.) wide. The route includes a straight stretch of three kilometres long, on which it would be possible to run kilometre and mile races. The name of Baras, the well-known driver of Darracq cars, has been connected with the scheme.

A 100 kilometre road race was held on Sunday last between Maison Carrée and Arba by the Automobile Club of Algeria. The Guérin Cup for single-cylinder cars was won by Homolle on a Renault in 2 hours 1 min. 3 sec., while the A.C.A. Criterium for four-cylinder cars was also won by a Renault driven by Bellemare, who covered the distance in 1 hour 22 min., Malgaive on a Darracq being second in 1 hour 44 min. 10-2-5 sec.

MOTOR-CYCLING NEWS.

It was a capital suggestion of the Motor Cycling Club to hold the inaugural run of the winter season on the Sunday of the week following the opening of the cycle shows, and the number of members, together with friends and visitors, who accepted the invitation to join the function quite surpassed expectations. In-

land Revenue supervisor, Derby, conducted the prosecution. Defendant bought his motor-cycle in June last, and has used it continuously ever since. The local officer saw him riding on August 23rd, and sent him a declaration form giving all the necessary information. Defendant took out a licence on September 24th, thirty-one days after he got the form from the officer, and three months or more after he first bought the cycle.

Photo by]

The Meet of the Motor Cycling Club at Slough.

[Mr. H. Kennett, jun.

deed, the crowd that assembled at the Royal Hotel, Slough, was altogether an imposing one, and probably the largest attended meeting of the club on record. After the company, to the number of sixty, had been marshalled into position in front of the hotel preparatory to facing the photographer, an adjournment was made to the dining-hall for lunch.

A FRENCH motor-cyclist has recently succeeded in riding from one end to the other of Algeria in five days. He rode a Peugeot machine, the distance traversed being over 1,000 kilometres.

BETWEEN fifty and sixty members have already been enrolled in the Manchester Motor Cycle Club. Its president is Mr. J. H. Baynes, and Mr. P. H. T. Butler is captain. The sub-captains are Messrs. J. Varden and J. W. Butterworth, and Mr. H. Brady, of 8, Ashton New Road, Manchester, is the honorary secretary. Unluckily the opening run to Chester on Sunday week was spoiled by the weather. Last Sunday's fixture was to Brereton for dinner and Macclesfield for tea; and Rudyard Lake is the objective for to-morrow (Sunday).

THE Rex Co.'s free gift of a motor-cycle to the rider who covered the greatest mileage during August and September last has been won by Mr. C. E. Jenkins, of Cardiff, with a record of from 5,000 to 6,000 miles.

A MEETING of the London members of the Cyclists' Touring Club will be held in the Society of Arts Lecture Room, John Street, Adelphi, W.C., on Tuesday, December 8th, when some information will be given on the subject of motor-cycles, by two or three experienced riders, after which the meeting will be thrown open to discussion.

AT the Ilkeston Petty Sessions, Harold Hunter was charged with keeping a motor-cycle without a licence. Mr. A. Goodhind,

The facts were put before the Commissioners in London, and they agreed to compromise the case in order to save the defendant going into court, and he was asked to pay 10s. This he refused to do, and so the case came before the bench. Defendant was fined 2s. 6d. and 9s. 6d. costs.

ON Tuesday next, December 1st, the first annual dinner of the Auto-Cycle Club will be held at the Club house of the A.C.G.B.I. After the dinner Mr. M. O'Gorman will read a paper on "Improvements Desirable in the Motor-cycle," to be followed by a lantern display on "Motor-cycling Subjects," by Mr. J. van Hooydonk.

THE press reports of automobile accidents that occur on the road are frequently exasperatingly indefinite as to the precise primary cause in each case. This is doubtless due in part to the ignorance of the usual daily newspaper correspondent and reporter regarding things mechanical, especially as they pertain to automobiles, and also in part to the unwillingness of the driver of the car to confess his own inexperience and carelessness. Reading between the lines of such reports, however, it seems apparent that inexperience, nervousness and recklessness are primarily responsible for most of the accidents. There is little doubt that in most cases, when accidents are reported as due to the machine having got beyond control, ordinary prudence was not observed. Unknown or dangerous roads are traversed at a high speed, and when some sudden danger looms up, such as a sharp turn or a slippery stretch of road, the speed cannot be slackened sufficiently before the danger point is reached. Practically the only cause of a motor-vehicle getting beyond control for which the driver is clearly not responsible is a failure of the steering gear. The accidents reported as due to cars getting beyond control are mostly cases of skidding, preventable with ordinary prudence.

The French Motor-Cycle Trials—Holley and his Bruneau Machine.

THE "ENGLISH" STEAM WAGON.

THE list of heavy steam wagon builders in this country, already a comparatively large one, is steadily receiving additions. In recent issues descriptions have been given of the "Naylor," "Wantage," "Robertson" vehicles, all relatively newcomers in this important branch, and this week we are able to present some particulars and illustrations of still another steam wagon which is known as the "English." The vehicle contains several patented features, the result of many years' experience of Mr. A. Herschmann, mechanical engineer to the Adams Express Company of New York, who in such capacity has had every facility to thoroughly study mechanical transport of both light and heavy goods. The wagon illustrated in Figs. 1, 2 and 3 is the standard 5-ton type constructed by the English Steam Wagon Company, of Hebden Bridge, sole licensees for Great Britain, Colonies, etc., under the Herschmann patents. The main frame is of steel girder section, while the goods platform is 12 ft. long by 6 ft. 6 in. wide over all. It will be noticed that the driver is located in front of the boiler, thus having a clear view ahead. The boiler is of special fire-tube type with

gether rigidly when necessary on bad roads. Two speeds are provided, three and six miles per hour. The front axle arrangement (see Fig. 2) is of a patented type, there being no rigid action between the springs and the axle, the latter being free to assume any position without imparting the slightest strain to either springs or frame. The axle moves in guides and is so shaped that its centre will always move in a vertical line in the centre of the wagon, no matter what the relative position of the four wheels may be; another advantage of this type of axle is stated to be that it gives a bearing support close to both wheels. A 2-ton vehicle on somewhat similar lines is also being turned out. The engines in this class have cylinders $3\frac{1}{2}$ in. and 6 in. dia. by 5 in. stroke, and any type of flat platform, van, or omnibus body can be adapted to the frame. The road wheels are of the artillery type, the rear pair being 3 ft. 9 in. dia., shod with 6 in. wide tyres; the front wheels are 3 ft. dia. by 5 in. wide. Respecting fuel consumption, the makers inform us that in the type of boiler employed this is to be exceedingly low indeed. With the 2-ton wagon the amount of fuel consumed averages 200 lbs. per day, travelling 30 to 40 miles in heavy traffic and steaming for 12 hours. We learn that already there is a good demand for these wagons, and that orders are being executed for the North of

Figs. 1 and 2.—Plan and Front Elevation of the "English" Steam Wagon.

straight tubes, and specially constructed for being quickly opened out for cleaning and other purposes; it is also designed to give dry steam, and is fired from the top through a central shoot, gas coke or coal being used as fuel. The working pressure is 200 lbs. per square inch. The exhaust steam is passed through a re-heating coil in the firebox so as to be sent into the air through the chimney as invisible vapour. To feed the boiler a steam pump is fitted which exhausts its own steam, and provision is made for heating the feed water; an auxiliary injector with removable cones, or preferably a duplicate steam pump, is provided. The engines are of the horizontal enclosed type with splash lubrication, the cylinders being 4 in. and 7 in. dia. by 6 in. stroke, or, when preferred, link-reversing type engines can be fitted 4 in. and 7 in. dia. by 7 in. stroke, covered with a sheet steel casing. A controlling valve is fitted to admit high pressure steam to both cylinders when required. The system of transmission employed is of Herschmann's flexible type, the rear road wheels being driven by means of internal gear rings attached thereto, meshing with the driving pinions on a compensating gear shaft. The pinions are swung from the stationary rear axle by radius links and have also a swinging suspension to the wagon frame, so that when starting the engines the tendency of each pinion is to mount or climb up on the internal gear, which being resisted by the load on the vehicle, the ordinary springs of the wagon are brought into play to avoid shocks. In this way the operations of starting and stopping are effected without shock. The compensating gear is fitted with a special self-locking or braking device, which is automatic under some conditions and can be actuated from the driver's seat to lock the two rear wheels to-

Spain and South Africa as well as for a well-known English firm of carriers.

A MOVEMENT is on foot to form a motor-cycle club in Melbourne. One has lately been formed in Perth, and another in Adelaide, so that it is evident that the motor-cycle movement is making progress in Australia.

AUTOMOBILISM is a subject of considerable discussion in India, and those English owners of cars who have ever taken their vehicles with them when visiting the Dependency have done much to foster the popularity of motor-cars in a country where they will be of great service in the future. Unfortunately the roads in many of the Indian cities are totally unsuitable for rapid traffic, and even the three main streets of Bombay come within this category. But a motor-car service between that city and the suburbs should be productive of profit. A fleet of cars between Malabar Hill, Cumballa Hill and the Fort in the morning, and a return service at the close of office hours in the evening, would be acceptable to many. Another service between Bandora Station, Bandora Hill and Palli Hill would be patronised. Connection between Wathar, Poona, and Mahableshwar during the season is urgently necessary. The present arrangements for the last-named service are a disgrace, and more particularly so in connection with a Government Station. A fair estimate of what a motor-car would earn during the two hot seasons of May and October would be probably £250. During the rainy season the car could ply for hire at Poona and would certainly reap a rich harvest during the racing seasons at Poona and Bombay.

HERE AND THERE.

THE Roadway Autocar Company, Limited, is shortly removing from Burwood Place, W., to new premises at 19, New-man Street, Oxford Street, W.

MR. E. W. WELLS has been declared the winner of the gold badge of the Nottingham Automobile Club for his performance in the recent hill climb at Kettleby.

THE Main Wheeleries, Limited, has been registered with offices at 97, John Bright Street, Birmingham, to carry on dealings in motor-cars, motor-cycles, etc.

ALL persons who drove throughout the recent Reliability Trials, and against whom no complaints were upheld by the committee of the A.C.G.B.I., will receive certificates.

IT is reported that the American Darracq Company has ordered from the Paris firm a racing car of no less than 180-h.p. According to the rumours that are circulating it will have two four-cylinder motors, each of 90 horse-power, one mounted over the front axle and the other over the rear axle.

A MOTOR hose wagon is being built by Messrs. Merryweather and Sons, Limited, for the fire brigade of Valparaiso.

AT a meeting of the Institution of Electrical Engineers, on Thursday, Mr. W. Hibbert read a paper on "The Edison Accumulator for Automobiles."

THE University students at Princeton, N.J., U.S.A., have organised an automobile club. There are half a dozen large cars owned by students and as many light vehicles, with about a dozen motor-bicycles.

THE West London Motor Company, Limited, has been registered with a capital of £2,000 to adopt an agreement with the Begbie Manufacturing Company, and to carry on the business of motor manufacturers and dealers. The first directors are Messrs. S. D. Begbie and O. F. M. Mundy.

WE learn that the Passe Partout, which started a year or so ago on an eventful trip round the world, and which was dug out of a ditch in Russia by Mr. C. Friswell, has now passed into the hands of Mr. Harris, of Llangibby Castle, Monmouth, where it will serve as a station omnibus.

Fig. 3. — General View of the "English" Steam Wagon. (See opposite page.)

THE Electric Vehicle Equipment Company has just received an order for a number of electric motor vans to be substituted for the horse-drawn mail cars which carry mails between the general post office and the railway stations in Philadelphia.

AN excellent catalogue of some 180 pages has been issued by Messrs. David Brown and Sons, Limited, of Huddersfield, in which numerous illustrations and much descriptive and tabulated matter are published respecting their machine-cut gearing. Spur, bevel, worm, rawhide, screw and spiral gearing are included, together with certain information for determining the dimensions of different kinds of gearing.

THE first motor-cycle road race in Australasia was held by the Christchurch Cycling Club from Riccarton to Waddington, New Zealand, and back, on the 24th September. There were twelve starters, of whom seven finished. Unfortunately the scratch man, Best, on a $3\frac{1}{2}$ -h.p. machine, who conceded starts up to 40 minutes, had trouble with his driving belt, which prevented him from starting. The following were the results:—First.—Williamson (2-h.p.), 25 min. (2 hrs. 7 min. 30 sec.) Second.—Smith (3-h.p.), 10 min. (1 hr. 59 min. 32 sec.) Third.—Hargreaves (2-h.p.), 23 min. (2 hrs. 14 min. 15 sec.)

THE Sharp Air-spring Company, Limited, has been registered with a capital of £10,000 to adopt an agreement with Messrs. A. Sharp and W. T. Shaw, and to carry on the business of manufacturers of and dealers in compressed air springs, motor-cycles, motor-cars, etc. The registered office is at 47, Victoria Street, Westminster.

THE fact that ladies are debarred from membership in the different American automobile clubs will, in all probability, eventuate in the formation in New York of a ladies' automobile club. A movement is reported to be on foot among the wives of prominent members of the Automobile Club of America to organise, the Ladies' Automobile Club of London having furnished the example.

"How to detect the miscreant throwing glass in the street," was the title of a paper recently read by Dr. C. A. Howell before the Automobile Club of Columbus, O., U.S.A. It dealt with an existing evil, and the reading was followed by the adoption of a resolution requesting the legislative committee of the club to call upon the Mayor and insist on the enforcement of the ordinance relative to the throwing of broken glass and similar matter into the streets.

A COUNTY motor union is being formed in Hertfordshire.

MR. RADFORD COOKE has resigned the assistant secretaryship of the A.C.G.B.I.

A MOTOR-BOAT section is, we learn, being formed in connection with the Austrian Automobile Club.

WE hear that the Sunbeam Company are at present engaged on the construction of a new six-cylinder car.

THE new lifting jack illustrated herewith has recently been put on the market by Herr Friedrich Dick, of Esslingen,

Germany. As will be seen, it is a compact and simple affair; when closed its length is just under twelve inches, while by means of the internal screw it can be extended to twenty inches.

FROM Messrs. S. F. Edge, Limited, we have received a photograph of a light Gladiator lorry, to carry up to two tons, they have lately introduced. The engine is of nominally 12-h.p., but develops considerably more on the brake. Three speeds and reverse are fitted, the speed on the level, when loaded, being about 15 miles per hour, and a gradient of 12 per cent. can be negotiated. The length of the platform is 11 feet 3 in., while the petrol capacity is sufficient for a run of about 80 miles.

MOTORING is now regarded as fair game by novelists, and in the "Motor Pirate" Mr. G. Sidney Paternoster has availed himself of the modern pastime to the extent of 250 pages. The wonderful doings of the "Motor Pirate," who seems to have terrorised the users of many of the roads of the home counties, are set forth with a wealth of detail that is not without interest. Some of the accompanying illustrations are equally remarkable in their way. The book is published by Messrs. Chatto and Windus.

MR. PERCY RICHARDSON, who has long been associated with the Daimler Motor Company, Limited, has now resigned to take up the general management and a seat on the board of the Brotherhood-Crocker Motors, Limited. This is a private company recently formed in connection with the old-established engineering firm of Peter Brotherhood, Westminster Bridge, London, the other directors being Earl Fitzwilliam, Mr. Stanley Brotherhood and Mr. John Crocker. The Brotherhood-Crocker Motors, Limited, intend manufacturing touring motor carriages, and cars and wagons for commercial purposes.

AN interesting two days' race meeting came to an end at the Ingleside track, San Francisco, U.S.A., on the 7th inst. In all fifteen events were run off—eight on the first day and seven on the second. In the five-mile race for cars of 1,800 pounds and under Oldfield was signally defeated by Grothe on a White steamer, in a fairly fast race for this weight car, the time being 6 min. 4 2-5 sec. Later in the day, however, Oldfield redeemed himself by winning the ten-mile open race in the good time of 11 min. 15 1-5 sec., his fastest mile being 1 min. 1-5 sec.; while on the second day he covered the same distance in 10 min. 19 1-5 sec., with one mile ridden in 58 4-5 sec.

AN Isle of Wight Motorists' Association has been formed.

A MOVEMENT is on foot in Paris to form a club among military automobilists.

THE Lanchester Engine Company, Limited, now have one of their new type water-cooled cars running in London.

THERE will be no fewer than 213 registration authorities in the British Isles in connection with the Motor Car Act.

ALDERMAN SCOTT FOSTER, Major Cox, and Mr. F. T. Jane have been appointed to represent Portsmouth motorists on the Hampshire Motor Union.

FROM Messrs. John Marston, Limited, comes a neatly got up catalogue of the 12 h.p. Sunbeam car, one of the noticeable features of which is that the driving chains are enclosed in gear cases.

THE Manchester Carriage Company (1903), Limited, has been registered with a capital of £30,000, to carry on the business of hirers, etc., of omnibuses, wagonettes, motor-cars, and other vehicles.

WE regret to hear that Mr. S. F. Edge has been absent from business for some days owing to a serious illness. As we go to press we learn that he is fortunately entering the convalescent stage.

THE Lycett's Rawido Belt Company has been registered with a capital of £2,000 to acquire from the Lycett Saddle and Motor Accessories Company, Limited, the business of Lycett's Rawido Belt and Patent Connection, and to carry on the business of manufacturers of and dealers in raw hide, motor belts, motor and cycle accessories, etc. The registered office is at 164, Deritend, Birmingham.

DR. AUGUST GRETH, of San Francisco, is building an immense dirigible balloon, with the intention of competing for the £20,000 prize and gold medal to be awarded for the most successful airship at the St. Louis Exhibition. Dr. Greth recently sailed an airship of his own construction over San Francisco Bay, and claims to have demonstrated the advantage in the use of some features in the design of his machine over others, especially that of Santos Dumont.

A NEW steering wheel has lately been put on the market by the South British Trading Company, Limited, the advantages claimed for the same being that it is impervious to moisture and consequently will not warp or twist. The accompanying illustration shows an end section of the three-ply laminated rim of

the wheel. The grain of the wood running in different directions in each lamina ensures a very rigid and strong construction. The wheel is entirely self-contained, requiring no metal section to hold it together.

MESSRS. MICHELIN, in one of their weekly budgets, point out that many outer covers of motor pneumatic tyres are ruined owing to their coming into contact, when running, with the chain, with a bolt, or even the mudguard. They therefore recommend motorists to see that there is nothing near the tyre that is likely to rub against it. Another point worthy of notice, to which Messrs. Michelin draw attention, is that while many outer covers sent to them for repair are received in most elaborate cases and packages, little or no care is taken with the inner tubes. The latter are generally simply folded up and tied with string, with the result that further injury is done them in transit to the works. While outer covers may be safely sent wrapped in old pieces of cloth or even paper, inner tubes should be carefully packed so as to prevent them being damaged en route.

THE NATIONAL SHOW.

THE exhibits at the National Show, which is this week being held at the Crystal Palace, comprise a larger proportion than ever of motor-cycles, the principal displays being those of the Singer, Quadrant, and Rex Companies, and Messrs. Bayliss, Thomas and Co., Ltd. A number of new cars are also shown for the first time.

Undoubtedly one of the most interesting stands in the exhibition is that of the British Automobile Commercial Syndicate, Limited, on which are to be seen the 1904 models of the Talbot cars. These comprise so many interesting features that full justice cannot be done to them in the course of a show report, but a brief summary may now be given. The new models are three in number, 6-h.p. single cylinder, 11-h.p. double cylinder, and 20-h.p. four cylinder. With the exception that the 6-h.p. car has only one cylinder, and that in the 11 and 20-h.p. vehicles they are cast in pairs, the following particulars may be taken as applying to all three types.

Differing from the 1903 engine, the valves are on opposite sides of the motor and are mechanically actuated by different cam shafts. The inlet and exhaust valves are interchangeable. The bore and stroke of all three types are exactly similar, and therefore, whether in the 6-h.p., 11-h.p., or the 20-h.p., the pistons, piston rings, cylinders, valves, connecting rods, bearings, half-time gear, pump gear, nuts, springs, bolts, etc., are identical in size. This is the first time, we believe, that engines of such varying horse-powers have been thus standardised in their parts,

independently of any other part of the car. The clutch itself is made adjustable by means of one nut. Three speeds forward and a reverse are provided; and on top speed the power is conveyed to the rear axles without the interposition of any reducing gear. The brakes are of the expanding type similar in design to those fitted to the rear wheels of the 1903 cars, but have been considerably improved. The contact parts are metal; they are carried inside a dust-proof case and thus protected from grease or mud. The transmission is through bevel-gearing and a cardan jointed shaft, which is carried for the whole of its length in a phosphor-bronze bearing.

While the 11-h.p. and 20-h.p. cars comprise, as will be seen, a number of novel features, what is perhaps the most interesting vehicle is the new 27-b.h.p. Talbot voiture-de-luxe. Like the other models, this has a pressed steel frame. The engine is of a new type, comprising four cylinders, cast in two pairs, the diameter being 110 mm. bore by 130 mm. stroke. The inlet and exhaust valves are all mechanically actuated; the inlets are set in the top of the combustion chambers, and provided with a variable lift device controlled from the steering wheel. The ignition is by means of a magneto in which the sparking can be advanced or retarded. The water circulation is maintained by pump and honeycomb radiator. In place of the usual belt driven fan, the arms of the flywheel are formed as vanes, to induce a current of air through the cooler. Instead of the usual clutch, an ingeniously arranged one of the coil type of small dimensions is employed. The change gear gives four speeds ahead and one reverse, the various speeds being brought into mesh by a disc having

Photo by]

Fig. 1.—General View of Chassis of the new 27-h.p. Talbot Car.

[Russell.

and should prove an interesting point to users of Talbot cars, inasmuch as agents throughout the country will be more readily inclined to stock spare parts, and thereby ultimately benefit the users by giving greater facilities for their immediate supply.

The ignition is by means of a rotary magneto designed to permit of considerable advancing and retarding of the ignition spark. The pump is gear driven from the engine, and its position is varied from that previously customary, inasmuch as it is placed on the cylinder level instead of below the crank case, thereby facilitating examination. The carburettor, which is automatic in its action, is provided with a small automatic air-inlet valve; as the speed of the engine is increased or decreased, the valve is opened or shut to permit a smaller or greater quantity of gaseous mixture to pass into the cylinders. The governor, which is of course adapted to act on the inlet, is arranged to come into action at a speed of 1,200 revolutions per minute. The water circulation has been so arranged that there is barely two feet of tubing. In the case of the 6 and 11-h.p. engines, an ordinary radiator is used, whilst in the 4-cylinder car a honeycomb cooler is employed, a ventilating fan being also provided to induce a current of air through it. The lubrication of the engine is automatic, a small bye-pass conveying pressure from the exhaust, so that the oil is forced into the cylinders when the motor is at work. The frame is of hydraulically pressed steel suspended on exceptionally long carriage springs arranged outside the chassis. The clutch is of the ordinary cone type with a leather face, and the clutch head has the advantage of being detachable

cam-shaped grooves on its faces, the disc being inside the gear case. Quite a new and radical departure in the Talbot cars is the adoption in the 27-b.h.p. vehicle of side chain transmission in place of the cardan shaft and bevel gear. The starting handle is fitted with a simple spring device by means of which no injury can result to the operator should the engine give a back kick. The car is provided with no less than four brakes—a band brake operated by a right and left handed screw on a forward extension of the side shaft in the gear box, a large wide brake on the differential shaft, and internally expanding brakes connected with the hubs of the rear wheels. In contradistinction to the usual method, the latter are actuated by the driver pulling a lever towards him instead of pushing it forward. The differential shaft is carried in such a way that it may be detached without serious difficulty. The frame is attached to the rear axle by means of a special rocking arrangement connected with the springs. The new car is full of new features and its behaviour on the road during the coming season will be watched with interest. A prominent feature of the British Automobile Commercial Syndicate stand is the Bayard (Talbot) racer which played such a prominent part in the recent competitions at Dourdan and Gaillon. It is a marvel of light construction, the car complete, although equipped with a four-cylinder engine developing fully 75-h.p., weighing only 11½ cwt.

The well-known Garlio cleaning cloths shown on the stand of Messrs. M. and E. Marx appear to maintain their popularity among motorists, and are now being brought before the notice of motor-cyclists.

It is a new thing to be able to inspect the 1904 models of a French company in England ere they have been seen at a French exhibition, but, like the other concern already referred to, this is possible in connection with the extensive display made by Messrs. A. Darracq and Company. For 1904, this concern is making five types of cars: 8-h.p. single cylinder, 9-h.p. and 12-h.p. double cylinder, and 15-h.p. and 24-h.p. four cylinder. The 15-h.p. car is a new and interesting model;

Fig. 2.—The 24-h.p. Darracq Roi des Belges Tonneau.

it has a pressed steel frame of new design, slightly turning in at the fore part to allow the car to turn in a much smaller circle than previously. The four-cylinder engine has mechanically-actuated inlet valves, accumulator ignition, governor acting on the inlet, honeycomb radiator and fan, and all other modern fittings. The cardan shaft and bevel gear system of transmission is still retained, while the gear box is adapted to give three speeds ahead and one reverse, with direct drive on the top speed. Another feature of the Darracq cars which is retained in the new model is that the change gear is actuated by a lever on the steering column. The lubrication is effected by pressure from the exhaust, while, in order that there shall be no failure in the supply of petrol to the carburettor when travelling over hilly roads, an auxiliary petrol tank is fitted under the bonnet. The brakes on the car are of the internal expanding type, and, of course, act equally well whether the car be running in a forward or backward direction. The 24-h.p. cars are on similar lines, and of these, handsome specimens are seen in a double and a single brougham, having side entrance, these special bodies being fitted on to an extra

Fig. 3.—The Darracq Brougham with Side Entrance.

Photo by]

[Russell.

long chassis. The Darracq Co. are devoting much attention to the demand for cars, the rear seats of which can be reached from the pavement, and are building vehicles of this type in the 12-h.p., 15-h.p., and 24-h.p. models. The 12-h.p. car has a steel frame, but a framed ribbed-pipe radiator is employed in place of the honeycomb one. Other exhibits of interest on

the stand comprise an 8-h.p. van capable of carrying a load of 10 cwts. and one of the Darracq four-cylinder racing cars which took part in the recent competitions in France. This forms an interesting study of what can be done in the way of combining lightness with strength.

Messrs. Hall and Co., of Tonbridge, have an extensive display of De Dion and Darracq cars. Of the former only the 6-h.p. Populaires are shown, the bodies being painted in different colours. These little cars are now too well known to need description, but we may mention that among the detail improvements in the 1904 models are the fitting of a framed radiator and a separate cylinder head to the engine. Of the Darracq cars examples of 8-h.p. single-cylinder, 12-h.p. double cylinder, and 15-h.p. and 24-h.p. four-cylinder vehicles may be inspected. The 15-h.p. is quite a new type, and fitted with a Limousine coupe to seat six, and, with entrance at the side, forms a very attractive car. The frame of this vehicle is of one piece of stamped steel. Messrs. Hall and Co. also display an 8-h.p. double-purpose car. This is provided with a detachable tonneau and a van body to carry 5 cwt. It is well adapted for tradesmen's purposes, as either body can be readily substituted for the other.

For the 1904 season the Quadrant Cycle Company, Ltd., have brought out a decidedly novel two-seated motor-cycle known as the Tri-Car, of which we give an illustration in Fig. 4. Two separate motors of 2½-h.p. are employed, these being so arranged that they can be run singly or together by moving a foot lever. This feature of employing two motors is claimed to get over the difficulty of cooling a large single-cylinder motor. When disconnected, the electric current is also cut off from the idle engine, so that there is no waste of electricity or of gas. The control by one lever and the air tap is exactly the same as on the Quadrant motor-bicycle, whether one engine is working or both. The power is transmitted by V-section belts on to pulleys attached to each side of the back wheel. The latter is fitted with a special back-peddalling band brake, and the side wheels have band brakes actuated by Bowden wires. The driving wheel is fitted with a 2½-in. tyre and the side wheels with 2 in. The front carriage is coach built, and is suspended on extension coil springs. The principal spring is adjustable to different weights. Foot-rests with rubber mats are provided. The frame of the fore-carriage is attached by two tubular projec-

Fig. 4.—The Quadrant Tri-Car.

tions, which telescope into two open tubes of the tricycle near the bridge, and at the top by a bolt and nut on the steering head. It can be quickly removed when necessary, so converting the machine into a single-seated tricycle. A number of the Quadrant 2 and 3-h.p. motor-bicycles and tricycles are also shown. The engine has proved so entirely satisfactory that alterations have not been required except in very small details. Some riders having desired an exhaust-lift operated from the handle-bar, the makers inform us that this can now be supplied. As a result of experience, it has been decided to retain the surface carburettor. As, however, a little petrol is occasionally required for injection into the cylinder, a neat petrol extractor is now arranged in connection with the carburettor chimney, so that a charge can be withdrawn and applied in a moment. The radical change in connection with the Quadrant machine is the adoption of a spring fork which is claimed to largely reduce the amount of vibration usually experienced by motor-cyclists.

Practically the only firm showing a two-wheel motor-tandem is Messrs. Pitcher and Bartlett. It is arranged for a lady passenger at the rear; the motive power is supplied by a 2½-h.p. M.M.C. or Minerva engine, the driving belt being provided with a guard.

The Clarendon Motor-Car and Bicycle Company, Ltd., Coventry, have on view a number of their 3-h.p. "Clarendon" motor-bicycles. All machines made by this firm will be fitted with their patent adjustable outside pulley bearing, which has been improved for next season. A specially-designed 3-h.p. engine is fitted, the bore and stroke being 77 by 81 mm. respectively. A mechanical inlet valve is one of the improvements for next season, as also an effective silencer. No alteration in frame design has been made, this having proved satisfactory during the past year.

Although Messrs. J. R. Richardson and Co., Lincoln, Ltd., have been making motor-cars for some little time, it is the first occasion we have had an opportunity of inspecting them. Their attention is at present being centred on 12 to 14-h.p. cars, of which two are being exhibited, one having a standard tonneau body, painted in dark blue, and fitted with hood and side curtains, the other being provided with a special tonneau body upholstered in red leather, and painted the same colour. So far as the chassis is concerned both are identical, and, generally speaking, follow the lines which

Fig. 5.—The 12-h p. Richardson Car.

may be said to have become standard. The frame is of tubular construction, in the fore part of which is set a 12-14-h.p. Aster double-cylinder engine. The governor, which is adapted to act on the inlet, is entirely enclosed. The water circulation is maintained by a chain-driven pump and a ribbed radiator of the latest type, neatly set in a frame which fills up the front opening in the bonnet. The power is transmitted through a specially-arranged, self-contained clutch to a gear-box, giving four speeds forward and one reverse. Thence a cardan shaft conveys the power, through bevel gearing, to the rear live axle. Special attention has been paid to the brakes, one being fitted on the forward end of the bevel gear shaft near the cardan joint. On the shaft is mounted a special disc, in which is an expanding brake, actuated by a cam controlled by a lever. Altogether the Richardson cars appear to be of high-class construction, both as regards the chassis and the carriage work, large provision having been made in the way of lockers and pockets for the convenience of the passengers.

Quite a new car, and one which has a number of interesting features, is the 18-h.p. "Windora," which is being introduced by Mr. Stephen A. Marples to meet the demand for a high-class, fully-powered vehicle of up-to-date design at a reasonable price. The frame is of channel steel construction, but in the later cars one of stamped steel will be employed. The motive power is furnished by a four-cylinder engine of the slow-running type, fitted with mechanically-operated inlet valves and a new automatic carburettor. The automatic governor is, as in all modern cars, adapted to act on the inlet. Either the ordinary high tension or magneto ignition can be provided. The Grouville and Arquembourg enclosed radiator is employed in connection with the water circulation, which is maintained by a pump. The fly-wheel, of special design, is fitted with helical arms, to create a forced draught through the radiator, the engine being entirely enclosed above and below. The clutch is made of rolled sheet steel pressed into shape and faced with leather. From the clutch the power is transmitted to the change gear-box, thence by bevel gear to a differential shaft, connected by side chains to the rear road wheels. The differential shaft is entirely separated from the gear-box, the power being transmitted from one to the other through a flexible joint. A new design of clutch brake is employed; slight pressure of the pedal when changing gears throws out the clutch, and a further pressure brings into contact with the latter a leather-faced brake, which instantly arrests its motion, greatly facilitating the operation of changing up gears. With a view of facilitating the control, the accelerating and advance sparking levers are arranged above the steering wheel. The irreversible steering gear is of a new type, claimed to present a great advance on the usual worm and segment type. Any play in the steering wheel may be adjusted by turning a single nut without risk of damage to the gear. All essential parts of the steering mechanism and front wheel control are in forged steel, case-hardened at the wearing points, and provided with small oil holes. Both front and rear axles are of forged steel, while the wheels are of large size—870 by 90. Altogether, the "Windora" appears to be a high-grade car, well worthy of the close inspection of motorists.

Four distinct types of Durkopp cars are exhibited by the Motor-Car Emporium, Limited. First we examined a splendid example of the latest Durkopp three-cylinder 15-16-h.p. car, which comprises too many special features to be fully dealt with in a show report. The general arrangement is similar to that adopted in chain-driven cars of the Panhard type, the motive power being supplied by a three-cylinder engine having mechanical inlet valves. The three cylinders are in one casting with an air space between each. In addition to the governor which acts on the inlet, the engine is also controlled by a variable cam fitted to the inlet valve, by which not only can the lift of the inlet valve be varied, but also the time of lifting, by means of a small lever on the steering column. This arrangement is claimed to result in an exceedingly elastic engine, it being possible to vary the speed from 120 to 1,000 revolutions per minute. A special form of cooler is employed, through which a current of air is induced by a fan, the water being circulated by means of a gear-driven pump. Either magneto or accumulator ignition can be fitted. Three forward speeds and a reverse are provided, the drive on the third being direct. Special attention has been devoted to the question of brakes and the lubrication, while the engine and gear box are protected from below by means of a sheet-steel casing. Those seeking a closed car with side entrance will find such a vehicle in the Durkopp brougham, which is fitted with a 10-h.p. two-cylinder engine. To admit of a low-built car the frame is of special construction, while modifications have also been made in the transmission mechanism; from the gear box the power is conveyed by a cardan shaft and bevel gear to a rotating shaft, below the fixed axle; on the ends of the shaft are pinions which gear with internally toothed rings bolted to the rear road wheels. What is undoubtedly the largest vehicle in the show is the Durkopp public-service vehicle, of which we give an illustration on page 739. In addition to the driver and conductor this car has accommodation for twenty passengers. The engine comprises three cylinders and develops 18-h.p. Three speeds and a reverse are provided, the maximum being about eighteen miles per hour. The vehicle has somewhat a heavy appearance, but we understand that a number of them are already at work in Germany and proving successful. On this stand is also to be seen a small 6-h.p. two-seated car on standard lines introduced to meet the demand for a popular-priced vehicle. What is perhaps the most interesting exhibit, at least from an engineering point of view, is the Durkopp six-cylinder engine. This is practically two 3-cylinder engines coupled up on to one large crank case. It develops 40-h.p., and is undoubtedly a fine piece of work.

For the 1904 season the Rex Motor Manufacturing Company, Limited, are introducing two new types of cars—12-h.p. and 24-h.p.—these being known as the "Rex Simplex," the 12-h.p. having two and the 24-h.p. four vertical cylinders, 4 in. dia. by 4½ in. stroke. Of the new type only one of the 12-h.p. models is shown. From an inspection of this we find that a frame of pressed steel is being employed, to which the engine and gear box, as well as the body, is directly attached, no underframe being employed. A feature of the engine is that no outside fly-wheel is employed, each connecting rod being attached to a couple of discs acting as flywheels inside the crank case. The exhaust as well as the inlet valves are located in the top of the cylinder head, the exhaust valves being operated by a side rod and suitable levers very much in the way adopted in the Buchet engines. The carburettor is of the float-feed type with a throttle valve attached. The gear box, which is adapted to give three forward speeds and a reverse, with a direct

Fig. 6.—The 18-h.p. "Windora" Car.

drive on the third, is supported from the frame by long arms extending from the case to the sides of the frame. Very wide pinions are employed in the gear box; the cardan shaft and bevel gear system of transmission on to a live axle is adopted, universal joints being introduced not only in the cardan shaft, but between the gear box and the clutch. The latter is of the cone type, 15 in. in dia., and can be readily dismantled without disturbing the change speed gear. Altogether the new Rex car is a marked advance on its predecessors from the same works.

Still another new car is the "Wilkinson-De Cosmo," the joint production of the Wilkinson Sword Company and M. J. de Cosmo, until recently the consulting engineer in the motor department of the Fabrique Nationale d'Armes, of Herstal, Belgium. The vehicle, which is being introduced by the Cadogan Garage and Motor Company, Ltd., of Chelsea, is an excellent specimen of modern motor-car construction, and has been closely inspected during the week. The frame is of channel steel, in the fore part of which is arranged a four-cylinder engine developing 24-h.p. The cylinders are cast in two pairs, and are 130 mm. bore by 100 mm. stroke, the normal

Fig. 7.—The Wilkinson-De Cosmo 24-h.p. Car.

speed being 900 revolutions per minute. The gas is furnished by a special carburettor, in which the mixture is automatically varied according to the speed by means of a diaphragm. The automatic governor is adapted to act on the inlet and can be cut out by means of a pedal. The silencer is of new design, claimed to allow the engine to work quietly at all speeds, without any appreciable back pressure. A framed rib radiator is employed in connection with the water circulation, which is maintained by a gear-driven pump. Three speeds and reverse, controlled by one lever, are provided, the engine driving through a clutch, gear-box, and cardan shaft on to a rotating shaft inside the rear hollow axle, which carries the wheels, the power being communicated to the latter at the ends. In addition to the usual brakes, a ratchet sprag is fitted on the shaft which projects from the rear end of the gear-box, to prevent the car running back on hills. Altogether, the new car, as will be seen from the illustration (Fig. 7), is on up-to-date lines, being fitted with a luxurious tonneau body adapted to seat five persons. The Cadogan Company also exhibit two "Antoine" belt-driven motor-bicycles, of 2½ and 2¾-h.p. respectively. The engines, which are set vertically in a loop frame, are noticeable for the deep radiating flanges with which the cylinder is provided.

The well-known De Dietrich cars are to be seen on the stand of the Burlington Carriage Company, Ltd., whose exhibit comprises a couple of highly-finished 16-h.p. cars with tonneau bodies and the chassis of the

Fig. 8.—Chassis of the Wilkinson-De Cosmo Car.

12-h.p. type, permitting the details, which have already been described in the *Journal*, to be examined.

Quite a large family of Baby Peugeots is to be seen on the stand of Messrs. Friswell, Ltd., including one of the first of the 1904 models. Among the many minor improvements in the latest type we note that the rear axle is now being made stronger, and that adjustable ball bearings are fitted in the centre, outside the differential gear-box. The wheel base has been slightly lengthened. So far as the 5-h.p. engine is concerned no alteration

has been found necessary, except that an improved form of silencer is being provided. A new three-speed and reverse gear is now employed, ball bearings being fitted to the second shaft. An interesting little detail is that the oiler is now arranged so that it can be actuated by the foot. With a hood, side doors, and front glass, the new Baby makes a decidedly smart little car. Several of the 2-h.p. Peugeot motor-bicycles are also to be seen on the stand.

Messrs. Burkin and Clarke, of Beckenham, exhibit an ingenious form of portable canopy for the use of motor-cars. The blinds are fitted with springs, and, as they are independent of each other, fold up neatly when not in use. The side or back blinds can be used independently of each other, and employed to protect the passengers either from rain or dust.

Accumulators for use on motor-cars and cycles form the exhibit of Messrs. H. W. Cocks and Company, Richmond. They are made in celluloid, ebonite, and polished teak or walnut cases. A feature of the Cocks accumulator is that the plates are well raised from the bottom of the cell, and are fitted with non-short-circuiting separators. They are sealed with composition, and a special acid-proof cement is used, which is stated to neither crack nor allow acid to creep to the terminals.

A car, which since its introduction a few months ago has quickly run into the front ranks of popular-priced vehicles is the "Vauxhall," made by the Vauxhall Ironworks Company, Limited. The standard pattern is a two-seated car, but examples of vehicles capable of seating four persons are also on view. The motor consists of a 5-h.p. governed water-cooled horizontal engine of the slow-running type. The piston and all working bearings are automatically lubricated from a glass-sight feed drop lubricator, placed on the dash-board in full view of the driver. The crank case is so designed as to be readily opened completely in halves, by un-screwing four nuts. A large inspection door is also provided through which a quick examination of all the main working parts can be made. A heavy fly-wheel of large diameter is employed, which aids greatly to steady and easy running of the engine and car. The

Fig. 9.—The Vauxhall 5-h.p. Car.

carburettor is of the spray type, with self-adjusting air inlet, and is self-contained with the inlet valve and its case, the whole being detachable for inspection by unscrewing three nuts. The governor is of the centrifugal type, and is controlled by a small foot pedal, by means of which the speed of the engine may be varied as desired. Two speeds are provided—eighteen and eight miles per hour. On the top speed the power is conveyed direct from the crank shaft to the tubular back axle by a single chain. The low speed is obtained by a special form of rotary or crypto gear box carried on the motor shaft. The frame is of the flitch plate girder type, the strength of the wood body being incorporated with the steel frame. Leather-lined double-acting band brakes are fitted to drums on both back wheels, actuated either by a pedal or a hand lever. The control of the speed of the car and engine is effected by a handle conveniently placed to the driver's right hand on the top of the steering pillar. By slewing this handle partly round the pillar, the three positions, "1st Speed," "Stop," "2nd Speed," are obtained, and by slightly rotating the same handle the speed and power of the engine are controlled by limiting the amount of mixture admitted to the cylinder. The steering is effected by the left hand of the driver actuating a horizontal tiller so hinged to the top of the steering pillar that it can be thrown up vertically to permit of easy access to the driver's seat. The water circulation is maintained by a small rotary gear-driven pump and a series of brass radiators. A feature of the vehicle is the employment of spiral springs, these having been adopted in order to obtain the ease of motion associated with the best examples of heavy cars, at the same time adding generally to the neatness and strength of the design. Owing to the general design, low revolutions, and a novel form of exhaust silencer, the running of the car is extremely silent.

An immense display of motor-cycles is made by the Rex Motor Manufacturing Company, Limited, no less than fifty machines being staged. For the 1904 season the Rex is being fitted with a 3½-h.p. vertical engine, fixed in a cradle in front of the bracket. It is attached to the cradle by four of the crank chamber bolts, which slip into slots in the cradle, allowing the engine to be easily detached from the machine. The engine is now fitted with valves 1 7/8 inch in diameter, and a new quick detachment inlet dome which can be taken off by simply unscrewing one set screw.

Fig. 10.—Sectional View of Tank and Carburettor of Rex Motor-Bicycle.

In Fig. 10 we show the arrangement of the engine, petrol tank, carburettor, lubricating oil tank, accumulators, and coil. The new engine is fitted with the Rex silencer, which is incorporated in the walls of the cylinder, but a departure has been made by casting a series of air ducts between the exhaust chamber and the cylinder wall in a direction fore and aft of the machine. Through these ducts a current of air is constantly passing when the machine is in motion, which is claimed materially to assist in keeping the engine cool.

The wipe contact has been adopted in conjunction with a trembler coil, and a spare accumulator is provided. New oval girder forks and extra wide mudguards make another feature of the machine, while the wheel base has been considerably increased. The mudguards over the rear wheel are now provided with a side extension, which covers the belt, and protects it from wet, mud, and dirt.

All the new models are finished in aluminium, and lined, a finish which the firm have adopted as a standard. Another feature which will be appreciated by users of these machines is a direct action brake operating on the inside of the belt pulley. This is put into action by means of the rider's foot without leaving the pedal. In addition to the motor-bicycles a number of the two-seated Rex "tri-cars" are on view, one being fitted with a small box in place of the front seat, and being intended for tradesmen's use.

The Beaufort Motor Company are early in the field with a car built to meet the demand for a vehicle the rear seats of which can be reached from either side, instead of at the rear. The car, which is known as the "Princess" phaeton, is of pleasing design, and has attracted much attention during the week. The rear part of the carriage body is of tonneau form, having ample room for three passengers. So far as the chassis is concerned, it may be mentioned that the frame is of pressed steel. The 12-h.p. engine is fitted with mechanically-operated inlet valves, actuated by two cams, these and the automatic governor running in oil baths. For ignition purposes, the Bergmann magneto is adopted. Three forward speeds and a reverse motion are provided, the cardan shaft system of transmission on to a live axle being adopted. A feature of the rear axle is that it is surrounded by a casing which relieves it of all strain. The brakes are of the internal expanding variety, while the water cooling is effected by a gear-driven pump and a special radiator, through which a current of air is induced by a large fan. The Beaufort 10-h.p. two-cylinder car is a no less interesting vehicle, comprising practically all the same features as the new 12-h.p. vehicle; while a powerful touring car is to be seen in a 20-h.p. four-cylinder chain-driven tonneau with canopy. On the stand are also to be seen examples of the Beaufort 9-h.p. single-cylinder cars, which are so well known as to render a description unnecessary at this time.

A car which has come into considerable prominence during the past few months is the "Sunbeam," made by Messrs. John Marston, Ltd., who

exhibit two well-finished examples of the same. While following the now standard lines of chain-driven cars, the details are such as to command attention. The motive power is supplied by a four-cylinder engine having a relatively long stroke, the cylinder dimensions being 80 mm. bore by 120 mm. stroke. It is of the slow-running type, the normal speed being 800 revolutions per minute. The governor is adapted to act on the inlet. Four speeds forward and a reverse are controlled by one lever, a safety device being provided to prevent the reverse motion being used when the car is going forward. The engine and gear are entirely protected below by a steel shield; while what is perhaps the most interesting feature of the car is the fact that the driving chains are entirely enclosed in oil-containing gear cases, which are so fitted as to move with the springs in every direction. There can be no question that by means of these cases the life of the chains is considerably increased. Messrs. Marston also display one of the curious-looking "Mabley" cars, which have already been described in these columns.

What appears to be a well-made 3-h.p. motor-cycle engine is that shown by Messrs. White and Poppe, Ltd., of Coventry. The cylinder has a bore of 80 mm. by 80 mm. stroke, developing 3½-h.p. on the brake. We understand, however, that a slight alteration is being made in these dimensions in order to bring the engine up to 3½-h.p. The inlet and exhaust valves are on the same side of the engine, both being mechanically actuated. The rods which lift the valve stems are provided with adjusting screws, so that any wear may be taken up, and prevent any noise or rattle in connection with the valves. Another useful feature is that the valve seatings, as well as the valves, can be readily detached, and that air can circulate completely round the externally-ribbed walls of the valve chambers.

An interesting display of the Westfield Autobikes is made by the Rising Sun Motor Works, of Brockley Road, S.E. The engine—of 2½-h.p.—is mounted vertically in the frame; the cylinder is 74 mm. bore by 78 mm. stroke, with large flywheels and bearings. Transmission is by means of a V-belt. A feature of the machine is that an improved twisting handle, connected with the exhaust lift and switch, enables it to be controlled without taking the hands from the handlebars. Two brakes—an expanding band brake in the back hub and a front rim brake—are fitted. Three sizes of engine pulleys are made—small, for forecarriage and trailer work in hilly districts; medium, for ordinary travelling and trailer work; large, for fast road work and racing; these pulleys being interchangeable and easily detachable. A couple of Trimos, or motor-bicycles with fore-carriages, for two persons, are also shown, one having a 2½-h.p. motor and the other an engine of 3½-h.p.

A large display of the "Britmo" motor-car components is made by the British Motor Fittings Company, Birmingham. Among these are examples of the firm's 9-h.p. and 12-h.p. vertical two-cylinder engines. These are of the slow-running type—about 900 revolutions per minute. The two cylinders are cast in one piece, the bore and stroke in the 9-h.p.

Fig. 11.—The British Motor Fittings Company's Change-Speed Gear.

type being 4 in. by 4½ in., and in the 12-h.p. 4½ in. by 5½ in. The contact maker is of the "wipe" variety, while the centrifugal governor is, as usual in all modern engines, adapted to act on the gas inlet. Change-speed gears are another product of the concern, these being made arranged for both chain-driven and live axle cars. Fig. 11 depicts the gear-box giving three speeds and reverse on one lever, adapted for chainless cars of from 7 to 10-h.p. Specimens of water-circulating pumps, front and rear axles, worm and segment steering gears are also included in the display, which is well worthy of inspection by motor-car agents and builders.

(To be concluded.)

THE STANLEY SHOW.

As at the National, there is a very imposing display of motor-cycles at the Stanley Show, at the Agricultural Hall, Islington, N.

One stand is devoted to a representative display of chain-driven motor-tricycles, bicycles, and tandems by Messrs. Humber, Limited, the presence of a working model of the engine being a popular feature. The chief development for the coming season is the fitting of the clutch illustrated in Fig. 1. This enables the engine to be started by means of a handle. It will then run without the machine being mounted on a stand. When the engine is running, the machine can be

Fig. 1.—The Clutch on the Coventry Humber Motor Bicycle.

mounted and the clutch brought into play to connect the engine with the road wheels, thus obviating the necessity of pedalling. This clutch is shown on the 2½-h.p. Humber motor-bicycle, the 2-h.p. Humber motor-bicycle, and the 3-h.p. Humber Olympia motor-tandem. This latter has a water-cooled engine in the usual position on the Humber machines, the radiators projecting from the tank fitted behind the seat of the fore-carriage. A fore-carriage for the G.P.O. is also one of the attractions on this stand.

The Iris Motor Company exhibit a range of both air and water-cooled motor-bicycles. Although they have only been introduced into this country during the past season, they are already well known, while on the Continent they occupy a leading place among motor-cycles. The first machine to catch the eye is the 5-h.p. double-cylinder water-cooled motor-bicycle, fitted with friction clutch, 1½ in. flat driving belt and hand starter. The water tank has an ingenious little radiator on each side and carries sufficient water for a run of 200 miles. The whole machine, although water cooled and having two cylinders, does not appear clumsy or complicated, while the weight, 160 lbs., cannot be called great. The carburettor is of a new type, with

Fig. 2.—Section of Clutch on the Iris Motor Bicycle.

automatic mixture adjustment, and the only lever is for the throttle. As will be seen from Fig. 3, the engines are arranged in the form of a V, the two pistons working on to a central crank shaft. The cylinder dimensions are 65 mm. bore by 80 mm. stroke. As already mentioned, the engine pulley is provided with a clutch which enables the motor to be started by hand before mounting. A sectional view of the clutch is given in Fig. 2. The disc *a* fixed to the motor shaft *b* is covered with vulcanised fibre *c*, and forms a cone for engaging in the belt pulley *e*, which is forced into contact with it

by a spring *f*, but otherwise runs free on the shaft. The pulley *e* has a ring *k* engaging in a groove in the collar *i*. This collar and the fixed shoulder *h* have inclined surfaces, so that when the collar is rotated by the arm *j*, the pulley *e* is drawn out of contact with the cone *c* and the engine runs free. With the parts in this position the motor may be started by a handle applied to the extension *l* and cross pin *m*. The Iris Company also show a machine fitted with a single-cylinder, water-cooled 2½-h.p. engine, with multitubular water tank. This is also provided with friction clutch and hand starter, other details being similar to the 5-h.p. machine. The total weight is 120 lbs. For those not desiring water-cooled machines, 5-h.p. twin-cylinder and 2½-h.p. single-cylinder air-cooled machines are also made, as well as a very light 2-h.p. air-cooled machine weighing 80 lbs. The Iris Motor Company are also agents for Bara and Pascual, manufacturers of electrical accessories, Paris, and have a large display of accessories for motor-cycles and cars. Another line well worth carefully examining is the Nil Supra make of coils, an exhibit of interest in this section being a four-cylinder coil for cars with only one high-speed trembler for the four plugs.

Considerable interest is being shown in the exhibit of Griffon Motors, Ltd., and more particularly in the 4½-h.p. racing motor-bicycle which Demester, the well-known French racing motor-cyclist, has ridden to victory in several recent competitions and races in France and Belgium. The standard Griffon motor-bicycle is fitted with a 2½-h.p. engine, located vertically in the frame. The inlet valve is mechanically actuated, while the mixture is furnished by the latest type of Longuemare carburettor. The machine, which is belt-driven, appears to have been well thought out with the object of rendering all the parts of easy access, while the weight has been kept down as far as possible, the weight complete being 110 lbs.

One of the latest Coventry cycle firms to take up the manufacture of motor-bicycles is the Rover Cycle Company, Ltd., who have produced a very interesting machine. The frame is of special design for the purpose of carrying the motor in the popular vertical position. The motor is of 3-h.p., having both a bore and stroke of 3 in. The inlet and exhaust valves are mechanically operated, a separate cam being used for each valve, and the

Fig. 3.—The Iris 5-h.p. Water-cooled Motor Bicycle.

lower end of each valve tappet being provided with a roller to minimise the friction. An improved method of retaining the valve springs is employed, consisting of a slotted collar which slides on to a reduced diameter near the end of the valve stem, over which a sleeve fits, holding it in its place; the top of the sleeve is cupped out to accommodate the lower end of the valve spring. The sparking plug is situated immediately above the inlet valve, and in the exact centre of the cylinder head is inserted a patent paraffin valve. Handle-bar control is provided by the left inverted lever actuating an exhaust valve lifter, whilst the right inverted lever breaks the electric current and also applies the front brake. The contact-breaker is an original design, having neither a trembler blade nor a platinum-tipped screw; it is a "wipe" contact, there being, however, no friction except at the moment of the contact being made. The carburettor is of the float-feed spray type. Two separate accumulators wired up to a two-way switch are provided, so that one accumulator can be always held in reserve and instantaneously switched into use upon the other evincing signs of exhaustion. Transmission is effected by a V-belt. In addition to the front wheel rim brake worked by the right hand inverted lever, a back-pedalling expansion brake actuated by a clutch on the crank shaft is provided.

At the stand of the Motor Manufacturing Co., the 8-h.p. M.M.C., which has figured so well in recent Trials is conspicuous, and the chassis, which is also shown, is worthy of close study. The company is making an important feature of bicycle motors, and that fitted with mechanically operated valves is receiving considerable attention from the trade. To this we hope to refer again in a later issue.

The new models of the Minerva motors and motor-cycles have already been dealt with in the *Journal*, so that it is only necessary to mention that a big display of these well-known engines and machines is made by Minerva Motors, Limited. Examples of motor-bicycles, with the engine set both vertically and inclined, are staged, the horse-powers ranging from 2 to 3½-h.p. Much interest is being shown in the 3½-h.p. racing and pacing machines, with their long and curious handle-bars, as also in the frames containing the component parts of the Minerva engine. Reference may also be made to a 2-h.p. motor-bicycle ingeniously arranged for the use of a lady rider.

With the view of overcoming the great vibration experienced on many motor-cycles, Mr. J. L. Thomas, of Barnet, is showing a very ingenious

spring fork. Although this is exhibited in connection with a 2½-h.p. motor-bicycle of his own construction, the spring fork is now made in such a way that it can be fitted to any machine. Not having had a trial, we cannot speak from experience, but the arrangement certainly looks one likely to at least reduce the amount of vibration transmitted to the rider.

Messrs. Alldays and O'ions have an interesting exhibit of their new pattern motor-cycles, some of which have fore-carriages attached. They are also showing their latest model of "Traveller" voiturette. There are several special features in the motor-cycles. The 2½-h.p. engine is made throughout by Messrs. Alldays, and all parts are interchangeable. The frame is designed with a special cradle for carrying the motor in an upright position. Lugs are provided on the crank case which correspond with the faces on the cradle, and are securely held by four bolts, an arrangement which is claimed to give great strength to the frame, and obviates the necessity of clamping the engine to, or bending the tubes. The tank has compartments for two accumulators, coil, lubricating oil, and sufficient petrol for 160 miles. A float register is provided for showing the quantity of petrol in the tank. The machines, fitted with fore-carriages, are strongly built, and a specially-designed frame is constructed for carrying a well-finished and smartly-upholstered bucket seat. The 5-h.p. "Traveller" voiturette, which has already been described in these columns, shows a few changes in detail, but is otherwise unaltered. We understand that the company are at work on a somewhat larger car, which will be fitted with a 6½-h.p. engine.

An ingenious motor-cycle belt fastener is exhibited by Messrs. Smith Bros. and Co., of Gloucester. It is designed so that both ends of the belt meet together; the top cleats have oval holes put in them, so that when passing over the engine pulley they come into operation and take away half the strain on the centre staple and allow the belt to be perfectly flexible. The fastener is intended for use with flat and V-shaped belts.

Among the exhibitors of tyres are Messrs. Reddaway and Company, who show their non-slipping treads; the Dunlop Pneumatic Tyre Company, Ltd., who, in addition to a full range of tyres for cars and motor-cycles, have a good display of motor clothing, including the Autosaque, the D.B. motor suit, driving aprons, etc.; and Messrs. Shippey Bros., with their Diamond motor-tyres and the "new puncture proof" jelly compound. The Palmer cord tyres, illustrated in the *Journal* last week, are attracting crowds to the stand of the Palmer Tyre, Ltd., while the identical set of tyres used by M. Jenatzy in the Gordon Bennett race render equally good service to the exhibit of the Continental Caoutchouc and Gutta Percha Company. The North British Rubber Company, Ltd., have a large display of Clincher-Michelin motor-tyres, Clincher motor-tyres and solid tyres for automobiles. Adjoining their exhibit is that of another firm from north of the Tweed, the Scottish Tyre, Ltd., which shows the "Scottish de Luxe" voiturette tyres, which are built up with rubber and tangential linings, the normal crescent shape being maintained throughout the whole process, to ensure resistance to punctures. The Clipper Pneumatic Tyre Company have a selection of motor repair outfits, and their Clipper-Continental motor tyres for heavy cars as well as for voiturettes. Messrs. David Moseley and Sons, in addition to a selection of leather goods for motorists, show their ribbed tyres for light cars, jointless motor tubes, and the Simplex motor-cycle cover.

A motor tool bag of good appearance is the principal exhibit of Messrs. Gough and Co., of Birmingham. This has separate compartments for each tool, and closes into a space of 8½ in. by 6½ in. by 4½ in., the shape being retained by reason of the thin sheets of aluminium with which the top and sides are lined.

Motor tools are shown by Mr. Joseph Bradbury, of Braintree, and from the same town come Messrs. Lake and Elliott with some of their specialties, which have been previously illustrated in our columns. Their "Millenium" universal motor jack has a long handle with easy adjustment, while its range is from 8½ in. to 21½ in. Brazing lamps, wheel-building tools, stands, and jacks of great variety make up Messrs. Lake and Elliott's good display.

Excellent motor castings in aluminium attract many visitors on entering the Arcade, these being shown by Mr. Robert W. Coan, of Myddelton Street, Clerkenwell, whose practical experience in the business has been the great factor in its success. His castings are characterised by good work, and Mr. Coan's clientele embraces the leading firms in the industry.

The portable steam vulcaniser shown by Messrs. Harvey Frost and Co. will prove a useful machine in many a provincial garage. This is adaptable to work either on the curve or the flat, and with steam heat at 80 lbs. pressure the temperature can be assured to be exactly that necessary for an efficient repair. The steam is raised by a Bunsen gas burner, located under the generator, and is easily regulated by the admission of more or less gas. By means of this simple device tyre repairs can be quickly effected. Messrs. Harvey Frost and Co. have also an assortment of accumulators, auto-tremblers, coils, plugs, contact breakers, and other accessories.

Bifurcated rivets are shown by the company bearing that name, whose offices are in the Wool Exchange, E.C. These are proving effective for the repair of belts, etc., and can be had in sizes ranging from ½ in. to 1½ in.

Motor clothing in almost confusing variety is exhibited by Messrs. Alfred Dunhill, Ltd., who is attracting visitors to his stand by means of a mighty motorist clad in a paraphia and accompanied by a diminutive lad in motor-cycling garb. These, perambulating the gallery, lead the onlooker to the stand, whereon is as fine a show of motor accessories and clothing as we have seen. Motor-car driving aprons, speed indicators, goggles of a hundred styles, lamps, cleaning outfits, etc., find a place, while the display

of motor coats and waterproof clothing is equally comprehensive. "Bobby finders" are a new feature of this firm's display, these consisting of a pair of opera glasses neatly embedded in a goggle frame.

Ample preparation for the new conditions which will be imposed on motorists by the new Act has been made by Messrs. Salsbury and Son, Ltd., who have brought out a new tail lamp fitted with a removable red glass at the rear. This, when taken out, enables the lamp to be used for inspection purposes. The side light is set at a proper angle to fully illuminate the number plate, and the lamp is well designed as well as neatly executed. To avoid the glare from the headlights some of the lamps are now fitted with a detachable shade, which can be drawn across to avoid frightening horses, etc. Recently Messrs. Salsbury and Son have extended the scope of their business to embrace motor accessories of every kind, and are now placing the "Strictor" belting on the market. Clothing is also within the range of their activities, their specialties in this department being distinguished by the trade name of "Komilfo."

The "Bartlite" acetylene lamps for motor-cars comprise a serviceable display made by Messrs. Bartlett and Co., of Monkfield Road, South Tottenham, N. These are of uniform good design and finish, being made with round or oval fronts in brass, German silver, or in nickel-plated brass. In this lamp the generation of gas can be stopped at once, and should the charge of calcium carbide not have been exhausted, the lamp can be put on one side and relighted when required, without recharging. The "Bartlite" lamp will burn in any position and will give a good light for twelve hours with one charge of carbide, and one charge of water. An excellent arrangement is that of an independent generator with two lamps. This is intended to be fixed under the driver's seat, and is connected with the lamps by flexible metal tubing. Each generator is provided with three taps, one of which can be used in connection with the tail lamp if desired.

From Nottingham come Chas. Binks, Ltd., with a novel four-cylinder motor-bicycle of 5-h.p., in which the rider sits in a spring bracket seat, properly upholstered, and provided with foot rests, giving something of the comfort associated with the car. Our illustration (Fig. 4) shows the machine with the cylinders arranged longitudinally, although these can also be fitted transversely, thus presenting a greater surface for air cooling.

Fig. 4.—The Binks Two-Wheel Car.

The motor-cycle is chain-driven from the countershaft. The crank-shaft and the cam-shaft are both mounted on ball bearings. Mechanically-operated inlet valves have been fitted. The ignition is effected by a four-trembler coil and one set of batteries. To start the engine no pedalling is required. The petrol supply having been turned on, the machine is pushed about three feet, the rider takes his seat and raises the clutch lever and the machine will start at once. It is claimed that vibration is reduced to a minimum in this machine, which has an aspect of simplicity about the handle bar which will prove attractive to many riders.

(To be concluded.)

THE couplings on the exhaust pipe should be carefully watched when a car is new. It will be found that they are apt to work loose at first, owing to the expansion of the exhaust pipe when hot and its subsequent cooling. Occasionally tightening the couplings with a wrench will soon set them right, after which they should require no further attention.

A READY way to test petrol in the absence of a hydrometer is, remarks Mr. R. B. Bramwell in "The Automobile," to pour a quantity of the doubtful fluid on the palm, moving the hand rapidly about to aid evaporation. If the hand is left perfectly dry the petrol may be safely employed, but if an oily residue remains it should not be used.

WHILE in a petrol car the water jackets of the engine cylinders are the parts most likely to be damaged by freezing, in a steam car the piping system is the most exposed. As anti-freezing solutions cannot be employed in steam boilers, in very cold weather the tanks and pipes of a steam car should be completely emptied when it is stored in a cold stable.

CORRESPONDENCE.

CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. Cave-Browne-Cave, the "Boron" battery is merely a double-fluid chromic acid cell, which is perhaps the best type for charging accumulators. Three cells of such a battery will charge two 2-volt accumulators in parallel, but as some car cells are made up permanently in pairs, as 4-volt accumulators, about five cells would be necessary, and, in this case, it would be advisable to have a resistance in circuit, which may be merely a length of, say, No. 16 German silver wire, so as to adjust the current to that suitable to the accumulator, generally between two and four amperes. Two-fluid chromic batteries work best if a proportion of potassium chlorate is used in the depolarising solution, a good formula being:—Chromic acid, 12 oz.; sulphuric acid, 12 oz.; potass. chlorate, 1 oz.; water, 40 oz. Batteries, however, are messy and troublesome at the best, and if power, or even a good water pressure suitable for running a miniature water motor, is available a small dynamo is much to be preferred, or the latter can be fitted on the car.—Yours truly,

R. W. BUTTEMER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The photo I send you shows my Boron battery applied to charging two accumulators, from which it will be seen that the method of using the battery is very simple and requires no extensive knowledge of electrical science. I have had the battery over four years. There are other batteries to be obtained, but I think the Boron battery would be hard to beat for economy, simplicity, and freedom from risk. Even if I could

get my accumulators charged 100 yards away I would prefer to do them myself. In fact, I have current in my shop driving a 2-h.p. motor, but I would not take the trouble to tap the supply while I have the battery. I have no interest other than that of a satisfied user. Mr. Cave-Browne-Cave or anyone else will get fullest particulars from the Boron Battery Company, of St. Domingo Road, Liverpool.—Yours truly,

J. HOPE.

DIFFICULTY IN STARTING MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under this heading, "Anxious," who possesses a stubborn 2-h.p. Beeston, asks your readers for kind advice as to the treatment of his fractious engine. In your interesting editorial answer, the difficulty is attributed to a variety of causes, which, from their multiplicity, are apt to perplex the inexperienced beginner. After some years' practice I have always found the difficulty in starting due to one cause alone, and to none other, viz., the solidification of the lubricating oil in the cylinder piston rings. My own much-valued 2½-h.p. Clyde "Magneto" bicycle always annoys me in this manner. As it, happily, is not subject to the sparking troubles to which you refer, it is clear the cause is not to be sought for in that direction. Now, as to the remedy, let "Anxious," the moment he finishes a journey, run out the lubricant from the bottom of his crank chamber, and, as you say, inject some paraffin, or petrol through the compression tap. Motor-cyclists must, however, purchase portable stands—the McCurd I can recommend. Then, after another injection, before starting let them mount their stationary steeds, and the two hours' difficulty, which "Anxious" alludes to so feelingly, will resolve itself into two or three moments' vigorous pedalling, which breaks down the adhesions of the lubricating oil. Of course stale petrol in the carburettor might, if the machine has been put on one side

for some time—be responsible for faulty firing, but your correspondent tells us he sees to this. After trying my remedy, if "Anxious" will inform us of the results he obtains, in your columns, I think he will in future sign himself "a joyful motorist," instead of an anxious beginner.—Yours truly,

EDWARD KENNARD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Anxious's" letter in the last issue of the *Journal*, I think that his trouble is very likely due to the petrol, which of late has been very indifferent, though he must bear in mind that all surface carburettors are liable to give trouble in starting, especially in cold weather and after standing. He will possibly get over the difficulty by injecting petrol into the cylinder, so that the first few explosions may be obtained. A spray carburettor would certainly be preferable, and there should be no difficulty in affixing one to his tricycle.—Yours truly,

HAZELDEAN.

QUERIES RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly inform me, through the *Journal*, (1) Is it possible to fit a 3½-h.p. De Dion engine in a 3½-h.p. Benz car in place of the original engine, and connecting the crank shaft with the present drum so as to retain the ordinary Benz belt drive? Of course the large flywheel would be taken off. (2) If so, would the gearing of sprockets require very much alteration, and would the original trembler coil and carburettor be successful? Also, would the present system (ordinary Benz) of water-cooling act all right? If possible at a moderate cost would you advise the alteration? Would it develop more power than the slow speed engine?—Yours truly,

W. R. COLLIS.

[It would be quite possible to fit a 3½-h.p. De Dion engine into a Benz car, but not without a considerable amount of alteration and expense. In the first instance the gearing down of the sprockets would need to be just double what they are at present, the Benz engine running at 750 revolutions per minute and the De Dion at from 1,500 to 2,000. The carburettor would probably prove satisfactory, but we are in doubt as to whether the coil would be sufficiently fast, as those usually fitted are not of the high-speed type. The water circulation would also need a pump and radiator, as with the present engine the water rapidly boils away, and this would be doubly increased with an engine running at double the speed. Upon considering all points, we should not advise the alteration. The power would be practically as at present.]

THE SPEED OF TRAMCARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to know what useful purpose is being served by the course pursued by Mr. Ford in regard to the speed of the electric tramcars. In these times people want to get from place to place in the quickest time possible, and I feel sure they will not thank Mr. Ford for his trouble. Who asked Mr. Ford to champion this cause? Does he hold any mandate from the British public to so act?—Yours truly,

CHAS. J. CLAMP.

CARBURETTOR TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I write to ask if you or any of your readers can explain the cause of the trouble I am experiencing with the float feed carburettor of my car. If the vehicle is not used for two or three days, the float and the interior of the float chamber become corroded to such an extent that the float is prevented from shutting off the supply of petrol. Each time the car is left standing for a few days I have to take the carburettor apart and remove the products of corrosion before it will again operate properly. Is there any method of preventing this corrosion? The carburettor is made of cast brass or bronze, while the float is of sheet brass.—Yours truly,

COUNTRY MOUSE.

[There should be nothing in petrol which can cause corrosion in brass fittings. If the car is a new one the cause might be looked for in an excess of soldering fluid left about the joints of tank, but this could hardly have a long-continued effect. Is the sticking due to actual corrosion, or merely to a deposit? There may be too little clearance for the float; but in any case trial should be made, after cleaning out the tank, with a good brand of petrol, before attempting to meddle with the construction of the carburettor.]

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I, and several fellow motorists, would like information on the following point. I have asked several electricians and motor experts, but they can only tell me what they "think." In my car I have a trembler coil and an ordinary De Dion contact-maker (with the contact screw tighter up, of course), and the trouble is the rapid burning or "pitting" of the platinum points in the contact maker.

The trembler coil is one of those with only one high-tension terminal, the other end of the secondary (or high tension) coil (connected internally) getting "earth," or complete circuit down the primary or low-

tension wire from coil to contact-maker; therefore both the high and low tension currents pass through the platinum points of the contact-maker. Query—Is the voltage at those points that of the two currents combined, and is that the cause of the burning or "pitting?"

I know someone will advise a wipe contact, but wipe contacts have to get "earth" through the oiled bearings, and misfires are the result; I have had one. With a positive contact maker and the base connected direct to "earth" there are no misfires, all else being in order, until the platinum points become "pitted."—Yours faithfully,

J. C. EDDISON.

[The voltage of the low-tension current is so small compared with that of the high-tension (4 volts to 30 or 40,000) that its effect is negligible. Not so, however, with the induced current on the make and break in the primary circuit, which (as there is not always sufficient condenser capacity in small coils) may assist in damaging the contact points. Try reversing the connections at the accumulator terminals. If this does not diminish the pitting, try larger platinum points, of well-known red pure platinum. It is quite possible, by the way, to arrange a wipe contact that does not necessitate "earth" through an oily bearing.]

THE TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 14th inst., in your correspondence columns I notice a communication signed "A Mechanical Engineer," declaring that his experience of pneumatic motor tyres has been such that no reliance can be placed on them, and he appears to favour solid tyres. He desiderates some appliance which will reduce puncturing to a minimum, to give assurance to travellers that, when they set out on a journey of some distance, they will get to their destination without mishap to tyres. He does not, it would seem, know of any appliance such as meets his complaint. Permit me to say that I have had an experience of motoring probably greater than that of your correspondent, and that, like him, I often desired that an effective appliance could be invented to overcome the inconveniences of punctures. Early this year I was advised to try a patent band, which is attached to the inner side of the outer cover. I obtained on trial the patent band known as "the Cassell non-puncturable band," and I have no hesitation in attesting, after having travelled for several thousands of miles, on all conditions and all sorts of roads, that this band absolutely meets the very requirements of "A Mechanical Engineer." Although the covers were cut to pieces I had not a single puncture, the bands and tubes are still in as good a state as at the beginning of the season.—Yours truly,

A MOTORIST.

THE PROPOSED FEDERATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The announcement made by you as to the severance of the Manchester A.C. from the A.C.G.B.I. emphasises the serious nature of the situation as regards the Club and its affiliated clubs. It is certain that something should be done at once, and it would be a good thing if the A.C.G.B.I. would meet the promoters of the proposed Federation and the affiliated clubs and talk the matter over, so as to endeavour to prevent the establishment of more than one organisation for automobilism. Perhaps mistakes may have been made and shortcomings have existed, but concerted action is needed, and now. I do not think, from my experience, that the amount payable to the Club is the stumbling-block. It is rather the fact that affiliated clubs simply pay and take no part in the work. Some such scope as outlined by you in last week's *Journal* is wanted, and then, taking part in the work, and possibly dealing with all purely local matters, and properly and proportionately represented on the executive and committees of the Motor Union, or whatever the body is to be named, I do not think there would be any desire to join anything but the A.C.G.B.I. The clubs realise the need of action, but affiliation with representation on a committee which never meets is not to the liking of the strong young clubs growing up all over the country (there are nearly forty now, without counting the motor-cycle clubs), and if they cannot work with the parent Club, will most assuredly have an organisation of their own, which will be far more powerful than the A.C.G.B.I., but, of course, far weaker than a united organisation having every club in the kingdom in its ranks. What is wanted is this opportunity of "talking the matter over," and it is to be hoped every club in the kingdom will be invited by the A.C.G.B.I. to a friendly conference to that end.—Yours truly,

G. WILKINSON.

SIDE-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your South African correspondent, my impression is that he is a little too reckless on corners with his side car. He must bear in mind that it is a tricycle, not a bicycle, and moreover, that the bulk of its weight is on the extreme right of the vehicle. As an old racing tricyclist, I find that one must take it round corners much slower

than a bicycle or even a fore-car. The greatest care is necessary in turning to the left without a passenger in the car to keep the left wheel down. My plan is to throw all my weight on the left pedal, slipping partly off the saddle sideways so as to get my weight well over the basket; some riders drive sitting in the basket, but I regard this as inadvisable and even dangerous in frequented places. Once the hang of the machine is got the side-car is a very handy and sociable attachment and tends to convert one to the merits of the three-wheeler. I have done several long runs on it by myself and find it a great blessing to feel safe from side-slip on mud and also to have accommodation ready for a friend or luggage. The chief drawback is lack of engine power. One wants at least 5-h.p. and a two speed gear; a starting clutch is also very desirable, as restarting on an up-grade or in traffic is extremely tiresome and exhausting. The new patterns at the present shows seem to be likely to meet all these points. Yours truly,

BASIL CRUMP.

TIMING A TWO-CYLINDER MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps you can help me in timing a two-cylinder engine. At present it works as follows:

- (a.) 1. Inlet, compression, explosion, exhaust.
2. Exhaust, inlet, compression, explosion.

Should they not be timed:

- (b.) 1. Inlet, compression, explosion, exhaust.
2. Explosion, exhaust, inlet, compression?—Yours truly.

MOTOR STUDENT.

[In some of the earlier types of vertical two-cylinder engines it was usual to have the two cranks set one on each side of the shaft, at an angle of 180° to each other, the idea being to balance the moving parts, the cycle of operations in the two cylinders being in this case as shown at a by our correspondent. In modern engines, however, the usual practice is to have the two cranks on the same side of the shaft, the cycle in this instance being that given at b. The advantage of the latter arrangement is that an impulse on lower stroke is given to the crank shaft at each revolution, while with the cranks set at 180° the engine does not work so evenly, there being two impulses in one revolution and none in the next.]

THE ROUSSEL SPRING WHEEL.—In answer to F. Bassano and other enquirers, the address of the makers of the Roussel spring wheel described in the last issue of the *Journal* is De Cadignan and Company, 20, Rue Brunel, Paris.

WINTER USE OF MOTOR-CARS.—H. Trower, who enquires for the proportion of water to glycerine to prevent freezing, is referred to the article on "The Winter Use of Motor-Cars," in our issue of the 7th inst., and to the letter from "Chemist," in the last number.

6-H.P. DAIMLER CARS.—"Daimler" would like to hear from readers who have successfully converted, or added to the power of the standard 6-h.p. car.

MOTOR-CAR ACCIDENT.

AT the Kingston-on-Thames County Bench, on Monday, Mr. Rupert D'Oyly Carte, of 2G, The Albany, Piccadilly, London, surrendered to his bail to answer a charge of wantonly and furiously driving a motor-car on the Portsmouth road, at Long Ditton, on Sunday, November 15, and causing bodily harm to Theodora Franklin, aged three years. From the evidence it appeared that three motor-cars were passing along the Portsmouth road, some little distance apart, Mr. D'Oyly Carte riding in the third car, which, a witness stated, was going at the rate of twenty-three or twenty-four miles an hour. When the second car had passed a point about a hundred yards from Winter's Bridge, the child started running from the right side of the road to the left. Mr. D'Oyly Carte, proceeding from behind, turned his car to the left to avoid the child, who, however, came into contact with the vehicle, and was knocked down. The girl was picked up in an unconscious condition and taken into an adjoining house. After hearing the evidence the Bench dismissed the case.

A BRAKE TEST.

THE Birmingham and Coventry Cycle Company have sued Dr. Nankivell, in the Bournemouth County Court, for £77s., the cost of a brake supplied and fitted to the defendant's motor-car. After hearing the evidence His Honour said he had come to the conclusion that the design for the brake was such that it could not be efficient as applied to the defendant's car, and, therefore, there must be judgment for the defendant.

THE MOTOR-CAR ACT.

LINCOLNSHIRE.—The Spalding Rural District Council have adopted a resolution asking that the whole of the roads in the district should be scheduled against motor-car traffic over ten miles an hour.

FURIOUS DRIVING CASES.

CLUB NEWS.

SOUTH AFRICA.

THE annual general meeting of the Automobile Club of South Africa was held on the 2nd inst., Mr. A. T. Hennessy being in the chair. Mr. A. C. Fuller, the hon. secretary, read the report, which showed that considerable progress had been made during the second year of the club's existence. The committee expressed their appreciation of the co-operation they had received from the majority of motorists in the matter of driving with due care and consideration for other users of the road. It was thought, however, that it might be well to impress upon recent recruits the extreme importance of ever exercising the care and consideration in driving necessary to impress upon the public the fact that motorists as a body had a due sense of their responsibilities and appreciation of the rights of others. The report went on to state that the membership roll of the club now included nearly sixty names, the members owning among them over fifty cars. The Chairman in his speech said that most of the work of the club during the past year had been of an unostentatious nature, but in addition to matters dealt with in the report he would like to mention that the committee had endeavoured to compile a list of hotels throughout the country, and had advertised in the leading papers asking hotel proprietors and dealers who were prepared to accommodate motorists to advise the hon. secretary of the accommodation they had available with regard to storing cars and supplying lubricating oil, petrol, etc.; but to this request there had been absolutely no response. As a result of the club's inquiries and suggestions, a number of garages had been established in Cape Town, where motor requisites were supplied and repairs done at reasonable rates. In conclusion, the chairman emphasised strongly the importance of that portion of the report which urged upon individual motorists, especially new recruits, the necessity of cautious and considerate driving, more especially in crowded thoroughfares, and to remember that it was not merely safe driving which was required, but driving with due consideration to the feelings of those who were unaware of the ease and safety with which a motor could be manipulated. A number of proxies being then handed in to the secretary, the election of officers for the ensuing year was proceeded with, the hon. president being Sir Walter Hely-Hutchinson, G.C.M.G., in terms of the constitution of the club. The retiring vice-presidents, Mr. H. M. Arderne, Mr. W. E. Park, and Mr. A. T. Hennessy, were re-elected, Mr. Fuller being also re-elected hon. secretary.

POLICE TRAPS.

Two or three police traps have lately been reported on the main road between Ipswich and Colchester.

A TRAP one eighth of a mile in length has been laid by the police along the Bayswater Road, W.

THERE is a police trap between Preston and Lytham, on the Preston side of Lea Gate public-house.

DEFENDED ON PRINCIPLE.

EARL RUSSELL has successfully defended an action brought against him at the Maidenhead County Court by a local firm of engineers, who sued him for 14s. 6d. for repairs to motor-lamps, etc. His lordship's engineer and gardener said they had paid for the goods. Earl Russell said he defended the action because it was the habit of tradesmen to supply servants, and then three or four years later send in bills to their master or mistress. The action was dismissed.

CLAIM AFTER STORAGE.

At the Southampton County Court, the case of Patterson v. Giddings has been heard. The plaintiff, who resides at Kenilworth, claimed £10 for damages done to a motor-tricycle. It was stated that on September 10th the plaintiff left the machine at the defendant's shop at Lyndhurst Road, to be stored until sent for. At that time the tricycle was in good condition, but when it was returned it was badly damaged. The defendant did not appear. Judgment was given for plaintiff for £8.

COMMON SENSE IN SCOTLAND.

At the monthly meeting of the Western District Committee of the County Council of Stirlingshire the Clerk submitted the recommendations of the Parish Committees on the regulations for the speed of motor-cars on the district roads. Mr. David Wilson, who presided, thought they could hardly agree to the recommendation of the Campsie committee. Motor-car traffic had come to stay, he believed, and as the Crow road, which was recommended for prohibition, was the natural outlet from Fintry to the railway at Lennoxtown, it would seriously affect the letting value of the large houses thereabouts if motor-cars were prohibited. A carriage and pair took two hours to do the distance, while a motor-car could accomplish the journey in half-an-hour, so that they could see the serious effect this prohibition would have. It was pointed out by the Campsie representatives that this was the most dangerous road in the whole district, that it was unfenced, and in some parts very narrow. To fence it would entail an expenditure which the Committee would not be justified in incurring simply for the motor-car traffic. Going round by Killearn would add ten miles to the journey, but that was not much to a motor-car. The Chairman said he was convinced the Local Government Board would not permit them to prohibit the traffic entirely, and he moved that danger posts be erected on the road, and that the speed of cars be restricted to ten miles. This was adopted against an amendment for prohibition.

THE Grappler Pneumatic Motor Tyre Syndicate, Limited, has purchased from the liquidator of the New Grappler Tyre Company all the patents and patent rights in connection with the Grappler motor tyre. Mr. J. G. Bartlett will be the manager of the Syndicate, and arrangements have been made with the Hyde Rubber Works, Limited, of Woodley, near Stockport, for the supply of materials and the sale of the tyres.

A MEETING of the shareholders of A. Darracq and Company, Limited, has been held in London, Mr. J. S. Smith-Wenby presiding. The balance-sheet showed a net profit for the year of £100,275. The Chairman said it had been arranged to construct about 1,200 cars for the 1904 season, and that types, ranging from the 8-h.p. single-cylinder car to the 30-h.p. four cylinder car, would be put on the market.

MR. E. FAILES BAKER, who drove the winning Duryea in the Phoenix Park, Castletwellan and Southport trials, met with a startling experience on Saturday, which came very near to ending his career as a *chauffeur*. An attempted ascent of the Aero Club was being made in the Crystal Palace grounds, and Baker found himself amongst the spectators when the balloon became unmanageable in the strong wind then prevailing. He was among those who helped to restrain the balloon, which, however, gave a violent plunge, and in an instant Baker found himself high above the tree tops hanging on to a rope. Happily it was not long before the balloon was got down again, and once within measurable distance of mother earth he lost no time in getting there, and now says motor-car racing is quite exciting enough for him.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, DECEMBER 5, 1903.

[No. 248.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN the sad accident by which Mr. S. Loewe met his death at Hounslow the other day, the nervousness of a young woman crossing a road seems to have been a great contributory factor. The jury, in finding the death was accidental, and exonerating the driver from all blame, added a rider expressing an opinion that the power of lamps used on many cars was greatly in excess of what was necessary. In the evidence it was stated that the lady was confused by the bright lights carried by the automobile. There is no doubt that the

lighting of motor-cars is a subject which motorists will have to consider very seriously. Some firms are already providing masks or covers to lessen the illuminating power of the lamps on the approach of restive horses and the like, while others have decided to throw the lights directly upon the road surface rather than on the hedges and all round. In view of the early operation of the Motor Car Act, designers are also considering the lamps used at the rear of cars, and at the recent shows several good types were exhibited with a side glass fixed at a proper angle to illuminate the number which will now have to be carried at the rear. Altogether the subject of the lights carried on automobiles is sufficiently important to warrant discussion by some of the clubs which arrange regular debates on motor-car topics.

Recent Floods.

THE heavy rains of Saturday and Sunday had the effect of raising the waters of the Mole to an abnormal height, and where the river has overflowed its banks the low-lying grounds are flooded to the extent of many acres. The main road which connects Reigate with Dorking was covered to the depth of two feet or more, and a motorist who tried to pass through had an unpleasant experience. The machine came to a dead stop when half-way through, and the driver had to seek help on foot. A neighbouring farmer was prevailed upon to send a horse to haul the motor to the other side—an experience resembling somewhat that which occurred on the Great North Road just before the Reliability Trials of the present year.

Police Timing.

TWO cases have been brought to our notice during the past week in which the unsatisfactory nature of police evidence with regard to the timing of measured distances has been thoroughly exposed. At Otley, in Yorkshire, a Bradford gentleman who has had considerable experience in the timing of races, etc., was able to show the Bench that an inexperienced policeman in charge of a stop watch with which he was probably inadequately acquainted was altogether untrustworthy in dealing with the speed of automobiles; and at Barnet the cross-examination of a constable revealed such an unsatisfactory and crude knowledge of the principles of timing that the Bench had no alternative but to dismiss the case. We hope that defendants in motor-car cases will instruct their solicitors to give the

police a thorough cross-examination on these points, because the new Act is coming into operation in less than one month's time, and there will be absolute need of accuracy. Seeing the number of cases at present heard where the speed is only twenty or twenty-one miles per hour, it will be readily recognised that this is a matter which may mean all the difference between conviction and acquittal.

The "Pedrail."

A SUBJECT with which the name of Professor Hele-Shaw has lately been associated is the "Pedrail," upon which he read a paper at Liverpool on Saturday evening. The meeting was held under the auspices of the Liverpool Self-Propelled Association, whose president, the Earl of Derby, was in the chair. Only last week we referred to Mr. Diplock's "revolution in mechanical locomotion," of which a full description was given in our issue of January 3rd, so that the features of the "Pedrail" are familiar to our readers. After the lecture, in the course of which Professor Hele-Shaw spoke with enthusiasm of the invention, Lord Derby moved a hearty vote of thanks to the speaker and wished him "Godspeed" in his work in South Africa. Mr. Thornycroft Vernon seconded the motion, which was carried with enthusiasm. Messrs. Diplock and Vernon Hill were associated with a similar compliment to the Chairman, who, in reply, said it seemed to him that a great point in the use of the "Pedrail" would be that they would localise the expense of their transport. The importance of this kind of traffic would be felt in its effect in military operations.

The Conduct of Drivers.

OFTEN have we referred to the dissatisfaction among motorists with regard to the persons employed as drivers, and while there are many of the latter who work conscientiously and well, it must be confessed that too large a proportion appear indifferent to the interests of those by whom they are employed. A motor-car driver committed suicide at Mortlake recently, and the inquest brought out two or three unpleasant facts. On one occasion he took the car out without the authority of his employer and was summoned for exceeding the legal limit. His employer paid half the fine and warned him of dismissal should such an unwarranted liberty be taken again. But this was ignored, and again he took the car out without permission. This time he collided with an electric brougham and smashed the two front wheels of the car. Then came the suicide.

Firmness on the Part of Owners Essential.

FREQUENTLY have drivers met with mishaps when taking friends out in cars without permission. Many think nothing of taking out private cars worth hundreds of pounds for the gratification of friends, without any thought of wrong. But drivers will have to realise that such proceedings are quite unwarranted, and employers will have to be firm in dealing with cases in which their orders are wantonly disregarded. So general has the evil become that the registration of drivers will

have to be encouraged, and employers will have to give a preference to those men who are on the register of the A.C.G.B.I. Otherwise motorists are at the mercy of drivers whose conduct may be exemplary when in the presence of their employers, but altogether wanting when out of their sight.

**An Interesting
South African
Photograph.**

On this page we reproduce an interesting photograph sent us by one of our South African readers. The first car in the picture is the 14-h.p. New Orleans, belonging to Mr. A. T. Hennessy, Chairman and Vice-president of the South African Automobile Club. Mr. Hennessy is at the wheel, and the lady sitting on his left is Mrs. Joseph Chamberlain. The gentleman in the second car is Sir Walter Hely-Hutchinson, K.C.M.G., the Governor of Cape Colony, and President of the S.A.C. The photograph was taken just as the party was about to start on a trip round the mountain, *via* the Victoria Road, Hout's Bay Nek and Constantia Nek.

Mr. A. T. Hennessy, Chairman of the South African Automobile Club, on his 14-h.p. New Orleans Car.

**Helping Friendly
Councils.**

ALTHOUGH an automobilist is bound to take out his licence to drive in the county in which he resides, he can register his car in any county he pleases. A good many inquiries have in consequence been received asking advice as to the best counties in which to register cars. In order that information may be available for the guidance of automobilists, the secretary of the Motor Union has addressed a letter to the clerks of most of the administrative counties of England and Wales and we advise our readers to delay their application for the registration of cars for a week or so until replies have been received. According to the letter sent out by Mr. Rees Jeffreys it appears to be the desire of many motorists that their registration fees of 20s. per car shall be paid to those counties which are most anxious to adapt their roads and their administration to modern requirements. The Motor Union has therefore under consideration the desirability of compiling, for the guidance of automobilists generally, a list of those county councils which have shown a desire to encourage the development of mechanically-propelled vehicles, in order to secure to those counties a considerable proportion of the revenue to be derived from registration fees.

**10 or 20 Miles per
Hour.**

At the meeting of the Perthshire County Council some useful points have been elucidated with regard to the Motor Car Act, and, although the Scottish view may not be parallel with the English practice, it is as well that it should be known. Sir Alexander Mackenzie, the chairman of the Council, has been in correspondence with the Secretary for Scotland on the subject of the speed of cars, and during the meeting referred to received a telegram from that high authority, in which he said, "As a matter of law have no doubt that the only speeds which are allowable are ten and regular speed of twenty miles an hour. You may quote this.—A. G. M." Sir Alexander said he presumed this to mean that they must either allow the speed allowed by the Act to be up to twenty miles an hour or restrict it to ten miles an hour (not less) where in the words of the Act places are "especially dangerous." This should be interesting reading to those who have sought to reduce the speed to six or eight miles an hour.

**A Quartette of
Questions.**

THE points upon which information is desired by the Motor Union are: 1. Is the council disposed to encourage road improvements and road widenings as distinguished from ordinary maintenance operations? 2. Does the standing joint committee (half of which is elected by the council) authorise or permit the setting of "police traps" on straight or open stretches of country road? 3. Is it the intention of your council or its responsible committee to apply to the Local Government Board to sanction, under clauses 8 and 9 of the Motor Car Act, the closing of any considerable length of road to motor traffic, and upon others to impose a speed limit of ten miles an hour. 4. Is it contemplated to carry out in a liberal manner the duty imposed upon them of erecting signposts denoting precipitous places, cross-roads, or to incur the expense in the near future of rendering them safe? Thus the councils are being brought to face an interesting position. Will they do what they can to encourage automobilism and so secure the registration fees, or will they prove hostile and so allow to be diverted to other bodies the pounds that they would otherwise obtain?

Taxing Automobiles.

ALTHOUGH the local authorities of Lincolnshire have shown an uniform consideration for the rights of motorists on the roads, it must be confessed that the Holbeach Rural District Council is a conspicuous exception to the rule. From what we hear, this Council is mainly comprised of farmers, full of bucolic prejudice, and quite ignorant of the wider aspects of the question. They have passed a resolution to the effect that motor-cars should keep strictly to a speed of ten miles an hour on the roads under their jurisdiction. They also object to put up warning notice boards as required by the Act, and, encouraged by this attitude, the chairman of the council expressed the view (in which several other members concurred) that motor-cars ought to be taxed at £20 and motor-cycles at £10. If such a rule were, however, to prevail, we are afraid it might extend to chairmen of councils who considered such matters without any regard to public convenience or the general welfare. Should such take place, the chairman of the Holbeach Council might possibly be taxed out of existence altogether.

Enlightenment in the Island.

IN conspicuous contrast to the narrow view of these Holbeach wisacres is the attitude of the Isle of Wight County Council. This body is more widely representative of various classes of the community than the Lincolnshire authority, and, recognising the prosperity to a district that comes from the circulation of tourists and others upon well-kept roads, has decided to conform to the spirit of the Act, at the same time giving full consideration for the rights of motorists upon highways. The Council has, with practical unanimity, decided not to apply to the Local Government Board for a limit of ten miles an hour to be applied to the roads in the Isle of Wight. They rightly recognise that section 1 of the Act provides against reckless driving, and this is really all that need be considered, so far as public safety is concerned. Had the House of Commons recognised this and accepted the principle of the abolition of the speed limit, the Motor Car Act would have been welcomed rather than accepted as an inevitable evil by the great body of motorists.

Motor Election Corps.

IT is rather late in the century to write of the value of motor-cars in connection with electioneering work, but not until the other day has the subject been gravely considered by political associations with a view to the organisation of Motor Electioneering Corps to play a similar part in the political world to that of the Motor Volunteer Corps in connection with military manoeuvres. The eastern division of the National Union of Conservative Associations met at St. Ives, and Mr. Ablewhite, of Stamford, moved a resolution that arrangements be made for obtaining a supply of automobiles for use at election times throughout East Anglia. His object was, if possible, to arrange for an equal distribution of available motor-cars in the various county constituencies. Mr. George Montagu, M.P., seconded the motion, which was carried unanimously, after Sir Samuel Hoare, M.P., had enthusiastically supported it. We understand the idea is to tabulate a list of owners of cars in the district who will place them at the service of political candidates at election times, and thus obviate overlapping in some places and possible paucity in others.

The Edison Accumulator.

AT a meeting of the Institution of Electrical Engineers on Thursday last week, Mr. W. Hibbert, chief of the Physics and Electrical Engineering Department of the Regent Street Polytechnic, read a paper on the "Edison Accumulator." The cell contains twenty-eight plates, fourteen positive and fourteen negative, which are placed alternately, and carefully insulated. The foundation is a thin sheet of nickel-

plated steel, in which twenty-four rectangular pockets or pouches have been made by a stamp. Into these pockets is placed the compressed active material, and fixed in position by a powerful press. The pockets on the positive plates contain nickel peroxide, and those on the negative plate finely divided iron. The twenty-eight plates, after being placed together and insulated, are put in a steel box, which is closed by a cover and soldered down. The cell is then filled with a twenty per cent. solution of caustic potash, which reaches the active material through fine holes in the walls of the pockets. For working on the road, a car fitted with a battery of thirty-eight cells was put at Mr. Hibbert's disposal. With these he ran 500 miles, and has watched the cells during further travel, in which the total distance covered was about 2,500 miles. The cells worked well, and the only attention actually needed during the long run was the occasional addition of distilled water. The paper was of a most exhaustive and highly technical character, based on the author's own experiments, which have led him to the opinion that the Edison accumulator is a decided step in advance.

Photo by) Mr. T. Thornycroft Vernon on his 18-h.p. Mercedes. (Mr. V. A. Stemon.

Dust.

LAST week's meeting of the Automobile Club was to discuss a matter which is a source of annoyance to passengers by motor-car and to pedestrians within their range. The problem has not been solved, although theories have been propounded, and we are inclined to agree with some of the speakers, that flour, which was the medium used in connection with the experiments, was not the most suitable way of testing the subject. Anyhow, it was done, and the authorities who investigated the dust problem gave their views in a paper which we summarise on another page. Their conclusions are somewhat halting on all points save in the view that it is desirable that cars should slope upwards towards the back.

The Discussion.

IN the discussion which followed, Mr. John Brown, of Belfast, believed that the unevenness of the lower part of the body of the car was responsible for more dust than were the wheels. Mr. Mervyn O'Gorman pointed out that disc wheels might be less likely to aggravate the dust nuisance than those built on present lines, a view supported by the Hon. J. Scott Montagu, who also drew attention to the position of

the exhaust, a point which Mr. Cozens-Hardy and Mr. Roger Wallace subsequently also emphasized. Mr. Shrapnell Smith would have preferred slaked lime to have been used in the experiments instead of flour, and the discussion was concluded by Mr. R. J. Mecredy, who extolled the merits of Westrumite in connection with the laying of dust.

An Association for Motor Van and Wagon Users.

As recently announced, it has been decided to form an Association for Motor Van and Wagon Users as a section of the Motor Union, and a circular letter has been addressed by the A.C.G.B.I. to all known users of such wagons in the United Kingdom. The Local Government Board has agreed to appoint a Departmental Committee to consider the existing conditions of usage and to frame new regulations respecting tare weight, diameter of wheels, width of tyres, etc. It is of the utmost importance, therefore, that the opinions and requirements of users should be placed authoritatively before this Committee. Accordingly, as the matter presses, the Automobile Club have appointed an expert Committee, to nominate witnesses, and to collect and prepare evidence to lay before the Departmental Committee. The proposals of this sub-committee will be available for the members of the Motor Van and Wagon Users' Association at their first meeting. A general meeting of members will be held at an early date, and in addition to looking after the interests of motor van and wagon users at the forthcoming inquiry, a vast field of utility is before the Association in protecting its members against the restrictions which local authorities propose to impose upon them, collecting and distributing information with regard to the use of heavy vehicles, securing for them legal protection, and placing at their disposal expert advice.

The Car as a Last Resource.

REALLY we should have thought that politicians like the Hon. G. J. Goschen, M.P., would never trust themselves to the uncertain tendencies of horse-drawn vehicles. But he, greatly daring, seems to have done so, to his regret. Anxious, a few evenings ago, to attend a meeting at East Grinstead, and finding no convenient train from Hawkhurst thither, he had to drive fourteen miles to Tunbridge Wells, starting at three o'clock and allowing two hours for the journey. But the horse broke down en route, and, as he passed through no villages, he could not get any other. Then Mr. Goschen missed the last train to East Grinstead, and tried to get a motor car in Tonbridge, without success. It would appear that the safer plan would have been to have started out with a motor-car and not to have suggested its use when the horse-drawn vehicle failed.

Side Slip Trials.

INVENTORS and motorists alike will regard with interest the side-slip trials now under course of organisation by the A.C.G.B.I. A committee has been appointed to examine the merits of the various ideas which will be submitted, and those that appear really practical will be subjected to a preliminary test over a greasy and tortuous route. Those that survive this ordeal will then be subjected to a further run of at least 500 miles, so that the trial is likely to be a thoroughly practical test of the capabilities of the devices entered for competition. A total sum of £200 will be offered as prizes, and the last day of entry will be February 29th next, on which date drawings and particulars of the competing devices must also be submitted.

Federation or Affiliation.

CONVENED by the Reading Automobile Club, who are to be congratulated on taking the initiative in a matter of national importance to the automobile movement, a representative conference of delegates from many of the provincial automobile clubs was held at the Inns of Court Hotel, London, on Wednesday. Mr. J. Hopkins Walton.

the president of the Reading organisation, having been voted to the chair, made a brief statement, in which he urged that the proposed federation, while working in harmony with the central body, would give the provincial clubs a voice that was now impossible in the councils of the A.C.G.B.I. Mr. Dobbs, of Reading, proposed a resolution in favour of a federation of all the automobile clubs in the country. This having been seconded, a general discussion took place, in which representatives of the Cheltenham, Eastern Counties, Midland, Oxford, Southport, Southern Motor, Motor Cycling, Manchester Motor Cycling and Birmingham Motor Cycling Clubs took part. After a somewhat protracted conversation the representative of the Eastern Counties Club moved as an amendment that "owing to the necessity of working in line it is the opinion of this meeting that the question of federation should be deferred until the meeting in February, and that motor-cycle clubs must be represented."

What the Clubs Want.

SUCH a conclusion was come to in view of the promise of the A.C.G.B.I. to hold a conference of clubs early next year—a decision arrived at since the issue of the Reading circular, and which undoubtedly affected the voting on Wednesday. This took place by clubs, and by seven votes to six the resolution in favour of immediate federation was lost, the amendment securing general assent. Subsequently the representatives of the various clubs met to consider the points upon which they desire concessions from the A.C.G.B.I. in the matter of affiliation. It was evident that the feeling of many of the clubs has been aroused and that the central organisation will have to give heed to their views if it desires to prevent the formation of another association on a national basis. The questions at issue involve not merely finance—that is a secondary matter—but the local rights of the clubs and their representation on the committee of the central body. This latter point is one upon which they feel strongly and which they will not willingly forego.

THE authorities of the Liege International Exhibition are offering £4,000 as a prize in an airship competition.

THE municipal authorities of Schöneberg, Germany, have decided to equip their fire brigade with steam motor fire engines.

THE Swiss Budget for 1904 includes a sum of £400 to enable the Postal authorities to make experiments with motor vans for the collection of mails.

IT is stated that about fifty physicians in Newark, N.J., U.S.A., have sold their horses and carriages and are using motor-cars exclusively in visiting their patients.

THE Fiat Motors, Limited, has been registered with a capital of £15,000 to adopt agreements (1) between the F. I. A. T. Motor Agency, Limited, and Mr. E. M. Davey, and (2) between Messrs. C. E. Foster, V. H. Miller, and D'Arcy R. Baker of the one part, and Mr. E. M. Davey of the other part, and to carry on the business of motor-car manufacturers and dealers.

FROM the Leipzig publishing firm of Grethlein and Co. comes a copy of a new book entitled "Der Automobil Sport." It is from the pen of Herr Max R. Zechlin, and, after a section devoted to the history of the automobile, deals in detail with modern motor-cars. The action of the four-cycle motor is described and illustrated, while chapters are devoted to carburetors, ignition, engine cooling, etc. Altogether the book is one which should prove useful to German motorists.

ANOTHER addition has just been made to the list of firms supplying petroleum spirit for use on motor-cars, Messrs. Whitaker and Co., of St. Mary's Works, Lower Broughton, Manchester, having sent us a two-gallon drum of one quality of the spirit they are now in a position to supply. Altogether three qualities are being made, viz., '680 deg., '700 deg., and '710 deg., the price varying accordingly to the extent of 1d. per gallon between each. Messrs. Whitaker inform us that their '680 deg. spirit is already being largely used by motorists. It is supplied in square screw-top two-gallon tins, packed four in a box.

AN AUTOMOBILE TOUR ON THE CONTINENT.

—*—
BY S. WOODWORTH.

WE started on our 3,400-mile tour from the Grand Hotel of the most beautiful city in the world at 2 p.m., May 24th, 1903. Our mechanic, from a Paris workshop, could speak French, English, Italian and Russian. Often we covered from 140 to 190 kilometres in a day, with stops varying from twelve hours to five days, depending upon mood and interest in the objects to be seen. There were five in our party, three ladies, the writer, and the mechanic. A general course was marked out, but this was to be varied, according to circumstances, as we went along. The tour extended over 71 days, with 50 days of driving, and about 3,400 miles were covered. There were steep grades to climb, mud and water to wade through, and suspicious Customs officers with whom to contend.

The tour could not have been made with any ordinary car. Mine weighed nearly two tons, and would carry seven persons comfortably. It is the heaviest and largest touring car yet turned out by the Panhard-Levassor Company, of 60 horsepower, and has a 10-foot wheel base. The two petrol tanks hold 42 gallons. The driving sprockets used were of small diameter, the smaller pair having only 16 teeth and the larger

to Mommingen; to Tuttlingen; through the Black Forest to Strasburg, stopping for dinner at Triberg; to Heidelberg, crossing the Rhine and stopping for dinner at Karlsruhe; to Frankfurt; along the Rhine to Bingen; to Prince Henry's castle at Rheinstein; along the Rhine to Cologne; to Aix-la-Chapelle; to Brussels; to Ostend, crossing Flanders and stopping at Ghent for dinner; to France and Amiens by way of Lille; to Versailles; and finally to Paris.

The finest roads are in France, and are of three classes—the *routes nationale*, the *routes ordinaire*, and the *petits chemins* or cross roads. It was a constant pleasure to glide over the French roads, generally smooth and clean, without stone or stick to jar even a springless conveyance. The new Corniche road is the best of all the roads we went over, and a masterpiece of engineering; but from Nice to Monte Carlo it was hard running because the surface was broken by a constructing tramway. There was a good road along the Mediterranean from Monte Carlo to Genoa. The Italian roads were mostly rutted and rough, with many loose, sharp stones, which cut the tyres; but seven miles from Milan toward Verona we found them much better, and there was a fine, wide, level highway between Mestre and Udina. From Genoa to Milan the roads were atrocious. The Austrian roads are generally good, but roughened in places by the absurd practice of dumping crushed stones and leaving them to be rolled

On Tour through Europe.

[Motor, New York.

35 teeth. This did not allow very high speed, but gave great climbing power, enabling us to go up steep grades at the rate of 25 kilometres an hour. During the entire trip the motor did not have to be adjusted or touched except to regrind the valves once at Budapest.

A resumé of what we accomplished, omitting details of dates, times and distances, is given herewith:—From Paris to Fontainebleau; to Cosne, to Rouen; to Avignon, with brief stop at Orange; to Monte Carlo via Aix, Frejus and Cannes, and across the Alpes Maritimes; along the Mediterranean to Genoa, crossing the frontier into Italy at Ventremille; to the overflowed river Po, and then 175 kilometres out of course to Piacenza to find a bridge; to Milan; to Verona; passing Lake Laguna; to Mestre, where the automobile was left and train taken to Venice; back to Mestre by train, and thence by automobile to Udina; to the Austrian frontier and Austrian Alps, and up the mountains to the hamlet of Ternova; to Raibl, to Villach; to Judenberg, crossing over the famous Semmering Pass; through Gloggnitz to Bruck on the Mur River; to the valley of the Danube and Vienna; on the south side of the Danube to Budapest; back to Vienna on the north side of the Danube; along the mountains to Salzburg; to a hotel on Lake Zell, through Saalfelden to Innsbruck; over the Zirl Pass to avoid the railroad, passing from Austria into Germany at Mittenwald, and through forests to a small hotel on a miniature lake; to Munich;

down by the wagons of traffic—a cheap but prolonged smoothing process which is provocative of swear words to those who drive over them. Germany has a variety of roads, some of which are equal to those of France, and others almost as poor as those of Italy. The roads of Baden are better than those of Bavaria, which are execrable. Between Tuttlingen and Triberg, in the Black Forest we descended a long hill so steep that there was a drop of 600 metres in 12 kilometres. From Strasburg to Heidelberg, Frankfurt, and Bingen, the roads were very good, and the best of all the German roads we tested was that along the Rhine from Bingen to Cologne. The Belgian macadam roads are excellent, but the block pavements of that small nationality are almost universal, and generally worn rough with many loose or obtruding stones. It was a relief to strike the smooth French macadam again after leaving Lille. We returned to Paris without any one of the party having experienced accident or sickness in the ride of 3,400 miles. Nor had a tyre been punctured, but we had worn out seven rear outer covers. The speed laws throughout the Continent are so liberal that one may drive his car as rapidly as he pleases, provided he has due regard to passing traffic and conveyances and people. The Customs officials are sometimes slow in unwinding their legal red tape, but polite and obliging, and although an occasional money deposit is required when first passing frontiers, it is returned wherever the country is left, minus a small and reasonable commission.

THE DURKOPP SIX-CYLINDER ENGINE.

WE are able to illustrate the six-cylinder petrol engine exhibited by the Motor-Car Emporium, Limited, last week, and which is normally rated at 40-h.p. It consists of two three-cylinder motors built up on a large crank case and with a six-throw crank shaft, the three cranks of each half of the engine being set at an angle of 120 degrees to one another. Each pair of three cylinders is made in one casting, with an air space between each cylinder. The inlet and exhaust valves are arranged on opposite sides of the engine. All are mechanically actuated and interchangeable. Two carburettors

are employed, each furnishing the gas for three cylinders, a feature being the employment of a gas-collecting and distributing chamber in the inlet pipes. The governor, which is entirely enclosed, is connected up to a throttle valve in connection with each of the carburettors. The speed of the engine can be further controlled by means of a variable cam actuating the inlet valves, by means of which not only can the lift of the valves be varied, but also the time of lifting. The plugs can be fitted either in the top or at the side of the combustion chamber. The engine is well balanced and is stated to be extremely flexible and quiet in its operation.

OPPOSITION to the motor-omnibuses at Eastbourne has now subsided, consequent upon the improved running of the vehicles.

THE Cambrian Railways Company are reported to have placed an order for a number of motor-carriages to be run on their line next summer.

AN institution of Motor Engineers is being suggested, one aspect of whose work will be educational and practical, including the carrying out of tests of vehicles and experimental work in connection with automobiles.

THE Four Wheel Drive Wagon Company is the name of a new company which has just been formed in Milwaukee, U.S.A., with a capital of £200,000. The principle upon which the vehicle is to be made depends upon the distribution of the power to each road wheel separately, in addition to which all four wheels will act as steerers.

A GOOD catalogue of their special lines for motorists has been issued by the Motor Castings Company, Limited, of 101, Gray's Inn Road, W.C. This gives particulars of the firm's motor-bicycles, accumulators, motor lamps, horns, etc., as well as of motor castings of every kind.

THE Kent Motor Car Company has been formed to take over the businesses of Mr. L. Cosh, of Gravesend, and Mr. George Senior, of Rochester, the first directors being Messrs. R. L. Cosh, H. L. Cosh, and G. Senior. The premises of the new company will be 144, High Street, Rochester, and the Clarendon Royal Hotel Cottage, the Terrace, Gravesend.

CONTINENTAL NOTES.

THE all-important matter, the route for the 1904 Gordon Bennett race, was settled at a meeting of the German Club in Berlin on Saturday last, that in the Homburg district being definitely chosen. An outline of the route is given herewith. The circuit is 137.6 kilometres long and will therefore have to be covered at least four times, the start and finish being at Saalburg. The most important places passed through and the distance is shown below:—

Town.	Distance in Kilometres from starting-point.
Saalburg	—
Wehrheim	3.9
Usingen	8.3
Grafenwiesbach	17.1
Weilburg	38.2
Heckholzhausen	47.6
Obertiefenbach	51.7
Limburg	59.7
Kirberg	71.3
Neuhof	88.3
Idstein	97.1
Esch	103.2
Glashütten	111.7
Königstein	118.8
Obernursel	128.1
Ober-Stodten	131.5
Dornholzhausen	133.5
Saalburg	137.6

Georges Prade, of "L'Auto," who, with Fournier, went over the route last week, describes it as "splendid, wide, and with a granite surface on which speeds of 100 kilometres per hour can be attained without danger."

WHILE a definite date for the race has not been fixed, it will take place some time in June, and it is probable that a series of kilometre and mile races as well as a hill-climbing contest will be held during "the automobile week," at Homburg. The Ger-

Map of Course of 1904 Gordon Bennett Race.

man firms which have so far entered cars for the eliminating trials are Messrs. Benz and Company, the Durkopp Company, the Neue Automobil Gesellschaft of Berlin, the Protos Company of Berlin, and Messrs. De Dietrich of Niederbronn.

DURING the past week the A.C.G.B.I. has enquired of the Belgian Club whether it would be possible to obtain the use of the road forming the Circuit des Ardennes for the British eliminating race. The A.C.B. replied that while it was favourable to the project they do not yet know whether they can obtain the necessary authorization from the Government.

QUITE the feature of the past week in Paris has been the visit of the large party of British members of Parliament, who reached the French capital on Wednesday, the 25th ult., finding a large number of motor-cars awaiting to convey them to their headquarters at the Hotel Continental. What with receptions and banquets the visitors had an enjoyable time and have had many opportunities of noting the rapid strides the automobile movement has made in France. On Thursday, the 26th ult., driving parties were arranged during the intervals of private or official receptions, accompanied in many instances by French deputies, making use of the large number of motor-cars which had been provided for the visitors. The French Automobile Club had arranged to supply the vehicles, and the drivers of the latter wore red, white, and blue badges, with the inscription "British Parliamentary visit, Automobile Club of France." On Saturday evening a reception was given to the party by the A.C.F. The latter paid a graceful compliment to the English visitors by deferring until this occasion the opening of a new suite of rooms which has been added to the existing premises. Four salons have been fitted up opening one out of the other and looking on to the Place de la Concorde, and these were as new to the club members as to the guests. The British M.P.'s turned up in full force at the club, where they were received by the President, Baron de Zuylen. An excellent pro-

petroleum to be employed in the tests will have a specific gravity of .800 to .810 at 15°C.

STILL another competition which is being organised in connection with the *Salon* is that relating to the automatic starting of the engines of motor-cars. Only those motors will be eligible for the competition which can be started by means of an electrical or mechanical arrangement which will release sufficient energy to put the engine into operation, such energy having been stored up when the motor was previously working. The points which the jury will consider in making their awards are (1) certainty of operation, (2) weight per horsepower of the starting device, (3) dimensions, and (4) cost.

"LA GAZETTA DELLO SPORT," of Milan, has decided to organise a touring competition for motor-cycles weighing under 50 kilog. It is to be held in January next, the route being Milan, Pavia, Fortona, Busalla, Genoa, Savona, San Remo, Ventimille, Monaco, Nice, the return being *via* the Col de Tende, Coni, Alba and Asti. The total distance is about 700 kilometres; the course includes the ascent of the Col de Tende, the altitude of which is over 4,000 feet. Should this be covered in snow at the time, which is not improbable, a somewhat longer return

Entrance to the Castle at Saalburg.

The Main Street of Konigstein.

THE 1904 GORDON BENNETT RACE.

gramme of music, recitations, and dancing was carried out on the stage of the small theatre in one of the rooms.

THE Grand Palais in the Champs Elysee, Paris, is rapidly being prepared for the forthcoming *Salon*, workmen being now daily employed from 7 a.m. until 11 p.m. in preparing the stands. Ere the next issue appears the great annual exhibition will have opened its doors not only to the French Automobile world, but to thousands of visitors from Great Britain, Germany, Italy, Austria, Belgium, Holland, and the United States. It may be of interest to mention that for the third year in succession the *Motor-Car Journal* will have its stand at the *Salon*, at which a hearty welcome will be given to all English visitors.

A TRIAL of carburettors adapted for using ordinary petroleum as fuel is to be held in the Grand Palais during the course of the forthcoming exhibition. Below are some of the conditions of this competition:—The tests will be made by the jury with motors placed at its disposal by the Executive Committee. The jury will award prizes, consisting of medals and diplomas, for the most meritorious devices entered. In addition, a cash prize of £40 will be awarded for the best carburettor, provided it operates equally well with ordinary petroleum, petrol, and carburetted alcohol, without necessitating any changes. The

route will be followed. During the competition a series of brake and stopping trials will be held.

ACCORDING to "La France Automobile" a French firm is building a 6-cylinder motor of 65-h.p., reported to be intended for a new motor-car for King Edward.

ONLY two entries have been received for the competition for alcohol motor tractors organised by the German Ministers of War and Agriculture. Both vehicles are of 40 h.p., one having been built by the Neue Automobil Gesellschaft and the other by the Siemens-Schuckert Co., both of Berlin. They are at present being subjected to a series of tests.

It is reported that during the coming winter the Allgemeine Elektrizitäts Gesellschaft will carry out some trials with a snow automobile or motor sleigh on the trolley omnibus line between Dresden and Klotzsche, on which electricity-propelled vehicles are run for passenger transport. The motor sleigh is very similar to the electric bus, with the difference that the hind pair of wheels is replaced by a pair of sleigh runners, while the driving wheels in front are fitted with tyres specially designed for taking hold of slippery surfaces.

THE "CORONET" PETROL ENGINES.

THE Coronet Motor Company, Limited, Coventry, have now been manufacturing petrol motors for the past four years, and the engines illustrated herewith are the outcome of experience covering this period. Fig. 1 shows the $3\frac{1}{2}$ -h.p.

FIG. 1.

air-cooled motor, which has a bore and stroke of 3 7-16 in. The flywheels are hard steel stampings, the shafts being stamped solid therewith, which enables the makers to produce a motor exceptionally narrow, the extreme width over all, with the

FIG. 2.

pulley attached, being only $7\frac{1}{2}$ in. The inlet valves are mechanically operated, the cams being solid with the half-time shaft. The valves are of large diameter; an exhaust valve lifter

and wipe contact breaker are fitted. The latter is carried on the cam shaft at the opposite end to the half-time wheels. The cylinder and cylinder head are in one casting. Three standard types of pulley for cycle work are being made. At present a Longuemare type of carburettor is being employed, but the Coronet Company are experimenting with one of their own make, which will shortly be placed on the market. Fig. 2 shows the $3\frac{1}{2}$ -h.p. water-cooled engine, which is in every respect similar to the air-cooled motor, except as regards the cylinder. As will be seen, the water jacket extends round the valve chambers as well as the cylinder. The weight of the water-cooled engine, as illustrated, is $58\frac{1}{2}$ lbs.

ACETYLENE LAMPS.

AT the annual meeting of the German Acetylene Association, recently held at Eisenach, Herr Ernst Neuberg read a paper on the subject of "Acetylene Lamps for Automobiles," with the object of interesting the association in a prize competition to be organised jointly by the German Automobile Club, the Mid-European Motor Wagon Association and the German Acetylene Association. The speaker dwelt in the first place upon the probable future of the automobile movement, and upon the importance of proper illumination.

If we inquire into the theoretical requirements with regard to the illumination of a vehicle running on unilluminated roads, we reach the conclusion that the road ahead of the vehicle should be illuminated for such a distance that the driver may recognise a road obstacle sufficiently early to be able to avoid it. As the braking power of most motor-cars is almost phenomenal, the distance which should be illuminated depends to a large extent upon the quickness of decision of the driver. It is not possible to specify a definite standard for the size of burner as a function of the vehicle speed, as the efficiency varies according to the construction of the reflector, and it also depends upon whether the car is equipped with one searchlight and two side lamps, only two lamps, or only a searchlight.

Another factor which necessitates the carrying of lamps at the front of a motor-car is the fact that pedestrians, animals and vehicles on the road should be able to recognise the car from a distance, and to clear the road in time to avoid being run over or coming into collision. Acetylene illumination has the advantage over all other systems that with it the luminous intensity per unit of flame surface is the greatest, and that the light is comparatively inexpensive.

The following are, in Herr Neuberg's opinion, the essential requirements made of the illuminating apparatus of a motor-car: (1) The lamp must be of tasteful form; (2) the material used in the construction of the generator must not be attacked by the acetylene gas; (3) in the construction of the reflector no material (German silver, for instance) must be used which suffers under the heat of the acetylene flame; (4) the lacquer with which the lamp may be coated must not suffer from the heat of the flame; (5) the attachment and locking mechanisms must be so constructed and attached that it is impossible for them to be lost or open during the run; (6) the generator must be provided with a safety valve; (7) precautions must be taken that neither the gas passage, the water feed channel, nor the burner can get choked; (8) the generator must be easy to fill and to clean—the parts to be cleaned must have smooth walls; (9) the lamps must not extinguish in even the strongest wind, independent of direction of same; (10) the cost price must be low; (11) the illuminating economy must be good; (12) in the case of interruptions in the gas consumption with full feed to the generator the economy must not be appreciably reduced, and the burner must resume operation immediately; (13) in the design of the lamps and the lamp brackets account must be taken of the vibrations produced by the motor and by running on uneven roads. The speaker then demonstrated with a number of acetylene lamps and searchlights to what degree these different requirements are met in modern lamps.

HERE AND THERE.

THE annual dinner of the Burnley Automobile Club will take place at the Bull Hotel, Burnley, on Tuesday next.

THE Glasgow Motor Lorry Company has been formed with a capital of £1,500. The registered office is at 169, Finnieston Street, Glasgow.

DR. RUTHERFOORD HARRIS, who, as we announced last week, has become the owner of *Le Passe Partout*, has just been adopted as a candidate at the Dulwich bye-election.

THREE Hotchkiss cars will take part in the eliminating contest for the French Gordon Bennett team; they will be driven by Henri Fournier, W. K. Vanderbilt, jun., and Achille Fournier respectively.

THE first diary for 1904 to reach us is from the office of our contemporary, the "Cycle Trader." This, in addition to the usual features of a diary, comprises a variety of references of use and interest to the cycle and motor trades.

IN addition to the standard *chassis* suitable for tonneau and similar carriage bodies, Messrs. De Dion Bouton are now able to supply the 8, 10, and 12-h.p. cars with longer frames, on which comfortable double phaeton, victoria and such bodies can be built

A MOTOR omnibus service will be inaugurated next summer on the east coast of Ross-shire, with the town of Tain as headquarters.

PERMISSION has been given to the omnibus company at Brighton to run a motor omnibus from Old Steyne to Portslade, by way of North Street and Western Road.

WE hope to describe the new O. H. B. car which made its first appearance at the Stanley Show, and also the Stevens-Duryea which was exhibited at the National Show, in an early issue.

ONE of the employees of the Stirling Motor Company, Mr. Smith, son of a Tamworth gentleman, has left for New Zealand in connection with a new motor-car venture in that colony.

A MOTORIST has been fined 40s. at the South West London Court for being drunk and for having a loaded revolver in his possession while vainly endeavouring to mount his motor-bicycle

MESSRS. J. R. HAMILTON AND CO., LIMITED, has been registered with a capital of £2,000 to carry on the business of manufacturers and repairers of, dealers in, and agents for the purchase and sale of motor-cars, motor-vans and vehicles, etc. The first directors are Messrs. J. R. Hamilton and A. C. Pritchard.

JOSEPH WILKINSON, driver of a motor-waggon, of White-chapel, has, at the Lambeth police-court, been acquitted of the

The De Dion Double Phaeton, with side entrance.

with entrance direct to the back seats from either side. The accompanying illustration shows an 8-h.p. double phaeton of this type. We may add that the building of side-entrance cars is not a new departure for the De Dion Company, as they remind us that nearly twelve months since a *chassis* of this model was built with a brougham carriage body, for the King of the Belgians.

FROM Messrs. S. F. Edge, Limited, we have received two photographs of a 24-h.p. Napier car they have recently supplied to the Duke of Bedford. It is fitted with a landaulette body with side entrances, with accommodation for three passengers in the rear portion, and room for an extra one by the side of the driver. The engine is a 4-cylinder one. The petrol capacity is sufficient for a 200 mile run.

AT the annual meeting of the Automobile Club of America, just held in New York, Mr. Winthrop E. Scarritt was elected president in succession to Mr. A. R. Shattuck, who has been president of the club for three years. The report of the membership committee showed that the club now has 464 members, of whom 395 own one or more automobiles. The total number of cars owned by the club members is estimated at 500.

charge of having caused bodily harm to George Tyler. The prosecutor was knocked down and run over by the waggon in Brixton Road, as he was wheeling a hand truck.

HUBBARD'S MOTOR AND ENGINEERING COMPANY, LIMITED, has been registered with a capital of £1,000 in £1 shares, to acquire the business of manufacturers of and dealers in motor engines, carburettors, etc., carried on at Much Park-street, Coventry, by Mr. C. Hubbard, as Hubbard Brothers.

A DIRECTORY and Map of Automobile Charging Stations has been published by the "Electrical Times," which contains particulars of upwards of 700 places in the United Kingdom where the batteries of electrically-propelled automobiles and the ignition accumulators of petrol motor-cars may be re-charged. The information given includes such details as the hours of business, the current available, price charged, and whether repairs can be carried out and garage given. The map shows clearly all the main roads, while all the places mentioned in the directory are marked in various ways according to the nature of the facilities offered. The work is of convenient pocket size and is bound in leather with rounded corners, the map being mounted on linen.

THE Hulbert-Bramley Motor Company, Limited, has been registered with a capital of £600 in £1 shares, to adopt an agreement with Mr. F. Hulbert, and to carry on the business of manufacturers of and dealers in motors, motor-cycles, etc.

THE British Accumulator Company, Limited, has been registered with a capital of £5,000, to acquire the business of electric accumulator merchants carried on as the British Accumulator Company, at Parliament Mansions, Westminster, S.W.

SOUTH HAMS, in Devon, is to have a service of motor 'buses, owing to the enterprise of the South Hams Motor Carriers, Limited. These are to be of the Milnes-Daimler type, and will be supplied by Messrs. H. Andrew and Company, of Yealmpton, Plymouth.

THE Cadogan Garage and Motor Company, Limited, has been registered with a capital of £3,000 to carry on the business of garage proprietors, manufacturers of and dealers in motors, etc. The first directors are Messrs. H. Kirchbaum and J. T. Musgrave.

WE herewith illustrate a steam delivery van which the White Steam Car Company have just completed for Messrs. Liberty, of Regent Street, W. This van is built on a standard 10-h.p. chassis, and, on account of the facility in stopping and starting continually during the day without incon-

venience and delay, will, it is hoped, make an ideal vehicle for the purpose for which it is designed. Messrs. Liberty are to be congratulated on their enterprise, which forms another step towards the general adoption of motor-cars for purposes of general utility.

THE Belsize Motor Car and Engineering Company, Limited, has been registered with a capital of £30,000 to adopt an agreement with Mr. J. H. Smith for the acquisition of the business of motor and motor-car builders and electrical and mechanical engineers carried on by Messrs. E. F. Hunter and J. Makeague, at Belsize Works, Clayton-lane, Clayton, Manchester, as Marshall and Company, and to carry on the said business. The first directors are Messrs. J. Barber, C. Higginbotham, H. Summers, J. H. Smith, and J. Whitehead.

ON the 15th ult. Mr. C. A. Smith, of the White Lion Hotel, Cobham, heard of police traps for motorists in his district, and was busy for several hours conveying the news to drivers of cars. In the evening the police visited his premises, discovered a man apparently under the influence of drink, and summoned him for permitting drunkenness on his licensed premises. Mr. Sherwood, for the defence, submitted that the action of the police in summoning him for permitting drunkenness was the result of a desire to retaliate for his action in connection with motor-cars. In the end the Bench dismissed the case.

ABOUT 200 persons attended the first lecture on the automobile at the Y.M.C.A. in Boston, U.S.A., the other week. The course is to be divided into two main divisions—petrol, and steam and electricity.

A NEW densimeter for testing the specific gravity of petroleum spirit is being introduced by Messrs. A. W. Gamage, Limited. The apparatus, which is known as the "Cossor," is illustrated herewith, one of its features being that the indicating scale is provided with three special red lines, the purpose of which is given below. A small glass jar is provided into which the sample of petrol to be tested is poured. The densimeter is then dropped in the liquid, care being taken that the stem does

not touch or cling to the side of the jar. If the broad red line or limit mark is above the surface of the fluid, the petrol is too dense and should be discarded. In winter or cold weather, the red line marked winter, and in warm weather the red line marked summer, should not be above the surface of the fluid. The densimeter, with glass jar, can be had either packed in a small tin or morocco leather case.

A SECOND edition of the work on "Gas Engine Design," by Mr. E. J. Stoddard, has just been published by Messrs. Parker and Burton, of Detroit, Michigan, U.S.A. The book, which has met with a favourable reception in America, is an attempt to place the subject of the design of explosion engines on a rational basis. While it is intended to avoid mathematics as much as possible, as, for instance, in the diagram by which the compression, explosion pressure, and generally the indicator diagram may be approximated without mathematics, and the diagram from which the mean effective pressure may be read directly, still it has not been necessary to omit mathematics entirely. An earnest effort has, however, been made to bring the theory and mathematics within the reach of those who are only familiar with the elements. Graphical methods have been used to cover almost the entire subject, and one capable of using graphical methods and not analytical can still go thoroughly into the theory of compressed air and the gas engine. The price of the work is normal, to cover merely a part of the cost of production and postage.

THE Krastin Automobile Company, of Cleveland, Ohio,* has lately devised a new silencer for petrol cars which they claim to be very light and to have a high efficiency. It consists of a sheet iron cylinder, divided into four compartments by three sheet iron discs. Three of these compartments are subdivided by sheet iron walls into four quarters. The motor exhausts first into compartment No. 1, and then, by a series of holes, equal in area to the exhaust pipe, into a quarter section of compartment 2; thence the gases pass through the other three quarters of com-

partment 2 into compartment 3; through its four quarters successively into compartment 4; then through its four quarters and out to the atmosphere. The number of small holes decreases gradually as the exhaust goes into each successive quarter section into the open air, and the discharge is effected through a few holes of small area. The result is said to be a gradual cooling of the gases as they pass through the various sections, so that they reach the outside air at a very low pressure, making no noise. As a result of a series of tests it is claimed that the silencer causes no appreciable back pressure.

THE NATIONAL SHOW.

(Concluded from page 753.)

ONE of the most novel two-seated cars we have seen was that exhibited by the Kyma Car Company, Ltd., and, in view of its relatively low price, it should meet with a large demand. The body is constructed of wicker, and is hung on special springs, which make it very easy riding. It is made in two varieties, one with a 4-h.p. water-cooled motor, the other with a 2½-h.p. air-cooled engine. In both patterns the transmission is by chains from the motor to a secondary shaft, and from thence to the driving wheels by flat belts. Two speeds, varying from six to twenty-five miles an hour, are provided, with free engine, and friction clutch operated by a pedal. Steering is by a wheel on an inclined shaft, to which all control levers are brought, within easy reach of the driver's hand. The engine is placed in a vertical position in front of the car, and petrol and oil supplies sufficient for a run of 120 miles are carried in a tank suspended immediately over the engine. Ignition is of the ordinary high-tension type, while the water circulation in the 4-h.p. machine is on the thermo-siphon system. Two pedal-operated brakes are fitted; these are of large dimensions, and act on the outer surface of the rear belt-pulleys. The two speeds are obtained by the aid of a feather, by means of which either one of the pair of enclosed chain drives from the engine to the countershaft can be made to transmit the power. No differential is used, the rear wheels being allowed to overrun each other in turning corners, by means of a free-wheel clutch in one of the small belt pulleys. The car is, as we have said, on exceedingly novel lines, and from an independent source we learn that it is

price, the "Little Star" has been introduced, the one at the Show having attracted considerable attention during the week. In general arrangement the vehicle is a reduced facsimile of the larger cars, chain transmission being adopted in place of the cardan shaft usual in this class of vehicle. The motive power is supplied by a 6-h.p. single-cylinder engine with water circulation maintained by pump and radiators. The cylinder is 4 in. bore by 4 in. stroke. Three speeds forward and reverse are provided, a direct drive being available on the top speed. Altogether the little car is one which should meet with a large demand, especially on the part of travellers, as the vehicle is not only of a convenient size but has ample space at the rear for bags, &c.

In a recent issue we announced that arrangements had been completed for the manufacture of the engines and component parts of the Duryea cars by the well-known engineering firm of Messrs. Willans and Robinson. The first of the English built 12-h.p. cars was last week exhibited by the Duryea Company, Coventry, and came in for keen inspection, not only by the general public, but by engineering critics. Needless to say the workmanship is of the highest class, the new model being a distinct advance on its progenitor. The three-cylinder horizontal engine is retained, but a number of modifications have been made with the view of increasing its efficiency. Thus the water jacket is larger than hitherto, it being carried not only round the cylinders but the valve chambers as well. The water circulation is maintained by a chain-driven pump and radiator. Both the inlet and exhaust valves are mechanically operated off one cam shaft, and all six valves are interchangeable. The crank chamber is now of aluminium with removable inspection covers, and the three-throw crankshaft is no longer hollow, but cut solid out of

Fig. 1.—The "Kyma" Car.

an excellent hill-climber, notwithstanding the belt drive, and that on favourable roads it has attained a speed of twenty-five miles per hour.

Mr. R. Owen Allsop exhibited an exceedingly interesting motor designed to use paraffin or kerosine as fuel. The feature of the engine is that in addition to a cylinder working on the usual four-cycle principle, it has at the side a small fuel vapour pump cylinder, operated from the crank shaft. The paraffin is sprayed into this, compressed, and afterwards admitted as gas into the combustion chamber proper. Owing to the positive feed of gasified hydrocarbon, there is no condensation on the walls of the cylinder, and no carbon or tarry deposit. The combustion is stated to be perfect, and the exhaust smokeless and inoffensive. The running is very regular, the engine picking up readily without any alteration to the feed of fuel or air. After many experiments the engine has been adapted for motor-car purposes. It is a high-speed engine with electric ignition, the motor cylinder being 100 mm. bore by 120 mm. stroke.

Occupying a leading position on the stand of the Star Engineering Company was the famous "Star" racer, which in its finished form as a touring car bears but little resemblance to its former self. It is now fitted with a large and comfortable tonneau body, capable of seating three persons at the rear. Various improvements and alterations have lately been made in the vehicle, notable among which is the adoption of a pressed steel frame. On the stand were also examples of the Star Company's 18-h.p., 12-h.p., and 7-h.p. cars. The first-named vehicle was well worthy of examination; it is fitted with a vertical four-cylinder engine of 18-h.p., the inlet as well as the exhaust valves being mechanically actuated. Four speeds forward and a reverse on one lever are available, the chain system of transmission from the differential countershaft being adopted. In view of the demand for a small two-seated car at a popular

one piece of steel. Whilst the magneto generator is still retained for spark generation, it is chain driven, and the current is passed through a coil, transformed to high tension, and used in the engine through ordinary sparking plugs. Several important improvements are introduced in this system, the magneto generating current of sufficient intensity for sparking at "dead slow" speed, and not only so, but automatically governing the spark advance in accordance with the speed of the engine. In the gearing, too, the ratio has been altered, the gear now provided being a three to one, instead of a four to one, reduction (and a reverse), thus making the low gear much more useful, and, by an alteration in the clutch, permitting of clutch slipping on the high gear in traffic. The power is transmitted by a specially constructed Renold roller chain. The engine is used as a brake, and supplemented by three powerful metal to metal grip brakes, two of which act in direct connection with the wheels. The axle is made of nickel steel, and by the construction of the new forecarriage not only is the front (tubular) axle held to its work by tension rods, but these are so fitted on universal joints that the axle is free to move vertically at either end without throwing any strains on other parts of the car, and an entirely new front spring system is introduced. The steering and control system is modified by separating the gear changing from the steering and throttle control, these latter being effected by a horizontal, instead of a vertical, lever, whilst the changing of the gear and the manipulation of the clutch are effected by a lever at the left hand of the driver, by the side of which a second lever actuates the reverse, and applies the reserve brakes, the differential brake being worked by the foot, as before. The steering handle is not only reversible, so that it may be used by either occupant of the front seat, or moved up out of the way when entering or leaving

the car, but can be adjusted to the height of the driver—a feature which will be appreciated by users. The carburettor has been improved, and is now fitted close to the inlet pipe, whilst the wheelbase has been considerably lengthened. There are several other important features in connection with the car which, in the absence of drawings, cannot be properly dealt with, but sufficient has been said to show that the new English-built Duryea is more than likely to uphold the reputation this vehicle has already attained. In addition to the chassis of the new type the body-work for a similar car was shown, as also a 10-h.p. Duryea brougham or coupe, controlled from the inside, and a 10-h.p. wagonette, with a hood over the front seat.

Messrs. W. Montgomery and Company, of Bury St. Edmunds, exhibited a number of the "Montgomery" side-carriages for bicycles, the special features of which are the compensating joints which connect them to the machines. The advantage claimed for the arrangement over a rigid connection is that the side-car rides much more comfortably, and that the steering and taking of corners are each rendered perfectly safe. Moreover, the machine can be ridden without a passenger in the side-car without any difficulty. Any up and down motion from the bicycle is entirely compensated for by the joints, the only motion the side-car has being due to the single wheel only.

The General Motor Car Company, Ltd., which have recently acquired large works at Mitcham, Surrey, are devoting special attention to a light form of car for general trading and commercial purposes. One of the most attractive vehicles exhibited was that specially adapted for the use of doctors or commercial travellers. This is fitted with a 6½-h.p. Aster engine, having throttle control, three speeds forward and a reverse, a cardan shaft conveying the power to a rear live axle. This type of car can be provided with either a two-seated body, or, when arranged as a commercial vehicle, with a readily detachable van body. The General Company had also on view a 12-h.p. van they are building for Post Office work. This has a long wheel base, and is intended to carry loads up to one ton. The power is furnished by a 12-h.p. Aster engine, chain transmission being in this case adopted. A smaller 9-h.p. van has been used by the G.P.O. for some time past, and has, we are informed, already run over 5,000 miles.

Quite a new departure in transmission has been made in the Starley motor-bicycle, made by Messrs. Starley, Coventry. The 2-h.p. air-cooled engine is, as will be seen, set vertically, but at right angles to the usual position. The crank case is in two parts, and is attached to the cylinder by means of a threaded collar. Through the rear side of the crank case the crank shaft projects into a small gear case. Referring to the sectional view (Fig. 2), the pinion wheel A is fixed rigidly to the crank shaft, and revolves at the same speed, while meshing at all times with the wheel C on the countershaft beneath. The wheels B and D are similarly related, but while B is free to revolve on the main shaft, the pinions C and D are rigid with the countershaft. The main shaft carrying the worm drive E is normally unconnected with the wheel A. Within the wheels A and B are expanding clutches, which are operated by means of cones attached to a sliding sleeve, free to move longitudinally, but not to turn except with the main shaft. When, therefore, the sleeve is pressed forward by means of the lever and flanged collar seen on the main shaft, the forward cone

Fig. 2.—View of Engine, Change-Speed Gear, and Worm-Gearing on Starley Motor-Bicycle.

engages gradually with the expanding clutch within A, thus rendering it rigid with the main shaft and constituting a direct drive, the other three wheels meanwhile revolving idly. If the sliding sleeve be pressed rearward, releasing the clutch in A, till the rear cone engages the clutch in the wheel B, the latter becomes rigid with the main shaft, which it drives by means of the power received from the motor through A, C, and D. This reducing gear gives a ratio to the direct drive as 5 to 9. On the same shaft as the large worm wheel is a chain wheel which transmits the power to a chain wheel on the rear spindle. This chain is the only one used, and can be

operated by the rider's pedals either to start with while the engine is running free, the cones being neutral, or to assist the motor on a hill. Thus, a fixed drive is provided in lieu of the usual belt, and in addition a change-speed gear with a gradually-tightening clutch, and a free engine at will. The ignition and the exhaust valve lifter are controlled by one lever.

Another Coventry concern to take up the manufacture of motor-cycles is the Centaur Cycle Company, Ltd., whose machines comprise a number of special features, the most noticeable being the inclusion of the silencer as an integral part of the frame, this taking the place of the usual tube from

Fig. 3.—The Centaur Chain-Driven Motor-Bicycle.

the bottom of the head to the bottom bracket. Two types of machines—belt and chain-driven—were shown, both being fitted with a three-h.p. air-cooled engine with mechanically-operated inlet valves. A Longuemare float-feed carburettor furnishes the mixture, while duplex accumulators are provided, the latter being connected up to a three-way switch. Another special feature is the antivibratory fork. The two fork blades, which are of a strong duplex section, are carried right through the fork crown to the head lug. In the ordinary fork, the point at which the vibration is concentrated is immediately below the fork crown, but in the Centaur machine there is no brazed connection at this point, the eyes of the crown being fitted with rubber cushions, through which the fork blades pass. The vibratory shock, instead of meeting with a dead resistance at this point, falls upon the rubber cushions, in which there is a certain amount of "give" in both a forward and backward direction. This is supplemented by a vertical movement, caused by the lower crown plate connecting the two fork blades being supported by a thickened rubber head, forming part of the cushion. The movement caused by the compression of these is provided for by an elongated slot and stud at the point at which the fork is hinged. In the chain-driven machine the engine drives a chain wheel on the bottom bracket by means of a sprocket on the engine crank-shaft, and thence by means of a second chain on a smaller sprocket to a larger chain wheel on the rear driving wheel. Pedalling forward is provided for as well as starting the engine by means of a ratchet clutch on the bottom bracket spindle and a ratchet clutch on the rear wheel hub on the right-hand side, in which the usual chain drive, with a very low gear, is provided for pedalling and starting.

The "Lithanode" accumulator in a variety of sizes formed the exhibit of Messrs. Longstreth's, Ltd. It is claimed for these ignition batteries that they are capable of being discharged at exceptionally high rates, and that the elements are not injured by being short circuited. The positive plates are constructed of solid material cast up into lead sections. A new accumulator for use on motor-cycles is provided with an ingenious anti-acid spilling arrangement, any acid which may find its way out of the cell passing into a side receptacle forming part of the accumulator. Another point to which attention may be directed is the non-corroding terminals, the positive terminal, where it leaves the accumulator, being surrounded with a short closed tube of celluloid containing resin oil. On this stand were also displayed a series of induction coils made by Marconi's Wireless Telegraph Company, Ltd. These are constructed both with and without tremblers, and for one, two and four-cylinder engines. One type of coil is fitted with a special high-speed trembler, in which, instead of "screw" and spring contacts, each contact is fixed at the end of a flat spring. The upper spring is so adjusted that when the circuit is closed the break is slightly retarded, so allowing the core to be more fully magnetised.

The well-known "Renold" silent chain for high-speed driving was exhibited by Messrs. Hans Renold, Ltd. This is made in pitches ranging from ½ in. to 1½ in., and in widths extending up to 6 in., and is being largely used on motor-cars for conveying the engine power to the gear box. A range of roller chains in English and French sizes were also on view, these being designed to give the greatest strength with a minimum of weight. It is claimed for these chains that, owing to the very large bearing surface on any given pitch, the maximum length of wear can be extracted from their use. Reference may also be made to a new specially strong ½ in. roller chain for chain-driven motor-cycles, which has been adopted by the Humber, Singer, Centaur, Juhu and other motor-cycle builders.

In addition to a 3½-h.p. motor-bicycle with vertical engine and belt drive, the Wearwell Motor Carriage Company, Ltd., exhibited a water-

cooled "Motette." The engine is of $3\frac{1}{2}$ -h.p., the water tank being fitted behind the front seat, while below the tank is a small ribbed-pipe radiator, its position being such that it meets with a considerable cooling draught. The power is transmitted through a chain and a Bowden clutch in the rear wheel hub.

The See Motor Car Supply Company exhibited several of the Lamaudiere motor-bicycles, for which they are sole English agents. The feature of this machine is that the motor is made entirely of steel, and is built into the frame, taking the place of the usual down tube from the saddle to the bottom bracket. The bore is $2\frac{1}{4}$ in. and the stroke 2.45 in., the engine actually developing over $2\frac{1}{2}$ -h.p. An outside flywheel is employed. The power is transmitted by a raw-hide belt working over a jockey pulley. The latter can be raised or lowered at will by the rider from his seat, thus obtaining, when desired, a free engine. The See Company also exhibited samples of the Samson-Hutchinson non-skidding and unpuncturable bands for pneumatic tyres, of which an illustration was given in a recent issue.

A new motor-bicycle of American design was the "Marsh," to be seen on the stand of Mr. W. P. Brough, Kettering. The engine is a large one, 80 mm. by 82 mm., stated to develop $3\frac{1}{2}$ -h.p. It is built in the frame, slightly inclined to the rear, and drives through a $1\frac{1}{4}$ in. belt on to a large pulley made in one with the rear wheel rim, a jockey pulley being provided to tighten the belt.

Mr. B. E. Dickinson showed his "Morette" motor-carriage of 4-h.p., and also a petrol-saver and strainer. The delivery tube is fitted with a rigid bend, so that it may be hung on or into the tank, and at the other end of the tube is a strainer. Waste of petrol is prevented by this useful device, which can be folded up into a small space.

A varied and comprehensive display of motor clothing was made by Mr. C. R. Base, whose exhibit always contains some features of interest. Leather and cloth coats, vests, etc., with special linings to render them

The Longuemare type of carburettor is fitted; high-tension ignition with detachable contact, and a new pattern speed regulator. The Dupont two-speed gear engaging with phosphor bronze spur wheel, mounted round the differential on the axle, is another feature. A wicker body of good design completes a well-made miniature car. The Eddington tandem motorette, No. 2 pattern, is a bolder vehicle with a 4-h.p. water-cooled engine of 80 by 104 mm. cylinder dimension as compared with 75 by 80 in the lesser vehicle. The water circulation is on the thermo-syphon system. Other details are on similar lines to the 3-h.p. machine. The wicker body is removable for a parcels box or carrier at will, and, altogether, Messrs. Hillsdon and Company have made a good effort to popularise "the poor man's car." A motor-bicycle with engine of 3-h.p. was also shown on the stand.

The "Buckley" Patent Motor Wheel and Carriage Company showed an open-sided accessible motor wheel fitted to a motor-bicycle. The machine is gear driven, and it is claimed by the makers that there is no sacrifice in mechanical principle in the mounting of the wheel or of the axle.

The Ilford Motor Car and Cycle Company, Ltd., were represented by the "Regina" motor-bicycle, fitted with $2\frac{1}{2}$ M.M.C. and 3-h.p. Fafnir engines respectively. The engine is placed in a vertical position, low down between the wheels, the transmission being by means of a solid V belt. Lubrication has received careful attention, this being by means of a positive sight-feed pump, fitted in position to be easily operated while running. The oil tank capacity is for 400 miles, and the petrol capacity $1\frac{1}{2}$ gallons. The control is by a switch on the left hand side of the bar and Bowden twist handle on the right-hand side of the handlebar and exhaust governor.

The Woodcote Engineering and Motor Works had a show of accumulators, charging batteries, coils, measuring instruments, etc.

The "Anglian" motor-bicycle, with its $2\frac{1}{2}$ -h.p. air-cooled De Dion engine

Fig. 4.—The 24-h.p. "Regal" Car. (See page 772.)

absolutely wind and air-proof, were a feature of the display, caps and hats for both lady and gentlemen motorists being also in profuse array on the stand. A selection of goggles, muffs, foot-muffs, and other goods necessary to the motorist in such weather as lately experienced revealed the growing scope of Mr. Base's activities.

A useful display of the Millford forecarriages, side cars, front carriers, and other of their specialities was made by Messrs. Mills and Fulford. This firm have become well identified with this particular line, and in bringing out fresh ideas have been prompt in meeting the changing demands of the industry. Their 1904 pattern of fore-car differs from the previous models in several details, the most important being in the fitting of the front portion. The front of the cycle is removed entirely and a special steering stem inserted; this dispenses with the spring in the forks, and renders the steering much more positive. The extension of the main tubes to the back portion of the motor-cycles makes the vehicle more rigid, besides allowing of their use as foot rests. The attachment admits of the fore-car being removed in less time than formerly.

Now that fore-carriages and similar devices have become so popular, the exhibit of Messrs. J. J. Plater and Sons was naturally of great interest to the trade. Cane and wicker fore-car bodies in all styles and designs, trailer bodies, side baskets, etc., were shown in infinite variety.

Among the minor exhibits was a "quick-grip" spanner and nut gripping pliers shown by Messrs. A. G. Taylor and Co., a time and temper-saving device of effective utility.

Messrs. Hillsdon and Company had a tandem motorette—a two-seated vehicle of somewhat ingenious design. In one pattern a 3-h.p. air-cooled engine is fitted. In this the inlet valve chamber is slightly to one side of the engine to secure it being entirely exposed to the rush of air.

and carburettor, was shown by the Anglian Motor Company, Ltd. The transmission to the rear wheel is by means of a V-shaped belt.

Messrs. J. Lacoste and Company exhibited an internal wipe contact-breaker, the feature of which is a red fibre ring placed in a gun metal body. A steel contact piece is provided in the ring, and on the end of the rotating shaft is a brass arm fitted with a steel roller. This makes contact with the insulated contact piece in the fibre ring, the results being very satisfactory. Accumulators, coils, sparking plugs, and other small goods made up an interesting display.

In tyres there were a few exhibitors, including the Dunlop Company, of whose exhibits it is difficult to say anything new, their merits being so well recognised; the Scottish Tyre, Ltd., with the Scottish de Luxe voiturette tyres built up with Para rubber and tangential linings; the North British Rubber Company, Ltd., with the Bartlett-Clincher motor-cycle tyres, the Clincher motor tyres, and the Clincher-Michelin motor tyres; the Wilkinson Tyre and Tread Company, Ltd., with their non-skidding tread—a device for vulcanising over the outer covers of motor-cars and motor-cycles; and the Williams Tyre Company with a non-slipping "Uvula" tyre for motor vehicles.

Recognising the early operation of the Motor Car Act, Messrs. Worsnop and Co. have brought out head lights and tail-lamps with side lights to illuminate the numbers. This formed a central feature of their display, which also comprised motor-bicycle lamps and several minor accessories for automobiles.

The Martin Pneumatic Tyre Company, Ltd., showed a number of their motor-tyres, the feature of which is their easy method of detachment, and the fact that inner tubes are not used. In addition to the ordinary form a tyre with a flat tread is now being made, while the company also exhibited a car shod with Martin tyres, which are stated to have been run 4,000 miles without having been pumped up or met with a puncture.

THE STANLEY SHOW.

(Concluded from page 755.)

The Enfield Cycle Company, Ltd., showed examples of their 6-h.p. and 10 h.p. Enfield motor-cars, an illustration of the latter being given in Fig. 5. The engines are of the vertical type with cylinders $3\frac{1}{2}$ in. diameter and 5 in. stroke, with mechanically-operated inlet and exhaust valves, Longuemare carburettor and centrifugal governor. The cylinders and water-jacket are cast in one piece, the valve chambers are also an integral part of the cylinder, this construction ensuring reliability of running. The

transmission being adopted. On the same stand were a couple of highly-finished motor-cycles, one being of $2\frac{1}{2}$ -h.p. and one of $3\frac{1}{2}$ -h.p., the latter being water-cooled. The motor, which is fixed vertically in a loop frame, has a steel cylinder, into which the cylinder-head is screwed. In both machines belt transmission is adopted.

"The Princeps" motor-bicycles were exhibited by Messrs. J. E. Hutton, Ltd., both chain and belt-driven designs being on view. One type to be used in connection with a fore-carriage was fitted with a 4-h.p. twin-cylinder engine of 70 mm. stroke by 72 mm. bore. A small lever is provided to admit of the engine being started before the rider mounts. A spray carburettor is fitted as well as adjustable valves. A special form of commutator is provided, necessitating only one coil for the two cylinders. A Hans Renold $\frac{5}{8}$ -pitch chain is employed, and ample wheel base has been given the machine. The F. N. motor-bicycle was again shown by Messrs. W. R. McTaggart, Ltd., its standard features being retained for the coming season. The $2\frac{1}{2}$ -h.p. engine is placed vertically in front of the bracket, a noticeable point about the motor being the wide bearings.

On the stand of Messrs. Bradbury & Co., Ltd., was the 2-h.p. Peerless motor-cycle that obtained a first-class certificate in the 1,000 miles trial of the Auto Cycle Club. In addition to types of their machines the firm also had a set of engine parts noticeable for their excellent design and workmanship.

Messrs. G. Strauss and Co. are well identified with the Fafnir engines, which were shown of various powers. For motor-bicycles this has an exhaust-valve governor worked by a rod from the handle-bar.

Werner Motors, Ltd., displayed their new models for the coming season, these including two machines with engines of $2\frac{1}{2}$ and $3\frac{1}{2}$ -h.p. respectively. The improvements which have been introduced include a free engine and speed regulator, while a new form of engine pulley has been adopted to prevent the slipping of the belt. A dust-proof carburettor,

a new system of brakes, including a rear rim-brake, and a new contact breaker are also features of the new Werner, which show the intention of the makers to keep well to the front.

Messrs. Brown Brothers had a complete range of accessories and fittings, and also showed their 6-h.p. "Brown" single-cylinder two-seated car. Their motor-bicycles for the coming season will be fitted with 2-h.p., $2\frac{1}{2}$ -h.p. and $3\frac{1}{2}$ -h.p. engines. In all these sizes the engine is rigidly fitted in front of the bottom bracket, so that it can be easily detached from the frame by removing two bolts. The $2\frac{1}{2}$ -h.p. and $3\frac{1}{2}$ -h.p. engines are fitted with mechanically-operated valves and extra large flywheels. The bearings are of exceptional length, being 2 inches wide on the driving pulley side. Special attention has been paid to the construction of the crank case,

crank shaft gives large and ample bearing surface for the thrust bearings, and also for the connecting rod bearings. The flywheel is of large proportions, ensuring great regularity in the running of the engine. The tubular frame is carried on four springs slung so that they will give a comfortable suspension under the most trying conditions. The change-speed gear gives three speeds forward and one speed reverse, the drive on the top speed being direct, and the intermediate speeds being automatically thrown out by the top speed engagement. The foot brake acts directly on the transmission shaft from the change-speed gear. Several excellent arrangements have also been devised in other parts, while the comfortable tonneau should make the Enfield a popular car for the 1904 season.

Mr. O. C. Selbach made an interesting display of the Regal cars, the features of which have been made familiar to our readers. He also showed a 24-h.p. four-cylinder car, fitted with a tonneau body, and having a most effective appearance (Fig. 4). The vehicle has three speeds forward and one reverse, the drive being through gears and cardan shaft on to the live axle. The mechanically-controlled valves, being set in the crown of the combustion chamber, are easily accessible for inspection when necessary. The coil, commutator, and lubricator are located on the dashboard. On the standard below the steering wheel are the levers for air, gas, throttle, and ignition, operated by means of Bowden wires.

The "Jaxon" car was shown by Messrs. Seabrook Bros. This is a 6-h.p. engine two-seated car at a popular price. The motor is located at the rear. The radiating coil is of brass tubing fitted with corrugated copper flanges, and the water tank is placed under the bonnet, rotary pump circulation being adopted. Two speeds forward and reverse are provided, the live axle being fitted with a spur differential gear. The London agents for the "Jaxon" car are the Central Motor Co.

The Roots Oil Motor and Motor Car Company are familiar to motorists in connection with their 5-h.p. and 12-h.p. cars, in which paraffin oil can be employed as fuel. Tube and electric ignition, the latter of either the magneto or accumulator type, can be provided. The governing is effected on the centrifugal principle at a normal speed of 750 revolutions. This can if desired, be reduced to 400 or increased to 850. A friction clutch and Renold chain effect the transmission, the gear box having three speeds and a reverse. There is a pedal brake and also a band emergency brake. These vehicles can be made with bodies to carry four, six, or eight persons, and are proving their serviceability in countries where petrol is dear, and in places where it is not to be obtained.

The Société des Automobiles Française occupied a stand in the Minor Hall, where they made a feature of a display of their Papillon cars, motor-bicycles and skeleton sets for motor-cycles, as well as of a varied assortment of accessories. The cars shown were of 6, 9, and 12-h.p. respectively, with tonneau bodies. With their long wheel base and low-slung bodies the cars attracted much notice. Power is transmitted by means of a cardan axle with cone clutch, the cooling of the engines being by rotary pumps worked by the motors. The engines are of the genuine De Dion type. Three speeds forward, and one reverse, all operated by one lever, are provided.

Hidden away in a corner, La Société Mécanique et Moteurs, of Liege, exhibited a 12-h.p. car, interesting from the fact that in place of the usual arrangement the power is transmitted through a Jenatzy magnetic clutch. The two-cylinder engine has mechanically-operated inlet valves. Three speeds and a reverse are provided, the chainless live-axle system of

Fig. 6.—The "Duco" Exhaust Valve Spring Remover.

which is absolutely oil tight. The belt pulley is also oil-retaining, thus keeping the belt free from oil. An efficient silencer is provided. The contact breaker is very neat and compact, and is of the universally used "make and break" type. An exhaust valve lifter is fitted. This latter and the advanced sparking are actuated by one lever. Fig. 6 shows the "Duco" exhaust valve spring remover lately introduced by Messrs. Brown Bros. The illustration clearly shows the method of using the device, which will be found a useful addition to the tool bag.

The Faceler Motor Syndicate had a set of the component parts of their "Faceler" motor, and a chain-driven motor-cycle fitted with one of their engines of 2½-h.p. The arrangement of the flywheel and gearing has been devised to give a narrow crank case, while the intermittent action of the second shaft allows the valves to open quickly without the use of cams.

A good show was made by Messrs. Hobart Bird and Co., Ltd., whose motor-cycles have an emergency handle-bar control, the movement of one lever breaking the electric circuit, lifting the exhaust valve, and applying a brake to the back wheel—the three operations being in succession. The firm are still fitting 2½ and 3-h.p. engines to their motor-cycles, while they have brought out a Tri-car with a 3½-h.p. engine, belt driven. In this a foot-rest is provided for the driver's feet, while foot-plates are fitted near the rear axle for mounting the car after the machine has been started.

On the stand of the East London Rubber Company was a lady's motor-bicycle and Kerry motor-bicycles of 2½-h.p., 2½-h.p. and 3½-h.p. Special attention was also directed to the "Empire" back-peddalling support, which is adjustable to all inequalities of the road, and when in use has a base of 18 inches, adequate to meet all danger of side-slip. It can be brought in and out of use practically instantaneously, and does not interfere with the machine being wheeled backwards and forwards. As an emergency support, a stand, a jack, or an anti-skid this "Empire" device is equally valuable.

Messrs. John A. Prestwich and Company showed their motor-cycle set and a 3-h.p. motor-bicycle with mechanically-operated inlet and exhaust valves fitted on the top of the combustion head.

The "Vincos" motor-cycles with Minerva engines of 2½ and 3½-h.p. were exhibited by Messrs. W. H. Heighton, Ltd.

The Coventry Chain Company had their familiar exhibit, much interest being shown by visitors in their motor-cycle belt fasteners and drives.

Messrs. J. E. Hopkinson and Co., of West Drayton, had a good display of solid tyres for heavy motor work, motor-cycle inner tubes, and covers. The London Tyre Repairing Company also took occasion to draw attention to their facilities for the repair of tyres.

Reference has already been made to the good show of motor garments made by Messrs. Alfred Dunhill and other firms. The Grapholine Manufacturing Company, Ltd., also had a selection of motor clothing, gloves, gauntlets, and rainproof coats, as well as levers for removing motor tyres, voltmeters, and sparking plugs.

Mr. Theo. Masui had a selection of motor and motor-cycle tyre covers fitted with "Samson-Hutchinson" non-skid bands. These bands consist of chemically-treated chrome leather, which is protected by rivetted steel studs. Being very light they do not slacken the speed of the cars, and being vulcanised on are not likely to come off.

The "Vindec" special motor-cycle was shown by the South British Trading Company. This is fitted with the 2½-h.p. "F. N." engine and carburettor, the engine being placed in a vertical position in the frame, and easily detachable. A hinged rear mudguard, to facilitate the removal of the rear wheel, is also provided.

"Garlio" was shown. These cleaning and polishing cloths are so familiar to motorists that their special advantages need no detailing here. They are made entirely from silk, and have the virtue of being non-inflammable.

Motor-car headlights, sidelights, and rearlights formed the attractive display of the Twentieth Century Manufacturing Company, who also exhibited special hand lamps burning acetylene gas. In the gallery, Mr. C. Lohmann had the "Perfecta" acetylene lamps for motor-cycles. Messrs. H. Miller and Company, Ltd., had a motor "Edlite" to burn oil.

Messrs. Steiner and Company, of Houndsditch, made a big show of lamps and of motor-horns, the former department including several powerful patterns intended to fulfil the requirements of the new Motor Car Act. Flexible tubing, with reversible clips, was also in great assortment.

Motor lubricants, greases, etc., were shown by the County Chemical Company, Ltd., of Birmingham, who are making a special feature of their motor carbide and of the G. B. puncture-proof device; the High Level Brand Company, of Newcastle-on-Tyne; the Elephant Chemical Company, who introduced "Calcoid," a new substitute for carbide, which is claimed to be economical and effectual, and are maintaining the repute of their "Motorol," which does not solidify in winter.

In the position long associated with the firm, Price's Patent Candle Company, Ltd., made a comprehensive display of oils for cylinders, motors, axles, chains and gearing, etc., as well as of the well-known "Belmoline" solidified oil and "Rangraphine" for motor chains. Oils, grease, and lubricants for automobiles were shown by the Stern-Sonneborn Oil Company, whose specialities are well known to motorists. These include the "Sternoline" lubricant for Stauffer and other grease lubricators.

Accumulators were shown by the Cologne Accumulator Works, who made a special feature of the "K. A. W." type. Messrs. H. and D. Friedenhain had a comprehensive selection of contact breakers, motor-cycle fittings, etc., and also showed several of the high-speed trembler coils made by L. Gianoli, of Paris. In the Arcade, electric motor-car lamps, batteries from three ampere hours up to sixty ampere hours, and accumulators of every description were shown by Messrs. Sanders; Messrs. Rehders and Company had a new accumulator on view with a solid fitting of special composition. The "Empire" ignition accumulators for motor-cars and motor-cycles were on the stand of Messrs. Sutherland and Marcuseon, where the "Empire" storage battery hand lamps were also to be seen. They also had a battery in which every part is readily accessible. Each element is independent of the others, and is fitted with non-corroding terminals.

When the lid is placed in position and the fly-nuts screwed down, the battery is practically liquid-tight. All connections are made with wire outside the lid. The elements are of the "Empire" type, in which ribbed porous separators entirely occupy the space between the plates, preventing the active material from falling away from the supporting grids. Messrs. Mason and Brown were present with voltmeters, improved ignition coils, and a motor-bicycle switch.

For attachment to ordinary bicycle frames the Bord Motor Company showed their 1½-h.p. engines. Light-weight motor-cycles were also on their stand, fitted with these engines. The carburettor has been improved, and an exhaust valve lifter, spark, and balanced flywheel have been introduced into the design of these motor-cycles.

The South British Trading Company, Ltd., showed the Kingston carburettors, motor wheels, Fisk tyres, and the well-known Sterling tool-bag, the features of which have already been described in the *Journal*. The Fisk tyres are steadily coming to the front in this country, and we hope to illustrate their principle of construction in an early issue.

Messrs. Shippey Brothers, Ltd., in addition to the Diamond tyres, referred to last week, had on view a 7-h.p. "Toledo" steam-car, with leather hood, admirably designed for the use of doctors.

Among the exhibits of the Crypto Works Company, Ltd., was an electrical speed indicator for cars. This can be placed in any position where driving is most convenient and can be arranged so that it is only working at the time when required to be read.

Weldless steel tubing, radiators for cars, &c., were part of the exhibit of Messrs. Accles and Pollock, who also showed a new sparking plug, terminal clips, and spare petrol tanks for motor-cycles.

Among miscellaneous goods not without interest to motorists were noticed the polishes, enamels, etc., of the Page Manufacturing Company, and the "Nugget" enamel and polishes.

Messrs. J. Dawson, Limited, took advantage of the Exhibition to show their "Linoona" motor-cycle belts, a feature of the display being a large belt for use upon high-powered cycles and where carriage attachments are used. In King Edward's Hall a display of motor-cycle beltings was made by Messrs. R. Lloyd and Co., special attention being called to the Bolata and canvas V-shaped "Motorite" motor-cycle belting and the "Motorite" belting in chrome leather.

Messrs. Clarke, Cluley and Co. exhibited the Globe belt-driven motor-cycle; the "Roc," with its 3-h.p. Kelecom engine and belt drive, was shown by Messrs. A. W. Wall, Ltd.; Messrs. May Brothers had the Lynx motor-cycles with belt drives, but fitted with various engines, including the M.M.C., Rex, Fafnir, and De Dion; Messrs. Graham Brothers showed the Parade and the Ariel motor-cycles, and also made a feature of their "Liberty" detachable sociable, in which the danger of side-slip is claimed to have been effectually prevented; on the stand of the Edmonton Manufacturing Company, Ltd., was an Edmonton motor-cycle, fitted with a 2½-h.p. Lurquin and Coudert engine.

The Abington Works, Ltd., were represented by the "King Dick" motor-bicycle, the novelty at the stand, however, being a motor-tricycle with a patent driving axle.

Messrs. J. E. Hopkinson, Limited, of West Drayton, had a good display of matting and motor-car rubber sundries, as well as solid tyres for heavy vehicles, an motor-cycle inner tubes and covers.

The Clyde Cycle and Motor Company had a motor-bicycle with a 3½-h.p. motor. Magneto ignition and mechanically-operated valves were two important features.

CORRESPONDENCE.

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having experienced the same trouble as your correspondent, I think I can give him the information he requires re his ignition troubles. The cause is not so much the combination of the high and low tension passing over the same wire, but mainly to the fact that the high tension current is of a slightly longer duration than the low tension, therefore

causing a jump spark between the platinum points after the contact is broken. This is undoubtedly due to the "stored-up" current passing from the condenser of the coil. I have remedied my trouble by two methods, both of which have proved very satisfactory. In the first method I connected an extra wire from the coil to a convenient place on the cylinder, thus getting the high-tension current to pass over this instead of through the contact breaker. Secondly, I connected the accumulator to coil the

reverse way round and run to "earth" through the accumulator.—
Yours truly,

H. J. T.

THE MOTOR VOLUNTEER CORPS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your reference to the discussion on the Motor Volunteer Corps at the Automobile Club, Lieut.-Colonel Mark Mayhew is reported to have given as the reason for the distinction between officers and men in the corps the fact that it is a military organisation, and that all such organisations had officers to lead and control the regiment. Such a reply seems a wholly inadequate one to the criticisms that have been made. Will Mr. Mayhew tell us the name of the regiment where the proportion of officers is twenty-four to forty-nine privates—to say nothing of the Adjutant and others high in authority?—Yours truly,

A VOLUNTEER.

WARMING A MOTOR-CAR HOUSE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would a Tortoise stove be suitable and safe for warming a motor-car house? No petrol would be kept in the house other than that in the petrol tank in the car, on which acetylene lamps are used.—Yours truly,

ENQUIRER.

[We would strongly advise "Enquirer" not to use a Tortoise stove for warming his motor house. Although no petrol is kept in the house there is always the possibility of a leakage. The draught from the stove

on a clear country road. Then we stopped, and the first lesson was begun. I was told all about valves, spark advance levers, lubricators, pumps, and compression levers, to say nothing about the clutch, water and petrol tanks, and a dozen other things, until my head fairly spun trying to memorize them all. Finally, I had so mastered the seemingly intricate mechanical details of my car—or at least thought I had—that I was allowed to try and start the machine.

I did everything as directed, and was overjoyed to hear the motor buzz. My joy was short-lived, however, for a moment later the engine ceased its rhythmical puffing, and stopped. However, we were soon off again, and, at the "breakneck" speed of five miles an hour, we went along, until the expert insisted that the top speed should be thrown in. I demurred at first, but he insisted, and forward the lever went. As the high speed was locked in and the car leaped ahead, I almost wished that I'd never attempted to run the thing, and I was trying to decide which way would be the easiest to get out should a hasty exit be necessary.

An hour's practice in starts and stops brought confidence with it, however, and I began to feel that the expert's presence was unnecessary—in fact, an imputation and reflection on my skill as a *chauffeur*, for, like all beginners, I already had inflated ideas of my own powers. I knew how to start and stop the car, and could also steer it with considerable confidence, and the throbbing mystery beneath the bonnet didn't worry me, at least, not while it gave every indication of running all right. So back to the agent's depot we went, and, despite the timely warning about over-confidence, I left the paid expert and started out alone. The car worked to perfection, and my nervousness rapidly disappeared as I found how easy it was to operate the clutch and to change the gear at will.

I was speeding along a country road, congratulating myself on my

The Beaufort Company's "Princess" Phaeton with Side Entrance. (See page 759, last issue).

would tend to draw the fumes from this, with disastrous results. Hot water pipes would be a much safer plan.

A NOVICE'S EXPERIENCES.

To the Editor of the *MOTOR-CAR JOURNAL*.

SIR,—I read with much interest the article in your last issue on "The Care of Motor-Cars." The difficulties and troubles of an inexperienced beginner with a petrol car during the first few weeks of ownership are things long to be remembered.

Like many others, a desire to become a motorist had taken hold of me, and, after a good deal of preliminary enquiry and investigation, I finally purchased a 4½-h.p. car. Bearing in mind the fact that I hardly knew a sparking plug from a valve, I climbed timidly into the car a day or so after it became mine, and sat in anxious expectancy while the agent's expert turned cranks and handles and pressed down levers, until, finally, with a spasmodic snort, the engine started puffing away, making the car shake and vibrate from end to end. Still, the thing didn't move, and I sat, momentarily expecting to see the vehicle spurt forward and kidnap me, for, in my ignorance, the best I could have done would have been, possibly, to have guided the vehicle until it dashed both itself and me to destruction against some convenient obstacle.

The expert, after fussing about a little, climbed up beside me, and, pressing his foot on what he termed "the speed accelerator" (a Greek term to me then), set the motor buzzing faster, and, with the kind explanation that he had to start on the low gear in order to let the motor generate more power, he pushed forward a lever, and we were off with a jump. Then followed a series of quick runs and stops until we were well out of town and

ability to manage my new found treasure, all unsuspecting of danger, when a dog of the vehicle-chasing variety jumped out directly in my path, barking loudly. Fearing a collision with the brute I dragged back one of the levers, and, in my excitement, forgot to apply the brake. There was a sudden jerk, followed by a ripping, tearing, grinding noise, then a whirring of wheels, and the sound of the motor racing. It didn't take me long to bring the car to a stop, and then, frightened, I shut off the petrol, and waited for the motor to stop. It dawned upon me in a moment that I had stripped those precious gears, as to the location of which I had little or no idea.

A few days later, when the necessary repairs had been made, I ventured out again to do and dare. I concluded to run out into the country and try my luck, but before I returned home I was convinced that I was not possessed of any of that uncertain quality. A five miles' run was completed in good time without a mishap, and, rejoicing at this new experience, I started on the homeward trip. I had gone about a mile, when suddenly, when half way up a small hill, the motor stopped. This was a new experience, and, while holding the car at a standstill with the brakes, I shut off all the various levers, and then, opening them again, went through the starting operation, but it was no use.

Unable to get the motor going, I let the car back slowly to the side of the road, then got out to investigate. My first move was to get out the book of instructions, which was stowed safely away in the tool box, and then I sat down to read over again, for the thousandth time, the "Hints to Beginners; or, What to Do When the Motor Won't Run," despite the fact that hours of study had made them all familiar to me. First I tried the battery connections, then I removed the sparking plug, only to find by testing it that it was all right. There was nothing wrong with the trembler,

and the next thing in order was to take out the needle valve in the carburettor to see if it was free from dirt. Having exhausted the book directions I sat down disgusted and disheartened, hardly knowing what to do, and waiting for someone to come along whom I might get to watch the car while I arranged with someone to tow me home.

I thought to put in the time in experimenting with the motor, with the hope that some lucky touch might set it going again, and decided to open the petrol tank and see how much of the liquid was left. Imagine my surprise to find the tank dry! Let it suffice to say that I whispered things most uncomplimentary to myself. After this I enjoyed a week or more of immunity from annoyance. The motor in my car being water-cooled, my next trouble came from an unexpected source, for the continual jar occasioned by travelling over rough roads had loosened the joint in the water tank. The water leaked out and my motor ran hot, a condition of affairs which mystified me greatly.

Of course, I, like all owners of petrol cars, had any number of little bothers, such as a lubricator which insisted on flooding the parts to which it was connected, sparking plugs that wouldn't spark, etc., but for weeks I studied my machine, and am now perfectly familiar with each part and the relation that it bears to the others, and since I have gained that knowledge the troubles which at first seemed to pursue me have disappeared. I have a fixed routine to follow whenever the motor does not work. "Never get discouraged" has been my motto, and I strive to remember first that the motor has run and will run again.

Half the blame for trouble and annoyance which is saddled on the defenceless motor-car should by right be the motorist's burden. His ignorance of the things he should know, and not the manufacturer's imperfect construction, is the cause of its failure to work properly. The troubles that once seemed so serious to me are now all forgotten in the past, and I

of steel) where it comes at the top. This was due to moisture through rapid evaporation, and caused the needle valve to stick; but I overcame the trouble by fitting a valve made of German silver. This, in all probability, is "Country Mouse's" trouble.—Yours truly,

RIPLEY ROAD.

6-H.P. DAIMLERS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I notice in your correspondence columns in the last issue that someone is asking whether the old 6-h.p. Daimler can be converted into higher power with success. I can answer this query emphatically "Yes," if he will only apply to Mr. Frank Morris, of the Sandringham Motor Works, King's Lynn, for particulars of his new cylinders and pistons, which can be easily fitted to his present base-chamber. Nine months ago I purchased a set, and my son and self fitted the same easily and took the car on the road. A great improvement was at once noticed, which, I am pleased to say, steadily increased as the cylinders got their surface up. At that time I was conveying His Majesty's mails a distance of over forty miles per day, the load frequently weighing 30 cwt. to 35 cwt., in addition to a heavy box van body fitted in the place of the usual pleasure type. The engine did this most easily, which would have been impossible with the old 6-h.p. After this contract ran out I used the car as a nine-seated char-à-banc pleasure vehicle, and in this condition I find that it runs up-hill faster than it used to with the old cylinders. The cylinders are well made, have very large valves, huge water jacket, and maintain their power wonderfully.—Yours truly,

W. F. MILLER.

A Municipal Automobile Demonstration at Cleveland, U.S.A.

[Automobiles.]

have actually at times wished for something to go wrong to vary the monotony of riding along speedily, easily, and uninterruptedly for miles up hill and down dale. I have become the life-long friend of the petrol motor-car, and to all fellow amateurs and beginners I would say what experience has taught me to be true: Know your car, and it will be a source of pleasure and enjoyment to you as long as its bolts and screws hold together.—Yours truly,

TYMPANUS.

CHARGING ACCUMULATORS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—In reply to R. W. Buttemer, kindly allow us to make the following corrections:—As the Boron battery for various purposes can be charged with solutions that contain no chromic salts, the term "merely" is scarcely applicable. Three cells of such a battery will charge two two-volt accumulators in series making one four-volt, not in parallel, or they will charge two four-volt accumulators in parallel. No resistance is required, as the cells are so constructed as to render it impossible to overcharge the accumulators. Potassium chlorate is always a bad addition, doing nothing but increasing the resistance.—Yours truly,

BORON BATTERY AND ELECTRICAL COMPANY.

CARBURETTOR TROUBLES.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I have not had any such trouble before my notice such as "Country Mouse" has experienced, according to his letter in the last issue, but have had the upper end of the needle valve get rusty (when made

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—In your last week's issue one of your correspondents asked "to hear from any of your readers who had successfully converted or added to the power of the standard 6-h.p. Daimler car." For your correspondent's information I may say that the power of the 6-h.p. Daimler engine can only be added to by putting on larger-sized cylinders. The Daimler Company has designed a solid-head cylinder giving the same stroke as the 6-h.p., but with 94 mm. bore instead of 80 mm., which adds, as near as I can judge, an extra 1½-h.p. These new cylinders are fitted with a new plug capable of taking an ordinary electric ignition spark plug as well as platinum tubes. The conversion also necessitates new induction valve cover and exhaust valves, and, of course, new piston and piston rings. I know of a good number having been converted, and have never heard of anything but satisfactory results having been obtained.—Yours truly,

WALTER R. SHEPARD.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Seeing in your paper an enquiry re increase of power of 6-h.p. Daimler, I may say that over a year ago I got from Mr. F. Morris, King's Lynn, a pair of his 10-h.p. cylinders, and attached them to the base of the 6-h.p. engine. I did all the work myself, and it made a very satisfactory job indeed. It increased the power fully 25 per cent., and I can now use the fourth speed, whereas before on same roads I could only use the third. I would strongly advise your querist to get a pair of these cylinders.—Yours truly,

JAS. EADIE.

[We have received a number of other letters recommending the Morris arrangement.]

THE TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter in your issue of the 21st ult. from a "Practical Motorist" has made me feel rather nervous. I drive a solid-tyred car, and have driven it just about 3,800 miles in the last year, at speeds that must average about fifteen miles an hour. In my car, which is a single-cylinder 8-h.p. two-seated vehicle, the steering is by a large screw on the steering-wheel column working a lever (either of brass or gun-metal), the long arm of which is 7 in. long and $1\frac{1}{2}$ in. by $\frac{1}{2}$ in. in thickness. After a universal joint, the pull or thrust is through a $\frac{3}{4}$ in. iron rod about 15 in. long. Will a "Practical Motorist" tell us what broke in his steering gear, and after what work did it fail? And am I to suppose that after a year's wear my steering gear is unsafe? I may add that I never intend to use pneumatics, so that if a car with solid tyres is not safe I must go back again to horses.—Yours truly,

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter from "A Motorist," in your last issue, advocating the use and singing the praises of Cassell's non-puncturable bands, perhaps he will be good enough to state where such are obtainable, and if at a reasonable price. I read several motor journals every week, but have neither seen these bands noticed nor advertised, nor ever heard them spoken of. This seems strange if they are so good as "A Motorist" describes, for non-puncturable or non-slipping devices must, of necessity, intensely interest all motorists.

I am always hoping that a non-slipping device will be introduced at a price within the means of the ordinary voiturette owner; or that, when

Taxes and insurance	£	s.	d.
Boy at 16s.	10	0	0
Rent of stable	41	0	0
	15	0	0

I am quite satisfied with the change, and do not think I would, in any circumstances whatever, again keep a horse. Only on six occasions have I been stopped on the road by small troubles which I could not immediately rectify myself, and two of these were at the end of journeys of over 100 miles. I am my own mechanic. In my opinion, a motor-car is far preferable to a horse and carriage for general practice, as it does not tire, and mine is always at my command whenever needed, night or day. My stable is a minute's walk from my house. I can have the car upon the road without assistance in three minutes from the time I leave my door.

The points for consideration in the choice of a car by a medical man vary according to the depth of his pocket. If he be content with a light open voiturette, weighing under 10 cwt., run upon pneumatic tyres (or solid), and will look after the mechanical parts himself, keeping a lad simply to wash and to oil the car, the expense need not be greater than in my case. But if, on the other hand, he chooses a car weighing from 15 to 30 cwt., he would, if a busy man, be compelled to keep a mechanic. If he has pneumatic tyres and uses his car as much as I use mine, he will find his cost of running comparatively heavy—his tyre bill alone may be anything between £100 and £300 per annum. Not only are pneumatic tyres expensive, but to find one's tyre deflated by a puncture just when one has an urgent message is more than annoying. I have had only one puncture (in August, 1903), since January, 1901. My little car is to-day in perfect condition throughout—it is in far better order than when I first bought it nearly new. It is, of course, only a motor-perambulator as cars go nowadays, but I have averaged fifteen miles per hour from Birmingham to my house (running

The C.G.V. Car which threw up the least Dust in the Large-Car Class in the recent Tests on the Crystal Palace Track.

the patentees of the several simple and inexpensively manufactured, but highly-priced slip preventers now on the market have satisfied the requirements of their long-pursued *début*, it may be to their interest to cater for the wants of the man of moderate means, who cannot, at the present absurdly prohibitive selling rates, indulge in the luxury of using a small length of chain, or a piece of rivet-studded leather.

Perhaps, too, acetylene lamp makers may in course of time find a profitable return, at less exorbitant rates than now ruling, from the same short-pursed motorist, who may then be in the happy position of being able to add these few necessary adjuncts to his little car without expending some 25 per cent. or more on its prime cost.—Yours truly,

DE D.

[Replying to "de D.," Mr. J. W. Bottomley, and other enquirers, the Cassell non-puncturable band is obtainable from the Central Motor-Car Company, 111, Bothwell Street, Glasgow.]

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a driver of a car in London for nearly three and a-half years, perhaps a few details may be of service to your readers. The car was a De Dion voiturette, $3\frac{1}{2}$ -h.p. The distance travelled was from 18,000 to 19,000 miles. The cost per annum was about £130 (as against £200 for single horse and carriage).

	£	s.	d.
Tyres, pneumatic	25	0	0
Petrol	20	0	0
Lubricating oil	2	0	0
Repairs	20	0	0
Sundries	5	0	0

time), "three up," and a large portmanteau on board. I have done a mile in two and a-half minutes. It will climb any ordinary hill. I have driven it up the West Hill, Highgate, and Aubrey Place, Holland Hill, W. It has twice refused to take me up Netherall Gardens—it went up empty. When buying a car, the medical man should buy one with a good family history, unless he proposes to experiment.—Yours truly,

G. WASHINGTON ISAAC, M.B. Edin.

THE DUST PROBLEM.*

By COLONEL R. E. CROMPTON, C.B., R.E., and Mr. C. W. S. CRAWLEY. THE Automobile Club, having decided in this year's Reliability Trials to award marks to cars for non-dust raising qualities, asked the writers and Captain Nugent, R.E., to devise a system of testing which would show the comparative amount of dust raised by each car under working conditions, with the nearest approach to accuracy.

The mere question of accurately estimating the comparative amount of dust raised by cars at first sight appeared difficult. After careful consideration we decided that photography offered the best means of obtaining comparative records, and, with the experience since gained, we now feel certain of it.

Our first rehearsals were for the object of ascertaining which kind of dust gave the most regular and trustworthy comparative results. We found that even a comparatively thick layer of sifted dust collected from the roads of the neighbourhood, even although it were perfectly dried, did not yield nearly so great a cloud of dust at any given speed as would have been the case if the same layer of dust had been on an ordinary road. We suggest that this is due to the fact that an ordinary road is full of depres-

* From a paper read at the A.C.G.B.I. on the 26th ult.

sions; that the dust collects to a greater thickness in these depressions, and that as the car plunges into them it pumps the dust out of the depressions with much greater force, and consequently disturbs it to a greater extent than could be the case on the hard concrete surface of the Crystal Palace track.

We therefore tried various grades of flour as a material which could be readily obtained of standard quality, and in the mill sweepings obtained from Lieut.-Colonel Mark Mayhew's company we found exactly what we wanted to give satisfactory results. Accordingly a half width of the track, for a distance of 60 ft., was covered with a layer of this flour to a depth of half an inch. Half of the track was left free of flour to enable us to run on this a pilot car fitted with speed-indicating apparatus, which could give the correct speed of the test runs to the competitors in turn. In this way we arranged that all the competitors should be on even terms as regards speed.

At this stage we think it as well to state briefly what those who had considered this matter believed would be the chief features which determined the amount of dust raised by a motor car when running at a given speed over a dusty patch of road. Previous to these trials, we were obliged to form our ideas on ordinary scientific lines. A motor-car passing over a high road disturbs the dust lying on its surface by its wheels. This disturbed dust is lifted and carried to a height or to a distance by the wind or by the air draught arising from the passage of the car. Motorists who are not very familiar with the laws which govern the movements of currents of air, and who have noticed that the passage of pneumatic tyres over a dusty road seems to suck out, as it were, the dust from the surface of the road, have jumped to the conclusion that the dust raising was probably caused by the nature of the tyres themselves, and have not paid much attention to the influence of the air currents produced by the car. One of the writers, however, happening to own a White steam car, which, although it is fitted with 800 mm. by 85 mm. pneumatic tyres, raises less than the usual amount of dust raised by other cars of the same size and weight, and when going at the same speed, noticed that the chief difference between this car and others is that the space for the air currents to pass underneath the vehicle is a good deal larger than that commonly given in other cars, and that this space was larger at the back than at the front end of the car. In further considering the matter, it was observed that the worst dust-raisers were cars which had tool-boxes or silencers fixed across the back of the car close to the ground, so as to leave a very small air exit at the back. In discussing this matter, it would be useful to use the words "air entrance" for the area in square feet measured between the wheels up to the height available for the air at the front end of the car, and "air exit" for the area measured in the same way at the back end of the car.

When a car is driven through still air at a speed of 20 miles an hour air is displaced by it in proportion to its cross section. Part of the air thus displaced passes over the top, part to the right and left, and part underneath the car, and it is with the part which passes underneath the car that we are most concerned in considering the dust question.

We are all of us familiar with the dust clouds raised by wind or currents of air sweeping along or across a dusty road. With some kinds of road dust quite a small breeze will raise the dust to a disagreeable extent. Sweeping over the surface of the road the breeze blows the heavier parts of the dust away from the prominences into the hollows, leaving the prominences bare of dust, but the lightest parts of the dust drift away in the form of a cloud to a considerable distance. If an ordinary horse-drawn vehicle comes along this road the horses' feet and the wheel tyres will disturb some of the dust that lies in the hollows. This dust is lifted only a few inches from the ground, is caught by the breeze, and forms a much larger cloud than the breeze can manage by itself. If a motor-car having pneumatic tyres comes along a still larger amount of dust is disturbed and lifted to a height probably in proportion to the speed, but in the case of the motor-car, even on still days, an artificial breeze or currents of air are set up by the passage of the car, and these probably play the most important part in throwing the disturbed dust to a great height and carrying it to a great distance.

As already stated, the most important of these currents of air is that which passes underneath the vehicle itself, and the side and back currents which are set up by the air rushing in to fill the vacuum caused by the passage of the car.

We have now to see how far these ideas are confirmed or falsified by the trials themselves. The first point we will consider is the effect of the tyres themselves. In a large number of cases the size of the tyres have been noted, and the general conclusion we have arrived at is that the difference caused by the tyres themselves is not very marked. It is undoubtedly the case, all other things being equal, that 120 mm. tyres will raise more dust than 90 mm. tyres, but this extra quantity does not affect the total cloud of dust to nearly the same extent as comparatively small alterations in the front wings or in the air entrance and exit.

We are indebted to Captain Brady, R.E., for the following clear explanation of the cause why all elastic driving tyres, more particularly pneumatic ones, lift the dust:—Motor-cars are propelled by a stress transmitted through their tyres. When the car is at rest the tyres are compressed vertically by the weight. When the engines apply a stress of starting, the car, as the driving wheels commence to turn the tyres, will be strained tangentially, the rubber in front of the point where the tyre touches the ground will be compressed, and that behind it, where it leaves the ground, will be stretched in both cases in a direction parallel to the rim of the wheel. As the car moves forward the particles of the tyre in front as they come under the wheel are always brought into a state of tangential compression. The roughness of the road surface and the driving power of the engine

prevent these particles from springing back until the forward movement of the car raises them from the ground. At this time they suddenly change their state of tangential compression for one of tangential tension, i.e., they move rapidly backwards along the rim to recover their original position. In doing this the surface of the tyre scrapes or sweeps the road surface and carries up with it the lighter particles of the dust. This difference of the speed of the portion which is thus alternately compressed and stretched is the speed at which the tyre sweeps the dust to the rear. It will be noticed that small stones behind the wheel will be overturned, and all the finer particles, including the dust, are projected backwards and upwards. In this respect the tyre is worse than a sweeping brush, which overtakes and smothers some of the dust it raises, but the tyre retreats and leaves the dust free to rise.

The small radial lines shown on the tyre, and which divide it into equal portions, resemble the bristles of a hair-dresser's machine brush. They stand out radially in all the unstrained parts of the tyre, but are bent forward as they approach the ground in the compressed parts, and again recover their radial position in the stretched part. The distance between their stretched ends is a measure of the speed of particles of tyre. It is quite probable that in the case of deep tyres, when the driving wheels are turned at a speed which, if rigid, would be only 20 miles, the tyre particles sweep the ground at a rate of 7 miles an hour quite apart from their rolling velocity of 20 miles. As driving wheels revolve their tyres can only obtain the necessary resistance for driving the car by sweeping away the more yielding parts of the dust until they meet with dust particles coarse enough to obtain a grip of the road. We may say, therefore, that the dust-sweeping properties of the tyres depends on the elastic sensibility of the surface of the tyre; secondly, on the width of the tyre which is applied to the road; thirdly, on the driving stress applied; and fourthly, on the speed of the driving wheels.

One point we should like to make very strongly, and it is against all previously conceived ideas. *A low car is not necessarily a dusty one, nor is a high car necessarily dustless.* If the bottom of the car is a tangle of gear and boxes, especially if smaller behind than in front, that is bound to be a bad car. We think it quite possible that many a dusty car could be much improved, if not made practically dustless, by the use of a plain straight sheet. But there is a further cause of dust—the air rushing in after the car has passed. This is in some cars negligible, in others very serious.

We sum up our final results as follows:—

Hard tyres are better than soft.

Narrow tyres are better than broad.

Neither have a preponderating influence.

Flaring mud-guards are probably bad, especially if they come low down.

Cars which are low underneath are worse than cars a long way off the ground.

But smoothness of bottom shape and absence of forward coning are infinitely more important.

There is strong evidence that it is desirable that the car should slope upwards towards the back.

MOTOR-CAR ACCIDENTS.

FRANK CECIL COLLIARD surrendered to his bail on Saturday, at the South Western Police Court, to answer the charge of furiously driving a motor-car and causing bodily injury to Henry Headhouse, a milk carrier. The magistrate committed the case for trial, allowing bail as before.

At Hounslow, Dr. Gordon Hogg has held an inquest upon the body of Mr. Siegmund Loewe, who was fatally injured in a motor-car accident. The deceased gentleman was a director of Messrs. Vickers, Sons, and Maxim. John Gooding, driver of the car in which Mr. Loewe was riding, said that they were proceeding from Maidenhead to Hounslow. When in Bath Road, near Wellington Road, another car with a bright light passed them. Witness then saw a young woman (Miss Coxall) running across the road in front of witness's car, which was proceeding at the rate of ten or twelve miles an hour. Suddenly she stopped and eventually turned back again. In order to avoid running into her witness turned towards the pavement, and came into contact with the kerb. He applied power to turn the car back, and it ran into a tree and a light fence. Witness, not knowing that Mr. Loewe had been thrown out, went to assist the girl, who was knocked down, and on returning to the car found Mr. Loewe on the path. The jury found that death was accidental, and they exonerated the driver from all blame. They added a rider expressing the opinion that the power of lamps used on many cars was greatly in excess of what was necessary.

THE MOTOR-CAR ACT.

ABERDEEN.—At a meeting of the Aberdeen magistrates with reference to the regulations under the Motor Car Act, the general opinion has been expressed that automobiles should not be allowed to run within the city at a speed greater than ten miles an hour.

YORK.—The Sowerby Bridge Urban District Council are asking the County Council for a six-mile limit for motor-cars through their district, and the Luddenden Foot Urban District Council (their neighbours) are asking for a ten mile limit through their district.

* Indicates Motor-Cycle Case.

AT Guildford, Edwin Checkley, of Notting Hill, was summoned for two offences, motoring at an excessive speed, and further with driving his car backwards for a greater distance than was requisite or necessary for public safety. P.S. Stevens stated the date was the 15th inst., and the speed thirty-two miles an hour. After being stopped defendant, instead of turning the car round, backed right up to the Royal Huts from Tower Road, a distance of 268 yards, at the rate of eight miles an hour. Fined £5.

JAMES E. HAMMOND, manufacturer, Baildon, whose case was adjourned from the previous week's court, has been summoned at Otley for driving his motor-car at a greater speed than 12 miles an hour. Mr. Neill, Bradford, appeared for the defendant, and said that Mr. Hammond had driven his car over 7,000 miles, and was certain that he was not driving at more than 6 miles per hour when the police stopped him. On the previous day he had at Bingley one of the balls in his off front wheel broken; this had taken off the case hardening from the spindle of the wheel, and he had to send for a mechanic from the Elsworth Automobile Company to take the car to their depot for repair. It was found that it would take at least two days to make a satisfactory repair; but Mr. Hammond was specially anxious to have the car on the Sunday (the day of the charge). So the spindle on which the car runs was taken out and turned over, to bring the damaged part to the top, and two new balls inserted. Mr. Hammond was warned that this was only a temporary repair, and that if he did take the car away for use he must use very great care and not drive at any great speed, as, if the balls dropped into the damaged part of the spindle and locked the wheel, the consequences might be serious. Mr. Neill asked the magistrates if they considered that when a gentleman was driving his wife and two lady friends out in his car in that condition, was it reasonable to expect that he would be driving at an excessive speed? Mr. Hammond, in passing the Swan Hotel, about fifty yards from the place where the signal was given, almost stopped his car to ask some motor people who were standing there with a disabled car, if he could give them assistance. P.S. Bell stated that he was in the Pool Road, Otley, when he received a signal of the approach of a motor-car. He timed it with a stop watch over a measured quarter of a mile, and found that Mr. Hammond had covered the distance in 45 secs., or at the rate of 20 miles an hour; he then gave the signal to another constable further down the road to stop the car. He then went up to the defendant and told him that he was driving over the limit, to which the defendant replied that he did not think he was. The constable said that the signal was given by a white handkerchief being shown. After police evidence had been given, Mr. House, of the Elsworth Automobile Company, stated that he had warned the defendant against driving at a high speed without doing so at great risk. The Inspector of Police asked the last witness if the defendant could not have driven the car at a greater speed than 12 miles per hour. The witness answered: "Yes; at the risk of his neck." Mr. A. Fattorini, of Bradford, spoke as to the unreliability of the watch, and the difficulties of timing accurately, and said that the watch used by the constable would not be accepted as a timing instrument by any sports' committee, and that the method of timing was absolutely unreliable. After consultation, the magistrates dismissed the case.

BRITISH AUTOMOBILISM.

AT the annual dinner of the British Automobile Commercial Syndicate (Limited), held at the Hotel Cecil, London, on the 26th ult., the Earl of Shrewsbury and Talbot occupied the chair, and announced that he, in partnership with M. Clement, had decided to commence the building of

the cars in this country, transferring the chief part of their business from French ground. Works were in course of erection in the West of London, and it was intended on their completion to produce the cars in England. For some time the cars would be sent over in the rough and finished here, but ultimately it was hoped to build them entirely in London, and with English labour. Owing to M. Clement having given a French firm the option of using his name, the cars made in this country would be known as the Talbot cars. His lordship hoped that they would soon be in such a position to offer work, and that many Englishmen who contemplated going to the colonies would be kept at home.

M. Clement, in responding to the toast of his health, supplemented Lord Shrewsbury's remarks by stating that he had been over the works that day, and that when completed they would furnish one of the finest engineering factories in the world. He intended to give the concern the benefit of his large experience, but, although a Frenchman would be at the head of affairs, he hoped that so far as possible British labour would be employed.

The toast "Success to Automobilmism" was proposed by Mr. Charles Cordingley, who said that automobilists generally were content with the conditions that had prevailed up to the present. The agitation to repeal these had been unfortunately fostered, and hence new regulations were about to be introduced. Motorists had no desire to go as fast as some of the public imagined, and so long as they gave a reasonable consideration to other users of the roads they had nothing to fear.

The Earl of Shrewsbury, in responding, said that if there had been no racing people might have been content with the old conditions of a 3-h.p. motor weighing nearly two tons. The first automobile seemed to have averaged about 1-h.p. per half ton. The latest type of 10-h.p. averaged about 1-h.p. per 17 lb. He mentioned that for the Gordon Bennett race in Germany the entrance fees alone were £200, and the French firms who had entered would have to spend £190,000 for the three cars which would run in the race as representing France. Each car, he calculated, would cost nominally £65,000. He suggested the formation of a body independent of the trade, to settle disputed points in automobilism.

IS A MOTOR-QUAD A CARRIAGE?

AT the Grimsby Police Court, John Mason has been summoned by the Inland Revenue authorities for keeping a carriage without a licence on July 29th. It was explained that the defendant was in the possession of a motor-quadracycle. He had been warned by the authorities that he required a licence for the vehicle, but had not taken one out for it, contending that, as he used the motor for purely trade purposes, he did not require a licence. He had bought the machine to sell again, and on the date in question had taken it to show to an intending customer. The magistrates decided to convict, and fined Mr. Mason £2 2s., the Excise to grant him a licence for the vehicle.

POLICE TRAPS.

AT Shottermill the police have a measured distance of 176 yards. In Rock's Lane, near Barnes Common, the police have a measured far-long—useful in trapping motorists coming from the direction of London. About eight miles from Oxford, on the Banbury road, is a well-designed trap for motorists. In the High Street, Christchurch, telephonic communication has been established in connection with a trap.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, DECEMBER 12, 1903.

[No. 249.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE roadside experiences related at the meeting of the A.C.G.B.I., on the 3rd inst., were a kind of ancient history, and many of the incidents retold would be impossible now. As Mr. Lyons Sampson, who presided, observed, motor-cars have been so much improved that it is difficult to realise what the pioneers had to do with the vehicles then available. Mr. W. S. Crawley gave some reminiscences of an Irish tour; Mr. H. J. Swindley confessed to his lack of experience, save with an early 3½-h.p. car that would go no further

than Barnes Common; Mr. W. Beaumont recalled early days, and Mr. E. W. Peall related a number of incidents in connection with the 1900 anniversary run, in which he drove one of the old Mors dog-carts. It took them hours to get started, and when at length they did get the engine going they were so pleased that they started off without having anything to eat. They got as far as the other side of Guildford without a stop, but after that the car stopped every twenty yards or so. Finally, at the end of the run, the car had to be pushed into a stable by a number of men. He brought the same car home a few days later in torrents of rain and with the transmission belts constantly breaking. The petrol feed went wrong, too, and he did the last part of the run with petrol simply pouring upon the road. Finally, he sold the car, and the last he saw of it it was being towed behind a horse.

Three Miles an Hour.

MR. SAMPSON proposed a vote of thanks to Mr. Rolls, which was seconded by Mr. Linton Hope, and carried by acclamation. In responding, the speaker of the evening said he was lucky enough to have a repetition of an old experience recently when taking a Mors racer from Havre to Paris. The car was able to do eighty miles an hour, and naturally he thought they would not take long over the journey, but as events turned out it occupied four days. The first day was spent fighting the *douane*; the second day all went well for two or three miles, and then a lot of little troubles cropped up. First, the horn went wrong; then something else happened, and ultimately, near the same village as on the original journey, he found one of the cylinders giving up, and had to sit down and wait until the proverbial tramps came along and pushed the car into the village. He got the car fixed up, and got away next day, and, after having a series of tyre troubles and the like, spent the night at Mantes. The following morning they thought they would have some speed trials. The hotel manager told them of a suitable stretch of road just at the end of the boulevard, and they took him along to show them where. The road was unsuitable, and they went out ten miles further, but there was too much traffic; finally, they took that man seventy miles out in the country, and had to take him back again to Mantes at three o'clock in the afternoon. They reached Paris next day, having

done the journey from Havre at an average speed of about three miles an hour, thus ending an adventurous journey.

A Military Tractor.

FOLLOWING upon its experiments with motor tractors for military purposes, the Government offered a prize for a suitable vehicle capable of travelling forty miles, with a gross load of twenty-five tons, without renewing fuel or water. The conditions were very stringent, and only one firm, Messrs. Hornsby and Sons, of Grantham, entered for the tests. They have been awarded the prize of £1,000 for a machine constructed on the lines of an ordinary traction engine, propelled by an oil motor of the Hornsby-Akroyd type. It weighs under thirteen tons, and in the trial covered fifty-eight miles without renewing fuel or water, thereby gaining an additional bonus of £180, or £10 for every mile over the forty stipulated.

The Yorkshire Club.

ON the 4th inst. the Yorkshire Club held its fourth annual dinner, the occasion affording opportunity for Leeds and London automobilists to exchange views on some matters of current interest. There are other automobile clubs at Halifax, Sheffield and York, so that the title Yorkshire is thought by some in the county of broad acres to be rather too wide for what is, in many respects, a district organisation. But, as Mr. H. A. Jones hinted at the annual dinner, some kind of union may yet be formed for all the clubs in Yorkshire, giving each its district individuality and the united body all the strength that Yorkshire possesses in other phases of sport.

Lights on Vehicles.

THE Bradford police have lately been active against motorists travelling with insufficient lights, and in other districts, too, severe have been the comments made upon those driving motor-cars upon which inadequate lighting arrangements have been made. We wish local authorities and the police would be equally severe upon the drivers of horse-drawn vehicles who take their animals upon the highway after sunset with no lights at all. At Gateshead, for instance, the subject has been discussed by the Corporation, which recently introduced new bye-laws on the subject. These have been administered by the local police, and at the last meeting of the municipal authority some members expressed disapproval of the prosecution of people for not having lights on their vehicles after dark. The Mayor thereupon gave an assurance that the new bye-law would not be carried out so rigidly. What, then, is the use of a bye-law?

Danger after Dark.

IN a letter on the advisability of using acetylene lamps on automobiles, Mr. Hugh Hughes, of Reigate, emphasises the necessity of vehicles being well lighted. He was recently driving a car along the Brighton road, and going steadily at about fifteen or sixteen miles per hour, when, on coming to a dark and overshadowed part of the road, he slowed

down to about ten miles per hour. Well it was that he did so, for right in front of him was a four-wheeled cart with no light whatsoever (although it was fifty-one minutes after lighting-up time), and more in the centre of the road than at the side. Mr. Hughes had not a "dazzling light" on, only his two paraffin side-lights, which were just enough to show up the cart when about three feet off it. He only had time to throw out the clutch and swing round to the right of the cart and along the pathway and pull up. He stopped, got out and took the man's name and address, and summoned him; he was fined 10s. and costs. Now, suppose the motorist had smashed into him, what compensation would he have got? He determined, after that little escape, to use a head-light, although he had always been against the use of them, because of the brilliancy to anyone meeting them.

In Surrey Again.

MOTOR prejudice is a long time dying in Surrey, and at the Woking Bench last week there was a recrudescence of the complaint. Sergeant Jarrett was again to the front with his alleged speeds of 21 miles an hour. Two defendants had only attained a speed of 18 and 19 miles an hour respectively, and they were fined £3—the customary amount at the Woking Court. The fact that such speeds will be legalised within a few weeks did not affect the decision. Sergeant Jarrett's stop watch was in evidence, and that was enough for Sir William Chance and his colleagues, Colonel R. Phayre, Colonel D. E. Gouldsburn and Mr. F. E. Eastwood.

The Prison Van of the Future. (Das Schnauferl, Munich.)

Public Bodies and the Act.

It is becoming increasingly evident, judging from the discussions which have taken place in the various public bodies of the kingdom, that a marked hostility to the motor-car characterises the rural districts, and that a feeling is growing among the urban authorities that the cost of maintaining roads should fall wholly upon the national exchequer. The latter position has been brought about by the enormous increase in the upkeep and general maintenance of roads during the past five years. In scores of districts this cost has been more than double, and the ratepayers are loudly complaining. The agricultural districts declare that this increase is wholly due to the motor traffic in its various forms, and the problem now before some of our County Councils is whether the roads are to be kept up to the standard of motor-cars and cycles, or just sufficient for agricultural purposes. In more than one County Council this question has been discussed with a view to it being sent to committee, and it seems likely before long that other methods of road repair and maintenance will be adopted in view of the new conditions which now prevail. But the most striking feature of the question of motor-car traffic is that which

relates to speed. There seems to be an almost universal demand that only the minimum speed shall be allowed, and, as if that were not enough, some district councils have expressed the view that motor-car owners should bear the cost of erecting signposts. The Act gives the local authorities plenty of scope, and their discussions and decisions show that they have availed themselves of every particle of power which can be used to restrict motor-car traffic.

The Hertfordshire Club.

At a meeting of Hertfordshire motorists held on Thursday of last week it was resolved to form an organization to be known as the Hertfordshire Automobile Club. The objects with which this club has been formed are to look after and safeguard the interests of its members, particularly in view of the provisions of the Motor Car Act, which comes into force on the 1st of January next; to secure fair play in cases in which motorists may be interested; to defend before the courts such cases as may show a reasonable chance of success; and generally to further the cause of automobilism in the county. The social side of automobilism will be an important element in the new Club, the provisional committee of which has been formed as follows:—Messrs. Noel B. Kenealy (chairman), E. Kenealy, W. James, A. Hunt, C. Wood, J. T. Gardner, and Dr. Gruggen. Hertfordshire motorists wishing to join are requested to communicate with the Hon. Sec., Mr. W. Whittall, Acme Studios, Watford.

The February Conference.

ALREADY the engagements of motorists for the new year are beginning to appear a lengthy list. Now it is announced that the conference between the A.C.G.B.I. and the provincial clubs will be held on February 15th, and at their next meetings these important organisations will appoint representatives to speak and vote on the matters to be brought forward. The subject is complicated by the fact that one half of the clubs have already signed the affiliation agreement; the other half have declared their intention of not entering into association with the central club on present terms. Should the latter secure concessions, the agreements already made by the former section will have to be revised; otherwise a sense of preferential treatment will militate against the good feeling that must be encouraged if the movement is to go forward with one powerful authority. Undoubtedly many of the provincial clubs feel that they have been somewhat ignored in the past and that the Club has sought to apply its rules in the spirit of the Medes and Persians.

Hill Climbing Competitions.

At the last meeting of the Salop County Council Sir Thomas Boughey called attention to an automobile contest held recently at Hermitage Hill. He explained that as he was not a member of the Standing Joint Committee, he had no opportunity of raising the question elsewhere. Some twenty or thirty cars were racing up the hill, he said, and he wanted to ask on whose authority that racing took place, as the chairman of the Roads Committee had informed him that he knew nothing about it. He also asked how many police were taken from their ordinary duties to keep the road clear. Mr. Southwell explained that it was not motor racing but hill climbing, a very different thing. Major Heber Percy said Sir Thomas Boughey gave him notice of the question, and he had obtained a report on the competition. His information was that it was a hill-climbing contest arranged in Wolverhampton, and held at Hermitage Hill on October 24th. The competition lasted from one o'clock to 4.30. The arrangements were exceedingly well carried out, every care being taken to prevent obstructions or inconvenience to the public. The local police were on duty, but no extra expense was caused to

the county. There were no accidents and no complaints during or after the competition, nor any ground whatever for police interference. Subsequently the Hon. Secretary of the Wolverhampton Club had an interview with Sir Thomas Boughey, and as a result he expressed himself friendly disposed towards the Wolverhampton and District Automobile Club, and that he would have pleasure in placing at their disposal a road upon his estate for competition purposes. In such ways the provincial clubs can do much good for the movement.

Prospects of Automobilmism.

At the second general meeting of the session of the graduate section of the North-East Coast Institution of Engineers and Shipbuilders, held at the Institution Lecture Hall, Newcastle, Mr. W. H. Waddingham presided, and an interesting paper was read by Mr. A. E. Berriman on "The Future Prospects of Automobilmism." He showed the many vocations for which the motor-car was suitable, and illustrated the practicability of its application in the principal traction schemes. On the question of the speed limit he showed that it was evident that any system

from Portsmouth, and that the officer commanding the defensive force required a rapid survey of the country about Cobham, on the main Portsmouth road. The actual work of reconnaissance was carried out by six of Colonel Bosworth's military pupils in three motor-cars, which left Cedar Court, Roehampton, at 11.30 a.m. On reaching Fairmile at 12.30 p.m., the ground to be reconnoitred was quickly divided into three sections, two young officers, with a motor-car, being detailed for work in each section. The work then commenced, after orders had been issued for rendezvous, at 2 p.m. The several reconnoitring parties having reached the rendezvous at the appointed hour, the sketches and reports were collected and later "joined up," with the satisfactory result that in three hours from the start a piece of ground about three square miles in area and fifteen miles distant from the starting point had been sketched and reported upon with sufficient accuracy to enable the officer in command of the defensive force to select his positions. This rapid piece of reconnaissance work was in itself a creditable performance. The novelty of the idea as an instructional method was due to Colonel Bosworth, and it was well sustained and carried out by his pupils.

The 24 h.p. Wolseley Double Tonneau, built for the Maharajah Gooch-Behar. This car is painted Indian red, lined with green, upholstery in green, and leather to match, the finish throughout being of a specially high quality.

of limiting speeds could have no useful effect, and would only increase the mistrust which was at present so apparent among a certain class. Undoubtedly much of the present antagonism had arisen through a lack of reciprocal courtesy among the users of their public highways in general. On the question of motor-cars versus trams and omnibuses in large cities he was of opinion that an extensive and well-organised service of small cars having a seating capacity for say eight or ten passengers would prove of the greatest use to the public, and provide the best financial results for the company owning them. The advantage of motor vehicles superseding all other horse-drawn traffic in towns was more obvious in that there was no alternative between the horse and a self-contained motor for the propulsion of delivery vans and other commercial vehicles.

Military Reconnaissance with Motor-Cars.

An interesting experiment with the primary object of testing the usefulness of motor-cars in the instruction of modern methods of military reconnaissance has just taken place. The reconnaissance was organised and conducted by Colonel Bosworth under the supposition that an enemy was advancing

Motor Volunteers.

On Tuesday the first annual dinner of the Motor Volunteer Corps was held at the Trocadero, London, under the presidency of Lieut.-Colonel Mark Mayhew. The toast of "The Corps" was proposed by Major-General Hildyard, who referred to the corps as the first organised body of motor soldiers raised in Europe. He testified to the admirable services rendered by the members of the corps in conveying the officers to and from the scene of operations, and to the saving of time which resulted. Major-General Hildyard had been much struck with the good work done by motor-cyclists at the manoeuvres, and concluded by making an important announcement with regard to the injury done to tyres during the manoeuvres. Lord Roberts had given the matter consideration, and the War Office had sanctioned compensation being given in such cases. In response, Lieut.-Colonel Mayhew said that if the corps were given a chance of doing more at future manoeuvres they would prove that the motor-car was really a useful thing for military purposes. Possibly they might be permitted to take their places in the combatant ranks. To the toast of "The A.C.G.B.I." given by Captain Skeffington-Smyth,

Mr. Roger Wallace, K.C., responded, and later "The Guests" was proposed by Captain Arthur Lee, M.P., Major-General Oliphant making response.

On the Continent.

It is appropriate that at a time when the leading British automobilists are on the Continent there should be issued Mr. A. R. Sennett's "Fragments from Continental Journeys." This is published by Messrs. Whittaker and Company and reveals Mr. Sennett's literary gifts in a very favourable light. Walking tours among the Alps, a trip in the valley of the Rhone, journeys around Lausanne and Geneva, in the St. Gothard Pass, a peep into Bavaria, and a visit to Monte Carlo give the traveller plenty of opportunity for retelling the legends that have given interest to many Continental old-world places. In these days of uncertain weather, when the car is generally in the garage, such a book as this is delightful reading.

The Founders' Dinner.

ON Wednesday evening of last week—too late for mention in our issue of the 5th inst.—a dinner of Founder members and members of the Club and House Committees of the A.C.G.B.I. was held at the Piccadilly headquarters. It proved a pleasant reunion of many of the pioneers of the automobile movement, about a hundred gentlemen taking part. In addition to many speeches reminiscent of the early days of the Club and the various stages of its progress, a musical programme was provided, and after the dinner a series of interesting automobile pictures was shown by means of the lantern. Among the toasts were "The Founder Members," who numbered 240, "The Prosperity of the Club," "The Club and House Committee," "The Press," and "The Chairman." In proposing the toast of "The Press," Mr. Wallace emphasized the importance of the services rendered to the Club and the movement generally by the automobile journals, coupling therewith the names of Messrs. C. Cordingley, S. Spooner, and H. J. Swindley. In responding the former pointed out that although sometimes they had to suggest something contrary to what the Club was carrying out, they had at all times been actuated by the same motive—the common good of automobilism.

A 14-H.P. four-seated "Dennis" car is being built for the Grand Duke Michael of Russia.

In our description of the Coronet petrol motor last week the cylinder bore was given as 3 7-16 in. This should have been 3 3-16 in.

A PROPOSAL to provide a steam fire-engine for Edinburgh has been referred back to the Plans and Works Committee of the Edinburgh Town Council.

THE request of the County Surveyor of Dublin County for a motor-car to assist him in the inspection and superintendence of motor-car traffic in his district has been passed over by the Dublin County Council.

THE mention of the word "liquidator" in connection with the Collier Twin Tyre Company was officially necessary in connection with the taking over of the parent concern by the Collier Tyre Company, Limited, otherwise it had no significance.

DURING a meeting of the Essex hounds last week a groom was mounting a horse when the animal bolted, and he was thrown, receiving such injuries that he has since died. His master's motor-car was requisitioned to convey him to the local cottage hospital.

MESSRS. J. E. HUTTON, LIMITED, who, by the way, are establishing large works at Thames Ditton, have sent us a copy of an elaborate catalogue they have just issued of the new 8 nominal h.p. Panhard car, which should prove a popular type next year. So convinced are Messrs. Hutton of the future of the new 8-n.h.p. model that they have placed an order with the makers for no less than 150 cars.

THE MOTOR-CAR ACT.

THROUGHOUT the country the local authorities are busily engaged in registering motor-cars and licensing drivers in accordance with the terms of the Motor-car Act, which comes into operation on the 1st prox. Many of the governing bodies, including the London County Council and the Liverpool Corporation, have agreed that, having regard to the various ways in which the identification mark for motor-cars and motor-cycles may be indicated, they will not issue identification plates. Others, including the Leeds Town Council, have decided that, in the first instance, these plates will be provided at the expense of the Watch Committee and charged to the applicants at cost price. Of course, if the owners of the cars desire to have the number painted on their vehicle in preference, the plate would not then be issued.

Some interest attaches to the names of the first gentlemen in the various towns to register their cars under the new Act, and we take the earliest possible opportunity of giving some of these, the letters following the addresses being the Index Letters assigned to the respective towns. The list will be continued next week, and we invite the assistance of our readers in making it complete—so far as the first registered car in each county or town is concerned.

BIRKENHEAD.—Dr. T. S. Floyd, J.P., 16, Devonshire Road, Birkenhead, C.M.1.

BOURNEMOUTH.—Mr. Henry Newlyn, J.P., of the Royal Exeter Hotel, Bournemouth, an ex-mayor of the borough, E.L.1.

CANTERBURY.—Dr. A. Channing Pearce, of Chatham, near Canterbury, F.N.1.

COVENTRY.—Mr. C. K. Welch, Park House, Warwick Road, Coventry, well known in connection with the Dunlop-Welch type, D.U.1.

CROYDON.—Mr. E. M. Preston, Shirley Hurst, Shirley, near Croydon, B.Y.1.

HALIFAX.—Dr. Crossley Wright, C.P.1.

LIVERPOOL.—Mr. A. G. Lyster, engineer of the Mersey Docks and Harbour Board, K.1.

NEWPORT MON.—Mr. Geoffrey L. Watson, D.W.1.

SHEFFIELD.—Mr. S. E. Fedden, 305, Fulwood Road, Sheffield, W.1.

SOUTHAMPTON.—Mr. R. E. Lauder, 158, Above Bar Street, Southampton, C.R.1.

SWANSEA.—Mr. A. Randall Lewis, 8, Mirador Crescent, Swansea, C.Y.1.

WALSALL.—Mr. C. H. Gameson, 51, Highgate Road, Walsall.

WARRINGTON.—Mr. Edwin Woods, managing director of the Longford Wire Company, Ltd., E.D.1.

At Cardiff no cars had been registered up to Wednesday last.

In connection with the licensing of drivers, it is of interest to learn that the Town Council of Liverpool are providing a case in which the license is enclosed, the latter being printed on parchment. The size of the license issued in that important centre has been reduced to the minimum, so that the case in which it is enclosed may be carried in the waistcoat pocket without inconvenience.

THE Isle of Wight Motorists' Association has become affiliated with the Motor Union.

WE had a short run one morning last week on the first of the new Brooke light gear-driven cars, with Mr. Mawdsley Brooke at the wheel. The vehicle ran extremely quietly and smoothly, and we hope to refer to it again in a later issue.

MESSRS. HUDSON AND KEARNS have issued their Diary Blotting Pads for 1904. That known as the Bankers' edition contains a useful date remembrancer on the right of a blotting pad of good size, while to the left is a book diary interleaved with blotting paper. This latter excellent feature is also introduced into the styles known as No. 8A and No. 6. The pads and diaries of this firm have lain on office desks so many years that their merits have become generally known.

The Paris Motor-Car Exhibition.

Le Grand Palais, Paris—The Locale of the Exhibition.

THE sixth annual Salon d'Automobiles was opened with great ceremony on Thursday morning, and will remain open until Christmas night, during which time it will be visited not only by motorists and motor traders from all parts of France, but also from Great Britain, Germany, Belgium, Holland, Denmark, Austria, Italy, Switzerland, and even the United States. To say that the Grand Palais, in which the exhibition is again being held, is full does not adequately express the condition of affairs. Every inch of space that is available has been taken up, and, notwithstanding its many advantages, it is clearly to be seen that the huge building at the corner of the Champs Elysees and the Pont Alexandre III. is now too small for the important automobile industry. All the week a vast army of men has been busily engaged in putting the finishing touches to the show, and it is only with difficulty that any particulars of the new models has so far been obtainable, while on the opening day the crowd was so great that the position in this respect was in no wise improved. As usual, the leading French makers have vied with each other as to who shall have the best-decorated stand, the result being that the general aspect of the show is more brilliant than ever. It would seem as if a kind of order had gone forth that the stands should be reproductions of celebrated buildings. Thus the *motif* of the De Dietrich Company's stand is the colonnade of the Madeleine, that of the Darracq Company represents somewhat the portico of the Cathedral at Seville. Prosper Lambert has copied the famous colonnade of the Parc Monceaux one of the most fashionable parks in Paris, while the stand of La Société Automotrice is on the lines of a Greek temple. One feature of the Salon is the steadily growing number of foreign exhibitors. Great Britain has this year five exhibitors of cars, the Motor Manufacturing Company, Limited, the Hozier Engineering Company, Limited, and the Electromobile Company, Limited, sharing the honours with the Wolseley and Napier Companies, while the French tyre and electrical accessory firms have new competitors in the Collier Co., the Dunlop Co., and the Electric Ignition Company. Naturally one's first desire is to visit the stand

of the Panhard and Levassor Company; but, as this desire was shared by thousands of others, I was not able to get sufficient details of this well-known firm's exhibit in time for this issue and must therefore hold over a report until next week.

Quite a big display is made by the Peugeot Company, which, for the 1904 season, is making no less than five different types, in addition to the well-known 5-h.p. Baby Peugeot, whose destinies are controlled by Messrs. Friswell, Limited. In addition to the 5-h.p. (Fig 1), the new features were given in a recent issue, a 6½-h.p. single cylinder car, with cardan shaft transmission, is being made. An interesting new model is that fitted with a double cylinder engine of 7-h.p., which should meet with the approval of those whose preference lies towards two cylinders. This car, like the 5-h.p. and 6½-h.p. types, has a cardan shaft driving through bevel gear on to a live axle. Another double cylinder car is of 10-h.p. with side chain transmission (Fig. 3). Next in order come the 12-h.p., the 18-h.p., and the 25-h.p. vehicles, all having four cylinder engines and side chains. In all cases the Peugeot engines are now of the vertical type. In the two-cylinder engines the cranks are set at an angle of 180 degrees to each other, while in the four cylinder motors the cranks of the two outside cylinders are set opposite to those of the inside pair. Except in the single cylinder engine, all the valves are mechanically actuated and interchangeable one with the other. The inlets and exhausts are located on different sides of the engine, the cam shafts operating the same being enclosed in the crank case. The 7-h.p., 10-h.p., 12-h.p., 18-h.p. and 25-h.p. cars are arranged to be fitted with either magneto or high-tension ignition, either of which can be advanced or retarded in the usual way, and the speed of the motor consequently regulated. In the single-cylinder cars the engine speed can also be controlled by means of a device varying the lift of the inlet valve. The multi-cylinder engines are provided with centrifugal governors acting on a butterfly valve in the inlet pipe. A lever on the steering column is also connected up to this throttle valve, so that the supply of gas can be varied as

desired, while a pedal accelerator is fitted, by means of which the governor can be temporarily put out of gear. The carburettor is of the float-feed pulverising type, equipped with automatically-regulating air inlet, in order that a perfect mixture shall be furnished at any speed of the engine. In the single cylinder cars the water-circulating pump is friction driven, but in

devised by M. Truffault; this acts as a sort of brake on the springs, preventing them from rebounding on the frame. A plate is attached to the bottom of the chassis, to which is fixed a powerful spring coiled in the same manner as that of a watch. One end of the semi-elliptical spring is joined to this by means of a bolt running through the centre of the coil. The result of

Fig. 1.—The 1904 Baby Peugeot.

Fig. 2.—The New 15-h.p. Darracq Car.

the multi-cylinder vehicles it is positively driven by gear wheels; the latter are also equipped with combined honeycomb radiators and water tanks, through which a current of air is induced by a fan. The 5-h.p., 6½-h.p., and 7-h.p. cars have three speeds, and the 10-h.p., 12-h.p., 18-h.p., and 25-h.p. vehicles four speeds, in addition to the reverse. All are controlled by one lever, and on the top speed the power is transmitted directly without the intermediary of any of the pinions in the gear box. As regards frames, in the single cylinder cars they are of tubular construction; for the 7½-h.p. and the 10-h.p. double cylinder vehicles the armoured wood frame is retained, while for the four cylindered cars stamped steel frames have been adopted. Except as regards the 5-h.p. and 6½-h.p. cars all the models are being

the combination is that in passing over rough roads the rebounding action of the main spring is counteracted by that of the coiled one. Altogether the Peugeot Company has a display worthy of its reputation, and with such a wide range of cars, appealing to motorists of all classes, from the man of moderate means, upwards, there can be no doubt of these vehicles being largely adopted in the coming season.

The Darracq Company has a magnificent stand, the design of which is, as already mentioned, intended as a reproduction in miniature of the portico of the Cathedral of Seville. This is one of the few concerns whose 1904 models have been shown in England ere being exhibited in France, and as a description of the same was given in the *Journal* for the 28th ult., no lengthy men

Fig. 3.—The 10-h.p. Peugeot Car.

made with different sizes of frames, the standard one being for bodies of the tonneau type and the longer chassis intended for carriage bodies having entrances to the rear seats at the sides. With the view of making the vehicles much more comfortable and free from jolting when travelling over rough roads, the Peugeot Company have adopted the cushioning arrangement

tion is necessary at the present time. It will suffice, therefore, to briefly state that for next year this concern is making five types of cars; 8-h.p. single cylinder, 9-h.p. and 12-h.p. double cylinder, and 15-h.p. and 24-h.p. four cylinder. The 15-h.p. car (Fig. 2) is a new model; it has a pressed steel frame of special design known as the "Darracq-Arbel," slightly turning in at the

fore part to allow the car to turn in a much smaller circle than previously. The four-cylinder engine has mechanically actuated inlet valves, accumulator ignition, governor acting on the inlet, honeycomb radiator and fan, and all other modern fitments. The cardan shaft and bevel gear system of transmission is still retained, while the gear box is adapted to give three speeds ahead and one reverse, with direct drive on the top speed. Another feature of

Fig. 4.—Fore Part of Chassis of 7-h.p. Renault Car.

the Darracq cars which is retained in the new model is that the change gear is actuated by a lever on the steering column. The lubrication is effected by pressure from the exhaust, while, in order that there shall be no failure in the supply of petrol to the carburettor when travelling over hilly roads, an auxiliary petrol tank is fitted under the bonnet. The brakes on the car are of the internal expanding type, and, of course, act equally well whether the car be running in a forward or backward direction. The Darracq Company are devoting much attention to the demand for cars, the rear seats of which can be reached from the pavement, and are building vehicles of this type in the 12-h.p.,

Fig. 5.—The Renault 14-h.p. 4-Cylinder Motor.

15-h.p., and 24-h.p. models, in all of which a fifth transverse spring is employed, adding greatly to the easy-riding of the vehicles.

Decorated in purple and old gold, Messrs. Renault Freres have a stand worthy of the firm's great reputation. Three standard types of Renault cars are being made for the 1904 season, 7-h.p. single cylinder, 10-h.p. double cylinder, and 14-h.p. four cylinder. A feature of the 7-h.p. engine is the provision of a

device by means of which the tension of the spring of the inlet valve can be varied and the speed of the engine thus regulated, this being in addition to the centrifugal governor, which acts on the carburettor, automatically regulating the supply of air and the quantity of mixture allowed to pass to the engine. The lubricator is mechanically actuated by means of a small connecting rod driven by the engine itself. As will be seen from Fig. 4, the tubular frame is retained. The large springs employed will also be noticed. The 10-h.p. two-cylinder shows a number of modifications. The inlet valves as well as the sparking plug are in the top of the combustion chamber, and are thus readily accessible. Furthermore, it is not now necessary, in order to remove the exhaust valves, to first remove the inlets; instead, they can be quickly taken out by first removing two plugs in the combustion chamber. The inlet valves are provided with the variable tension spring found on the 7-h.p. The old form of carburettor, slightly modified, is retained, the changes being in the direction of rendering it more accessible, and capable of being easily taken to pieces. In the 14-h.p. four cylinder cars, the engine (Fig. 5) is cast in two pairs, with an air space between each pair of

Fig. 6.—The Renault Change-Speed Gear.

cylinders. The inlet valves, which are mechanically actuated off the same cam shaft as the exhaust valves, are fitted with a special device to give a progressive lift. The carburettor is similar to that used on the 10-h.p. vehicles. On all the Renault cars the high tension system of ignition is adopted. On the 14-h.p. vehicle, however, I noticed that a duplex coil is employed, and consequently only two tremblers are used for the four cylinders. The contact breaker is of the wipe type and can be readily detached without using any tools. Another improvement, which applies to all the three types, is found in the change-gear box, or rather in the sector by means of which the gears are changed, the alterations not only simplifying the work of erection, but enabling the parts to be more easily inspected. The Renault firm, which is represented in England by the Roadway Autocar Company, Limited, has an interesting display, not only of finished cars—these including a long-frame side-entrance landaulet, but of chassis enabling the arrangement and workmanship to be inspected.

Messrs. Grouvelle and Arquembourg, whose radiators are employed by most of the leading French concerns—as, for instance, Panhard, Mors, De Dion, Darracq, C.G.V., Ader, Renault, etc.—have a big display of their *refroidisseurs cloisonnes*, or framed radiators for use in connection with the water circulation of petrol motors. These radiators are made in several forms, each in a variety of forms and sizes. Thus there is the plain radiator, set in a neat frame; a similar cooler, but fitted with a fan to induce a current of air through the air spaces formed by

Fig. 7.—Rear View of Grouvelle-Arquembourg combined Water Tank and Radiator.

- | | |
|-----------------------------------|--------------------------------|

| B. Inlet from pump to Radiator. | E. Overflow. |
| C. Outlet from Radiator to motor. | G. Lubricator for Fan spindle. |

the radiating ribs; and finally the framed radiator with water tank and fan combined (Fig 7). A new carburettor adapted for cars and motor-cycles is also displayed; it is of the constant-level pulverising type, and consists of a chamber A (Fig. 8) in which is the float F fitted with a needle valve which closes the petrol inlet S as the float rises. From the chamber A the spirit passes to the spraying chamber B, placed transversely at the rear. The latter is of special design, the internal surface being in the form of a sinusoidal curve, by means of which the suction of the motor, even when the latter is running slowly, is claimed to be sufficient to maintain a constant carburation. The carburettor is so arranged that it can be readily taken to pieces for cleaning purposes; for multi-cylinder engines it is provided with a jacket, R, through which hot water can be circulated, and with a throttle valve adapted to be controlled either

Fig. 8 and 9.—General View and Transverse Section of Grouvelle-Arquembourg Carburettor.

by hand or by the governor. The most interesting exhibit at this stand, however, is the new Grouvelle-Arquembourg speed regulator, which is intended for use in conjunction with all constant-level carburettors. Its action is based on the average reduction in pressure which takes place in the suction pipe when the engine is working. This reduction varies

in proportion to the speed of the engine, but is constant for any particular speed, and in the new device is made use of to actuate a valve between the float chamber and the spraying nozzle in the carburettor by means of which the supply of petrol is restricted to the requisite quantity. The arrangement is exceedingly ingenious, but cannot, without the aid of drawings, be clearly described. For the moment it must suffice to state that it is controlled from the steering wheel, and that among the advantages claimed for it are that it obviates the necessity of a centrifugal governor, and that, being pneumatically operated, there are no rods or levers. Furthermore, the consumption of petrol is economised, being reduced to the actual amount required at each suction stroke of the engine.

The Decauville Company have brought out a new model for the 1904 season, of which an illustration is given in Fig. 10. It is classed as a light car, although fitted with a four-cylinder engine developing 14-h.p. The cylinders are 95 mm. diameter by 110 mm. stroke; the inlet as well as the exhaust valves are mechanically actuated. The centrifugal governor acts on the

Fig. 10.—The 14-h.p. Decauville Car.

inlet, a pedal accelerator being fitted by means of which the speed of the engine can be increased to 1200 revolutions per minute. A honeycomb radiator and tank is now employed in connection with the water circulation. The carburettor is of the automatic air regulation variety. Three speeds forward and a reverse are controlled by one lever, the drive on the top speed being direct, the power being transmitted through bevel gearing to a live axle. As usual in Decauville cars, the engine and gear are entirely protected, and the new model should prove as successful as its forerunners.

PHANOMEN.

(To be continued.)

A MOTOR-CAR was included in a sale at Willis's Rooms, W., on Tuesday.

THE Panhard and Levassor Co. are establishing large branch works at Rheims.

MESSRS. PICKFORD, LIMITED, the well-known firm of carriers, are reported to have ordered two steam wagons.

MR. W. HARRIS, of Albert Road, Belvedere, S.E., has a motor garage and facilities for the charging of accumulators, etc.

PRINCE HENRY OF PRUSSIA, who has been using a Locomobile two-seated car during the past year, has just ordered a 10-h.p. "Surrey" from the German agents of the Locomobile Co.

THE Road Carrying Co., Limited, Liverpool, have been fined 20s. at Blackburn, at the instance of an officer of the Inland Revenue, for keeping a motor carriage without having a proper license.

FROM Messrs. G. Straus and Co., Limited, we have received a copy of a booklet in which the 1904 models of the "Fafnir" motor-cycle engines, which are being made in two sizes—2½-h.p. and 3-h.p.—are described in detail. The various parts of the motor, including the carburettor, contact maker, exhaust valve control, are all depicted in clearly-drawn illustrations, rendering the booklet of great utility to all users of "Fafnir" engines.

SOME USEFUL NOTES.

THE Michelin Company, in one of their recent articles on pneumatic tyres, remark that if they had to make a list of the enemies of the motor-car driver, they would without hesitation put the driver himself at the top. This is to a great extent true, one of the most frequent causes of damage to pneumatics being insufficient inflation. In the Michelin hand-book there is a table of pressures to which various tyres should be inflated. Not only must they be pumped up properly, but the fixing bolts must also be well screwed up. Should they be slack, the cover tends to move in the rim, and the thickened edge gets damaged. At high speeds the cover turns bodily in the rim, and this invariably tears the valve out of the tube. Moreover, if the tyre is not sufficiently inflated, and the bolts screwed well up, water is sure to get in, and then the cover lasts a very short time. As for the bolts themselves, care should be taken that the canvas covering is always intact, otherwise damage to the air tube will result. For the same reason bent bolts should never be used, as they do not seat properly.

ONE very often hears people say that they can "get home" with a deflated tyre. This is most unfair to the tyre. In case of puncture, unless the sacrifice of a cover and tube is of small moment, the tube should be changed at once. Even in a short distance the cover is generally much damaged and the valve pulled out of the tube. If it is decided to go on at all costs, the inner tube should be removed, the fixing bolt screwed firmly up, and the cover fastened with leather straps. If these are not obtainable rope will do, but it will not last so long. After running on a deflated tyre, the rim should be carefully examined to see if it is dented. This often occurs, and the edge of a new cover is with difficulty inserted in the recess. It can, of course, be forced in, but the rim afterwards invariably cuts the cover. In conclusion, the Michelin Company point out to motorists that water inside a cover is fatal; therefore after a puncture fill up the hole in the cover with solution, and repeat the operation when the run is over.

A GOOD deal of discussion has taken place in our correspondence columns recently on the subject of charging accumulators, and in one letter the suggestion was made that where a good water pressure is available an excellent charging method is by means of a miniature water motor or a small dynamo. Several readers having asked for particulars of such a combination, we herewith illustrate one which has lately been introduced by Messrs. Gilbert Gilkes and Co., Ltd., of Kendal. The

arrangement, which is easily controlled, is intended for use in connection with the ordinary house water supply. It consists of a water motor of Messrs. Gilkes' "Hector" type coupled direct to a small dynamo. In the space between the

water motor and the dynamo there is fixed a small instrument board with the necessary amperemeter, voltmeter, and connections. The terminals are clearly marked "positive" and "negative," and all that is necessary is to couple the short length of flexible tube, supplied with the set, to some convenient house tap, connect the battery as marked, and regulate the water supply so as to obtain the correct rate of charge in amperes. The set is designed for water pressures varying from 40 lbs. upwards. In supplying the same, the makers desire to know the pressure of the water supply of the district in which the intending user resides, and in cases when there is difficulty in ascertaining this, Messrs. Gilkes can send, for a small charge, a pressure gauge with nozzle and flexible pipe combined, by means of which the working pressure can be accurately ascertained.

As there are still a large number of light steam cars in use in various parts of the country, the following letter, sent by

Mr. F. Hiorth, of Christiania, Norway, to the "Horseless Age," may usefully be reproduced, as it describes a method of preventing freezing of the steam gauge. "Several times last winter," remarks Mr. Hiorth, "during cold and windy weather the steam gauge of my car became frozen and at times was nearly destroyed, the ice deforming the expanding part of the gauge. I had much trouble from this source at first. I found that the most careful packing with felt was useless, and several gauges broke. The following description of how I entirely remedied this trouble may therefore be of interest. To begin with, I disconnected the pipe leading from the boiler E to the gauge F and by means of two union fittings C inserted a U-shaped pipe, which was nearly filled with mercury (D). Care must be taken that the mercury can under no circumstances get into the boiler, as it would injure the copper or brass parts. The pipe A leading to the gauge is filled with alcohol (or glycerine) and the whole attached to the boiler as before. The part B should of course be as short as possible."

SINCE the question of anti-freezing solutions for the circulation water of petrol cars is on the tapis, we would call attention to a solution suggested by Mr. E. Mallinckrodt, jun., in an American contemporary, which is claimed to attack iron very much less than calcium chloride solution. The solution is composed of seventy-five parts by weight of ordinary carbonate of potassium (salts of tartar) in a hundred parts by weight of water, to which fifty parts by weight of glycerine has been added. Actual experiment has shown this mixture to remain perfectly liquid at a temperature of 22 deg. below zero Fahr. If it is not necessary to provide for such a low temperature, less glycerine can be used. The carbonate of potash employed by Mr. Mallinckrodt is not the dry article, but contains about 5 per cent. of water.

THE Committee of the Wolverhampton Automobile Club are of opinion that it is in the interests of automobilism that one club should govern automobile matters generally, but that each club should be allowed to manage its own affairs and to control absolutely any events restricted solely to its members. If the A.C.G.B.I., after the meeting they propose holding on February 15th, 1904, for the purpose of considering the affiliation question, do not exhibit a more reasonable attitude towards provincial automobilists, then the Wolverhampton Club are prepared to support a federation scheme.

THE FISK TYRE.

IN recent American automobile trials the Fisk motor tyre has figured so prominently and so favourably that its introduction into this country by the South British Trading Company is a matter of general interest to automobilists. The tyre has six layers of fabric, a thickness of rubber running between the upper and lower three. The cotton warp threads are specially strong, passing at an angle of 45 deg. across the tyre and crossing each other in alternate layers. The function of the web is mainly to hold the warp in place during the construction of the tyre. Subsequently it provides an absorbent for the rubber, also assisting to key the rubber in the fabric. In the Fisk tyre the rim is of flat steel with electrically-welded joint. This is attached to the felloe in the ordinary way, but projects somewhat on each side. A central core of partially-cured rubber, round which the layers of canvas are laid before being

finally vulcanised, is a feature of the thickened edges of the cover. Wedge-shaped rings fit closely upon the external surfaces of the thickened edges. Bolts passing between these and the base of the tyre against the rim grip the edges securely and place the tyre under compression, keeping it closely against the rim. As will be seen from the illustration, the edges of the cover meet in the centre, the effect of the bolts being also to press these firmly together. Should necessity arise the tyre can be quickly removed from the rim by removing the nuts, taking the bolts out and thus releasing the rings. After the repair has been made the inner tube is laid within the cover, the edges of which come together without force, it being manufactured throughout in the shape in which it is actually used.

As the air chamber is wholly above the rim the maximum resiliency is ensured, while the ease with which it can be detached is a point that will be appreciated by motorists who have had considerable experience of punctures.

A PUBLIC service of motor-cars is about to be started between Honfleur and Trouville.

PRINCE ALEXANDER of Solms-Braunfels has been elected president of the Austrian Automobile Club in succession to Count Schönnborn.

THE Church Society for the promotion of Kindness to Animals has issued as a pamphlet the address recently delivered at one of its meetings by the Hon. C. S. Rolls on the "indirect advantages of the motor-car to horses generally."

A MOTOR-CAR, the property of Mr. D. Macpherson, Kingussie, which left Edinburgh one night last week for the north, became blocked in the snow on the high incline between Perth and Inverness. A snow-drift several feet in depth lay along the road, and the car had to be abandoned for the night, the occupants being fortunate in reaching one of the Highland Railway signal boxes, whence they were conveyed to Kingussie by a passing pilot engine. The following day a squad of men proceeded to the embedded car, which had to be cut from the snow wreath, and was ultimately drawn to Kingussie by a team of horses.

CONTINENTAL NOTES.

THE latest report in connection with the Gordon Bennett race is a proposal accredited to Baron de Crawhez, that the eliminating tests for the Belgian, French, and English teams shall be held in conjunction with the Circuit des Ardennes, which is fixed to take place a month before the Cup race. It is also suggested that arrangements might be effected to make the Circuit a kind of training ground. The German Club will receive entries for its eliminating contest until the 1st February. The entry fee for each car will probably be £150. The latest entry for the German team is that of the Internationale Automobile-Centrale, Jeannin and Company, of Berlin. The Panhard-Levassor Company has also just entered three cars for the eliminating contest for the French team. The Touring Committee of the A.C.F., at its meeting on Saturday last, decided to organise a tour to Homburg on the occasion of the 1904 Gordon Bennett race. The proposed route is *via* Rheims, Luxembourg, and Coblenz, returning by Nuremberg, Stuttgart, Karlsruhe, Baden and Nancy.

AT the recent military manœuvres in Switzerland, a Martini, a Peugeot, a Rochet-Schneider, a Georges Richard and two Panhard cars were used by the leading officers. They report that without the service of these automobiles it would have taken at least three times as long to forward orders to and receive communications from different parts of the ground. Each driver kept a record of all car troubles.

ARRANGEMENTS are in hand for the establishment of a motor-car service for the conveyance of passengers and goods along the Caucasian coast between Novorossiisk and Sukhum-Kaleb, a distance of about two hundred and seventy miles. A company has just been formed at St. Petersburg, with a capital of three million roubles, for putting the project into practical operation. The concession is granted for twenty years, with power to the concessionaires of extending their field of operations. A company is also being formed at Kiew to start a service between Kamenez-Podolsk and Proskurów.

WHILE England has now its Association of Motor-van and Wagon Users, France has just organised a *Chambre Syndicale des Transports Automobiles*, which will embrace not only the users of commercial motor-vehicles but also the builders of the same. The objects of the new body are to encourage the adoption of mechanical traction and to defend the rights of motor-vehicle users. M. Turgan is the president of the new *Chambre Syndicale*, with M. Rondet-Saint, director of the French Hagen Company, as vice-president. The great progress made in England with the adoption of heavy motor-wagons is in strong contrast with the position in France, and it is hoped that the new body will be the means of giving an impetus to this branch of the automobile movement, and that at no distant date motor-vans and wagons will be as largely used in France as in Great Britain.

THE latest competition to be organised in connection with the *Salon* in Paris is called the *Concours de Gonflement de Pneumatiques*. Its object is to bring out the merits of the many devices which have recently been introduced to do away with the use of hand or foot pumps for the inflation of the pneumatic tyres of automobiles. The competition is being divided into two classes:—1, mechanical arrangements, driven off the motor, to either pump air directly into the tyres, or air or gas into a pressure tank. 2, devices consisting simply of receptacle containing air or gas under pressure, fitted with valves and connections, so that they can be attached for inflation purposes to the valve of the tyre. In class 1, the points which will be taken into account are: certainty of operation, weight, space occupied, and cost. As regards class 2, the principal features to which attention will be devoted are the number of tyres which can be inflated from one container, space occupied, and cost.

THE question of the classification of racing cars in France has not yet made any step towards a settlement. For a long time past the question of cylinder capacity has been under the consideration of the different bodies connected with the automobile world. La Chambre Syndicale d'Automobiles, which has taken an active part in the discussion, has decided that for 1904 no changes shall be made in the present classification, but that a further meeting shall be held in February next as regards the rules for 1905.

WITH the support of the Automobile Club of Marseilles, the "Provence Sportive" is organising a somewhat novel competition for the 6th March next. Speed trials over a 500-metre course, with a standing start and a stopping finish, have already been held at Uriage and Deauville, but these events were on a level road. The A.C.M. competition is to be held on the Platrières Hill, near Aix, and will be confined entirely to touring vehicles. There will be six classes, as follows:—(1) Cars up to 5-h.p., (2) vehicles between 6 and 9-h.p. inclusive, (3) cars from 10 to 15-h.p., (4) from 16 to 24 h.p., (5) motor-cycles less than 2½-h.p., (6) motor-cycles more than 2½-h.p.

THE question of the responsibility of racing motorists to their servants is shortly to be discussed in the French Courts in two cases. One is that of M. A. de Pallange, who was mechanician to Count Zborowski at the time of the latter's fatal accident in the La Turbie hill-climb at Nice in April last. M. de Pallange ascribes the catastrophe to the Count's imprudence, and claims £4,000 damages for the injuries which he received in consequence. The second case is that of the relatives of the mechanician to Mr. L. Porter, whose car upset at a corner in the Paris-Madrid race. The mechanician was thrown under the car and was burned to death when it caught fire. His family is bringing an action for compensation.

M. GEORGES DE LA NEZIERE, a well-known French sportsman, and the representative of the Wolseley Company in France, has offered a massive silver cup, valued at £400, for annual competition by motor launches. The race is to be run off every year on the Seine, near Paris, over a distance of 200 kilometres. The trophy is to be known as the Challenge International Competition Cup, and must be won three years in succession by the same boat owner and make of motor before becoming the permanent property of the winner. It was originally proposed to hold the

The 1904 Gordon Bennett Course - A View of Limburg, showing the Cathedral.

A HILL-CLIMBING trial was held by the Automobile Club of Algeria on the 3rd inst., on the Eucalyptus Hill at Cheragas, on which a kilometre course had been marked out. Unfortunately the weather proved unfavourable, and somewhat restricted the number of starters. The best time up the hill was made by M. Bellemare, who, on a 14-h.p. Renault, covered the kilometre in 1 min. 29 sec.

IN connection with the reliability trial for motor-cycles which, as I stated last week, is being organised by "La Gazette della Sport," of Milan, a proposal is now under consideration to organise a competition for heavy commercial motor vehicles to be held at the same time and over the same route.

ONE of the first firms in Sweden to take up the construction of motor-cars is the Scania Maskinfabriks Aktiebolag, of Malmo, which is now turning out three types of cars on modern lines—8-h.p., 6-h.p., and 4½-h.p. One of the 8-h.p. cars, which have a double cylinder engine, three speeds and reverse and chain transmission, was recently submitted to a road trial between Malmo and Stockholm, a distance of nearly 500 miles. Although the bad roads of the country do not permit of high speeds, the trip was successfully carried through.

first race on the 6th inst., but it has been decided to postpone it until April or May next.

M. JEANTAUD, the well-known French builder of electrical cars, read a short paper at a meeting of the Association Générale Automobile on the Edison accumulator, in the course of which he pointed out that it showed a great saving in weight over the pasted plate type of battery, but that the cost was almost double that of the ordinary type.

A FEATURE of the gala which is to be held at the Opera by the A.C.F. in honour of the delegates of the French Provincial and Foreign Automobile Clubs, on the 17th inst., will be a grand automobile ballet, in which four allegorical cars, one representing England, Holland, and Belgium, the second Germany, Russia, and Austria, the third Italy and Spain, and the fourth France, will appear on the stage.

ON Saturday last the Automobile Club de Nice entertained the English members of Parliament at present visiting France. An excursion by motor-car to La Turbie was included in the programme.

THE "STEVENS DURYEA" CAR.

THE latest American car to be introduced into this country is the "Stevens Duryea," the agency for which has been taken up by Messrs. Joseph Baker and Sons, Limited, of Willesden Junction. While in some respects the general arrangement is similar to that of the familiar type of American petrol car, there are a number of special features in the design, which is due to Mr. J. F. Duryea, a brother of Mr. C. E. Duryea. The motive power is supplied by a horizontal double-cylinder engine of the opposed type. The cylinders are $4\frac{1}{2}$ inches diameter by $4\frac{1}{2}$ in. stroke, the normal speed of the engine being only 600 revolutions, at which it develops 7-h.p. A very heavy flywheel weighing 78 lbs. is employed. The parts in the crank case are oiled from one reservoir, which holds sufficient oil for a run of 200 miles. The cylinders are lubricated from a separate cup. The water circulation is maintained by means of a rotary valveless, positively-driven pump and a radiating coil. The water tank holds five gallons, and this will, it is stated, ordinarily suffice for a week's run. The high-tension system of ignition is adopted, a separate vibrator coil being used for each cylinder. The circuit-breakers are enclosed in the crank-case and run in oil. The ignition can be advanced or retarded as usual, while the speed of the engine can also be controlled by means of a throttle valve. The motor is readily started from the seat by means of a short crank attached to the steering post.

The transmission gear comprises three speeds forward and reverse, all controlled by one lever. The change gear is of the individual clutch system, all the gear wheels being constantly in mesh. A clutch is used for each of the three speeds, also one for the reverse, the clutches being all exact duplicates, a feature

spring-plunger button called the throttle button, operated by the thumb of the hand gripping the lever, which is pushed down to throttle the mixture. If pushed all the way down it will release the compression, or it may be fixed at any point by a serrated spring catch, to hold the throttle adjustment. Thus this single-speed change lever controls the speed of the car, the power of the motor, and effects the compression release at starting.

The steering tiller appears somewhat unusual from an English point of view. The makers, however, state that in designing it they have recognised the principle which makes a wheel steering successful, and have taken advantage of this condition

and used the steering post. As, however, they have found the wheel itself to be in the way when used in a light car, they use but one spoke of the wheel. This enables them to also mount the starting and steering parts on the same bracket. The frame of the car is built of heavy gauge tubing. The front axle spindle is 1 2-16 inches diameter, and that of the rear axle 1 3-8 inches. The front axle is swivel jointed to the frame tubes. The track is 4 feet 6 inches and wheel base 5 feet 9 inches. Special stress is laid upon the matter of accessibility to the motor. Both cylinder heads may be taken off, the cylinders inspected, wiped out, and the heads replaced, in five minutes or less.

The exhaust and inlet valves are equally easy to inspect. The cover to the crank-case can be removed in half a minute, and all the working parts readily viewed. The speed gearing is also encased with leather, which can be opened to any extent for inspection of all internal parts, friction clutches, etc. As regards braking power the motor and friction clutches may be used to regulate speed down

Fig. 1.—General View of Car.

Fig. 2.—Plan of Motor with Crank Case Cover removed.

which considerably facilitates repairs; all are of the internal expansion shoe type, the shoes being leather faced and readily adjusted. From the clutch countershaft a single centrally-located chain transmits the power to the rear axle. The chain can be adjusted by swinging the countershaft forward without affecting the correct working conditions of the transmission as a whole. The speed-change lever is at the driver's left hand, and has a grip at the top and a sliding collar, the latter lifting the speed-change latch when depressed. On the top of the lever is a

Fig. 3.—The Change-speed Gear.

a long hill. The only other brake is that on the differential gear drum, on the rear axle. On the road the Stevens Duryea is an extremely quiet and smooth-riding carriage. The gearing and the exhaust are both noiseless, and the management of the vehicle appears to be very easy.

HERE AND THERE.

A MOTOR racing track is being established at Paris-Plage, near Boulogne.

THE Brotherhood-Crocker Motors, Limited, have taken temporary offices at 19, Hanover Square, W.

THE Scottish Motor Garage Company has been formed to carry on the motor-car business of Mr. James Inglis, at 96, Renfrew Street, Glasgow.

A Motor Meet near New York.

THE price of Pratt's motor spirit has been reduced by the Anglo-American Oil Company, Limited, as follows:—"A" grade 1d. per gallon. "B" grade, 2d. per gallon.

AT a track race meeting held in the Agricultural Park at Los Angeles, Cal., U.S.A., under the auspices of the Automobile Club of Southern California, Barney Oldfield, on the Winton eight-cylinder racer, succeeded in covering a mile in 54.45 sec., or a speed of over sixty-five miles per hour.

THE regulations in connection with the Side Slip competition to be organised by the A.C.G.B.I. have just been issued. Full particulars of any device to be submitted for the competition, with drawings (but no models), must be sent in by February 29th, which is to be the last day of entry. Drawings must be accompanied by an entrance fee of five guineas.

DR. JOHNSON, of Liscard, Cheshire, has brought out a device to meet the demands of the new Motor Car Act. The main features are that the name-plate required to be fitted on all motors and motor-cycles has the lamp bracket attached. The lamp, which consists of two lenses, will illuminate the name-plate from a white side-light and the rear light will be red. If used for the front of the car or cycle, both lights will be white.

AT the Tonbridge Police Court, Alfred Turner was summoned for driving a light locomotive on the highway at Edenbridge without a light. Defendant said he had a light on each side of his carriage at the fore part, and at the back of these two lamps with red glass, which he held was sufficient for the purpose. He produced one of his side lamps in Court, and lit it, when it showed a small red light at the back. The Chairman said, without any reflection on the constable, there seemed to be a doubt about the case, and it would be dismissed.

A DEVICE for the regulation of automobile traffic by means of coloured signal poles and discs has been brought out by Messrs. Spiers and Company, of Glasgow. This is a simple plan of indicating the roads upon which maximum speeds are allowed, those where speed is restricted, the areas in which motor-cars are prohibited and the roads that are dangerous. The idea is capital, and motorists would welcome its general adoption by local authorities throughout the country. Discs of different colours are placed at the top of poles near the corners of roads, each colour representing one of the four divisions into which roads will naturally fall under the new Act.

A NEW motor-car depot has been established at 217, Piccadilly, W., by Messrs. S. B. Bailey and Lambert, who will make a speciality of the Miesse steam cars and the Herald petrol motor vehicles.

THE latest development of the Oldsmobile is its adaptation as a railway inspection car, the makers having arranged it for that use by the simple expedient of fitting it with light pressed steel flanged wheels and omitting the steering apparatus.

THE Continental Caoutchouc and Gutta Percha Company is now bringing out puttees for the repair of motor-cycle tyres. These are of the same construction as those supplied by the company for heavy motor-car tyres, and which have proved so great a success.

THE Keighley Association of Engineers have arranged for a paper to be given in the Lecture Theatre of the Technical Institute, Keighley, to-day (Saturday), by Mr. F. G. Heseldine, of Leeds, on "Motor Cars—Gearing and Steering." The chair will be taken by Mr. Arthur H. Marriner.

A USEFUL daily tear-off calendar has been published by Messrs. Cassell and Company, Limited, under the title of Letts' No. 2 calendar, which gives the rising and setting of the sun on each day's sheet. All the home edition of Letts' diaries for 1904 will contain a £1,000 accident insurance coupon.

A CONTRACT has been entered into with the Traffic Automobile Manufacturing Company, of Birmingham, for the conveyance of parcel mails by motor-van between Birmingham, Coventry, Kenilworth, Leamington Spa, and Warwick. The van is expected to commence running in about three weeks' time.

A BOY has been charged at the Stratford Police Court with assaulting a Blackheath motorist by throwing a piece of cardboard, which cut his face. The Motor Union took up the case, their solicitor expressing surprise when, at the court, the lad proved he was only nine years of age. Mr. Tabrum, the chairman of the Bench, having shown that they could not birch him, nor hang him, nor send him to prison, discharged the boy with a caution.

HEREWITH we illustrate a lock, the invention of a Chicago doctor, and designed for locking the operating levers on Oldsmobile cars so that they may be left without fear of molestation from would-be thieves or mischievous small boys. The lock consists of a flat plate hinged to the side of the body in such a way that it may be thrown down into a horizontal position, bringing one end against the brake lever, should this lever

be in its elevated position. The opposite end of the plate comes in contact with the ignition lever and holds it at the limit of its downward movement, where the speed of the engine is lowest, while the outer edge of the plate is formed with a notch, which embraces the clutch or transmission gear lever and holds the same in the position it assumes when the clutches of the gear are out of engagement. The plate is locked in its lowered position by a lock secured to the under side thereof and engaging a keeper secured to a suitable bracket riveted to the top of the seat. The Automobile Lock Co., of 560, West Jackson Boulevard, Chicago, are the makers of the device.

THE 1903 RELIABILITY TRIALS.

THE Committee of the A.C.G.B.I. have, on the recommendations received from the Judges' Committee appointed by the Club, awarded the medals offered in connection with the Reliability Trials held in September. Medals have not been awarded unless recommendations have been made to the effect that the vehicles are worthy to receive them.

The awards have been made by adding together the marks gained by each car for:—(a) reliability, (b) cleaning, replenishing, etc., (c) hill-climbing, (d) condition after trial, (e) brakes, (f) steering, (g) absence of noise, (h) absence of vibration, (i) absence of vapour or smoke, (k) absence of dust-raising (l) speed on track, (m) re-starting on hill, (n) finish and appearance, (o) general cleanliness of motor and gear, (p) fuel consumption, (q) accuracy of h.p., (r) cheapness.

SECTION I.

Class 'A1. Tandems and Quadricycles above 170 lbs. weight and below £160 in price.

First prize: Silver medal No. 1, the Century Engineering Company's 5-h.p. tandem.

Class A. Vehicles declared at a selling price of £200 or less.

First prize: Gold medal, No. 21, Jarrott and Letts' 5-h.p. Oldsmobile.

Second prize: Silver medal, No. 17, Jarrott and Letts' 6-h.p. Oldsmobile.

Class B.—Vehicles declared at a selling price of £200 to £300.

First prize: Gold medal, No. 39, the Motor Manufacturing Company's 8-h.p. M.M.C.

Second prize: Silver medal, No. 24, the Swift Motor Company's 6-h.p. Swift.

Class C.—Vehicles declared at a selling price of £300 to £400.

First prize: Gold medal, No. 41, S. F. Edge, Limited, 10-h.p. Gladiator.

Second prize: No. 62, Mr. Oscar Thompson, 7½-h.p. Wolsley.

Class D.—Vehicles declared at a selling price of £400 to £500.

First prize: Gold medal, No. 92, New Orleans Motor Company's 12-h.p. New Orleans.

Second prize: Silver medal, No. 91, De Dion Bouton's 12-h.p. De Dion.

Class E.—Vehicles declared at a selling price of £550 to £700.

First prize: Gold medal, No. 105, Speedwell Motor and Engineering Company's 10-h.p. Gardner-Serpollet.

Special gold medal, No. 114, Captain H. H. P. Deasy's 14-h.p. Martini.

Class F.—Vehicles declared at a selling price of £700 to £900.

First prize: Gold medal, No. 130, Captain H. H. P. Deasy's 16-h.p. Rochet-Schneider.

Second prize: Silver medal, No. 133, the Motor Manufacturing Company's 20-h.p. M.M.C.

Class G.—Vehicles declared at a selling price of over £900.

First prize: Gold medal, No. 137, the Daimler Company's 22-b.h.p. Daimler.

SECTION II.

1. Gold medal.—Messrs. Clarkson's Limited, combined engine, differential gear, pumps, etc., complete.

2 and 3. Silver medal.—Messrs. Clarkson's, Limited, oil burner and boiler feed device.

4. Silver medal.—Albion Motor Car Company, magneto ignition.

8. Silver medal.—New Orleans Motor Company, gear box.

14.—Silver medal.—Hozier Engineering Company, gear box.

Of the special gold medals to be allotted by the judges under rule 36 to vehicles which they may consider to possess specially meritorious features, a gold medal was awarded to the Daimler Motor Company for their 22-b.h.p. 'bus for general excellence, and silver medals were awarded to Messrs. John Marston, Limited, for the chain case on their 12-h.p. Sunbeam

car, No 65, and to Messrs. Evart Hall, Limited, for their 15-h.p. C.G.V. car, No. 127, for its dustlessness.

An additional special silver medal was awarded to the White Steam Car Company for their 10-h.p. White steam car, No. 116, for its small water consumption.

It must be understood that the medals awarded in Section II. and seq. are purely for the points specifically named and not in any way for reliability.

The judges have carefully considered the question of making a detailed report on the trials, but they are of opinion that the inelastic system of marking adopted, whereby each point laid down in the rules has to be dealt with with a view to marking for that particular point alone, renders impossible the exercise of any judgment on the general merits of the various cars apart from the points actually marked.

The report is signed by Messrs. R. E. Crompton, W. Worby Beaumont, Dugald Clerk, E. H. Cozens-Hardy, Jas. Swinburne, R. E. Phillips, Lyons Sampson, and Charles H. H. Nugent.

THE OBJECT OF COMPRESSION.

IT may not be clear to everyone why the gaseous charge in the cylinder of a petrol motor is compressed before ignition, especially since the compression absorbs power. By compressing the charge before ignition a proportionally higher explosion pressure is obtained, and also a much higher mean pressure during the power stroke. Much greater power is therefore obtained from the same engine, and the thermal efficiency—i.e., the relative amount of power obtained from a certain amount of fuel—is also increased. Generally speaking, the higher the compression the greater the power of an engine of given dimensions and the greater the fuel economy; but there is, of course, a limit beyond which it is not advisable to go, which is fixed by the conditions that when the compression is too high the charge is liable to ignite spontaneously at a too early period—a phenomenon called pre-ignition—that the motor is hard to start (for the first explosion the charge must be compressed by hand), and that if the piston and valves are not a perfect fit a considerable part of the charge is likely to leak out.

In the more modern petrol motor a marked increase in compression over that in the older patterns is noticeable. It is not surprising, therefore, that many of the older vehicles will not develop the power they should. In many cases the compression can be raised with beneficial results by applying a plate of cast iron to either the top of the piston or to the inner side of the cylinder head. The latter method is to be preferred because any weight added to the piston will destroy the balance of the motor, unless the other moving parts are altered to correspond.

The proper thickness of plate to give the best results is largely a matter of conjecture, and if one of the later models of the engine to be altered can be secured, and a comparison of the compression spaces made, this will be the better way. Otherwise the original percentage of compression space should be secured, and the desired percentage subtracted from it, when it will be a simple matter to make a wooden pattern containing the number of cubic inches necessary. The compression plate should not, under any circumstances, obstruct the port openings to the valves, and in many motors this will necessitate chamer-fearing away the pattern at the part adjacent to the ports.

The original percentage of compression space on any motor may, remarks the "Horseless Age," be readily ascertained in the following manner. Have the inlet and exhaust valves closed and the piston at its innermost position. Now through the ignition plug opening, the cylinder being placed so this is uppermost, fill the compression space with water from a rectangular vessel so that the cubical contents may be readily computed. Find the displacement in cubic inches of the piston, and with these two factors the clearance percentage of any motor, no matter how irregular its port passages, may be readily calculated.

MOTOR-CYCLING NEWS.

JUDGING from present indications it would seem that 1904 is to be a motor-cycle year. The motor-cycle is no longer a toy, it is no longer in the experimental stage, in the popular acceptance of the phrase. The manufacturers are still experimenting, but they have already produced a machine that can be accepted as a finished article, constructed on scientific lines and thoroughly reliable. The evolution of the motor-cycle is a repetition of that of the cycle itself, with the important difference that in the case of the motor machine the manufacturers had a vast stock of experience behind them in the shape of the knowledge gained in bicycle designing. Doubtless in the next few years many changes will be made in the motor-cycle as we know it to-day. There will doubtless be some who will refuse to be convinced that the motor-cycle has reached the practical stage, just as there have been people in the past who held off buying bicycles because they were constantly changing. The majority of reasonable people are, however, coming rapidly round to the view that the fundamental lines of the motor-cycle are now settled, that the evolution of the next year or two is likely to be confined to details of engine position, lubrication, transmission, controlling devices, etc., and that the proper time to become a motor-cyclist is the present time.

THE results in the recent 1,000 kilometre reliability trial organised by the Motocycle Club de France have just been made known. Of the thirty-six competitors, only eighteen completed the whole competition, which was divided into two classes—(1) Machines having engines of a capacity of 200 cubic centimetres ($\frac{1}{4}$ litre), and (2) those of a capacity of 333 cubic centimetres ($\frac{1}{3}$ litre). In the $\frac{1}{4}$ litre class the machines are placed by the jury in the following order:—1, Motosacoche I.; 2, Motosacoche II.; 3, Gobron-Minerva; 4, Bruneau; 5, Bonnet; 6, Pécourt; 7, Paillard; 8, Mauxion; 9, Lurquin-Coudert; 10, Doué; 11, Chantemedé I.; 12, G. Knap; 13, Breuil; 14, Moto-Cardan. The classification in the $\frac{1}{3}$ litre section is:—1, Werner; 2, Lamaudière II.; 3, Chantemedé II.; 4, Lamaudière I.

THE Motor Manufacturing Company, Limited, which has built up an enviable reputation for motor-cycle engines, has for the 1904 season brought out a new 2 $\frac{1}{2}$ -h.p. motor with mechanically operated valves, of which we are able to give two views herewith. The two valves, which are of large diameter, are placed side by

side. The two-to-one shaft is located at the top of the crank case, the gearing being on one end, and the commutator on the other. A contact-breaker of the ordinary make and break variety is now fitted to the new type, although the genuine De Dion contact can be supplied if required, or the engine can be arranged for high-tension magneto ignition. The motor, which

normally runs at a speed of 1,750 revolutions per min., weighs 64 lbs. Its dimensions are clearly shown in the illustrations.

FOR the coming season a new form of Longuemare carburettor for use on motor-cycles is being introduced, the feature of which is the addition of a device by means of which the amount of air admitted is regulated according to the speed of the engine; the faster the speed the more air and vice versa. Instead of the air entering directly into the spraying chamber R through a

series of holes in the base, a dome X is now fitted below these holes. This dome is provided with a simple automatic throttle or regulator S, consisting merely of a little weighted and pivoted shutter fitted in the opening to the dome. When the motor is not at work this little shutter practically closes the air inlet, then when the motor is started a partial vacuum is formed in the spraying chamber and the little shutter swings open slightly and allows sufficient air to enter to give a good explosive mixture. As the speed of the engine increases, more petrol comes through the sprayer and a greater supply of air is required to keep the quality of the mixture constant. The shutter S at the same time opens wider with the increased suction and automatically admits the additional amount of air required. The extra air supply inlet C' in the upper part of the vaporiser is retained, so that, in case further dilution of the mixture is necessary, it can readily be effected. The throttle valve for controlling the quantity of mixture supplied to the engine is seen at Pp. The new automatic arrangement has been well tested before being put on the market, and practically obviates all the trouble of having to find the correct mixture.

AMONG the many motor-bicycles shown at the recent shows was the Star which found a place on the Star Cycle Co.'s stand at the National. This is fitted with engines of 2 $\frac{1}{2}$ or 3-h.p. of the air-cooled type, located in a vertical position. The motor is fixed by means of cradles bolted to the two lower extremities of the down tubes by half a dozen bolts passing through lugs on the outer side of the crank chamber. Electric ignition, a Longuemare carburettor, a V-section belt, and two rim brakes operated by Bowden wires from the handle-bar are other features of the Star motor-cycle.

THE German Cyclists' Union has decided to organise for next season a motor-cycle reliability trial from Frankfurt-am-Main to Berlin.

THERE will be a Boxing Day run of the Motor-Cycling Club to Wisley (Hut Hotel) on the Ripley road, meeting at the Roehampton-gate entrance to Richmond Park (the shortest route to which is via Priory Lane, Barnes Common), at 11 a.m. As many members are frequently to be met with on the Portsmouth Road, it is suggested that the Angel, Ditton, will be a central rendezvous for members to assemble on Sundays, about 11 o'clock, during the off-season. The annual dinner has been arranged for January 5th, at Frascati's.

CORRESPONDENCE.

POWER DISTRIBUTION IN A 6-CYLINDER MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in the article you published in a recent issue on "Power Distribution in Petrol Motors." The cycle of operations in a multi-cylinder engine is a question I have often discussed with many of my motoring friends, and I am keeping the article to refer to should the matter crop up again. You have dealt with two, three, and four cylinder engines and the cycle of operations in these. Now that we are promised a six cylinder motor, I have been trying to figure out the relative position to each other of the various strokes,—suction, compression, explosion, exhaust—of the six pistons during the two revolutions the crankshaft makes in completing the four cycle. I have not yet been able to satisfy myself on the point, and should be greatly obliged if you could elucidate the matter. I am sure there will be many readers of the *Journal* interested in the same, in addition to—Yours truly,

PUZZLED ONE.

[The accompanying sketch will perhaps aid "Puzzled One" in his question relative to power distribution in a six cylinder motor. The matter is not one that can be settled off-hand, and permits of more than one solution. The method we would recommend is as follows:—In the first place it is necessary to set the cranks out at angles of 120 degrees. This will give two cranks in a relative position at each of the three points, in the following order: Piston in No. 1 cylinder lined up to that in No. 4, No. 2 to No. 5, and No. 3 to No. 6. It is then an easy matter to see that the power will be equally distributed at

No. 1, Compression. No. 2, $\frac{1}{2}$ up compression. No. 3, $\frac{3}{4}$ down suction or inlet.
No. 4, Exhaust. No. 5, $\frac{1}{2}$ up exhaust. No. 6, $\frac{3}{4}$ down explosion stroke.

all points. When No. 1 piston is at the end of its compression stroke, No. 4 is at the end of the exhaust stroke; No. 2 is a quarter up compressed stroke, and No. 5 a quarter up exhaust; No. 3 is at three-quarter suction or inlet, and No. 6 at three-quarter down explosion stroke. Thus, upon completion of one revolution cylinders Nos. 1, 2, and 3 will have fired, and cylinders Nos. 4, 5, and 6 complete the second revolution, all firing at equal distance, again to be picked up by No. 1, the cycle of explosions being repeated without any break.]

THE TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "A Mechanical Engineer," in your issue of the 14th ult., a tyre such as he desires is already on the market. He stipulates that it must be resilient, long-lived, non-puncturable, and, above all, durable and cheap. All these qualities are claimed to be possessed by the tyre to which I venture to draw attention. It is that of the Patent Grooved Solid Tyre Company, of Leicester; it is a solid tyre with a continuous Clincher back fixed firmly in the rim. On the tread or road surface, however, there is a transverse groove every few inches, which divides it into sections. In this way there is much more resilience than with the continuous solid tyre, and it also allows for any lengthening of the tread caused by wear on the road. Another great advantage is that the tyre can be made to fit any existing pneumatic rim, and gives a much firmer grip on the road than the ordinary solid tyre.—Yours truly,

THOMAS BUCKTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have seen the letter signed "A Motorist" in your issue of the 28th ult. I, like him, have had four months' experience of the Cassell band, which he commends, and it gives me pleasure to attest the value of the patent. I travelled great distances over the hilly roads of the Highlands of Scotland this year—roads, too, of that peculiarly Scottish character which rends the heart of a motorist and keeps him in a state of apprehension such as makes him lose the delight of motoring, fearful for the holding of his tyres, and I never had the slightest trouble either with tyres or bands. I venture to say that, for all practical purposes, the bands commended by "A Motorist" overcome the difficulty of safety of tyres. I would be derelict in a public duty did not I offer my

testimony to motorists of the boon which the band in question affords.—Yours truly,

ANOTHER MOTORIST.

BRAKES FOR MOTOR-CYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with great interest, in your issue of the 21st ult., a letter from the Rev. Edwin Noyes re the new Wass and Cocks belt rim brake. I may say that I have just had one fitted to my Phoenix Trimco, and fully agree with everything that he says about it, as I can now pull up my machine almost instantly with this brake alone, and can also use it so as to ride in the very thickest traffic. I have not been pleased for a long time with the results to be got from my other brakes, but have now got all that I wished for in the way of brake power, and I am quite sure that any of your readers who have felt this same want would be fully satisfied if they gave this a trial.—Yours truly,

J. SCHOFIELD.

A MUTUAL AID SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Among the obstacles which have to be overcome by the motor-car in winning its way into universal favour is unquestionably the ignorance of the public regarding its nature, capabilities and handling. In the latter particular even the users of motor-cars have at first much to learn, and unfortunately they have to gain most of their knowledge unassisted. The lessons given by agents relate chiefly and necessarily to the matter of control, since it is, in the nature of the case, impossible to give each purchaser a complete mechanical education, with instructions as to what to do in any one of the hundred and one contingencies which will inevitably arise. The pupil therefore goes through these lessons with the assumption that the vehicle is in perfect order, and his education in the art of keeping it so begins only when he gets the vehicle on the road.

It is at this point that I consider all users of motor-cars can derive mutual benefit by exchanging notes of their experiences in the handling of the vehicle and its maintenance. It must doubtless be admitted that the owner of a motor-car, who is not blessed by nature with an instinct for things mechanical, is in a desperate case, and a weekly visit to a repair shop is probably his only hope. I believe, however, that many owners of motor-cars have acquired them because they take pleasure in possessing and operating such a piece of almost sentient mechanism as a good motor-car soon proves itself to be. These persons are not by any means mechanics by profession; they may be physicians, lawyers, or men of business; but either at once, or soon after they have acquired a car, they begin to feel an interest in its mechanism for the mechanism's sake. If breakdowns occur, as breakdowns will, they take pride in telling just how they tided over the difficulty. Doubtless they soon learn, but unquestionably they would be better prepared for the emergencies as yet unencountered, if each had the benefit of the other's experience. Now that you, Mr. Editor, have opened your correspondence columns to the ventilation of motorists' little troubles, I venture to ask those who have the necessary experience and knowledge not to be backward in coming forward. It takes time to sit down and write a letter, but I am sure that the writers will, in the end, be benefited by the responsive efforts of others, and by the discussion which will be evoked by such communications.—Yours truly,

A BELIEVER IN MUTUAL AID.

QUERIES RE TYRES AND IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask you the following questions re motor-car?

1. Solid tyres being a necessity in my case, are gear-driven or chain-driven cars best? Is the live axle unsuitable for solid tyres?
2. Are ball bearings suitable for solid tyres? Do the balls not break?
3. Is magneto ignition reliable and lasting, and what are its disadvantages?—Yours truly,

C. T. ELMSLIE.

[In respect to gear or chain-driven cars, when solid tyres are used, we should strongly advise the chain-drive. There being more vibration on solid tyres than on pneumatic, the possibility of cracking balls would be somewhat increased, and therefore it would undoubtedly be safer to fit roller or even plain bearings. Magneto ignition in its present stage is as perfect as anything, the only point being that it is somewhat more expensive in the initial outlay.]

THE SPEED OF TRAM-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any reader kindly inform me why Mr. Moffat Ford is allowed to take all the trouble and expense on himself with respect to

his actions regarding the speeds of electric tram cars. He is fighting the tram companies himself. I am rather astonished that motorists do not volunteer to help him. It is a matter of great interest to all who participate in this "pleasurable pastime." I do not see why electric trams are allowed to rush through crowded thoroughfares as they do. If the "Man in the Motor-car" attempts any such speed he is had up at once.—Yours truly,

THOS. E. HENDERSON.

A CASE DISMISSED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with a certain degree of satisfaction that I put on record the fact that a case of alleged furious driving brought against me, and heard at Brentford last Thursday, was dismissed. At the time, it appeared to me so bad that I wrote to the Automobile Club, of which I am a member, and they handed my letter over to the Motor Union, and it was the Union with Mr. Staplee Firth who were responsible for the dismissal of the case, after a hearing of nearly two hours. More especially is it gratifying, as we were told when we entered the Court, that it did not matter very much what defence we had, the result would be "£10 and costs."

When I was stopped, a few Sundays back, at Hanwell, I took the trouble to get down, and Mr. Dickson (the friend with me) and I interrogated the police officers, so that at the Court we had a good many facts to put before the Bench. One of them was that a motor-bicycle was being pushed by two men and pedalled by another, and that this bicycle was with us for 150 out of the 220 yards. Of course, it is obvious to anyone that a bicycle could not travel at the alleged speed that I was going, viz.—21 miles an hour. This incident, although small at the time, proved to be of very material importance.

I should advise motorists not only to stop and take a little time in collecting evidence, but to go to the court and fight the case, always provided they can afford it, or, like myself, have the assistance of the Motor Union.—Yours truly,

F. GUY LEWIN.

MOTOR VOLUNTEER CORPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent who conceals his identity under the pseudonym "Volunteer," I would like first to remark that in my opinion it is a pity "Volunteer" should have committed himself to print with so little correct information on the subject as only to demonstrate his colossal ignorance. My remarks as to the necessity of officers in a military organisation are quite correctly reported, and I would further add that the proportion of officers in a corps, extended as the Motor Volunteer Corps is over the whole of Great Britain, is bound to be somewhat larger, for purposes of organisation, than in purely local units. I do not know what "Volunteer" means when he suggests that the corps consists of 24 officers and 49 privates, unless he intends to mislead the public. In the November Army list there were 22 officers, and on the roll of the corps 84 private members—nearly double the number alleged by "Volunteer." Having exposed these glaring inaccuracies I can only suppose that "Volunteer" will feel impelled by soldierly sentiment to withdraw his insinuations and apologise to this unit of His Majesty's forces, of which he is presumably a loyal member.—Yours truly,

MARK MAYHEW, LT. COL.

O.C. M.V.C.

ACCUMULATOR MANAGEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We wish to put before your readers the following warning. On many makes of accumulators it is printed on the instruction label that distilled water should be added occasionally to make up for loss caused through evaporation. This is correct, but it is carried too far by the average amateur. When acid gets spilt through the accumulator being turned upside down or turned over, it seems to be the general thing to make up the loss with water: the result is that in time the accumulator contains nothing but water, and when this is the case trouble commences; the accumulator will not hold its charge, the paste begins to leave the plates, and general ruin sets in. The reason why we give this warning is that in several cases recently we have had accumulators of all makes brought us with one cell badly sulphated. After several hours' trying to get a charge into same and finding the voltage on both cells was only 2.5 volts, we tested the acid, and found this was simply water, without even the weakest trace of acid. After emptying out this cell and filling with correct acid and charging for several days, the accumulator has come up all right again. In one instance an accumulator contained nothing else but water, and had been utterly ruined. It is getting quite a common occurrence now to receive accumulators in this condition for recharging, and the number that are ruined yearly must be considerable. Water and acid in skilled hands and proper charging can work wonders on accumulators, but in unskilled hands it becomes an expensive item. We trust this will explain one reason why an accumulator will not hold its charge. We have had some of our best makes of accumulators ruined by this, and the blame thrown on us. New accumulators sent

to customers have been returned; on testing the strength of supposed acid, it has been in all cases a very weak solution, about one drop of acid to each cell. Not only do we speak to protect our own make of accumulators, but for all accumulator manufacturers. Our advice is, do not trust so much to distilled water; take the battery to a competent electrician, who understands the manufacture of accumulators, and get him to add the necessary acid.—Yours truly,

T. W. THOMPSON AND CO.

BENZ v. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very grateful if some reader would inform me whether a 3½-h.p. Benz with Crypto compares favourably, for pace up inclines, with a voiturette or light car of about the same power? From a mere tyro's point of view the great weight, i.e., 10 cwt., of a Benz must absorb so much of the power necessary in going up hill. Any information on the subject will be gladly read, as several of my friends as well as myself are much disappointed in the performance of our Benz cars as soon as a quite slight upward grade is met, and our cars have to go up on second speed.—Yours truly,

D. BEAUMONT.

KICKING ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your numerous readers inform me why my engine gives a sort of kick when running slowly? It is a 5½ to 6-h.p. single cylinder. Has it anything to do with the exhaust not freeing itself sufficiently soon enough? Any hint to overcome the difficulty will be much appreciated by—Yours truly,

"WINCONA."

["Wincona" might try retarding his ignition rather more than he does at present, as this may in all probability bring about a cure. The kicking would not be due to any effect of the exhaust gases, but more likely to small particles of metal in the cylinder head becoming incandescent and so causing a kind of premature firing, which would not be discernible at high speed. In the event of this not being the case the throttle may be slightly at fault, not allowing the engine to take an equal charge each revolution, and thus getting erratic explosions.]

PETROL AND STEAM. A SUGGESTED COMBINATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was wondering the other day if anyone had ever tried to propel a motor-car with petrol and steam engines combined. My idea was this. The exhaust pipe of a petrol motor, a quick running one, soon gets red hot; if, instead of connecting the pipe to a silencer, it was formed into a spiral coil and passed through a boiler, would it not heat the water sufficiently to get up steam in the boiler to drive a steam engine? The steam engine might be put in gear to help the petrol engine up hills, or at any time when sufficient steam was generated.—Yours truly,

D. J. M.

[D. J. M.'s idea is specious, and we have heard it put forward before. A little consideration, however, will show how little could be expected from it in practice. The absolute efficiency of a good oil engine may be taken as between 16 and 20 per cent.: taking the latter figure, this implies that 80 per cent. of the heat value of the oil is wasted. Much of this is lost through the cylinder walls, and even if we assume that more than half, say 50 out of the 80 per cent., is carried off by the exhaust, we know that the efficiency of a small steam-engine is seldom more than 1 to 3 per cent. Taking it as 2, we may conclude from this rough estimate that if we had a 20-h.p. motor, our auxiliary steam engine, heated from the exhaust, could not give us more than 1-h.p., certainly not enough to compensate for the extra weight and complication. And in this rough calculation we have neglected several factors that would further reduce the result.]

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you be so kind as to inform me whether my 6½-h.p. "Napoleon" car with De Dion engine would carry solid tyres on the back wheels during the winter months? Also, can any make of solid tyre be fitted without altering the wheel-rim? My overheating has been at last cured, thanks to the kindly help of your correspondents. The trouble was due to a deposit of about 2 inches of rust-flakes at the bottom of the water-jacket.—Yours truly,

"OPOSSUM."

[We are inclined to advise "Opossum" not to fit solid tyres to the back wheels of his car for winter use. The extra vibration and wear would

probably cost doubly in the long run in the way of repairs. In the winter months pneumatic tyres are really more essential than in the summer.

THE CASSELL NON-PUNCTURABLE BAND.—"A Motorist" writes that this is obtainable from the Glasgow Motor and Tyre Company, 71, Waterloo Street, Glasgow, and not from the address given in the last issue.

HEAVY OIL CARS.—Messrs. J. Petrie, Sons and Company, who enquire for the makers of cars using paraffin as fuel, are referred to the Roots Oil Motor and Motor Car, Limited, Chicheley Street, York Road, S.E.

TECHNOLOGICAL AND SCIENTIFIC DICTIONARY.—Replying to T. Andrews, the publishers of this work are Messrs. Geo. Newnes, Limited, Southampton Street, Strand, London, W.C.

THE 5-H.P. HUMBERETTE CAR.—"Tilehurst" writes:—"I think it would be of much interest to your 'moderate means' readers, of whom I form a unit, if some private user of the 5-h.p. Humberette car would send a short account of his experiences with this little car."

ROADSIDE EXPERIENCES.*

BY THE HON. C. S. ROLLS.

It is difficult to remember the many amusing adventures we have all of us had at different times, but I have jotted down a few of the most interesting ones that I can remember. My own experiences began in France in 1895, and I subsequently brought over to England a Peugeot carriage of 3½-h.p. This was considered a very powerful and almost dangerous machine, the most powerful one previously made being 3½-h.p. It was rather a top-heavy vehicle, hung on three springs, and it used to sway terribly when going down hill; it had a V-type Daimler engine behind, made by Messrs. Panhard and Levassor. As soon as I started to drive this thing out of Victoria Station, I was stopped and summoned for not having a red flag. I managed, however, to get a kind of permission from the Chief Constables of Hertfordshire and Cambridgeshire, who kindly said they would instruct their men to look the other way when I came along. This enabled me to start on my first journey from London to Cambridge. We deemed it advisable to run by night only, and the first part, as far as Potter's Bar, was covered according to the law, each of us taking it in turns to carry the red lantern, walking on foot in front. At one point the monotony was relieved by giving a lift to a policeman. I happened to be walking in front and got into conversation with the bobby. "Evening!" said he. "Evening!" said I. "One of these 'ere motors?" said he. "Yes," said I. "Don't see many of them these things about, but I should like to have a ride on one; they does seem to me to be so huncanny," said he. "Jump up!" said I. So up he got into the car and said: "Now you can just let 'er go as 'ow you please down this 'ere 'ill," holding himself on with one hand and his helmet with the other, "for there ain't no one on the beat for another mile and a 'alf." So away we went, greatly relieved at being able to let her out, after having crawled for so long at four miles an hour with the engine hot. After Potter's Bar we were free, but the car was not going well—much time was lost stopping for water, which was often very difficult to find; we frequently had to get into private gardens and draw from people's wells. But the fun was when we stopped in a village, the car made so much noise that it woke up everyone in the place, and night-clad figures appeared at every window.

Of course there were no radiators in those days, and the pump would not work above a certain temperature. You had to ascertain if the pump was working by sticking your hand under a pipe in a box behind, and as it was usually boiling hot, the passenger got tired of being burnt and got into a habit of saying "Yes" whenever he was asked if the water was circulating. This eventful run, after many troubles, ended in our arriving at Cambridge at 9.30 a.m.; this made a total time of eleven and three-quarter hours, or an average speed of under five miles per hour. So tired were we that I went to sleep momentarily several times while driving, and was awakened by feeling the car going off the crown of the road. My passenger slept all the latter half of the journey.

In November, 1896, I had my first smash—and this occurred, unfortunately, the night before the London to Brighton run. I was on my way up to London for this run, when going down hill at Hatfield the right front axle broke clean, and the whole car went over on its side with a tremendous crash, which I can still hear now. The car had a big canopy and was very top-heavy. Neither of us in front were hurt, but there were two passengers sitting behind, who had been fast asleep; when we shouted to them all we got was a grunt, but, fortunately, as it turned out, neither of them was badly hurt. We had, as usual, been about ten hours doing forty miles, and it was now about 10 p.m., so we had some difficulty in collecting the wreckage and getting the car to a stable. This done, we adjourned to a small inn, where our shaken passengers were attended to. We were then given the state bedroom (which was so small that you could not find the window), and proceeded the next day by train.

Everything used to go wrong excepting the tyres, which were solid, and even those used to come off sometimes and catch in the tyre brakes. In no case could you run much more than ten miles without stopping, for fresh water was then required, and it was often a difficulty to get

water just when you wanted it. The best thing was what Mr. Frank H. Butler used to do with his Benz car—sit on the side of the road with a bottle of port and wait for a tramp; when the tramp arrived he sent him across the fields for about two miles with a canvas bucket that leaked, so that when he got back to the car the bucket, of course, was empty.

The chief source of trouble in those days was generally loose nuts; split pins were rarely troubled about. Consequently, anyone walking behind a car with a basket would pick up a varied assortment of nuts and bolts, chains and lubricators, bits of the engine, belts, &c. Another great source of trouble was the ignition. It is, of course, essential that the tubes should be a bright red, but sometimes it seemed impossible to get the burners to burn properly, or to keep them alight. The most troublesome machine in this respect was the Bollée. The Bollée, as you may remember, was a curious looking, low-built three-wheeler, with a single driving wheel. If you wished to start out at ten in the morning, you had to be up at six. You then tried to light up the burner, but could not get anything to burn. You then discovered you had turned on the wrong tap, so you promptly turned on the other one full. You then went to light up, and you lit up! Cries for the fire brigade! After a bit you got it to burn, and it made a noise like a cross-Channel steamer waiting to start. The next thing was to get the engine to go. You first looked for the starting handle, which you had probably dropped on the road the day before, and when you had found it you proceeded to wind up for an hour and a half without a sign of an explosion. At last you got a bad back-fire—two days in hospital! After that you gave it another two hours' grinding, and at last the engine started off, and you were so surprised that you let go of the handle, which promptly flew off and hit you on the nose! Then the engine made a noise like an old pig grunting, and you set out on the machine prepared for a lively time. The car was mostly made of tin biscuit boxes and wire, and you got plenty of practice in soldering, etc. The cylinder wore oval in about a week, and would not hold any compression. In spite of copious oiling, the back of the cylinder was generally red hot. However, a great deal of fun could be got out of a Bollée, especially on greasy roads, for the tail continually swayed from side to side, and would sometimes come round and look at you when going down hill. My first run on a Bollée was from Coventry to Cambridge, in 1897, and we had a most interesting run, which ended by colliding with a cart. In '98 I had become possessed of a 6-h.p. Panhard, the first type fitted with wheel steering. I had many adventures on this car, perhaps the best of which was a run from Paris to Barentin. The most eventful run I ever had in France was in company with Colonel Mayhew, Mr. Russell, and Mr. Hutchinson.

THE MOTOR-CAR ACT.

GLOUCESTER.—A committee of the Stroud Urban Council recommended that the speed of motor-cars under the new Act should be limited to five miles per hour. At the ordinary meeting of the council, however, several members said the proposal was ridiculous, as many people could walk five miles in an hour. Ultimately the recommendation was altered from five to ten miles per hour.

In the area of the Gloucester Council speed on all narrow by-roads will be limited to ten miles an hour.

HERTFORDSHIRE.—The Watford Urban Council will take no action with regard to the ten mile schedule.

YORKSHIRE.—Thirty warning boards are to be erected at dangerous places in the area of the Driffield Rural Council.

SURREY.—At the Shere Parish Council, last week, it was decided to recommend to the District Council that motorists driving into the village be limited to a speed of ten miles an hour, and it was resolved to take steps to warn motorists that the following corners are especially dangerous: Coombe Bottom (at the top), Coombe End, the Surrey Trading Corner, Gomshall Tanyard Corner, and the corners at Gomshall Mill Bridge, Queen's Street and High View End.

WALES.—The Caerleon Council has received a letter from the St. Mellon's District Council inviting the council to consider the advisability of applying to the Local Government Board for powers to make regulations prohibiting or restricting the driving of motor-cars on highways which do not exceed sixteen feet in width, or on which motor-car traffic would be especially dangerous. It was stated that such a regulation would prohibit any motor-car passing through Caerleon. A reply has been sent to the St. Mellon's Council that there were no roads in Caerleon which came under the definition.

LANCASHIRE.—The Watch Committee of the Leigh Town Council have resolved that, with a view to the safety of the public, the Town Clerk be instructed to make application under the Motor Car Act to the Local Government Board to issue regulations limiting the driving of motor-cars on highways within the borough to a speed not exceeding ten miles per hour.

STAFFORDSHIRE.—At the last meeting of the Staffordshire County Council, consideration of the Motor Car Act was reported by the Main Roads and Bridges Committee, and they recommended the Council to delegate to the Committee until the Council meeting in February next all the powers of the Council under the Act, except applications under Section 9, which gives power to reduce the speed limit in certain districts to ten miles an hour. Mr. Peach moved an amendment that the words in reference to the section be omitted, to enable applications for

* From a paper read at the A.C.G.B.I. on the 3rd inst.

the reduction of the speed limit to be dealt with by the Committee. He moved the amendment to check those—idiots, he was on the point of calling them—who drove furiously through the streets to the danger of the public. Mr. Cotton, while admitting that he knew nothing about the matter, seconded the amendment, because he supposed Mr. Peach was in the right. The amendment was defeated by a large majority, and the recommendation approved.

DERBYSHIRE.—The Fairfield Urban District Council decided on Monday night to petition the County Council to limit the speed of motor-cars to ten miles an hour over their eighteen miles of roads. Mr. Headington said such a course was silly, and was calculated to drive the motor-car industry from England.

CLUB NEWS.

WOLVERHAMPTON.

THE members of the Wolverhampton and District Automobile Club have held a highly successful smoking concert at the Victoria Hotel, Wolverhampton. Mr. William Owen presided, and among those present were Councillors Grout and Dickinson, and Messrs. S. R. Rhodes (hon. sec.), T. J. Barnett, W. A. Foster, T. Cureton, O. Evans, T. H. Edwards, F. F. Sharp, E. W. Edwards, W. Evans, F. Bishop, B. B. Pearson, G. Evans, G. Green (borough surveyor), E. A. B. Woodward (water engineer), W. Edwards, W. A. Crombie, F. Platt, and J. E. Knight. At an interval in the programme the members pledged the health of "The Visitors," after which the Hon. Secretary (Mr. S. R. Rhodes) announced the result of the recent hill-climbing competition on the Hermitage Hill, at Bridgnorth as follows:—Motor-cars: 1, Geo. H. Evans (Wolseley); 2, E. B. Bayliss (Wolseley); 3, W. Clarke (M.M.C.); 4, T. Cureton (Sunbeam); 5, J. Lisle (Star); 6, P. S. Bayliss (Sunbeam); 7, W. Bayliss (Wolseley); 8, H. Moore (Star); 9, J. O. Evans (Wolseley); 10, A. E. Jenks; 11, Captain W. H. Haden (Star); 12, J. F. Mills (Sunbeam); 13, F. C. Bishop (Star); 14, A. E. Price (Vauxhall); 15, J. H. Dark (M.M.C.); 16, E. W. H. Trusselle (De Dion). Motor-cycles: 1, E. Lisle, jun. (3½ h p.); 2, C. F. G. Boyes (2½); 3, H. W. Jenks (2); 4, F. Cremonini (3). After announcing the results, as above, Mr. Rhodes said the club had now been in existence about three years, and he ventured to say that it had made for itself an important position among provincial clubs. He believed one result of their efforts had been to break down much of the prejudice which every new movement had to face, and was pleased to add that the membership now numbered seventy.

YORKSHIRE.

ON Friday, the 4th inst., the fourth annual dinner of the Yorkshire Automobile Club took place at the Great Northern Hotel, Leeds, Mr. E. H. Hepper presiding over a good attendance.

Mr. Arthur Willey, who proposed the toast of "Automobilism," said he knew but little about motoring, and that little was not particularly favourable. (Laughter). From a professional point of view, however, he commended everything motorists did, and he did not praise those who were too careful. (Laughter). He had set out by motor-car from Leeds at one o'clock for Ilkley, where he had been invited to luncheon, and he had reached his destination at 5.45, having had to walk 4½ miles to telephone for assistance for the car. He believed that whatever prejudice there was against motors would soon be lived down, and advocated a closer union among automobilists.

Responses to the toast were made by Messrs. J. W. Stocks, Rees Jeffreys, and H. A. Jones. Mr. Jeffreys, discussing the new Act and its probable operation in the country, said that the central body were anxious that they should not find the roads to the country closed to them here, there, and everywhere, with speed limits of ten miles an hour imposed in many places. The Automobile Club wished nothing to be done in a hole-and-corner way, and they therefore suggested that any application to close a road must be advertised in the local papers and the London Gazette, then that there should be a local inquiry in every case, and that the Local Government Board inspector should visit the road in question. If they could get the Local Government Board to adopt that proposal they would have some guarantee that no ill-considered proposals would be foisted on the country.

The "Visitors and the Press" was given by Mr. T. Atkinson, Messrs. C. Jarrott and W. F. Wray replying. The former said that the gigantic proportions which automobilism has attained in this country was shown by the fact that our imports from France alone this year were estimated at £2,000,000. Speed, however, was a crime in England. It seemed an extraordinary thing that an enlightened country like England should take such a view, but so the fact was. Under the old Act motorists were persecuted, but they would live that down. In the future, if they carried out the true spirit of sportsmen, recognised the rights of the road, and had consideration for others, they need have no fear as to the consequences.

Mr. W. Penrose Green proposed the Chairman, whose response brought the proceedings to a close.

MR. E. FAIERS, of Bradford, has promised to give a lantern lecture on Thursday evening, January 14th, 1904, in the Leeds club room. A new departure is about to be made in holding fortnightly meetings

at the rooms, commencing Thursday, January 28th, at 8 p.m., by having discussions on the motor-car and parts thereof. Mr. Winn will open the first discussion. Any members willing to commence discussions on any other branches of the subject are invited to communicate with the hon. secretary, Mr. Alf. W. Dougill.

SOUTH AFRICA.

ON the 9th ult. the Automobile Club of South Africa held a reliability and consumption trial from Capetown to Houw Hoek and back, a distance of 100 miles. The road was a difficult one, not only on account of the hills but also because of the numerous "sluits." Sixteen cars competed and only two succeeded in making non-stop runs—a Lan- chester and a Gladiator.

SCOTTISH.

THE annual dinner of the Western Section of the Scottish Automobile Club was held on Monday, at the Windsor Hotel, Glasgow. Lord Inverclyde presided, and the croupiers were Mr. John Adam (chairman of the section) and Mr. Wm. Weir. About 130 gentlemen were present, the company including the Marquis of Ailsa, the Right Hon. Sir J. H. A. Macdonald, Lord Justice-Clerk of Scotland; Colonel R. E. Crompton, C.B.; Count Louis de Clercq, member of the Administrative Council of the Automobile Club de France; Sir John Shearer, Mr. Norman D. Macdonald, Chief-Constable Stevenson, Mr. John Macdonald, Mr. John Wilson, M.P., and Mr. Robert J. Smith, honorary secretary. After the usual loyal toasts had been duly pledged, Lieut-Colonel Hugh Reid, V.D., responded to the toast of the Imperial Forces, proposed by Mr. J. R. Richmond.

The chairman proposed the toast of automobilism, and remarked that the development which had taken place in automobilism was little short of marvellous. Speaking, however, as a commercial man, he would confess to a feeling of disappointment that motor-cars had not done as much in commercial work as he hoped they would yet do. He was hopeful that the development of motors would help to keep this country going, and keep it amongst the foremost nations of the world.

The Lord Justice Clerk, in responding, said the movement was making progress not only as a means of sport, of touring, of carrying on business, visiting the sick, but in what was perhaps a still more important department—a department in which he ventured to say we were far ahead of everybody else—namely, motor transport upon the road. He did not think many men in this country fully appreciated what enormous value there was in the development of motor transport, in the revival of the use of the road, and in the prosperity which would be brought to many districts, and through those districts to the whole country. He counselled them to carry out the new Act in a reasonable manner, and if they did so they might be sure that very soon they would be able to ask for and obtain many concessions which were now denied to them.

Colonel Crompton and Count Louis de Clercq also responded.

Mr. Norman D. Macdonald proposed "The City and Corporation of Glasgow," to which Preceptor Mitchell responded. "Our Guests" was given by Mr. John Adam, Sir John Shearer replying. "The Chair" was proposed by Mr. John Wilson, M.P.

ALLEGED NEGLIGENT CUSTODY OF MOTOR-CYCLE.

AT the Brompton County Court, on Monday, before Judge Stonor, Mr. R. Holder, Elsenham Street, Southfields, S.W., brought an action against Mr. Howard Smeed, trading as the Howard Motor Company, 731, Fulham Road, S.W., claiming the return of a motor-bicycle, or £27 10s. as its value. The plaintiff stated that in July last he had a motor-bicycle which he desired to sell. He took the machine to the defendant's shop, where he saw both Mr. Smeed and his manager, Mr. Cummings, about the matter. The machine cost him £32 (trade price), and he asked Mr. Smeed to try to sell it for £27 10s., agreeing that anything above this amount should be retained by defendant for his trouble. The machine was placed in defendant's shop window and marked "For Sale." A few days later plaintiff went to Yorkshire, but on the morning after his arrival he received a telegram from his wife and a letter from the defendant stating that the machine had been stolen. After other evidence the defendant was called. He said that when a machine was left at his shop for repair or sale he always gave a receipt or had a written agreement. It appeared that the plaintiff was acquainted with Cummings, who had falsely represented himself as a partner in the business, and when plaintiff left his machine at the shop Cummings placed it in the window with a ticket upon it. Witness then made Cummings take off the ticket because he (defendant) had no instructions to sell it. The only time that he saw plaintiff was once when he called and wanted to hire a motor-car. On that occasion plaintiff said nothing about the machine in question. No one could have known where the key was put except himself, Cummings, and a man named Kelly, who, however, was with witness on the night in question. When plaintiff called, after the machine was missing, he (plaintiff) said, "No doubt Cummings knows something about it." The Judge: The question is whether this machine was ever left in the defendant's charge, and I am of opinion that it was not. As to the question of negligence, it appears that the defendant took as much care of it as he did of his own machines. I find for the defendant, with costs.

* Indicates Motor-Cycle Case.

the rear of the car. There were five lights burning on the car at the time. The judge gave judgment for the amount sued for.

At the Brompton County Court, on Monday, before Judge Stonor and a jury, Mr. G. F. Sporne, 10, Upper Tooting Road, S.W., brought an action against Captain Haig, Cadogan Gardens, Chelsea, claiming £50 in respect of personal injuries and damage to a bicycle, alleged to have been caused through negligence on the part of the defendant in driving a motor-car. Mr. Earle, counsel, appeared for the plaintiff, and Mr. Staplee Firth, solicitor, for the defendant. Plaintiff's counsel stated that on the 7th July last he was riding his bicycle along St. Margaret's Street, Westminster, when the defendant's motor-car, which had been stationary in the middle of the road, was turned suddenly, and came with great violence against the plaintiff. Corroborative evidence having been given, the defendant stated that when he was ready to turn he held his hand up to a policeman who was directing traffic, and turned at an ordinary rate. The Judge said that the chief question for the jury was whether the defendant was justified in turning until he saw sufficient of the road to be sure that it was perfectly clear, and that it was safe to turn. The jury found in favour of the plaintiff, assessing the damages at £20. His Honour gave judgment accordingly, and allowed costs.

At Kingston, J. B. Bluett-Duncan, of Ravenscroft, Upper Richmond Road, Putney, sued the West London Cycle and Motor Repository, Broadway, Wimbledon, for £3 7s., for damage sustained by a motor-car sent to defendant to effect a sale. Plaintiff said he sent a motor-car to defendant to be sold. The car remained for some time unsold, and then defendant sent a man for it. It was found that the car was damaged and had depreciated in value. Defendant said that when the car was first taken to his establishment the man who received it gave a receipt

An Automobile Meeting at Baden Baden.

[Automobil W.-H.]

CLAIMS FOR DAMAGES.

In an action at Edmonton County Court to recover damages caused by the bolting of a horse which was frightened by a motor-car, Mr. Windsor, solicitor for the plaintiff, urged that a horse which would take alarm at a motor-car ought not to be allowed on the highway. The Judge would not give a decision on the point, saying that he preferred to leave it to the Court of Appeal to settle.

At Newport County Court, Mr. Baldwin, pig dealer, sued Mr. Henry Shaw, Albemarle Street, London, for the recovery of £8 5s., in respect of damages for negligent driving of a motor-car. It transpired that the plaintiff's car drove into a lot of pigs in the neighbourhood of Llanwrn, killing one and injuring three. His Honour gave judgment for the amount claimed.

His Honour Judge Owen was also called upon to deal with a case in which Mr. Harris, Llandegveth, sought to recover £16 1s. in respect of damages caused by a motor-car. A sum of £3 and 8s. costs had been paid into court, with a denial of liability on the part of defendant, Mr. Richard Clay (Cardiff). His Honour gave judgment for £6 1s.

At the Bloomsbury County Court, before Judge Bacon, Mr. Charles Pinoli, of Wardour Street, W., sued the Great Central Railway Company for £24 10s. damages done to his motor-car. The plaintiff's solicitor stated that on the evening of August 24th Mr. Pinoli was driving in his motor-car, accompanied by his daughter, down Regent Street and Langham Place. At Mortimer Street a van belonging to the Great Central Railway Company dashed round the corner and into

for it as being in good order within five minutes, in which time he could not have overhauled it to see what was wrong. A special expert had to be employed on the car before it would go satisfactorily. Defendant held that the car was damaged before being taken to his works.—His Honour said the receipt cleared plaintiff, and defendant had no answer. He gave judgment for plaintiff.

POLICE TRAPS.

The police have a measured quarter of a mile down the Tartar Hill, near Cobham.

News reaches us of a trap on Streatham Common, where motorists should beware of the police.

On the Bath road, at Hitcham, the police have a measured quarter of a mile.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, DECEMBER 19, 1903.

[No. 250.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

Xmas.

IN taking this opportunity of wishing all our readers a Happy Christmas and a Prosperous New Year we would remind them that, owing to the forthcoming festive season, we shall go to press earlier next week than usual. Contributors and correspondents are requested to despatch their "copy" to reach us during Monday, or, at latest, first post on Tuesday morning. All communications relating to advertising should be sent to the manager of that department on Monday, with the exception of prepaid advertisements, which can be received up to first post on Tuesday.

The Reliability Trials.

ELSEWHERE we give some interesting extracts from the paper which Mr. E. H. Cozens-Hardy read at last week's meeting of the A.C.G.B.I. It was a pity that it was planned for the day on which so many motorists left for French shores, for the paper was one of the most valuable that has been produced at the Club this winter, and it would be well if opportunity could be found for a second paper by Mr. Cozens-Hardy analysing in fuller detail the valuable tabular matter shown for the first time last week. On another page we give a résumé of the marks obtained by the various competitors in the Reliability Trials—a useful corollary to the list of awards published in our last issue.

Points of Discussion.

SOME points brought out in the course of the discussion should not be lost sight of. As the starter of the Speed Trials at Southport, Mr. Shrapnell Smith was able to make some suggestions of a practical character for the guidance of organisers of future events. There a large number of people were allowed on the track, to the inconvenience of the officials, while the public interest was lessened owing to the difficulty of obtaining the results with promptitude after the different events. Mr. Crawley took up a point in the paper as to giving the judges a wider discretion in making their awards, and argued that the lines of the competition should be rigidly adhered to. Then Mr. W. C. White followed with a plea for the continuance of the Trials, if only for the sociability and friendliness they introduced into the trade. These gatherings gave those engaged in the industry an opportunity of meeting each other such as would be possible under no other conditions. Quarterly trials would hardly meet the want, and would not always be equally fair to the competitors, owing to the varying atmospheric conditions. Mr. M. O'Gorman mentioned the fact that competitors hardly ever troubled to read the rules for the tests for which they entered, and referred to the way in which M. Barbareoux had killed the weight limit in the Irish competitions by the way in which he stripped his Benz Parsifal.

Difficulties of Organisation.

MR. LYONS SAMPSON gave it as his opinion that the real judges were the observers, for the marks awarded depended in a great measure on the observations of the Observers. It was gratifying to notice that the winning cars in the annual Reliability Trials obtained 90 per cent. of the possible marks they could obtain. Mr. J. F. Ochs emphasised the point made by Mr. White as to the sportsmanlike temper shown during the events, and testified to the good work done by the Club in organising such contests. An interesting story of the difficulties of organising the Speed Trials in Ireland was told by Mr. Orde, whose good intentions to provide chairs and other conveniences for the timekeepers were frustrated by the energy of the police in putting "into durance vile" for the day the men in charge of the furniture, who were a little late in getting into Phoenix Park on the day of the Trials there.

Future Work.

MR. ORDE also dealt with the necessity of acquainting the public with the results of the contests at the earliest opportunity, and also as to the advisability of keeping them informed as to what was going on. For future events, a scheme with that in view had been devised, in which not only the telephone, but also the megaphone would be utilised. Mr. Burford agreed with the suggestion in the latter part of the paper, and expressed regret that a higher standard was not required of the Observers. Mr. Cross suggested that experimental work should be undertaken, and then Mr. Roger Wallace proposed a hearty vote of thanks to Mr. Cozens-Hardy for the way in which he had introduced the subject. The chairman of the Club did not see that they could put an end to the trials at present.

The Results of the Trials.

THE results of the trials, which we give on another page, will be regarded with keen interest by trade and public alike, and should be read in conjunction with the list of awards published last week. In our issue of October 3rd last we published a table of the daily runs of the various cars, and would now suggest that the results obtained should be made the subject of detailed criticism and discussion at the meetings of the Automobile Club.

Dulwich and Lewisham.

NEVER have London suburbs seen so many motor-cars as did Dulwich and Lewisham on Tuesday. The successful candidate in the former constituency, Dr. Rutherford Harris, is a motorist himself, and only a few weeks ago became the owner of the once famous "Le Passe Partout." It was computed that forty-five motor-cars were placed at his service during the day, including fifteen sent by Mr. Stroud, a well-

B

known solicitor. The Liberals in the constituency are said to have had more than thirty automobiles at work in Dulwich. The Prime Minister's motor-car was sent to the assistance of Major Coates, who had about sixty similar vehicles for the conveyance of voters. Mr. C. F. G. Masterman, the Liberal candidate, toured the constituency in a motor-car, and among those who lent their cars to one or other of the quartette of candidates were Lord Rothschild, Sir Thomas Dewar, M.P., Sir George Newnes, M.P., Sir J. Blyth, Sir W. Pearson, M.P., Mr. J. A. Baker, L.C.C., and Mr. W. H. Dickinson, L.C.C. One firm of mineral water manufacturers sent a dozen motor-cars to the assistance of one of the candidates.

Influencing Local Authorities.

THE circular issued by Mr. Rees Jeffreys to County Councils with reference to the registration of motor-cars, mentioned in our issue of the 5th inst., aroused much indignation among many leaders in local government. And although a second letter has been issued explaining that a wrong interpretation had been placed upon its intention, considerable harm has been done. The Hon. Arthur Stanley, M.P., has resigned from the Club as a protest. Meanwhile it is evident that the policy outlined in the original letter has had little weight with motorists, for there has been quite a rush of applications for the registration of cars, and we have heard of no cases in which vehicles have been registered outside the counties in which their owners reside.

A Military Reconnaissance. (See page 781 last issue.)

The Motor Volunteer Corps.

WE learn that the Secretary of State for War has decided, in respect to the outfit allowance for officers of the Motor Volunteer Corps, that the ordinary driving certificate of the Automobile Club of Great Britain and Ireland, countersigned by the officer commanding the corps, may be accepted as the qualifying certificate for the payment. A refund of the allowance will be required in the case of any officer who fails to serve for three years as an efficient. Last week we announced that Earl Roberts had consented that damage done to tyres during manoeuvres should receive compensation from the War Office, so that it would appear that the usefulness of the Motor Volunteers is being recognised in official circles.

Hooded Vans.

FOR several years Colonel Crompton and others who have studied the problems associated with street traffic have recommended that the hooded van should be made the subject of drastic regulation by borough and county authorities. Several councils are now moving in the matter, and after the 1st prox. a new bye-law to the following effect will be enforced throughout

the county of Glamorgan:—"Every tradesman's van or other covered vehicle intended to be driven by a person sitting inside thereof shall be so constructed with side windows or otherwise as to enable such person to see the approach of vehicles from behind on either side thereof." Many of the street accidents—and mishaps with horse-drawn vehicles are more numerous than many people would imagine—arise from the fact that the drivers cannot see the vehicles approaching from the rear or the sides. The provision of such windows would have the advantage of increasing the opportunities for observation.

London Regulations.

LAST February the London County Council made a bye-law prohibiting the use in the public thoroughfares of London of vehicles so constructed as to prevent the driver having an uninterrupted view of the traffic. Many protests were made, and the Local Government and Taxation Committee have drawn up an amended bye-law, to which it is understood the Home Secretary will consent. It is proposed, therefore, to repeal the former regulation, and the Council was on Tuesday asked to substitute the following, to come into force on May 1 next:—"No owner of a vehicle shall drive such vehicle, or permit the same to be driven, or to be upon any highway unless it be so constructed that the driver thereof shall have a full and uninterrupted view of the traffic of such highway in front and abreast of him on each side, and no person who shall be driving any vehicle upon any highway shall occupy such a position as will prevent or interfere with his having such full and uninterrupted view as aforesaid. Any person who shall offend against this bye-law shall be liable for each offence to a penalty not exceeding 40s." Mr. Johnson moved as an amendment:—"That the reception of the report be postponed until the Local Government and Taxation Committee shall have reported as to a proposed bye-law requiring vehicles to be fitted with brakes, in order that, if such bye-law be made, the two bye-laws could come into force on the same day, and thus unnecessary dislocation of business and expense to owners be avoided." The original motion was agreed to.

Motor-Car Imports and Exports.

NOTWITHSTANDING that the present is supposed to be the quiet season, the imports of foreign automobiles into this country show a further increase. The number of cars and cycles imported last month was 479, the value of the same being returned at £101,357. The value of the "parts thereof" is given as £22,623, so that we get a combined total for November of £123,980 as compared with £120,065 in October last and £91,462 (representing 289 cars) in November, 1902. Some of the imports were of only a temporary character, being reshipped to foreign destinations. Thus last month the shipments comprised 28 vehicles, amounting in value to £7,337, bringing down the net imports in November to £116,643. For the first eleven months of the year the net import of motor-cars, cycles, and parts stands at no less than £1,772,700 (representing roundly 5,890 vehicles). As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to 91 vehicles, of a value of £22,545. Of parts the exports attained a value of £4,160, making a combined total for November of £26,705, compared with £15,635 (representing 49 vehicles) in November, 1902. To the end of November 814 vehicles of British manufacture had been exported this year, these, together with the "parts," representing a sum of £289,307.

An Active Policy.

FOLLOWING closely upon the meeting of provincial clubs recently held in London, and at a time when motorists will have to be particularly watchful of their interests, comes the announcement that it has been decided to hold monthly meetings of the General Committee of the Motor Union. This is a large and widely representative body, consisting of representatives of the A.C.G.B.I., the delegates of affiliated

clubs and the representatives of members who have joined the Motor Union individually. It will be seen that such a committee will be able to speak with an authoritative voice, and hence the interest with which the first meeting, to be held on the 11th prox., will be anticipated by motorists generally.

What the Provincial Clubs Want.

A.C.G.B.I. Ultimately a series of five resolutions was adopted suggesting (1) That a committee be formed, consisting of an equal number of members of the A.C.G.B.I. and the affiliated clubs, to decide upon all matters other than those purely domestic. (2) That the affiliation fee be reduced. (3) That each affiliated club have the uncontrolled management of its own affairs. (4) That each affiliated club shall have all the advantages now offered by affiliation and membership of the Motor Union, and (5) that a representative of each club represented at the meeting be appointed to form a committee to meet the executive committee of the A.C.G.B.I. before the February conference, and urge these requirements for adoption by the central body.

No Limit in Certain Towns.

THE Watch Committee of Manchester have adopted a report presented by the Chief Constable in connection with the Motor Car Act, one interesting clause of which is to the effect that no speed limit will be imposed at present. The committee do not purpose at the present time to take any steps with a view of restriction, as they trust that the owners of motor-cars and cycles will in the future, as they have in the past (with few exceptions), regulate their speed in accordance with the state of the traffic of the roads in the city of Manchester. A similar course has been taken at Hull. This sensible decision will appeal to those members of the public wishing to give motorists fair play, and we trust there will be no inconsiderate driving in those towns to lead to suggestions of an alteration of such a policy.

Motor Fire Engines.

AT the last meeting of the Edinburgh Town Council a discussion took place with regard to the provision of a motor-fire engine, this being recommended by the Plans and Works Committee. A report in favour of the matter was submitted from the Firemaster, who spoke of the work done by motor fire engines at Liverpool, Plymouth, Brighton, Portsmouth, Leyland and Tottenham. Very few supporters of the idea spoke in the course of the debate, several speakers urging—with proverbial Scotch caution—that the experience of those places was of too recent a date to warrant the Edinburgh Council sanctioning the adoption of a motor fire engine for the brigade. Treasurer Brown opposed the motion. From a statement made by the Firemaster the horse engines drove at the rate of eighteen to twenty miles an hour for the first mile, up to fifteen miles an hour for the next one and a-half miles, and after three miles at the rate of twelve miles an hour. He supposed the Motor Car Act would come into operation on January 1, and outside the city the limit would be ten miles an hour, so that he thought the question of speed need not be considered in support of the committee's case. It was ultimately agreed to take the matter back to the committee.

Railways and Automobiles.

LORD CLAUD HAMILTON, who, as president of the Norfolk Automobile Club, presided at the first annual dinner, reported on another page, seems to have become entirely converted, although not yet quite enthusiastic, as to the value of the automobile. It is only a few months ago since the chairman

of the Great Eastern Railway Company seemed to look askance upon the competition threatened by motor-cars, tram-cars, and other necessary means of locomotion in these days of rapid travel. He now rightly recognises that when once the appetite for travel is whetted, there is no limit to its development, and he has only to look to the enterprise of the North-Eastern Company to see how automobilism may be used in the service of the railway company. The North-Eastern Railway has had such success with its Beverley motor 'bus service, that it is now considering the question of providing a similar means of conveyance between Howden station and the village of that name, one and a half mile away. There are scores of places within similar range of the Great Eastern Railway service to which Lord Claud Hamilton and his directors might be able to turn their attention with a view to imitation of this excellent example.

A Practical Treatise.

So popular was the first edition of Mr. Paul N. Hasluck's work on "The Automobile," issued little more than a year ago, that a new edition has been called for, and this has just been published by Messrs. Cassell and Company, Limited. Although based originally on Laverne's "L'Automobile sur route," the work, in its present form, assumes an importance of its own. It has been extended to 832 pages, and there are nearly as many illustrations. More than 500 pages of the book are new, the descriptions of machines of historical interest only having been condensed to narrow limits, while an attempt has been made to set forth the details of all noteworthy European and American cars. Unfortunately the demands on our space at the present season of the year prevent anything like a full review of the volume; some of its salient features, however, must be mentioned in recommendation of a volume which has attained to the dignity of a standard work on the subject.

The Tony Huber Paris-St. Petersburg Car at the Paris Salon. Mde. Lockert at the wheel and M. Huber near the Bonnet.

The Scope of the Work.

HAVING given a lucid account of the evolution of the automobile from the patents of the seventeenth century to the days of Hancock and his contemporaries, Mr. Hasluck has two excellent chapters on steam cars, followed by three hundred pages dealing exhaustively with petrol motors, the transmission of motor power to driving wheels, axles, and steering gear, the wheels and tyres of automobiles, springs, frames, bodies, and brakes. Electric automobiles, petrol-electric carriages and motor-bicycles also come in for notice, no less than forty types of the latter being mentioned. Several pages are devoted to automobile records, etc., and the results of the leading trials and races of the last few years are given in convenient form and order. Altogether the work is one that no student of the motor-car should pass over.

Trials of 1904.

IN connection with the Motor-Van Trials to be held by the A.C.G.B.I. next year, the Club Committee of Organisation has been appointed, and it has been decided that the events shall take place in October and November next, the distance to be traversed being 2,000 miles. Unfortunately, as only two entries have been received for the trials of electrical vehicles, it has been agreed to abandon the idea of holding such tests during 1904. A special feature of the year's operations will be the holding of Trials of light cars costing not more than £300, and the Technical Secretary is preparing a scheme of work to be submitted to the executive.

Traction Engine Orders.

IN consequence of representations made to them, the Local Government Board have issued an order modifying the requirements with respect to the wheels of traction engines used on highways. The old orders provided that the driving wheels should be smooth soled or have diagonal cross-bars not less than three inches in width and $\frac{3}{4}$ -inch thick, with spaces between them of not more than three inches. By the new order the wheels may be shod with blocks of wood, which must be arranged in two or more rows and work on efficient springs or other elastic material, so as to yield with the pressure of the weight of the locomotive, but not to such an extent that the block shall be depressed below or even brought level with the iron tyre.

Registration in Guernsey.

FOR the first time since the law affecting automobile matters was promulgated, Guernsey automobilists have had to register their vehicles. The last day was the 15th of November, after which all owners of machines previous to this date, and who have failed to register, are liable to a penalty, in the discretion of the Court, not exceeding £5. The result, of the registration is interesting. By this means it is possible to know the number of automobilists in Guernsey. So far the figures to hand show that there are twenty-two motor enthusiasts in the island. The majority, however, are motor-cyclists, as in the total number there are only five who use motor-cars. The registration fee, or tax, is £1, which has to be paid annually. The number plate required by law is comparatively small and need not be lighted after sunset. The plate, both on motor-cars and motor-cycles, is fixed at the back.

Cylinder Lubrication.

FROM the Henry Wells Oil Company, of Manchester, comes a valuable volume on cylinder oil and cylinder lubrication. This is the preliminary result of an investigation into the character of cylinder oils by Messrs. H. M. Wells and W. S. Taggart, and some of the conclusions arrived at are as applicable to the lubrication of the cylinders of petrol motors as of gas, oil, and steam engines. Professor Hele-Shaw is responsible for an introduction in which he insists on the necessity of tests in all matters of modern engineering, and gives his testimony to the value of the experiments in connection with cylinder oils that the Henry Wells Oil Company have promoted during the last two years at the Walker Engineering Laboratories, Liverpool. These investigations are still in progress, and whenever definite results are arrived at they will be published. So far there has been ample demonstration of the difficult nature of the scientific work in investigating cylinder lubrication. It has been shown that two samples of oil may come from the same place, manufactured under the same conditions, though at different times, and have the same general appearance, and yet give totally different results when tested under high pressure, with high temperatures, as a cylinder lubricant.

Signposts Wanted.

DURING the recent Endurance Contest in the United States the need of guide posts was demonstrated so forcibly that the America Motor League now talks of providing such "aids to travellers" wherever they are required. In England we are not so badly served in this respect, although the suggestion made recently as to the provision of name plates over post offices might be usefully carried into effect. But in the south of Ireland the absence of signposts amounts to a scandal, and if the good people of the Emerald Isle hope to have any influx of motorists from this side, the erection of guide posts is one of the matters that will require early attention from the local authorities. We hope to hear from readers as to places where this duty is neglected.

Local Authorities to See to their Provision.

IN fact, guide posts are essential to the pleasure of motoring, and, although there are many excellent guide books and route maps issued by publishers, they cannot be expected to be adequate substitutes for the wooden finger that points the way and tells the distance with accuracy. Local authorities should not be allowed to neglect their obvious duty in this respect.

Marine Motoring.

INTEREST in the marine motor will be quickened by the Reliability Trial, for motor-boats to be held under the direction of the A.C.G.B.I. next year. These will spread over a period of three days, the course being confined to Southampton Water or extended to the Solent as may be thought expedient in the prevailing conditions of weather. The boats will probably be run for twelve hours each day, credit being given for non-stop runs as well as for the aggregate distance traversed.

Robbing Pleasure Resorts.

EVERYWHERE it should be pointed out that the closing of roads may lead to reducing the prosperity of large districts. How many villages in Devon and quiet resorts elsewhere have learned to regard the automobilist as a source of revenue? Hotels have been refurbished, village streets have been repaired, and an air of welcome given to several places that a few years ago were shabby centres of tourist resort. Is such enterprise to be robbed of its reward? The answer will be found in the attitude of local authorities throughout the country to motorists.

MESSRS. CARLESS, CAPEL AND LEONARD have reduced the price of their standard petrol a penny per gallon.

WITH reference to the *canard* which has appeared in a morning paper as to an English motorist representing France in the Gordon Bennett race next year, it may be pointed out that the team has not yet been selected.

A PATENT brush for removing the dirt from finger nails without tearing the skin has been brought out by the Star Brush Company, Limited. It is a simple invention likely to be of service to motorists who have experienced difficulty in this respect.

MESSRS. J. E. HUTTON, LIMITED, have entered three cars for the British Eliminating Trial for the Gordon Bennett team, entries for which close on the 31st inst. Salleron and Leger will drive two Mors cars in the French eliminating tests, while Gabriel, Stead, and De Brou are mentioned as the probable drivers of the three De Dietrich cars.

AT the meeting of the Pontefract District Council on Saturday, Mr. Baines gave notice that at the next meeting he would propose that a motor-car be provided for the surveyor, Mr. Senio, who now covers his district by means of a motor-cycle.

The Paris Motor-Car Exhibition.

General View of the Salon.

GENERAL IMPRESSIONS.

TO say that the sixth annual Salon d'Auto nobles eclipses all its predecessors is but to give a faint idea of the excitement that is at present prevailing at the Grand Palais, in the Champs Elysées, Paris. No sooner were the doors open on Thursday of last week than the rush began and within a few minutes the building was a mass of people representative of all nations. It is estimated that on the opening day, fully 200,000 persons visited the Exhibition. Since then a continuous stream of pedestrians and vehicles has wended its way to the huge building, and at the time of writing there seems no sign of any diminution in the attendance. The show is a veritable Babel of languages, the visitors emanating from all parts of the world. Great Britain and Ireland are well represented, and in fact to give the names of those who have or are attending the Exhibition would mean the production of a directory of all the leading British motorists and motor traders.

A cursory inspection of this year's *Salon* leaves the visitor with a vivid impression of the general progress of the industry, though there are few conspicuous novelties to attract his attention. Advance is noticeable in the minor details of construction, and the number of *chassis* and sectional models of their mechanism provides a bewildering wealth of material for careful study. By far the largest number of cars are four-cylinder vehicles of 16-h.p. to 24-h.p., nearly every maker having a car of this description on view, while two cylinder vehicles are fewer in number. The three-cylinder cult is decidedly making headway, as, besides the 8-h.p. Panhard, three-cylinder cars are exhibited by Cottureau and other firms, one noticeable example being the 18-h.p. Louet, which claims to be a pioneer of this design, and has other features of notice in the shape of a double-spark ignition, consisting of a two-pole plug in cylinder head and a single-pole at the side, the two plugs being connected in series. It also has an ingenious gear, in which one or other pair of a series of pairs of gear-wheels is slid into engagement transversely instead of, as usual, longitudinally.

The same firm also show a six-cylinder motor, which is by no means the only example of its kind in the show; in fact, the tendency to employ smaller cylinders and more of them is unmistakably the ruling idea at present.

Ingenious and often complicated gear-boxes are legion, though few makers break away from the accepted practice of sliding gears longitudinally into mesh; the variations are for the most part attempts to obtain a direct drive on top speed without an idle-running lay-shaft. Propeller-shaft transmission, while almost universal on the smaller cars, is spreading upwards, as witness the 24-h.p. Hotchkiss, which, with its peculiar cylindrical bonnet, resembling an early Victorian locomotive minus its funnel, attracts as much attention as any car in the show. It is certainly not beautiful, though, in view of the remarkable reputation the car has acquired, Fournier's explanation that it was designed so as to be unmistakable at a glance has some reason. The adoption of ball-bearing crankshafts, both by Hotchkiss and C. G. V., is a refinement that it is impossible to look on with complete confidence. The question as to what would happen if a ball break is met by the statement that "it doesn't." Time alone can decide.

Honeycomb radiators are, of course, plentiful, both the Hotchkiss with brazed triangular tubes, and the Decauville with the tubes of a sort of quatrefoil section expanded into a tube-plate, being noticeable attempts at making them less vulnerable; but there is certainly an increasing tendency to use a tubular radiator plus forced draught, a sort of compromise between the two being the Guetat radiator, visible on the Passy-Thellier and several other cars. This has vertical flattened tubes, each made of two brass ribbons, about two inches wide, corrugated at intervals of about 1½ in., and united by a good breadth of solder at their edges.

As regards frames, the "chassis embouti" decidedly preponderates, and a remarkable example of it is seen at the Darracq stand—a frame pressed complete out of one piece of steel, without angle pieces or rivets; cross-bars and supports for engine in-

cluded, the latter being in the form of a sheet enclosing the motor below, somewhat after the style of the Decauville of this year. There are, however, many armoured wood frames; while Georges Richard displays a combination of pressed steel frame with tubular underframe. This wide adoption of pressed steel frames, together with the increase in wheelbase, due to the demand for bodies with a side entrance for the rear seats, has led to the frequent adoption of frames narrowed in front, in order to obtain better steering ability. And while on the subject of steering, the arrangement on the Hotchkiss car, in which a sliding sector takes the place of the usual pivot, thus causing the front wheel to turn on its centre, is worth remark.

Throttle-governing is almost universal, and is often accompanied by devices to regulate the quality of the mixture automatically for varying engine speeds; in fact, novelty this year is more evident in carburettors than in anything else, though detail improvements are more numerous than ever. Among

and Bardon), have only their well-known record for economy and reliability to keep them in countenance.

R. W. B.

THE EXHIBITS.

Naturally one makes first of all for the stand of Messrs. Panhard and Levassor Company, where three types of car—8, 24, and 35-h.p., are shown, these figures in all cases being nominal. The two larger sizes mentioned are fitted with four-cylinder engines, the cylinder being cast separately and fitted with mechanically-operated inlet valves on the opposite side to the exhaust. Ignition is by means of a chain-driven magneto on the dashboard. The wood and steel frame is retained as well as the Krebs automatic carburettor. A ribbed radiator, set in a frame which forms the water tank, is employed, a fan being provided to induce the necessary current of cool air through the same. Several specimens of the new three cylinder car are also on view. The engine

[Fig 11.—View of Chassis of Panhard Three-Cylinder Car.

minor ones may be noted: the use of double helical gear teeth (Charron-Girardot-Voigt); indicator and graduation on fly-wheel to show position of pistons (Georges Richard); commutator cover fastenings without loose nuts, also an ingenious system of trembler regulation (Prosper Lambert); and many little points of like nature. Magneto ignition is widely used, and where it is not, a charging dynamo frequently accompanies the accumulators. Valves are mostly mechanically actuated, and a rough estimate seems to show that the balance of opinion is in favour of placing them all on one side of the motor, though exceptions are numerous. The new Panhard motor has independent cylinders, a practice which is spreading to some extent, and which certainly seems theoretically correct.

Freaks are singularly few in number, though a six-wheeled car (Janvier), steering with its front four wheels, which form a "hogie" under the motor, may be classed thus. Vertical engines reign supreme, the solitary exhibits, as far as French makers are concerned, of horizontal engines (by Gillet-Forest

is rated at 8-h.p., but this is nominal, the actual horse-power developed being given as about 12. The car is being made with frames of two different lengths, the shorter one being adapted for the standard tonneau body, while the longer is adapted to take the landaulette side-entrance body, to seat two or four persons. Generally speaking the car, as will be seen from the illustration (Fig. 11)—for which we are indebted to Messrs. J. E. Hutton, Ltd.—follows the well-known Panhard lines, although many important modifications have been introduced. The most important departure is the motor, which comprises three cylinders, each of which is self-contained and independent from its neighbour. The inlet valves, which are automatic, are placed in such a position that without undoing a single nut they can be freed, should they become gummy, with the finger, a departure which will be appreciated by practical motorists. The valves, either exhaust or inlet, can be removed in a few seconds, one nut only being required to be taken off, while no joints on the inlet pipes from the carburettor have to be broken. The ignition, which is electric,

is on an improved system; the wiring is carefully encased in a water-tight tube, and the connections of the sparking plugs are rendered so flexible that no fear need be entertained of their breaking or jarring off. The carburettor, which is of the well-known Krebs type, is fitted with a throttle actuated by the governor. This throttle can also be controlled by an ingenious arrangement on the steering wheel, in which position is also located the control for varying the time of ignition. The water-

A most strange-looking vehicle is a 35-h.p. "Grande Voiture de Voyage," a modified type of the old stage coach. There are seats for four persons in the interior, a detachable seat at the rear for two attendants, and a curious seat for a couple of persons on the top, for use, as Messrs. Panhard say, in fine weather. The car is altogether a somewhat uncanny looking vehicle, and he would be a bold motorist who would introduce it into London.

Much has been heard recently of the cars of the Hotchkiss.

Fig. 12.—Plan of 35-h.p. Hotchkiss Car.

cooling is arranged with improved pattern radiator and centrifugal pump, while a manometer is fitted on the dashboard in view of the driver, so that he may at a glance see if the pump is working properly. The lubrication of the motor has been carefully attended to, and is so simple that, with the exception of periodically filling up the small reservoir on the dashboard every 150 miles, no further attention is required, the operation being entirely automatic.

A special fan driven by the engine causes an induced draught of air to be drawn in through the radiator, in front, so that should the car be standing in traffic for even quite a long period, the engine will not become appreciably heated. A simple

Company, of St. Denis, the sale of which is controlled by La Société Paris Automobile—or, in other words, M. Henri Fournier, the well-known racing chauffeur—and considerable interest is being shown in the cars, which are now being publicly exhibited for the first time. To permit of the chassis (figs. 12 and 13) being examined from all points of view, it is placed over a mirror, in which the underpart is clearly reflected. The Hotchkiss cars are being made in two sizes, 20 and 35-h.p. The chassis is of stamped steel, and is supported on four side springs and a transverse one at the rear. The engine comprises four vertical cylinders, cast in pairs, both the inlet and exhaust valves being mechanically actuated and interchangeable. The ignition is by magneto

Fig. 13.—View of Front Portion of Hotchkiss Chassis.

leather-covered cone clutch transmits the engine power to the gear box. The change gear, which is on the well-known Panhard system, provides four speeds forward and reverse, actuated by a single lever. From the countershaft to the back wheels the drive is by means of side roller chains. The brakes, which act both backwards and forwards, are metal to metal. The application of either the hand or foot brakes also withdraws the clutch and disconnects the engine.

Fig. 14.—The Engine of Mr. W. K. Vanderbilt's 90-h.p. Mercedes. (See page 806)

while the water circulation is maintained by a gear-driven pump. The radiator is of the honeycomb type, of a circular shape, which, although it may be due to its novelty, does not strike one favourably from an æsthetic point of view. The tubes of the honeycomb are of a triangular section, giving a large radiating surface. The fan, inducing a current of air through the tubes, is made in such a way that the inclination of the blades or vanes can be varied from the driver's seat, and the air draught increased as desired,

as, for instance, in mounting long hills. The clutch is on novel lines; it is of the leather-faced type, and is provided with a locking device which prevents any tendency to slip. Four speeds forward and a reverse are provided, the power on the top speed being transmitted direct to the rear live axle through a cardan shaft and bevel gearing. The rear axle is entirely enclosed; the case which encloses the differential and large bevel gear being divided in a horizontal, instead of, as usual, in a vertical plane. The pivots on which the front wheels are mounted lie in the centre of the hubs, and the steering rod is placed out of harm's way behind the forward axle. The brake on the countershaft is of the contracting band type, and those on the rear wheel hubs of the internal expanding variety. Naturally, any style of carriage body can be

Jenatzy won the Gordon Bennett race this year; it belongs to Mr. Clarence Gray Dinsmore, and is now fitted with a large tonneau body. The 90-h.p. vehicle (Fig. 14) is one of the solitary examples of this type not destroyed in the fire at Cannstatt; it belongs to Mr. W. K. Vanderbilt, jun., and is a remarkable specimen of automobile construction. The raked steering is one of its marked features; while the relative simplicity of the controlling mechanism is another characteristic of this speedy car. In England, the Mercedes is usually seen with a racing or tonneau body. With its long frame, however, it is well adapted to accommodate a side-entrance brougham body, as the excellent example on view fully testifies.

The new models of the Georges Richard Company, represented

fitted to the chassis of the Hotchkiss cars, of which much is likely to be heard in the near future.

To the list of English exhibitors has to be added the name of Messrs. John Marston, Limited, who exhibit one of their four-cylinder 12-h.p. Sunbeam cars, the chains of which run in oil-bath cases, which not only prolongs the life of the wearing parts by keeping them absolutely free from grit and dirt, but also ensures silent running. Unfortunately the vehicle is displayed in an out of the way corner, where it does not receive the attention it deserves.

Throughout the whole day the Mercedes stand is the centre of a crowd of interested spectators. The vehicles displayed include specimens of the 20-24-h.p., 28-32, 40, 60, and 90-h.p. types. The 60-h.p. car on view is the identical one with which

in England by Messrs. Mann and Overton, comprise quite a number of special features. For next year 8, 12, 16, 24, and 40-h.p. cars will be available. Two-cylinder engines will be fitted to the 8-h.p. and 12-h.p., while those of the 16 and 24-h.p. will have four cylinders. Except that the 8-h.p. car has only three speeds forward in addition to the reverse, while the others have four, the following remarks apply to all four vehicles. The main frame is of stamped steel, the engine and gear being supported on a secondary frame of tubular construction. The cylinders, which are cast in pairs, have mechanically operated inlet valves, these being set on the opposite side to the exhaust valves. Magneto ignition is being retained, but the Georges Richard Company have struck out a line for themselves in deciding to abolish the pump, relying on the thermo-siphon action in conjunction with

a fan-cooled beehive radiator for the water circulation. The carburettor is an automatic air-regulation one of the company's own patent. The transmission is by means of a cardan shaft and bevel gear on to a live axle, a new point being the introduction of a universal joint between the engine and gear box, this not only relieving the shafts of the latter of all strain, but permitting the clutch to be dismantled without interfering with the gear box in any way. With the object

of rendering the cars quieter than ever, and also of keeping down the dust, a new form of silencer is being adopted; it is of large size and is placed transversely across the rear of the car, the burnt gases finally emerging through two flattened pipes projecting at an angle to the silencer. Enclosed internally-expanding brakes are now fitted, while a new point which will appeal to all who have suffered from "back kicks" of the motor, owing to the ignition not having been retarded, is an arrangement whereby the act of putting the starting handle into gear at the same time automatically retards the ignition; the moment the handle is released the ignition returns to its normal position. The 12-h.p. and 16-h.p. chassis are of sufficient length to take bodies with side entrance, while the 24-h.p. type is made with chassis of two different lengths. On the stand is also shown the chassis of a 40-h.p. four-cylinder car with chain transmission, which is, I understand, intended for the Hereditary Crown Prince of Russia.

The main features of the Argyll cars are already well known to the readers of the *Journal*, so that it will only be necessary for me to briefly refer to the improvements introduced

in the 1904 models which the Hozier Engineering Company, Limited, now exhibit for the first time. Three types are displayed, a 10 h.p. two-cylinder, a 12-h.p. three-cylinder, and a 16-h.p. four cylinder. The engines of the 10-h.p. and 16-h.p. cars are of the latest Aster type, with mechanically-operated inlet valves, while the 12-h.p. three-cylinder motor is of the company's own manufacture. In designing this engine advantage has been taken of the experience gained by the Hozier Company in the use of all the best known makes. The left hand side of the engine is shown in section through the centre of the cylinder in Fig. 17. The piston D is provided with four piston rings, the bottom ring holding the wrist pin in position, dispensing with the use of any small screws which are liable to get loose. The water jacket is of good capacity. The connecting rod E is machined from a steel stamping, and the crankshaft B is made from a high quality of nickel steel, the balance weights being solid with the crankshaft. There are bearings between each crank; they are all of the same size, and interchangeable with the connecting rod end bearings. The central portion of the engine is shown in section through the middle of the valve chambers; the valves are all alike and interchangeable, M being the inlet valve and N the exhaust. They are both mechanically operated by the cam shaft H driven by the two to one gear G. The lifts of the valves can be adjusted by the pin and locknut U. Fig. 18 shows a cross section of the engine, O being the inlet pipe and P the exhaust pipe. They are held to the cylinder heads by means of "dogs," and can be quickly and easily detached. A large diameter fly-wheel F is provided. Inspection doors are fitted at both sides and bottom of crank chamber. The engine, which is suspended directly from the main frame X, is lubricated on the splash system, and the bearings are provided with oil pockets insuring the proper distribution of the lubricant. All are provided with a Longuemare carburettor, to which the Hozier Company have added a simple

device of their own by means of which the supply of air is automatically increased as the speed of the motor increases, and vice versa. Another noticeable feature of the latest Argyll cars is the pressed steel frame, which, instead of being of the usual \square form, is of \square shape, the forward and rear tapering to

form pockets for the springs. Although the 12-h.p. and 16-h.p. cars only weigh complete 16½ cwt., the 34 in. road wheels are being fitted with 105 mm. tyres, the result being a marked reduction in the troubles experienced by users of pneumatic tyred cars.

Messrs. Rochet-Schneider, of Lyons, for whom Mr. Morgan Donne is agent in Great Britain, are building two types of cars for 1904, both of which have a four cylinder engine, the 16-h.p. and 24-h.p., the former giving 22-h.p. and the latter 35-h.p. on the brake. The 16-h.p. car has a wheel base of 8 ft. 6½ inches, the chassis weighing 650 kilos. The 24-h.p. has a wheel base of 9 ft. 2½ in., the weight being 750 kilos. The frame is of pressed steel and is narrowed in front to increase the "lock" of the steering wheels. The steering rod connecting the front wheels is, I note, behind the front axle and consequently protected from accident. There are two brakes on the 16-h.p. car and three on the 24-h.p., the latter having two pedals, each acting on its own countershaft brake, this being in addition to the hand lever which actuates the band brakes on the hubs of the rear wheels. The pedals are mounted upon a transverse shaft underneath the footboard which actuates the clutch, and also the countershaft brakes; it is therefore necessary for the driver to push the pedal from him and not to press down as in some cars. Although there is no radical alteration in the engine, there are a number of improvements; it is of the double twin cylinder type, having the inlet valves, sparking tappets, and the vertical rods and levers for actuating the same on one side of the engine and the exhaust valves on the opposite side, both inlet and

the side, and fitted with canopy and front and rear wind-protecting screens.

A firm which is not so well known as it deserves is that of M. Berliet, of Lyons, who is making for the 1904 season three standard types of four cylinder cars—12, 20, and 40-h.p. In

Fig. 21.—The Berliet Flywheel Fan and Clutch.

each a pressed-steel frame is employed, narrowed at the forward end to give the front wheels as full a "lock" as possible. The cylinders are cast in pairs; the inlet valves are mechanically actuated, and are interchangeable with the exhaust valves; the half-speed shaft with the cams being enclosed in the crank case. The centrifugal governor is adapted to act on the inlet. The water circulation is maintained by pump, and a combined tubular radiator and tank. One of the special features of the Berliet cars is the clutch (Fig. 21) The flywheel of the engine is provided with vanes, which serve to induce a strong current of air through the water cooler; the centre of the flywheel is made in the form of a hollow boss, inside which is a metallic segment connected with the gear-box, which may be expanded or contracted as desired by the clutch pedal. The clutch, which works in oil,

Fig. 20.—The Rochet-Schneider Change-Speed Gear.

exhaust valves being interchangeable and mechanically worked. The ignition is by a low-speed rotary magneto with tappets and advance sparking device, as in the 1903 cars. The governor acts directly on the carburettor; a throttle lever is also fitted on the steering wheel, while adjacent to the wheel are two levers, one for regulating the air to the carburettor and the other for the advance sparking. The gear presents several marked improvements; four speeds and reverse with direct drive on the fourth are provided. It will be noticed from Fig. 20 that the arrangement for changing from one speed to another is now on a new principle. The top shaft, which is square in section and connected with the clutch, has mounted upon it the sliding gears; the latter are in two portions, and are operated upon by two forks, one of which controls two speeds and the other two speeds and reverse. These forks are actuated by means of a locking bar, which has several projections and recesses to give the desired motion necessary for placing the various gears in and out of mesh; this arrangement permits of a short gear box, and at the same time enables very broad and strong gears to be used; the shafts also are short and stiff. It will be also noticed that the male portion of the clutch is connected to the gear by means of a universal joint, which counteracts any undue strain on the gear box and engine; the joint also permits of the male portion of the clutch finding its true position in the flywheel. Some excellent specimens of carriage work are to be seen on Messrs. Rochet-Schneider's stand, especially noticeable being a 16-h.p. double phaeton, with entrance at

Fig. 22.—Cross Section of Cottureau Three Cylinder Engines. (See page 800).
{La V6 Automobile.

is claimed to work progressively, and without any jerky action. Four speeds forward and a reverse are provided, the transmission of the power from the gear-box to the rear road wheels being by side chains. All the speeds are controlled by one lever, and on the fourth the power is transmitted directly from the engine

to the differential shaft. The brakes are all double-acting, and of the metal-to-metal type.

The novelty at the stand of Messrs. Cottureau and Co., of Dijon, is a new three-cylinder car of 12-16-h.p. The frame of the vehicle is of stamped steel. The engine (Fig. 22) is an excellent specimen of workmanship, the three cylinders being mounted

of these vehicles. The change-speed gear is of the *train balladeur* type, but, instead of the shifting gears being carried on the clutch shaft, the latter terminates in a bevel pinion. As will be seen from Fig. 23, the change gear is set at right angles to the position usually adopted, the fixed pinions being mounted on the differential countershaft.

Fig. 23. —The Vinot-Deguingand Change-Speed Gear.

Fig. 24. —Chassis of Vinot-Deguingand Car.

separately on a large crank case. The inlet valves are, of course, mechanically actuated, in accordance with modern practice, but, in addition to the throttle on the admission, the speed of the engine can also be regulated by means of a variable lift device fitted to the inlet valves. The cylinders are 95 mm. diameter by 120 mm. stroke. The motor is claimed to be exceedingly quiet in operation, as well as very elastic, any speed—from 200 to 1,200 revolutions per minute—being readily obtainable. All the bearings on the car are of the ball type.

The stand of Messrs. Martini and Co. is continually surrounded by an interested crowd, the object of their attention being the identical Martini car on which Capt. Deasy recently drove up the cog railway on the Roobers de Naye, near Caux. An attempt has been made to indicate what the feat meant by the laying down under the car of a section of cog railway track, together with the loose ballast on which the wheels of the vehicle had to run. So realistically has this been done that many who should have known better have gone away with the

Fig. 25. —The 20-h.p. Light Napier Car with Cape Hood.

La Société Vinot and Deguingand are making three types of four-cylinder cars—10, 14, and 20-h.p. Mechanically-operated inlet valves, on the opposite side to the exhaust, are adopted, but the wood and steel frame is retained. Internal expanding brakes on the rear wheel drums are among other new features

idea that it was by means of the rack in the centre of the track that the car made the climb. Needless to say, the car went up by its own power, without the use of any rack or outside aid. Capt. Deasy pointed out to me the features of the 1904 model—only one type is being made for next year, a 16-20-h.p. four-cylinder vehicle.

The engine (Fig. 26), although on the same lines as last year's model, is slightly more powerful. Mechanically actuated inlet valves are employed, together with a combined honeycomb radiator and water tank, a feature being the provision for drawing off all the

Fig. 26.—The Martini 16-20 h.p. Engine.

water, when necessary, from the radiator tank, pump and cylinder jackets. The carburettor is provided with a jacket through which part of the exhaust gases may be made to circulate. Four speeds forward and a reverse are provided; a direct drive is obtained on the fourth, and the single lever controlling all the speeds has only

ception of one hand-controlled lubricator for the pump and radiator fan spindle, the lubrication is entirely automatic; the base chambers are provided with cocks, by means of which it can readily be ascertained whether they contain the desired amount of oil. The engine and gear box are entirely protected below, while the steering rods are placed behind the front axle. Ball bearings are fitted to all parts except the engine.

Another well-known name is that of the Compagnie des Automobiles et Cycles Hurtu, whose display comprises 8-h.p.,

Fig. 27.—The 16-h.p. Hurtu Car.

12-h.p. and 16-h.p. cars, one of the striking exhibits included in the display being a 16-h.p. landaulet (Fig. 27). This is fitted with a four-cylinder Aster engine, developing its full power at a speed of 1,000 revolutions per minute. The Longuemare carburettor is provided with a throttle valve regulated by the governor. The power is transmitted through a leather-faced clutch to the gear-box, which gives four speeds ahead and reverse. The two shafts in the gear-box are arranged side by side, and on the top speed the drive is direct. A cardan shaft conveys the power

Fig. 28.—The M.M.C. 25 h.p. Saloon.

a forward and backward movement. The clutch is of the leather-faced cone type, and a universal joint is introduced between it and the gear box, to prevent any strain being thrown on the latter. The main frame, as well as the secondary one supporting the engine and gear box, are of pressed steel, while the dumb irons extend well to the rear to allow of placing the rear axle well back and the use of long springs. With the ex-

through bevel gear to the rear live axle. The brakes are of the metal-to-metal type, while the frame is of stamped steel.

PHANOMEN.

(To be continued.)

[We regret that our reports of the Wolseley, Motor Manufacturing, and Napier Co.'s exhibits have miscarried in the post. —Ed. "M.C.J."]

THE MOTOR-CAR ACT.

LAST week we gave the names of the gentlemen who were the first to register their motor-cars in thirteen of the leading boroughs. In continuation, we are now able to publish a further list of the No. 1's in Great Britain, from which it will be recognised how the ranks of motorists are fully representative of the leading public men of the country.

LONDON COUNTY COUNCIL.—Earl Russell, A.1; Mr. David S. Waterlow, A.2; Mr. J. Allen Baker, A.3; Lieut.-Colonel Mark Mayhew, A.4; Sir William Bell, A.5; Sir John Dickson-Poynder, A.6; Mr. W. H. Dickinson, A.7; Mr. G. S. Baker, A.8; Mr. P. B. Baker, A.9; Earl Russell, A.10.

BEDFORDSHIRE.—The Duke of Bedford, K.G., B.M.1.

BERKSHIRE.—Capt. F. C. Loder-Symonds, Hinton Manor, Faringdon, B.L.1.

BIRMINGHAM.—During last week a hundred applications to register cars and a dozen for motor-cycles were received by the Public Carriage Department of the Birmingham Corporation.

BUCKINGHAMSHIRE.—Mr. Tonman Mosley, Bangor's Park, Uxbridge, Chairman of the Highways Committee of the Bucks County Council, B.H.1.

CARNARVONSHIRE.—Mr. L. W. Jelf-Petit, Brynhyfryd, Llanrwst, C.C.1 motor-car, and C.C.2 for his motor-cycle.

CHELMSFORD.—Mr. P. J. Sheldon, County Surveyor of Essex, F.1.

DURHAM.—Captain H. S. Streatfield, Ryhope Hall, Ryhope, near Sunderland, V.1.

GATESHEAD.—Mr. H. Eastcott, Endsleigh, Gateshead, C.N.1.

GLOUCESTERSHIRE.—Dr. H. P. Fernald, Clarence House, The Promenade, Cheltenham, A.D.1.

GRIMSBY.—Mr. T. G. Tickler, E.E.1.

HULL.—The first applications for motor-car licences were received from Sir Alfred Gelder (ex-Mayor of Hull), Dr. Fullerton, Mr. J. J. Underwood, and Mr. A. P. Bannister (Beverley). Canon Lambert, vicar of Newland, applied for a licence for a motor-cycle.

HUNTINGDONSHIRE.—The Earl of Sandwich, E.W.1.

NORFOLK.—Mr. G. C. Davies, Town Close, Norwich, A.H.1.

NORTHAMPTONSHIRE.—Mr. A. Smith, Midland Road, Thrapston, B.D.1.

NOTTINGHAM.—Mr. R. M. Knowles, Colston Bassett Hall, Nottingham, A.U.1.

OLDHAM.—Mr. T. Crossman, 40, Coldhurst Street, Oldham, B.U.1.

OXFORD.—Councillor E. A. Bevers, M.R.C.S., Mayor of Oxford, B.W.1.

ROCHDALE.—Mr. Robert Walker, jun., Fairlight Villa, Spotland Road, Rochdale, D.K.1.

SALFORD.—Councillor F. W. Wheatcroft, B.A.1.

SHROPSHIRE.—Captain W. H. Foster, Woodcote Hall, Newport, Salop, A.W.1.

SURREY.—Mr. F. G. Howell, Oaksend, Oxshott, P.1.

WARWICKSHIRE.—Mr. H. G. Hawkes, Eaton Lodge, Warwick Place, Leamington, A.C.1.

WEST HAM.—Councillor C. E. Scrutton, A.N.1.

WIGAN.—Mr. Edward R. Crippin, Wigan, E.K.1.

WOLVERHAMPTON.—Mr. S. R. Rhodes, hon. secretary Wolverhampton Automobile Club, D.A.1.

WORCESTERSHIRE.—Lieutenant-Colonel Walker, A.B.1.

SCOTLAND.

ABERDEEN.—Mr. W. Jackson, Thorngrove, Mansfield, Aberdeen, R.S.1.

ABERDEENSHIRE.—Mr. W. Ramsay, The Bunga'ow, Dyce, S.A.1 (motor-cycle); Mr. J. Grieve, Turriff (motor-car), S.A.2.

ARGYLLSHIRE.—Mr. J. S. Matthew, Ardfillayne, Dunoon, S.B.1.

GLASGOW.—Mr. R. J. Smith, Secretary of the Scottish Automobile Club (Western Section), G.1.

EDINBURGH.—~~hon.~~ Sir J. H. A. Macdonald, Lord Kingsburgh, President of the Scottish Automobile Club, S.1.

LANARKSHIRE.—Mr. James Burns, solicitor, and Town Clerk of Motherwell, V.1.

PERTSHIRE.—Dr. J. F. Graham, the county medical officer, E.S.1.—a motor-tricycle. The first registration of a car is by Captain Murray Thriepland, of Fingask.

STIRLINGSHIRE.—Mr. H. A. Salvesen, Lathallan, Polmont, M.S.1.

From the correspondence we have received there appears to be some uncertainty as to where drivers are to apply for their licences, and also for the registration of their motor-cars. In our issue of the 28th ult. we gave a list of the authorities in England and Wales; and as a general rule it may be taken for granted that such applications should be made to the Clerk

The Trappers Trapped.

of the County Council, or, in the case of county boroughs, to the Town Council. Some of the Councils have transferred the duty of registration and licensing to the Chief Constables, to whom early application should be made.

UNTIL the 17th inst. the Paris Salon closed at 6 p.m., but from that date to the end of the Show it will remain open to 10 p.m., the latter being an entirely new departure.

THE AERO CLUB has arranged for an Exhibition, on similar lines to the annual exhibition held in Paris in the Automobile Club Salon at the Grand Palais, at the International Motor Car Exhibition to be held at the Agricultural Hall, London, towards the end of next March.

MESSRS. MEARS, the well-known wharfingers and haulage contractors, have been served with three summonses at Epsom for different offences alleged to have been committed under the Traction Engine Act of 1898, presumably on the ground that a light locomotive used by them was a traction engine, because it emitted a little visible vapour. Mr. Staplee Firth defended, and the summonses were dismissed.

CONTINENTAL NOTES.

A PART from the *Salon* there is very little of interest to record from the Continent. Motorists and motor traders from every point of Europe have this week descended in their thousands on Paris, which has once again proved its claim of being the international automobile market of the world.

THE Gordon Bennett race is already attracting much attention, meetings convened by automobilists, hotel keepers, and traffic authorities being held almost daily. According to a statement just made by Herr von Marx, Burgomaster of Homburg, arrangements are to be made for the accommodation of at least a hundred thousand visitors. Herr von Marx has generously placed a large area of land at the disposal of the Race Committee for the erection of an extensive motor garage. The programme of the races and festivities will extend over ten days. Baron de Caters and M. C. Jenatz have been

THE death is announced from Monte Carlo of Baron Arthur de Rothschild, the son of the late Baron Nathaniel de Rothschild. The deceased was an enthusiastic motorist and steam-yachtsman.

IN a recent issue I mentioned that a German firm—the Berlin Motorwagenfabrik, Tempelhof—had built no less than 16 petrol cars for the use of the Royal family of China. The fleet of vehicles is said to be a present from Viceroy Yuan Shikai to the Empress Dowager. Nine of the cars, which are intended to run between the West Gate of Peking and the Summer Palace, have lately arrived at Tientsin. Three of them are most sumptuously fitted up, being intended to convey the King, Queen, and the Empress Dowager; they are painted bright yellow with blue and silver dragons on two of the panels on each side. The inside is upholstered in Utrecht yellow velvet with a floral design. Only one seat—a revolving chair covered with yellow damask, is provided. The other cars are intended for the use of the Court, and are painted a rich cherry red, ornamented with flowers.

One of the Cars Built for the Empress Dowager of China.

[Allgemeine Automobil Zeitung.]

named as the two drivers of the Mercedes cars which will form part of the German team. A grand stand, to hold 3,000 persons, and to include a special box for the Kaiser and his suite, is to be erected at Saalburg, where the race will begin and end. Count Siegfried Wimpffen has been appointed the Austrian delegate to the International Racing Commission.

M. CORMIER arrived back in Paris on Wednesday of last week from his long tour on a De Dion 8-h.p. two-cylinder car. Altogether over 7,000 kilometres were travelled, and Algeria, Switzerland and Belgium visited. The car is now on view at the *Salon*, and, while greatly mud-stained, is none the worse for its long trip.

PEOPLE are beginning to wonder how many cars King Edward will eventually own. The other week it was reported that the Filtz Company were building a powerful one for his Majesty, while now the "Velo" gravely announces that he has ordered a six-cylinder car from Messrs. Louet.

THE latest report to be presented to the French Extra-Parliamentary commission is that of M. Bourcier de Saint Chaffray, in which he urges the necessity of a continuance of racing, but that it should be carried out under conditions which will make for the development of the touring car. He thinks *chassis* should provide room for four persons, and that the full complement of passengers should be carried in every case, while the power of the motor should be limited according to a formula based on the bore, stroke, and number of revolutions per minute.

THE committee of the French Automobile Club has decided to open a subscription for the erection of a memorial to the late Count de Chasseloup-Laubat.

MR. J. COUSINS NIXON (son of Mr. Alfred Nixon, manager of the motor department) has just been appointed motor-engineer to the General Accident Assurance Corporation, Limited.

HERE AND THERE.

AMONG new members of the A.C.G.B.I. are the Marquis of Ailsa, Viscount Mountgarrett, Sir Randolph Baker, Bart., and Captain Henry Kirk.

ONE day last week three motor fire-engines, fully manned, visited Sutton, apparently on a trial run. One of the engines broke down whilst passing through the town, and had to be left at Messrs. Jeffries' works in the Carshalton Road for overhauling.

Mr. C. Percy Maitby on 10-h.p. M.M.C., and Mr. J. P. A. Long on 10-h.p. Georges Richard at the Cat and Fiddle, near Ruxton, reputed to be highest licensed house in England.

THE committee of the Midland Automobile Club have decided to write to the members for the purpose of organising, if possible, some action with regard to the recent Light Locomotive Act, as there seems to be an inclination on the part of some district councils to close unnecessarily roads within their districts. Mr. T. C. Aveling, the hon. sec. of the Midland Club, will be glad to have suggestions from members on the subject.

USEFUL as a work of reference the "Daily Mail" Year Book for 1904 comes with 20,000 facts bearing mainly on newspaper topics of interest. Some pages are devoted to the motor-car, the figures relating to the import and export trade being given for the first half of the present year. There is also a summary of the new legislation affecting motorists and a chronicle of automobile records. Accuracy seems to be a feature of the volume.

THE sum of 2,000,000 marks has been voted in the German estimates for 1904 as a second instalment of the State contribution towards securing the representation of the German Empire at the St. Louis World's Fair, making, with the sum already voted, a total of £175,000. A memorandum submitted to the Reichstag states that the German building is being erected upon the best site in the exhibition grounds, and special prominence will be given to the advance which has been made in the construction of motor vehicles.

FROM Messrs. Charles Letts and Company come a selection of their excellent diaries for the new year, these being both for the pocket and the desk. The distinguishing features of these diaries, namely, the insurance policy and the patent "self-opening" tablet, have been retained—the insurance having been increased from £500 to £1,000, and the conditions attaching thereto made even more liberal than before. Of the self-opening tablet we can only say that experience has demonstrated its utility. There is a great variety of editions in different bindings to suit every requirement, while the firm's enterprise is also shown in an admirable series of automatic date calendars and office reminders.

To meet the demand for a popular priced vehicle, Messrs. Horsfall and Bickham are bringing out a 6-h.p. Horbick car early in the new year.

EVIDENCE of the fact that the motor-car is making progress in Australia comes to hand in the news that Mr. C. B. Kellow is opening a garage in Lonsdale Street, Melbourne, where not only will cars be stored but repairs of all kinds will be carried out.

THE Motor Car Acts, 1896 and 1903, have been summarised and explained by Mr. John A. Williamson in a neat little volume just issued by Messrs. Iliffe and Son, Limited. The notes on the new Act and the synopsis of Acts of Parliament applicable to motorists should prove of real utility to all who own or drive automobiles.

COLLINS' DIARIES are distinctive in the fact that most of them show a week at an opening of the page. The pocket sizes have an insurance policy for £500, and are of convenient size for the waistcoat pocket. Messrs. Collins, Sons and Company also publish a portable diary for the coat pocket, and larger scribbling diaries filled with writing and blotting paper of good quality.

ONE day last week four ladies, living about three and a half miles out of Aberdeen, hired a single horse cab to take them to a ball. The animal took a very considerable time to do three miles and then stopped, and no end of gentle (and other) persuasion would induce him to move a step further. Luckily one of the local public service motor cars came along. This was hailed, and the ladies were conveyed to the end of their journey in good style.

GOLD medals were awarded to eight competitors in the October endurance run to Pittsburg at a meeting of the committee of the National Association of Automobile Manufacturers at New York. The gold medal winners are as follows:—Columbia, driven by B. B. Holcomb; White, driven by Webb Jay; White, driven by Paul H. Deming; Toledo, driven by George Soules; Pierce Arrow, driven by Charles Sheppie; Pierce Stanhope, driven by Percy P. Pierce; Packard "Old Pacific," driven by E. T. Fetch; and Stearns, driven by Frank B. Stearns.

An American Hunting Party on a White Steam Car
[Motor, New York.]

THE Ormond-Daytona Beach tournament, which will be run early in the new year under the auspices of the Florida East Coast Automobile Association, over the Ormond-Daytona Beach, promises to be a more important affair than it was last winter. Mr. Alfred Reeves, ex-secretary of the Empire trotting track, has been at Daytona for several days, and believes that 60 miles an hour will be easy. He thought the Empire track was about the fastest course in the United States, but describes it as a country road, as compared with this beach, for automobile speed.

MESSRS. JOSEPH LUCAS, LIMITED, have brought out a pocket catalogue of their "motoralities" and also a pamphlet on Motor Lubrication, in which the merits of the Wells-Lucas motor oils are recounted.

AFTER the Irish Automobile Club's recent hill-climbing competition at Glen Dhu, Mr. G. Tickell went up the scene of the contest on his 10-h.p. Argyll car in 4 mins. 0 $\frac{3}{4}$ sec.; subsequently, with Mr. J. Dunlop aboard, he did it in 4 min. 18 secs.

FROM the Palmer Tyre, Limited, comes a catalogue of their cord motor tyres, recently illustrated and described in the *Journal*. It deals fully with the method of manufacture and construction of this tyre, and will be of interest to motorists generally.

HEREWITH we illustrate a horse-drawn vehicle which has been converted to an automobile by Mr. Henry Adams, of Tunbridge Wells. In sending us the photograph Mr. Adams states that he could not see why petrol power should not be added to any vehicle with four wheels, and so "I set to work on designs, patterns, and castings, and have practically completed my first vehicle, which travels very well. It is a four-wheeled dogcart exactly as when drawn by a horse, minus only the shafts. The engine is fixed on the footboard, the front wheels or under-carriage are controlled by a specially designed steering gear and

wheel similar to an ordinary motor-car. It has three forward speeds and one reverse, and geared on top speed to eighteen miles an hour in order to keep within the limit of the law. The trials have been very satisfactory. The next vehicles I intend to bring out are a lady's victoria and a doctor's brougham, which will each be driven by an 8-h.p. motor, and will be simple enough for any ordinary coachman to manage with a little practice. I do not alter the carriage in any way by removing either the under carriage or the axles. This design will be extremely useful to tradesmen who wish to get their rounds done quickly at a much less cost than using horses, which are generally soon run off their legs."

AT a recent meeting in Wolverhampton, Sir Alfred Hickman M.P., referred to Lysaghts, Danks, Walker and Company, Neve and Son, and other great firms which had removed from the town within recent years. Local papers are now giving vent to a hope that the development of the motor-car industry in the town may provide increasing employment for the labour thus displaced.

As already announced, the Brotherhood-Crocker Motors, Limited, have taken temporary offices at 19, Hanover Square, London, W. They have also taken large premises in the West End for showrooms, garage, repair shops, etc. Besides the sale of their Brotherhood motor carriages, they are laying themselves out to cater for automobilists in all departments.

THE Furness Railway Company are contemplating a motor-car service in connection with the Coniston and Lakeside branches of their system.

THE Harvard Automobile Club, of Cambridge, Mass., U.S.A., is organising a course of lectures on the automobile, for motor-car owners, prospective buyers, and mechanics.

LOVE'S AUTOMOBILE COMPANY, of Kirkcaldy, send a circular relating to their agencies and their garage, the latter being most conveniently located for motorists north of the Firth of Forth.

A LOCAL GOVERNMENT BOARD inquiry has been held into the Eastbourne Corporation's application for permission to borrow £10,000 for electric supply purposes and £4,398 for motor-buses.

ACCORDING to statistics compiled at Toronto, Canada, 175 automobiles were sold there during the season of the present year, of which number 135 have remained in the city, while forty have gone to all parts of Canada.

THE Ordnance Survey have recently issued a folding pocket map of Chelmsford and the surrounding district, one of the series of official maps of areas in England and Wales on the scale of two miles to one inch.

ON account of the increase in the motor department of their Manchester branch, Messrs. Brown Brothers, Limited, have taken the adjoining building, No. 269, Deansgate, which is now open for business; as complete a stock of motor goods will be shown in the north as have been kept in London.

A SERVICE of motor-cars is about to be established between Windermere Station, on the London and North-Western system, and Keswick and other places in the Lake District. Experiments have already been made with a steam lorry, and the roads were found to stand the test remarkably well. The service is intended for passenger and goods traffic.

THE diaries and calendars issued by Messrs. T. De la Rue and Company, Limited, are of infinite variety and display considerable ingenuity in the arrangement by which the minimum space can be utilised to the best advantage. "Thumb" and "palm" condensed diaries and engagement books are a speciality, and some excellent date cases are also published by the firm.

WHITAKER'S ALMANAC for 1904 has been brought up to date by the inclusion of a summary of the provisions of the Motor Car Act. The articles relating to India and the mercantile fleet have been entirely revised, and this standard work of reference certainly knows no deterioration. As a directory of titled persons Whitaker's Peerage has become as famous as the almanac, and the new volume for 1904, with its comprehensive index to country seats and extended lists of society persons, is useful not only as a work of occasional reference but also as a companion to the daily newspaper.

THE new edition of the Clement-Garrard Motor Book for the coming season has just been issued, and gives complete details and drawings of the Clement-Garrard motor and the Garrard "two-speed" gear, as well as of the motor-cycles of the Garrard Manufacturing Company, Limited. Several pages are devoted to a list of the interchangeable parts of the motor. The system adopted in listing the various spare parts of motors and two-speed gears enables motor-cyclists to order any part that may be required without trouble.

AMONG southern places few have such memories as Winchester, the ancient Hampshire city which has been familiar to participants of the Reliability Trials of the A.C.G.B.I. during the last few years. It has been the subject of many volumes, but of none so pictorially interesting as that which Mr. W. T. Warren has edited, "Winchester Illustrated," and which has just been published locally by Warren's Library, and in London by Messrs. Simpkin, Marshall and Company. Within two hundred pages we have as many illustrations—many of beauty and all of interest. It will prove a pleasing souvenir for all who have visited King Alfred's city.

THE "SEDDON" TYRE.

AFTER having had the advantage of being tested for twelve months in the north of England, the "Seddon" tyre for motor-cars is being placed upon the market, and should attract considerable attention. A good quality of red rubber is used in the manufacture of the tyre, and the strand or cord fabric is subjected to a special treatment.

The strands are dealt with separately by raw or unvulcanised rubber being forced between each and made taut under enormous pressure, in order to take their equal proportion of the strain. Several layers of fabric are practically moulded into one.

Section of the Seddon Tyre.

This process is claimed to prevent the chafing of the cords or strands and reduce the internal heat.

We understand that the Seddon tyre has been subjected to most exhaustive tests on both touring and racing cars, the result being so satisfactory as to justify high claims being made by the makers. In proof of this a set of tyres which were fitted to a 16-h.p. Darracq in February last are to be seen at the showrooms in Manchester, showing only slight signs of wear although they have run over ten thousand miles. A notable feature is that an air tube is not used in these tyres, and, although they allow of its insertion, it is only necessary in case of emergency. In all the experiments and trials that have been made no air tubes were used, as the tyre itself makes a mechanical joint when the flanges are bolted up to it through the felloe of the wheel; therefore this must greatly reduce friction and heat. The tyre may well be termed a double-tubed tyre, the tube being an adjunct and an accessory, and need only be used as stated above, namely, in case of necessity. The advantage of the "Seddon" tyre is its square tread of about one and a half inches in width, thus covering so small a road surface that side-slip or skidding is entirely abolished, as in no instance has this been perceptible in any degree in whatever the condition of the road. In the accompanying illustration the loose inside section rim, the loose flanges, the bolts, which go through the felloe, and the square non-slipping tread are clearly seen, these being the distinguishing features of the tyre. The "Seddon" tyre is secured to the wheel by two loose flanges which are bolted to the felloe, and to detach, only one flange requires to be taken off. This in manipulation is very simple. There is only one tool supplied for the purpose, viz., a box key to unscrew the nuts which fasten the flanges. The tyre can be fitted to all makes of wooden wheels, and the latter require no alteration beyond the edges of the existing rims being turned off.

MOTOR-CYCLING NEWS.

AMONG the new candidates for membership of the Auto-Cycle Club is Captain T. Dennistoun, of the Royal Horse Artillery—a resident of Krugersdorp, in the Transvaal.

THE "Morris" motor-bicycle, introduced by the Oxford Automobile and Cycle Agency, has a 2½-h.p. M.M.C. engine fitted with the mechanical inlet valves illustrated in our last issue. The carburettor used can be of either the Longuemare spray or the Morris type, the latter being claimed to work well regardless of the atmospheric conditions. In the firm's new catalogue the motor-bicycle is shown fitted with a fore-carriage of excellent design.

THE prosecution of Edward Cordner for riding a motor-bicycle on the footway at Lisburn, co. Armagh, has failed, because of difficulty in identification. Edward Cordner is exactly like his twin brother Joseph in face, height, and complexion. One of the two brothers was summoned, but a constable swore that it was the other brother he saw riding the machine. A magistrate remarked that he could not tell which of the two men had been in the witness-box. The solicitor who defended Edward Cordner explained that he was able to identify him only by putting a private mark on him.

UNDER the name "To-Bah" Messrs. Beard Bros., of Cricklewood, have introduced an ingenious set of coupling rods by which an ordinary bicycle can be attached to the side of a motor-cycle. The rods coupling the front forks are arranged upon the parallel motion principle, and allow the steering wheel of the attached machine to take its proper inclination and curve, whether upon the outside or the inside of the bend. By means of these couplings, which are not expensive, the possessor of a motor-bicycle would be able to afford pleasurable runs to friends of either sex who own ordinary safety bicycles.

Now that motor-cycles for pleasure purposes have become so popular an increasing amount of attention is being devoted to adapting these machines for the purposes of tradesmen. The accompanying illustration shows the useful carrier motor-tricycle exhibited at the recent cycle shows by the Neckarsulmer Fahrradgesellschaft, of Neckarsulm, Germany. The motive power is supplied by a water-cooled engine of 3½-h.p. The water circulation is on the thermo-siphon system, water being contained in a large tank perforated by a number of tubes, and carried over the rear wheel. Two speeds and a free engine are provided by a kind of Crypto gear on the engine shaft, from which the power

is transmitted to a pulley attached to the rear wheel by a special combination chain belt. The two speeds give approximately fifteen and six miles per hour. No pedals are provided, as the engine is started by means of a detachable handle. A large seat is provided for the driver and also broad footboards. Steering is controlled by an inclined hand wheel just the same as in a car, and both hand and foot brakes are provided.

The 1903 Reliability Trials.

SUMMARY OF MARKS.

No.	Description.	Reliability. Maximum 3000.	Cleaning and Replenishing. Maximum 1500.	Hill Climbing. Maximum 1000.	Brakes. Maximum 250.	Horse-power. Maximum 250.	Steering. Maximum 250.	Consumption. Maximum 500.	Speed. Maximum 500.	Cheapness. Maximum 250.	Re-starting. Maximum 250.	Noise. Maximum 250.	Vibration. Maximum 250.	Vapour. Maximum 250.	Dust. Maximum 500.	Finish. Maximum 250.	Cleanliness. Maximum 125.	Condition. Maximum 1000.	GRAND TOTAL.	Marks deducted for excessive speed.	NET TOTAL.

CORRESPONDENCE.

BORES AND STROKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A controversy of long standing, which does not seem to be any nearer solution, is that relating to the ratio of engine bore to stroke. In your issue of the 21st ult. I notice that Mr. A. Govan dealt with the point in the course of his recent paper in Glasgow, in the course of which he advocated the stroke being a $\frac{1}{4}$ in. more than the bore. The long stroke still has a good lead, but there is a very noticeable tendency to get closer, proportionately, to the bore, in marked contrast to the practice of a few years ago. Such combinations as $4\frac{1}{4}$ in. by 5 in., and 5 in. by $5\frac{1}{4}$ in., 5 in. by 6 in., are very common, but it is rarely that the stroke exceeds the bore by more than an inch. On the other hand, the "square" cylinder—that is, the cylinder with the bore and stroke approximately equal—has distinctly gained ground, engines 4 in. by 4 in., $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in., 5 in. by 5 in., etc., and even a few where the bore exceeds the stroke, being now frequently met with.

Some interesting information on the point can be gleaned from an inspection of the engine dimensions given in the programme of the recent Reliability Trials. In this can be found many examples of the square cylinder—the Vulcan Company, for example, adopting 4 in. by 4 in. in their 6½-h.p. engine; the Humber Company $3\frac{1}{2}$ in. by $3\frac{1}{2}$ in. in their Humberette; the 6½-h.p. Cadillac has a 5 in. by 5 in. engine, the 10-h.p. Pick two cylinders $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in., the 10-h.p. Georges-Richard with 100 mm. and 100 mm., etc. Examples of long stroke engines are to be seen in the 9-h.p. double cylinder James and Browne, 4 in. by 6 in., and the 10-h.p. Dechamps 100 mm. by 140 mm. Even the Hozier Company in their 14-h.p. three cylinder Argyle use a relatively long stroke motor, 90 mm. by 120 mm. I should be glad to see the point brought forward by Mr. Govan further discussed, as it is one on which there seems to be little data available. In particular I should be glad to know the advantages claimed by those motor designers who have adopted engines with equal dimensions for the bore and stroke, over one with the stroke say an inch longer than the bore,—Yours truly,

F. L. FERGUSON.

LARGER DRIVING WHEELS ADVOCATED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If cars were fitted with higher wheels, or at least higher driving wheels, would it not lessen the dust nuisance considerably? As everyone knows, the higher the wheel the slower it revolves to attain the same speed of the vehicle, thus the wear and tear of the tyres should be rather less on wheels of large diameter. At the same time a higher wheel would bridge over many of the depressions in the road, and would, therefore, avoid the pumping out of the dust or mud that collects in these depressions. Another advantage would be that the distance between the floor of the car and the ground would be greater, thus allowing a free passage for the air that passes beneath the car. High driving wheels (with solid tyres) were fitted to the old Daimler and Benz cars, but when pneumatic tyres came into general use the diameter of the wheels lessened considerably. The only reason for this, as far as I can ascertain, is to keep down the cost of production. In my opinion a high wheel with a good solid rubber tyre rides almost as easy as a wheel of small diameter with a pneumatic tyre pumped hard.—Yours truly,

N. W. P.

PETROL AND STEAM—A SUGGESTED COMBINATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am afraid "D. J. M.'s" idea of using a petrol and steam engine combined would not give very good results if the steam engine had to depend on getting its steam from the form of generator stated. In the first instance, the exhaust pipe would not give off sufficient heat to generate enough steam to drive even a small engine, and upon putting the steam engine into action all the steam would be rapidly consumed, and the petrol motor would then have the extra work of driving the steam engine, in addition to its ordinary load. Even on the smallest type of steam generator or boiler, the heat required to keep up the required pressure is greatly in excess of that which can be furnished by an exhaust pipe.—Yours truly,

BLOW-OFF.

BENZ v. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Beaumont's letter in your last issue, a 3½-h.p. Benz car cannot in any way be compared with light cars of same power for pace uphill. I myself have had the handling of several Benz cars, and have only known one of these to go up a small incline at anything like speed. This was undoubtedly due to the extremely light body fitted. The others were failures when hills were concerned, the crypto gear having to be used to crawl up at about 4 m.p.h. This is not the case with the light cars, which generally maintain a good moderate speed up hill as well as on the level. The cause is, without doubt, a question of weight.—Yours truly,

BATTERSEA.

BENZ v. LIGHT CARS.—Mr. F. Cove writes:—"If a Benz is thoroughly understood in every detail it certainly will compare favourably, and is a most excellent hill-climber at a good speed, but there is much to know on the subject. I have had five Benz cars of various powers."

THE WINTER USE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with interest the "Useful Note" in your last issue on Mr. Hiorth's method of preventing the steam gauge of his steam-car from freezing in very cold weather. I overcame this difficulty in my own case by putting in a T connection just below the steam gauge and attaching an ordinary radiator drip cock. This does not detract from the appearance of the equipment, and by allowing a slight drip or by blowing-off the cock now and then the gauge and all connections may be heated up to boiler temperature. This is not, perhaps, a new idea, but I have not seen another light steam car so fitted.—Yours truly,

LOCOMOBILIST.

AN OPENING IN MALTA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a reader of your *Journal* it may be of interest and use to young Englishmen to know of localities where a reasonable prospect of success for mechanics may be found. Malta is such a place. There are quartered there a large section of the British Army of all arms, besides the Island being the headquarters of the British Mediterranean fleet. Amongst these a number of wealthy officers already own, or are likely to purchase, motor-cars and cycles. When I left the Island four months ago there was, as far as I know, no qualified person to undertake repairs, and within the last fortnight I have read a letter from a motorist commenting on the want of a competent repairer.

By printing this letter you may be conferring a benefit not only upon the users of motors, but also the prospective engineer.—Yours truly,

SUBALTERN.

MOTOR VOLUNTEER CORPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Accepting the figures given by Lieut.-Col. Mark Mayhew as to the proportion of officers to privates in the Motor Volunteer Corps, I still think that there was scarcely any need for one officer to every three men, especially as all who join are presumably of good social position. The carrying of baggage for Army officers and similar duties may be interesting, but to secure that this is done there need not be one officer to every three privates. Surely a committee elected by the members of the corps would have been sufficient, until, of course, the scheme was properly matured, and it must be confessed the present method has lessened the enthusiasm of a good many who would have joined the corps.—Yours truly,

A VOLUNTEER.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Opossum," as to whether his 6½-h.p. "Napoleon" car would carry solid tyres, as this car is of the *légère* type, I am of opinion that it would not pay to use solids owing to the extra vibration and wear they would cause on the mechanism. As no doubt his troubles are from cuts and punctures over stony and rough country roads, I should advise him to use metal-protected treads on his present covers; there are several on the market which have been more or less successfully used on "Napoleon" cars. Perhaps the users will kindly give "Opossum" the benefit of their experience.—Yours truly,

BERNARD NEAVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask any of your correspondents who have actually tried pneumatic and solid tyres on the same car to give the result of their experience as to the advisability of fitting a light car with solid tyres or a combination of the two kinds? The speed required would be well within the new legal limit.—Yours truly,

PUNCTURE TIRED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I be allowed to answer "Opossum" with regard to solid rubber tyres on his 6½-h.p. car with De Dion engine? I note you suggested that to fit solid tyres to the back wheels of his car would cause such extra vibration and wear as to cost probably double in the long run in the way of repairs. I may say, however, that my company has converted dozens of De Dion cars from pneumatics to Royal Buffer tyres, and the results have been so successful that we have, at the present moment, I believe, nineteen De Dion cars being converted from pneumatics to "Royal Buffers." I can refer "Opossum" to half-a-dozen actual users who have had their wheels converted from pneumatics, and who assert that they find practically no difference in vibration, and that

they would not on any account go back to pneumatics. I shall shortly have one of the latest type of De Dion cars fitted on all four wheels with "Royal Buffers," and shall be pleased to let "Opossum" try it himself or any of his friends, by appointment. As to Mr. Elmslie's enquiry, the above information about De Dion cars answers his question with regard to live axles, and I may say that of the hundreds of cars we have converted from pneumatics we have never heard of a single ball breaking.

—Yours truly,

J. M. MACLULICH.

THE SAMSON HUTCHINSON BANDS.—Mr. Walter E. J. Mourilyan, replying to "Opossum," says:—I am the owner of a "Napoleon" car, and it may interest him to know that I have recently had "Samson Hutchinson" bands fitted to my two back tyres with most excellent results.

CATALYTIC IGNITION.—"Syntax" writes that he and several motoring friends would be glad if some of those who have tried the catalytic ignition would send an account of their experience with the same.

MESSRS. BAILEY AND LAMBERT, LIMITED, request us to state that the car illustrated in their advertisement last week was of 12-h.p., not 10-h.p.

SPEED AND RELIABILITY TRIALS.*

By EDWARD H. COZENS-HARDY.

THE Club may justly be proud of the reputation which it has established for the successful organisation of impartial motor trials, and the number of entries for this year's events is proof that a Club certificate or award is a valuable asset. It would be interesting to know the total expenditure that makers have thought it worth while to incur in the hope of securing a trophy from Ireland, or a medal in the recent 1,000-mile tests. In the Gordon Bennett Race the Club had to deal with conditions differing greatly from those of any previous contests under their jurisdiction, and we may be proud that, thanks in no small measure to the tact and energy of our Secretary (Mr. Orde), we have secured such general approval in this new field. We have quite eclipsed the record of the "Paris-Madrid." If to be busy is to be happy, let me assure anyone who undertakes the duties of organiser or marshal for such events as the speed trials in Ireland or at Southport that he will be very happy.

SPEED TRIALS.

It is, to my mind, very doubtful if motor-racing has come to stay, unless the classification difficulty be tackled at once—not on a crude cylinder capacity basis, but on some more scientific plan, which will make further increases of speed impracticable. Under the present weight classification the nerve of the driver more than the perfection of the car is tested. Speed contests may afford true sport, but with the serious work of a Society of Encouragement in view, we must only allow a moderate licence to this more popular side of our activities.

Apart from the monumental Phoenix, it would be hard to find a better course than that in Phoenix Park, Dublin, either from the point of view of spectators, competitors, or organisers. By keeping a width of 40 ft. clear on each side of the track everyone had a better view of the race for a longer distance, and the gravel paths parallel with the track were left available for mounted messengers, flagmen, and officials. With fencing along the side, and high barricades across the track beyond the finishing point, the possibilities of danger to spectators were remote. The remedies for the grievances that occurred are more suited for discussion in committee than on the present occasion. But it may be well to record my opinion—

(1) That in any short races on made road, the use of a dust layer is almost essential.

(2) That a 40 ft. road is adequate for touring cars competing in pairs, but is somewhat risky for two large racers unless with the most experienced drivers.

(3) That 400 yards is sufficient distance for racers to pull up in after crossing the line at 85 miles an hour.

(4) That short races from a standing start are practically tests of the clutch and of the adhesion of the driving wheels, and pushing off should be forbidden.

(5) That a telephone system is essential for marshalling purposes and for announcing results, and should be independent of any electrical timing arrangements.

(6) That for races longer than at Phoenix Park—say, more than two miles—a special arrangement of electrical timing apparatus should be provided to prevent the serious delays which were found necessary with the Clough to Castlewellaan races, where competitors had frequently to be detained on the starting line until the time of a vehicle which was expected at the finish had been recorded on the apparatus.

(7) That the number of officials allowed on the course should be kept as small as possible, and that the duties of each should be very clearly set out.

(8) That the last day for entries at the "late fee" rates should be at least fourteen days before the date of the trial, in order that competitors' instructions and timed programmes of events may reach the competitors a week before the event.

* From a paper read at the Automobile Club on the 10th inst.

(9) That if there is a large number of competitors, to eliminate them in heats of two requires only one less test than to time them individually; but if they be run against the clock, the prizes may be given to the shortest time, although the running is in pairs. To run the two shortest times in the final has the drawback that a mistake in timing, or a successful protest, may make the entire race void.

The chief defects of the present classification by weight are that it places no limit on the horse-power, and does not sufficiently encourage the features which are desirable in commercial vehicles. It is to be hoped that whatever new system is evolved will as far as possible eliminate the "driver's nerve" factor, and will encourage efficiency of fuel consumption—a factor which includes efficiency of engine, of transmission, and of driver.

RELIABILITY TRIALS.

Turning to the more practical Reliability Trials, we come to a field in which we as a Club may claim to have been the pioneers. The general lines on which these Trials have been run owe much to our first Secretary, Mr. Johnson, and we are fortunate in now having as Technical Secretary one of his able lieutenants. The amount of detailed organisation necessary for the success of competitions of the magnitude of the 1,000 miles Trials in September last is enormous, and Mr. Joy is to be warmly congratulated on the success of his untiring efforts.

The awards in these Trials have only just been issued, and many have thought the two months' suspense unnecessary and vexatious. I can assure them, however, that their opinion would be reversed if they saw the reams of calculations which the system of marking has involved both for the Judges and for Mr. Mallam, the indefatigable Hon. Sec. of Records. Those who have seen the inner working of this year's system must have come to the conclusion that the elaborate marking under no less than seventeen heads is a cumbrous method, very liable to defeat its own ends. In fact, I am not at all sure that the final marks have placed the awards in accordance with the intentions of the Trials Organisation Committee. As a member of that body before I was honoured by elevation to the Bench, I heard most of the lengthy discussions which resulted in allotting certain maximum marks to each item, and I believe the Committee's intention was to give to each item an importance in proportion to its maximum marks. Thus reliability on the road, with a maximum of 3,000 marks, was to be the most important factor; garage work, with a maximum of 1,500, was to come next; then condition after trial and hill-climbing, with a maximum of 1,000 each; then fuel consumption, dustiness, and track speed, with 500 each; then steering, brakes, re-starting on hills, noise, vibration, smoke, and accuracy of declared horse-power, with 250 each; and, finally, cleanliness of motor, with 125. As the work of judging progressed, however, it quickly became evident that the marking would not have this effect, and I think I shall be expressing the feelings of my brother judges in saying that we saw the final order of marks last week with a sense of relief that, in spite of the awful possibilities of the system, it had resulted in placing the awards with really good cars.

The point which was overlooked when settling the system of marks was that the awards would depend, not on the aggregate marks obtained, but on the marks lost—i.e., it is a matter of differences, and not of ratios. The Committee's views as to the relative importance of reliability, condition, dust, etc., could more correctly have been put into effect by so arranging the marking that the estimated difference between the best and worst cars under any heading would be in proportion to the desired importance of that heading. I have had the curiosity to work out the marks lost by all the cars under each of the seventeen headings—a little matter of some 1,200 subtraction sums. The greatest difference in reliability between the cars which are at all "in the running" is seldom more than 100—a difference which is equalled under almost every other heading, and is greatly exceeded under "Condition after Trial" and "Dustiness." That these last two items are important no one will deny, but it is also obvious that any of the other fifteen headings had as much effect on the final order as had "Reliability."

In the cheapest class the medallists are low down in regard to "Accuracy of Horse-power," apparently because they had not many gears, and therefore, on the hills on which horse-power was measured, they could not keep their engines at normal speed—i.e., they could not exert their normal horse-power; though the cars with more gears scored in this respect, they apparently lost under reliability, tending to prove that the simple two-gear cars are wise in sacrificing speed on hills for the sake of simplicity and reliability.

A more equitable result could have been arrived at if the Judges had been given a wider discretion as to how marks were to be deducted. There can be no question that the Trials have secured a vast amount of information which should be invaluable in showing makers in what particulars their cars are open to improvement, as well as in securing accurate data as to current practice upon which to base useful general conclusions.

It has been suggested, with a considerable amount of truth, that trials of the kind just held are no test at all of the large cars, and are too severe for the small cars. It is obvious that a 5-h.p. car must be continuously working at high pressure if it is to keep up to the requisite speed, whereas under the same conditions a 25-h.p. car can hardly any time be developing its full power. For this reason, I think, the 1,000 Miles Trial of 1903 will be the last of its kind, and we shall have to find some other method of proving the qualities of various cars. The number of cars to be tested is certain to increase, and with it the difficulty of marshalling, observing, and judging.

To my mind some more severe form of the Quarterly Trials would afford sufficient opportunity for testing the reliability of any new cars. A 200-miles non-stop run might be a suitable test for the larger cars, and 150 miles non-stop for the smaller ones. The annual competitive trials might then be confined to cars holding these non-stop Reliability Certificates, and might consist solely of tests of particular features, without any attempt to determine by an arbitrary standard which car has the best collection of features.

It would be of real value to have independent tests upon a large number of cars of the efficiency and easy running of the engines and of the transmission gear, tests of the carburettors and the range of engine speed, of the fuel consumption under varying loads, of the silencers and back pressure, of the radiators and the weight of water and power lost, and of other similar points upon which makers have now little more than experience of their own patterns to guide them. Such tests can best be undertaken by the Club, but there is room for work of a more experimental nature, which is, perhaps, beyond the province of a Society of Encouragement. I, for one, feel the need of such research in connection with spirit engines, and, following the lead of Mr. Dugald Clerk, I hope shortly to begin a series of tests, with a view of throwing a little light on some of the obscure points in this interesting field.

CLUBS AND ASSOCIATIONS.

NORFOLK.

THE first annual dinner of the Norfolk Automobile and Launch Club was held at the Maid's Head Hotel, Norwich, on Friday, the 11th inst. Lord Claud Hamilton, the president, was in the chair, and after the toast of the King and the Prince of Wales—the latter being the Patron of the club—had been honoured, Mr. R. W. Wallace, K.C., proposed "Success to the Norfolk Automobile and Launch Club." It was some time since they came to Norfolk on a tour and to show the benighted people of the district who had not seen a motor-car what wonderful things they were. The members of the club met with a pleasant reception in Norwich. In coupling with the toast the name of Lord Claud Hamilton he could not help thinking that his lordship was a great source of strength to a local club of that character. He did not think that motorists would be easily suppressed. As cars became cheaper and more popular, they would find that their use would be much more acknowledged, and that popular prejudice would die out. It was most important that the Automobile Club should have representatives throughout the country, and therefore he welcomed the promotion of clubs like the Norfolk. In conclusion, Mr. Wallace referred to the vast possibilities of motor launches, and said people would be able to take extended tours on the Broads of Norfolk, and would be able to move about regardless of the wind.

Lord Claud Hamilton, in reply, said that when he was asked to accept the office of president of the Norfolk Club he had some misgivings on the subject, because he was not an enthusiastic motorist. He looked upon motoring not so much as an amusement, but as an enterprise which would confer vast benefits upon the human race. He knew in some respects that motor-cars might prejudicially affect railways—"No, no"—but in the long run anything which tended to promote locomotion must benefit railways. That was the view which he wished to take—and therefore he felt, when he was asked to become president, that he would show there was one railway chairman who did not fear, but rather welcomed, the advent of motor-cars. The motor-car industry had made great advances in the last year or two, and he felt that the advances might have been greater had not there been shortcomings among, he was glad to say, only a small minority of motorists. In all these matters they were bound to consider not only one or two classes, but the interests of the whole of the community. A limited number of selfish men had by their conduct placed a large number of the poorer inhabitants of the island in antagonism to the promotion of the motoring interest. He urged the members of the club to avoid doing anything that would prejudice the interests and good feeling of other classes. By degrees they would find them come round, and the restrictions which Parliament had put upon motoring would be relaxed. Motoring would then become not a sport for one class, but for every class. In conclusion, his lordship spoke of the services of Mr. Chamberlin, the chairman of the club, and Mr. James Howlett, the secretary.

Mr. S. F. Edge then read a paper on "Motor Vehicles," in the course of which he said that when the man with the red flag was abolished in this country there were three important types of cars, the Daimler, the Benz, and the De Dion. Since then changes had been made in the higher speeds of the engines and the reduction of the moving parts, and the almost universal adoption of electric ignition in some form or other. The next stride forward was to eliminate all the parts necessary to remove the old hit-and-miss governor on the exhaust of the early Daimler and substitute the throttle contrivance, which had not been convenient to do with the old tube ignition, requiring constant speed and constant compression to give its best results. Whilst this evolution of the Daimler engine had been going on, the Benz type had not been idle; the connecting-rod and crank shaft had been covered in, two cylinders of higher speed were being used, and other improvements made. The high-speed De Dion was also developing. To-day the vertical engine was universal, with practically the one exception of the horizontal engine of the great engineering firm of Wolseley, but the number of cylinders

was still in doubt. They had cars with from one to eight cylinders, and, speaking broadly, the price, comfort, and reduction of noise grew with the increase in the number of cylinders, but, curiously enough, the increased number of parts caused by multiplying the number of cylinders did not seem to increase the number of breakdowns on the road. There was no doubt the comfort of users was materially increased by the multiplication of cylinders. There was a choice of one of the following types:—(a) Small single cylinder car to carry two or three people, for £150 to £250; (b) light or heavy twin cylinder car for £300 to £400, to carry up to five people; (c) light four cylinder car for £500 to £900, to carry up to five people; (d) light and heavy four, six, and eight cylinder cars for £800 to £2,000, to carry from four to seven or eight people. The future would, he thought, bring forth the (1) one cylinder car, and make it a most useful and standard car, cheap to buy, keep, and run; (2) a four cylinder car of four speeds; (3) four or six cylinder car for speed, touring, weight carrying, and other severe work, with two, three, and four speeds. These seemed to him to be the eventual types. They must, of course, always keep in mind that there might be a development of an engine on the turbine principle to take the place of the reciprocating engine, but exactly what effect this would have on design he had not considered. A reference to motor-boats concluded the paper.

Mr. G. M. Chamberlin proposed the toast of "The Visitors," coupling with it the names of the Dean of Norwich (Dr. Lefroy), and the Sheriff of Norwich (Mr. Leathes Prior), Mr. R. W. Wallace, K.C., and Mr. Rees Jeffreys.

In proposing the toast of "Our Guest, Mr. S. F. Edge," Mr. H. L. Clark gave a summary of the proceedings of the club during its short and successful existence.

Mr. Edge having replied, the health of the chairman was proposed by Mr. Wallace, and the response of Lord Claud Hamilton brought the pleasant gathering to a close.

YORKSHIRE.

THE paper on the new Motor Car Act read by Mr. Herbert A. Jones, at the Yorkshire Automobile Club, on the 8th inst., was a great success. There was an extremely large muster of members, and an interesting discussion took place, in which Messrs. Farnell, Winn, and others joined. Mr. E. Hepper was in the chair. Amongst the firms who sent sample lamps were Messrs. Salsbury, and speedometers were sent by Messrs. Markt, Paffard, Staunton, and Dunhill. Messrs. Elliot Bros. sent an interesting model, comprising a speedometer on dash board and actuated from a front steering wheel, which was driven by a small electric motor. Those showed graphically the use of the speedometer.

DURHAM.

A MEETING of the members of the A.C.G.B.I., the local correspondents of the Motor Union, the Committee of the Sunderland and District Motor Association, and other gentlemen interested in automobilism, has been held in Durham, under the presidency of Mr. John H. Pease. It was decided to form a County of Durham Automobile Association of contributory local associations (covering the whole of the county) of which two are already in existence, and two will very shortly be. It is to be hoped that all owners of motor-cars and motor-cycles will join their local associations. Gentlemen residing in any part of Durham who are willing to join the association are asked to communicate with Capt. H. Streatfield, of Ryhope Hall, near Sunderland.

KENT ROADS.

At a meeting held at Fooks Cray, with Mr. F. Arrow in the chair, Mr. Bayntum proposed the formation of the Kent Roads Cycle and Motor Club, which was carried with enthusiasm. Mr. N. Cunningham proposed "That the officers of the Club consist of a captain, sub-captain, hon. secretary, and hon. treasurer, the captain and sub-captain to be elected at the general meeting." Mr. H. Worthington seconded this motion, which was also adopted. Mr. Chitty proposed that the management of the club be left in the hands of a committee consisting of seven members, until the general meeting takes place, which should be at some date early in January, 1904. Mr. Barnard seconded this proposition, and the following gentlemen were elected on the committee:—Messrs. F. Arrow, B. Cunningham, C. Martin, H. Chitty, Huntley, Barnard, and Bayntum.

MOTOR-CAR RACING—A SEQUEL.

LORD STORMONTH DARLING, in the Edinburgh Court of Session, has closed the record in an action by the Equitable Assurance Society of London against the General Accident Assurance Corporation, Limited, of Perth, in which they ask a decree for £2,000. In November, 1900, the plaintiffs insured the life of the late Claude Lorraine Barrow, of Biarritz, France, for £2,000, and defendants agreed to reinsure plaintiffs to the full extent against any loss which might be incurred by them under the policy in the event of Mr. Barrow's death arising directly from accidental injuries received from an accident to a motor-car in which he should be riding. Mr. Barrow received injuries in the motor-race from Paris to Bordeaux, as a result of which he died, and the plaintiffs now seek payment of the sum named.

The defendants aver that the guarantee was procured from them by concealment of the true nature of the risk to be insured, and state that Mr. Barrow was designated as a gentleman, this being the only information received as to the class of risk to be insured.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED, M. P. H.	RESULT.
Bow St., London	Capt. A. Hill, Grafton St., W.	—	£2, etc.
Brighton	J. Lorecunley	16	£2, etc.
Guildford	*J. F. Rickings	—	£3.
"	G. C. Halahan, Chiddingfold	—	Dismissed.
Coventry	W. Williams, Coventry	—	£5, etc.
Wycombe	A. Loeb, Oxford Street, W.	27	£1 5s.
"	P. H. Harrington, Oxford	24	£1 6s. 6d.

ALLEGED BREACH OF CONTRACT.

AT the Marylebone County Court, on Monday, before Judge Stonor, Mr. John W. Alexander, of Mile End Road, E., brought an action against the Automobilia Societe Anonyme, Oxford Street, Marble Arch, W., claiming £25 damages in respect of alleged breach of contract to supply motor-cars on hire. The plaintiff stated that he had been in the habit of taking a party down to Goodwood to attend the races there every year, and this year he decided to take his friends by motor-cars. In July he arranged with defendants for the supply of two large motor-cars on July 30th, each to hold eight persons. He paid £2 deposit and arranged to call for the cars at six o'clock on the morning of the day in question. On the preceding day he called at the garage, and was told that he could not have the two large cars, but two smaller ones, each to hold four persons, would be ready. After some demur, plaintiff agreed to have the smaller cars at reduced price, but when he and his party called next morning the cars were all in pieces being repaired. Owing to the cars not being ready as agreed he sustained considerable loss and great inconvenience. The defendants' manager at the Marble Arch garage said that the only reason the cars were not supplied was because the plaintiff refused to sign the usual form of hire. The plaintiff stated that on the 29th he was told that he would have to sign the form, and he agreed to do so as soon as he got possession of the cars, but when he went to the garage next morning nothing was said about signing the form. His Honour said he thought that there was no defence to the claim, and judgment was given for the plaintiff for £12, with costs.

MOTOR-CAR ACCIDENTS.

MR. WALTER SCHROEDER held an inquest at St. Pancras on Monday on the body of Arthur Goodrich, aged sixty, who was, it appeared, travelling by a tramcar on October 18th, up the incline of Camden Road towards Holloway, and, alighting on the "off" or wrong side of the car at Cantelow Road, he essayed to cross Camden Road at a time when a motor-car, belonging to the Fairman Automobile Company, was descending the incline at the moderate rate, according to independent witnesses, of eight or nine miles an hour. As the motor-car neared the deceased, the driver sounded the horn several times. Ultimately Mr. Goodrich stopped, the driver simultaneously altering his course to avoid him, but the deceased immediately retreated instead of advancing, and, colliding against the front wheel of the car, he was knocked down. It was stated by a representative of the Fairman Automobile Company that the driver, after supplying them with a written account of the accident, had disappeared, and his whereabouts at present was unknown. The car had been hired by a gentleman, and the company had no responsibility in relation to the car or the driver after the motor left their premises. The jury returned a verdict of accidental death.

A SERIOUS accident occurred on Monday evening at Houghton, near Leicester, a motor-car belonging to Captain Neil Haig running into a dray when descending the Houghton Hill. One of the dray horses was killed on the spot, and the motor-car was smashed. The four occupants were thrown out, the driver, Adams by name, sustaining such injuries that his life is despaired of. A little girl had her skull fractured in two places, and now lies at the Leicester Infirmary.

A CASE DISMISSED.

DILLON WILLOUGHBY surrendered to his bail at the Central Criminal Court to answer the charge of having obtained money by false pretences from Mr. C. Jenkins. The case arose out of a dispute as to terms agreed upon in certain negotiations for the purchase of a Panhard motor-car. Mr. Newton Crane, for the prosecution, stated that since the case was before the magistrate certain documents had come to light which put a different complexion on the whole dispute, and after

examining the papers, he had felt it his duty to advise his clients that the case was one rather for a civil action than a criminal prosecution. It now transpired that the defendant was really an agent for an agent of the Panhard Company, and that there was substantial ground for the defence he had set up. Under these circumstances he proposed, with his lordship's permission, to offer no evidence. Mr. C. F. Gill, K.C., on behalf of the defendant, concurred in the course proposed to be taken, intimating that if the case had been proceeded with there would have been a complete defence. The jury, by direction of the Recorder, returned a formal verdict of not guilty, and the accused was discharged.

ON THE WRONG SIDE.

AT Liverpool, a motor-car driver, named George Burke, was summoned for neglecting to keep on the near side of the road when crossing the junction of Dale Street and Hatton Garden. The magistrates imposed a fine of 10s. and costs.

AMONG the new members of the French Automobile Club elected last week we notice the name of Mr. D. M. Weigel.

THERE will be five Napier cars in the British eliminating race for the Gordon Bennett team. Three of the drivers have already been nominated, viz.:—Messrs. John Hargreaves, Mark Mayhew and S. F. Edge.

In addition to the making of motor castings, Mr. Rowland Hill, Coventry, has added several branches to his business, such as pattern making, machining boiler cylinders, steering gears, back and front axles, and also the manufacture of channel steel frames. Extensions have been made to the premises to make room for this extra work.

MR. R. S. L. BOULTER writes that the Godstone Rural District Council has decided to ask the Local Government Board for permission to restrict the speed of cars to eight miles an hour from the top of Godstone Hill to Blindley Heath, a distance of four miles. This road is the main highway from London to Eastbourne, and is probably one of the widest in that part of the county.

MESSRS. LOWE, BEVAN AND COMPANY, Charlotte Street, Birmingham, are introducing a registered design of paraffin lamp, and name plate attached, to be affixed to the rear of a car. There is an adjustable reflector above the lettering. The name plate is detachable, and a red light is sunk into the centre of the reflector, which latter is a hinged door that can be closed down during the day. The lamp is fixed to a bracket on the car by means of a clip and fastened by a set-screw to prevent vibration. As the lamp is above the lettering the number can be readily seen from any position on the road. The lamp itself is of a similar type to the firm's well-known ordinary paraffin pattern, and is made in two sizes, according to the number of letters to be illuminated.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, DECEMBER 26, 1903.

[No. 251.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

COMPLAINT is often made as to the difficulty of obtaining efficient drivers for motor vehicles. It is hoped that the classes which have been established at Battersea and elsewhere under the auspices of the L.C.C. Technical Education Board will have the effect of increasing the supply. Very gratifying is the interest which such classes have evoked among intelligent young men with a predilection towards mechanical matters, and it is clear that a wider knowledge of the principle upon which the automobile is constructed may be of value to the community. The usefulness of the tuition thus afforded will be increased now that a motor car is in the actual possession of such an institution as the Battersea Polytechnic, and the students are being instructed in the practical driving of cars as well as in the details of construction.

The Affiliation Question.

ALTHOUGH not represented at the recent conference of provincial clubs in London, the Lincolnshire organisation has at its annual meeting come practically into line with the clubs there represented, the members at the annual meeting having adopted a resolution to the effect that "before advising the committee to affiliate with the A.C.G.B.I., or the Motor Union, or other recognised central automobile authority, this meeting place on record their opinion that in any scheme of affiliation or federation it is essential that the terms should make provision for adequate representation for members of their club on the actual governing body of the association to which they affiliate." This is a statement of one of the reasons that led the Reading Club to take the initiative in the agitation. It was also agreed "That this club should be recognised as the local authority in all purely local matters affecting automobilism, and that it is desirable that a reduction in the affiliation fee should be obtained. Before signing any affiliation agreement, the agreement shall be placed before a meeting of members of this club for approval." Captain Cole and Dr. Cragg will represent the club at the conference to be held with the A.C.G.B.I. on February 15th next.

Naming Cars.

IN our Correspondence columns the Lord Chief Justice Clerk of Scotland refers again to the suggestion he made as to naming motor-cars in a similar way to that which owners of yachts and similar craft have long adopted. He hopes that the practice will become general—a point upon which we are at present somewhat sceptical. For, as automobilism increases in favour in this country, it will be seen that the mere sporting element will be relegated to a minor place in the industry, and that the greatest development will have to be in the direction of business. Of course the pleasure car will always have its place on the road; but vehicles used in a more utilitarian direction will be in the majority.

Wisdom at Wolverhampton.

THE Wolverhampton Council having delegated the powers conferred upon them under the Motor Car Act to the Watch Committee, they invited motor-car manufacturers and the Honorary Secretary of the Wolverhampton and District Automobile Club to confer with them on Wednesday week. As a result of that meeting the Watch Committee decided that the fee payable for assigning a general identification mark to a manufacturer or dealer should be 20s., and that no effort should at the present time be made to close any of the streets in the borough against motor-cars, or to reduce the speed limit. The governing authorities have been extremely considerate towards motorists, and, in view of complaints which have been made against strangers driving through the town at excessive speed, offenders in the future will be prosecuted. The members of the Wolverhampton Club will support the police in this matter.

London's Congested Traffic.

THE Royal Commission on Locomotion and Street Traffic continues to receive evidence from representatives of London boroughs. It has been abundantly shown that the present chaotic state of things with regard to the opening of roadways, the closing of thoroughfares, and the general dislocation of the business interests of the Metropolis is wasteful and wanton. Mr. Whur, Chairman of the Works Committee of the Paddington Council, urges that slow-moving, heavy vehicular traffic should be under more stringent regulations than at present. Mr. W. N. Blair, engineer for the important borough of St. Pancras, which has a population of 235,280 persons, gives the ratable value at £1,795,207, and says that it contains ninety miles of road. A census of traffic recently taken showed that there passed at Cleveland Street 875 vehicles, including 114 omnibuses, in one hour; at Tottenham Court Road 1,028 vehicles, including 289 omnibuses; and in Pentonville Road 791 vehicles, including 147 omnibuses and 46 tramcars, in one hour. It would appear, therefore, that the bus traffic of London is one of the great obstacles to speed, and the creation of new routes would seem to be a necessary step in any early reform. Were motor-omnibuses general, not only would they take up less space on the roadway than the present horse-drawn vehicles, but their more rapid movement would result in a general quickening of traffic and a consequent lessening of the congestion of the streets.

A Motorist helps the Police.

THAT motorists are not unfriendly to horses has been often proved in these columns; further evidence comes from Kingston, where a man was charged with cruelty to a horse by working it in an unfit state. The chief witness was a motorist, Mrs. Howell, of Clive Lodge, Esher, who was out driving in her motor-car when she saw the defendant's horse attached to a cart standing by the side of the road at Esher. Noticing some sores on the animal, she stopped her motor-car to speak to the defendant, who at the same moment drove off. She called on him to stop, and as he would not do so she signalled to

a police constable, who got into her car and went in pursuit of the defendant. He was ultimately obliged to pull up, and his name and address were taken. The chairman, on behalf of the Bench, thanked Mrs. Howell for the trouble she had taken in the matter, and fined the horse-owner 40s. and costs. It seems a pity that the police and the motorist cannot always be on such friendly terms. There is no doubt the latter could help the former in carrying out their duties very materially.

The Conveyance of Cars by Rail.

ON another page Mr. E. M. C. Instone calls attention to an extraordinary form of indemnity which the railway companies now require to be signed by the consignor of a motor-carriage before they will accept it for conveyance by rail. The person sending the motor-car is to indemnify the company against "all damage, loss, or expense which may arise out of, or be incurred in consequence of, such conveyance." This is an unwarrantable demand on the part of the railway companies when it is remembered that such vehicles will not be carried at all unless they conform to the regulations of the carrying company. We trust the suggestion made by Mr. Instone will be seriously considered by the trade and amateurs alike. The fact that the matter has been brought forward in this fashion shows the necessity for combination among motorists.

Young Motorists.—The Children of Mr. Gould, the American millionaire, in their miniature Electric Car. (Motor, New York.)

Protests Wanted.

COMING at the Christmas season, there is just a fear that the importance of the subject may be overlooked amid the prevailing festivity. Hence the hope that other correspondents who have received similar forms of indemnity for signature will make early protest against the evident desire of the railway companies to relieve themselves of a responsibility which should be entirely theirs, especially having regard to the high rates charged for the conveyance of automobiles.

Unattended Horses.

A POINT of some interest to motorists occurred in the case heard in the City of London Court, when Mr. P. Baxter, the owner of a car, sued a laundry company for damage done to the automobile by the defendants' horse suddenly becoming restive. The plaintiff was turning out of Savoy Street into the Strand, London, when the horse attached to the defendants' van swerved round and damaged his vehicle. The horse was unattended at the time. Judge Lumley Smith said it was too wide a proposition that merely leaving a horse in the street while a driver went into a house was in itself negligence. Coming to the court every morning, he noticed the streets were lined with carts while the drivers were calling for orders or delivering parcels. He dismissed the case in question, but we would doubt his general opinion as to the right of horse-drawn vehicles to line the streets without anyone being in charge of the horses. The unwisdom of such procedure is apparent to the lay mind.

Artists and the Car.

ARTISTS have lately been turning from their studios to watch the change that is coming over the locomotion of our streets. Sir W. B. Richmond has discovered that the motor-car is not a "thing of beauty." Mr. Briton Riviere, R.A., has come to the conclusion that the horse is an beautiful animal, the loss of which would rob our streets of much of their joy. Possibly that might be the case, but the London ratepayer—a being with an inartistic and utilitarian soul—is more likely to be affected by the calculations of Borough Surveyors to the effect that the scavenging of the metropolis costs thousands a year. If motor-vehicles became general in the City and suburbs, some proportion of that amount would certainly be saved. But even the artists are not united on the matter, and while the two named have shown a sturdy conservatism with regard to automobiles, another, Professor Herkomer, is an enthusiastic motorist, his sympathy with the movement being practically shown by the offer of an international trophy for touring vehicles.

Slow Traffic.

A CASE connected with the new regulations of the Manchester Corporation for the control of slow-moving and heavy traffic in the streets has been heard at the Manchester City Police Court. A van-driver employed by the Cheshire Lines Committee was summoned for not keeping his van as near as possible to the footway or kerbstone on the near side of the road, the prosecution being undertaken on an allegation that the defendant had by failing to do so obstructed a tramcar. It was urged by Mr. A. E. G. Chorlton, for the defence, that the Corporation statute of 1902 and the bye-law made thereunder only applied to heavy and slow-moving traffic, and did not cover a light, fast-moving vehicle like a van, and that the Corporation could not be allowed to stretch their regulations to include other than the heavy and slow-moving traffic which the Act specified. The Bench dismissed the summons on this ground—a very nice distinction.

The Efficiency of Motor Fire Apparatus.

AN interesting test of the Tottenham Fire Brigade's motor chemical fire engine and fire escape was recently made in a neighbouring district, where some trouble was experienced with the horsing arrangements. The machine was placed in the fire station as for ordinary service, the trial being to ascertain what advantage, if any, could be obtained over the existing arrangements by the use of an automobile. Upon the "call" being received (which also gave the alarm for the horses) the vehicle started out of the station in less than half a minute, and immediately proceeded to a spot selected, at a distance of one and a half miles. Considerable delay occurred in the arrival of the horses for the manual engine, and this, with the extra time

involved in travelling, made a difference of over fifteen minutes beyond the time taken by the automobile. The return journey, one and a half miles, was accomplished by the latter in four and a half minutes, equal to what is about to become the "legal limit."

Look at the Brake.

MANUFACTURERS long ago recognised the importance of providing a sufficient number of powerful brakes, effective in both directions, and the majority of cars have not only the usual brake on the transmission, but a pair of band brakes operating on drums directly attached to the rear road wheels. These, when kept in proper adjustment and condition, will hold a car, fully loaded, on any hill that it can climb. It would therefore seem that the only reason for a vehicle running backward down a hill and getting beyond the control of the driver is that the first principle in the use of any piece of machinery has been neglected—that is, the careful examination of all operative parts to see that they are in proper working condition and properly adjusted. The brakes require occasional adjustment to compensate for wear, and should be given particular attention before starting for runs over roads that are known to be hilly.

Modern Locomotion.

A NEW work on up-to-date locomotion, viz., "Tube, Train, Tram, and Car," by Mr. Arthur H. Beavan, has just been published by Messrs. Geo. Routledge and Sons, Ltd. It has a brief introduction by Mr. Llewellyn Preece, who apparently believes in the future of the electric automobile, for he regards it as "only a question of a few years for the petrol and steam cars to be placed in museums and shown as monstrosities of the past, and (thinks) that every cab, omnibus, and private carriage throughout the country will use electricity as the motive power." Mr. Beavan's book is mainly interesting for its ample review of the history of electrical railways in this country, and the way in which the author treats of the tramways of the provinces. Popularly written and well illustrated, the book is likely to have a wide circle of readers among those who are interested in the development rather than the drier technicalities of modern locomotion.

Short Spins for Workhouse Inmates.

MR. C. W. BARTHOLOMEW is a guardian of the Towcester union and a motorist of benevolent mind. He drives to the Board meetings in his automobile, and has just offered that his vehicle shall be used in taking the workhouse inmates for rides in the country while he is engaged with his fellow guardians. Life in such institutions must be monotonous indeed, and the motor-car may do much to relieve the daily routine. We hope the nerves of the passengers will not be upset by the police of the district, and that they will not have to suffer from the indignity of police traps—those un-English methods in which the police seem to take official delight.

Motorists and Hotels.

HOTEL-KEEPERS have much to learn, and at this season of the year, when they are looking for clients as well as receipting bills, they might well reflect upon their ways. In the future competition will be keener than ever; but if the proprietors of hotels are wise they will not suffer on that account. Motoring is producing a new generation of travellers—men who can afford to pay a little more than the jaded cyclist of a decade ago, and who generally have some of their family or a few friends with them. Hence their expenditure when away on tour must necessarily be fairly considerable. This is true of normal times; when meets are arranged by clubs expenditure gets beyond all idea of reason and vaunt, into the ridiculous—thanks to the rapacity of the proprietors of some hotels.

Reasonableness Wanted.

THESE gentlemen must remember that motorists are not millionaires, and that, although they may not have to pay railway fares, the expenses of automobile touring are sufficiently high without being raised further by extravagant hotel charges out of all proportion to services rendered. Thanks to motoring several hotels we could mention which would otherwise have been practically closed this winter will remain open for the convenience of the many ladies and gentlemen who seek to get away from cities and towns in December to the freer atmosphere of the country. They will assuredly reap their reward in a revenue likely to be of an increasing character, provided moderation in charges prevails.

The Berkshire Club.

AT a meeting at the Great Western Hotel, Reading, on Saturday last, the Berkshire Automobile Club was formed, and already it numbers nearly fifty members. There was a representative attendance, while the Earl of Craven, Sir Francis Jeune, and other well-known motorists, wrote approving of the formation of the club, and promising their help in making it a success. Sir Gilbert A. Clayton-East has been elected chairman, other members of the committee being the Earl of Craven, Sir Alexander Henderson, Bart., Captain Arthur Hill, M.P., Sir Francis Jeune, K.C.B., Mr. C. D. Rose, M.P., Mr. R. Hargreaves, Mr. J. F. Ochs, and Major E. R. Portal. Mr. Shrapnell Smith has been elected treasurer, the hon. sec. being Colonel W. Waring, of Beenham Grange, Reading. It was also decided to affiliate with the A.C.G.B.I., the committee of the club, however, being empowered to arrange terms.

Balloons at the Agricultural Hall.

WITH regard to the International Motor Car Exhibition to be held at the Agricultural Hall, London, we hear that the War Office will co-operate with the Aero Club in a way that should add to the public interest in the event. They are likely to lend for the purpose of display the experimental models, etc., of the balloons used at Ladysmith, and these should provide a popular feature of the Central Hall.

MR. FRANK MORRISS has taken from the Corporation of King's Lynn three and a half acres of land on which to erect a new automobile factory.

OWING to the success of the Reliability Trials promoted by the Motor Cycling Club last season, Mr. S. F. Edge has offered to present another trophy to be competed for during 1904.

AT the West Ham Technical Institute three bicycle motors are in course of construction by students under the direction of Mr. John Duncan, the head of the engineering department.

THE Automobile Club is anxious to secure a private piece of road, either asphalt, cement, or wood, for the carrying out of the Side Slip Trials. If possible, the road should be within ten miles of London.

THE motor repairing department of the Imperial Tyre and Rubber Company, Limited, is in thorough working order. Early in the coming year the Imperial Company will place upon the market a new non-skidding tread for fitting on to existing tyres.

"THE Handy Touring Atlas of the British Isles" has just been published by Messrs. George Newnes, Ltd., and is designed to supply motorists and tourists generally with maps in a convenient form in place of the cumbersome sheet maps which have done duty hitherto. Its size is 6in. by 4in., making it convenient for the pocket. It shows all roads, villages, and hamlets with topographical and other useful features, and is a complete atlas of the British Isles in miniature. The maps have been reproduced by permission from the Ordnance Survey, and the hundred routes for motorists with which the book closes should be useful to readers in every part of the country.

The Paris Motor-Car Exhibition.

[Photo by]

GENERAL VIEW OF THE SALON.

[Dranger Dayé.]

The Paris Motor-Car Exhibition.

Fig. 29.—Tae Latli Motor Lorry for the Transportation of Stage Scenery. (See page 826.)

M. LUCIEN PERISSE, in an interesting review of the *Salon* in "La Vie Automobile," shows that of the chassis on view at the great exhibition 17 per cent. have engines of 8-h.p. and under, 62 per cent. have motors ranging from 8 to 20-h.p., while the remaining 21 per cent. are of greater horse-power. In another table it is shown that 15 per cent. of the chassis have single cylinder engines, 26 per cent. two cylinders, 4 per cent. three cylinders, and 55 per cent. four cylinders. The percentage in the case of the two cylinder engines has declined as compared with last year, while all the others show an increase, the greatest advance being in the case of the four cylinder type. The proportion of motors with mechanically-actuated inlet valves has increased from 45 per cent. of the total in 1902 to 67 per cent. this year, while now 96 per cent. of the engines have governors acting on the admission. As for frames, 46 per cent. are of pressed steel, 32 per cent. of armoured wood, 14 per cent. of tubes, and 8 per cent. of channel iron. Coming now to transmission, M. Perissé shows that while chain drives are still in the ascendant they have declined from 62 per cent. in 1902 to 53 per cent. this year. On the other hand, the cardan shaft transmission has increased from 35 per cent. to 45 per cent.

Among the first stands I examined on reaching the *Salon* were those of the Wolseley Motor Manufacturing and Napier companies, but my efforts to include a report of these exhibits in the last issue were frustrated by the postal authorities, who so far have failed to deliver the copy entrusted to them for transmission. The Wolseley Company display examples of their latest 24-h.p., 16-h.p., 12-h.p., 7½-h.p., and 6-h.p. cars. The latter should prove a popular type; it is a two-seated reproduction in miniature of the larger vehicles, and, although at first designed for two speeds and reverse, is, I notice, now being provided with three speeds forward. A feature of the latest models of Wolseley cars are the stamped steel frames and the longer wheel base. The countershaft brake has been abandoned, the drums attached to the rear road wheels now having brakes both inside and out, one expanding and the other contracting. The change gear-box has been improved, and is now not only oil-tight, but the top half can be removed without disturbing the bearings. The contact breaker is also now fitted on the dashboard.

The Motor Manufacturing Company, Limited, are to be congratulated on furnishing one of the *clous* of the exhibition, viz., the 25-h.p. Saloon car, of which an illustration was given in the last issue. The body, which was designed and built at the Coventry Works, is of the most sumptuous description. There are four corner seats inside, consisting of comfortably upholstered revolving chairs. Folding tables, drawers, and lockers are among other fittings, in addition to a barometer, thermometer, and clock. The occupants can communicate with the driver by speaking tube, while in addition there is an instruction dial, by means of which, by moving a handle, the wishes of the owner are transmitted to the driver, somewhat on the same lines as a captain communicates orders to the engine-room of a steamer. Specimens of the M.M.C. 20-h.p. and 8-h.p. cars are also displayed, a noticeable improvement in these being the provision of an iris throttle valve. This is controlled by the governor, and works on similar lines to the well-known iris shutter in photographic cameras. A new addition to the popular 8-h.p. M.M.C. cars is a governor, as a result of which the running of this vehicle has been made much quieter. It is pleasing to find that the M.M.C. concern have two chassis on view, one of the 20-h.p. type and one of the 8-h.p. Both are excellent specimens, and are attracting much attention on the part of French visitors to the *Salon*. In addition, examples of the 20-h.p. motor with mechanically-operated inlet valves, the 10-h.p. double-cylinder engine, and a full range of the M.M.C. cycle-motors, find a prominent position on the stand.

Messrs. S. F. Edge, Limited, display two cars, a 15-h.p. and a 20-h.p., both fitted with the hydraulically controlled carburettor described in a recent issue of the *Journal*. The 20-h.p. car with Cape-cart hood, illustrated in the last issue, is an excellent example of British motor construction, and is attracting much attention. Mr. Oscar C. Selbach has a stand on which he exhibits, among other things, a novel water-cooled engine, known as the Bailleul, for motor-cycles, the feature being the use of a combination inlet and exhaust valve, actuated by a double cam disc and a single rod and pivoted taper. A display of the "Spitfire" commutators and sparking plugs is also made.

Of the Tony Huber cars four types are shown—9-h.p.

two cylinder, and 16, 20, and 25-h.p. four-cylinder. The two larger sizes have engines with separate steel cylinders and copper water jackets. In all the inlet valves are mechanically actuated. Armoured wood or steel frames can be supplied, while the transmission may either be by cardan shaft or side chains.

Among the few firms making *avant trains*, or motor fore-carriages, is M. Latil, of Rue de Charonne, Paris. The arrangement is complete in itself and enables a horse-drawn vehicle to be converted into an automobile. They are made in sizes from $4\frac{1}{2}$ to 12-h.p. Fig. 29 shows a special 12-h.p. vehicle on this system, built by M. Latil for the Theatre des Variétés, Paris, for the transport of stage scenery. The car, which has a wheel base of at least 15 ft., is one of the attractions of the Show, and forms another illustration of the uses for which the automobile can be adopted.

The Elswick Motor Company, of Newcastle-on-Tyne, occupy a stand, on which three of the four-cylinder Elswick cars are displayed, a noticeable vehicle being a four-seated cab.

The stand in the Show which is probably attracting most attention is that where the new Leon Bollée cars are exhibited, the chassis displayed being continually surrounded by a group of admiring spectators. I was fortunate in getting hold of

the engine on the same shaft as the magneto, a flexible coupling being introduced between the two. The water pipes are of large diameter, and in order to prevent them rendering the valve gear inaccessible, both the pipe from the pump and the return pipe to the honeycomb radiator enter at the top of the cylinder jackets from above the engine. A collecting chamber is inserted in the return pipe, in which any fur can collect and be removed at intervals. A three-way cock is also introduced between the radiator and the pump, so that either the radiator or the cylinder jackets can be emptied independently. The fan fitted behind the honeycomb radiator is driven by a broad belt, the fan spindle being carried upon a rocking plate, sustained by an adjustable spring, so that the belt is always kept at the proper tension. The car is fitted with two distinct ignitions—magneto and coil, and the retarding or advancing of the spark of either is controlled by one lever from the steering-wheel. The high-tension ignition-plugs are supplied from an ordinary set of induction coils, each having a separate trembler. The commutator is mounted centrally on the cam-shaft operating the exhaust-valves. The low tension igniters work in conjunction with a rotary magneto driven by the engine, and the mechanism operating the igniters is so arranged that it can be thrown entirely out of use when required. In addition to the ignition, the speed

Fig. 30.—The Chassis of the Leon-Bollée 24—28-h.p. Ca

Mr. Dew, of the Speedwell Motor and Engineering Company, who have secured the British agency for these cars, the feature of which is their marvellous silence, either when in operation or when standing still with the engine running. The new vehicles are being made in two sizes, 24-28-h.p. and 40-45-h.p., both having four-cylinder engines. The following details, although taken from an inspection of the smaller car, may be regarded as applying to both. The frame, of stamped steel, is made in two sizes—one to suit the ordinary tonneau and one for bodies with side entrance. The cylinders, which are cast in pairs, are, in the 24-28-h.p. type, 106 mm. diameter by 130 mm. stroke, and at a speed of 1,100 revolutions per minute the engine is said to develop 32-h.p. The inlet valves are mechanically actuated, and are located on the opposite side to the exhaust valve. The motor is suspended from three points, the front or single point being carried in a bearing which avoids any strain on the engine shaft likely to ensue from frame torsion. The result is that it is practically impossible for the motor and gears to get out of alignment, and should even this take place, the clutch is designed to compensate for any deflection between the motor and the gear box. A large slow-running pump of the vane type is employed for the circulation of the cooling water; it is driven by gearing from

of the engine can be varied by a small hand-lever, also mounted above the steering-wheel, which regulates the strength of the spring acting against the governor. The magneto igniters are so arranged that they can be taken out in a few seconds and adjusted or cleaned like an ordinary sparking plug. Coming now to the carburettor, this is an entirely novel departure, consisting practically of two distinct spraying chambers. Up to a speed of about 30 miles per hour the mixture is supplied from the smaller jet. As the speed, and consequently the suction, of the engine increases the larger jet is brought automatically into action and the smaller one closed. The speed of the engine can be varied over a very wide range, and will run at as low a rate as 100 revolutions per minute. Passing to the clutch, this is also on special lines. The main portion is of the ordinary cone type, but the internal portion is mounted upon its shaft on a kind of spherical joint, so that it is capable of fitting accurately into the outer member, even if the shafts carrying the two members are not perfectly in line with one another. A flexible coupling is fitted between the clutch and the first-motion shaft of the gear box. The latter, like the engine, is supported at three points. Four speeds forward and reverse are provided, these being arranged in such a way that it is possible to readily change

from the first to the fourth. By an ingenious arrangement of three pedals, the clutch can be withdrawn alone, or the clutch withdrawn and the brake applied, or the brake applied without withdrawal of the clutch. To effect this the usual brake pedal, which ordinarily takes out the clutch and applies the brake, is made in halves, one half applying the brake only. The brakes on the hubs of the rear wheels are compensating, and are so mounted that when the chains are adjusted they automatically take up a corresponding position. The lubrication is effected throughout by air pressure, a few strokes of a small hand-pump sufficing to give sufficient pressure for sixteen hours' running. All the lubricators are named, and arrangements are made so that more oil can be fed to any desired bearing. The steering gear, differential shaft, and road wheels run on ball bearings. Although the Leon Bollée car has only been on the market a short time, I learn from the Speedwell Company that a number have found purchasers in this country.

At the De Dietrich stand, Mr. Jarrott, who was in attendance, pointed out to me the main changes in these well-known vehicles for the 1904 season. Four sizes are being made, viz., 12, 16, 24, and 35-h.p. The inlet valves are now mechanically-actuated off the same cam shaft as the exhaust valves. The carburettor is supplied by gravity from a special petrol reservoir which is kept supplied under pressure from the main petrol tank. The carburettor is provided with an ingenious but simple automatic device, by means of which the quality of the mixture is kept in consonance with the requirements of the engine. The ignition is by magneto, with provision to test the sparking in

Fig. 31.—The De Dietrich 16-h.p. Omnibus.

each cylinder separately by a simple cutting-out device. The clutch spring has been placed in a horizontal instead of a vertical position as hitherto, the alteration greatly facilitating the adjustment. To prevent any strain on the engine or gear-box, two universal joints are introduced between the latter and the clutch, a refinement I did not notice on any other car. The carburettor, which is controlled both by the governor and from the steering wheel, is also connected up to the clutch pedal, so that as the clutch is disengaged, the supply of mixture to the engine is throttled. A further connection is provided between the carburettor and the ignition, which provides that the latter cannot be advanced except the throttle valve be open. The brakes attached to the rear wheels are now of the internal expanding type. In consequence of the good results obtained, the De Dietrich Company are retaining the old type of ribbed pipe radiating coil, with a water tank in a sufficiently high position that the circulation will be maintained by thermo-siphon, even if the pump should fail. The frames are being made of a length to accommodate side entrance bodies, a 16-h.p. landaulet, with carriage work by Kellner, being a noteworthy example of this type. On a separate stand, what may be termed the industrial vehicles are shown, these comprising a 16-h.p. 10-seated omnibus (Fig. 31), a 16-h.p. lorry capable of carrying a load of 2½ tons and a 12-h.p. waggon to carry 1½ tons. The engine and gear of these vehicles are similar to the pleasure cars, but lower speeds are provided to adapt them for their special purpose.

Holland is represented at the Show by the Spyker Company,

of Amsterdam, and at this stand I met Mr. Elsworth, of the Elsworth Automobile Company, who holds the agency for the Spyker cars in England. The novelty of the display is the chassis of a six-cylinder 60-h.p. car, originally intended for the Paris-Madrid race, but which, unfortunately, was not completed in time for this memorable event. The frame is of pressed steel, while the engine has six separate cylinders, the inlet valves

Fig. 32.—Diagrams showing Spyker Front and Rear Wheel Driving Gear.

being on one side and the exhaust on the other, all being mechanically actuated. It is in the transmission, however, that the principal novelty lies. The power is transmitted through a leather faced clutch to a gear-box, from which extend two cardan shafts, one driving on to the rear axle and the other on to the front one, so that all four wheels are driven. No less than three differential gears are employed, one on each of the axles and one in the gear-box. It is claimed that the car is proof against side-slip. As regards the standard Spyker cars, these are being made in three sizes—12-16-h.p., 20-24-h.p., and 30-36-h.p.—all having four-cylinder engines. The car follows the usual lines of cardan-shaft transmission vehicles, among the features being the ready means of access to the pinions in the gear-box, and the pivots of the front wheels, which are entirely enclosed and work in an oil bath. The engine in the Spyker cars is a distinct departure. At first sight it resembles more than anything else a dynamo. Two cylinders and their valve chambers are cast in one with a large circular water jacket which surrounds the whole. The two castings to form the four cylinder engine have faces which fit closely together, and are kept in position by bolts. A large body of water—about 1½ gallons—is always maintained around the cylinders, this being circulated in the usual way by pump and radiator. We hope to illustrate the new motor in a subsequent issue.

Fig. 33 gives a general view of the novel six-wheel car displayed by M. V. Janvier, of Paris. The front part of the car, instead of being supported on a single pair of wheels, is carried on a set of four; the steering spindle of each wheel is connected

Fig. 33.—The Janvier Six-Wheel Car

in such a way to an articulated steering gear, that when deflected they each take the necessary angle for the curve which it is intended to make in turning the car. The connections are also such that each wheel is free to mount an obstacle without affecting the others, or lifting the car. It is claimed that the arrangement not only prevents skidding and allows of corners being taken at a

fair speed, but that the engine, being carried on a four-wheel carriage, the vibration transmitted to the car and its occupants is greatly reduced. M. Janvier's arrangement is attracting much attention, but it remains to be seen to what extent his idea will meet with adoption.

For the 1904 season La Société des Automobiles Motobloc, of Bordeaux, represented in England by Messrs. Montague

Fig. 34.—Chassis of 10-h.p. "Motobloc" Car.

Hawnt and Co., are practically confining their output to a two-cylinder car of 10-h.p. As will be seen from Fig. 34, this is on distinctly novel lines, the two cylinder engine, the cranks of which are placed at an angle of 180 deg. to each other, being set at an angle to the ground, the explosion chamber being foremost. The water circulation is maintained by a pump and fan-cooled honeycomb radiator; the arrangement, however, is such that, should the pump fail, the circulation will continue on the thermo-siphon system. The change-speed gear, which gives three speeds and reverse, is enclosed in what is practically an extension of the crank case. The sliding pinions are mounted on an extension of the half-speed shaft of the engine, and the counter-shaft, on which the friction clutch is mounted, and which is in line with the crank-shaft, is connected with the rear live axle by a single side chain. The car, although differing from the usual lines, has an excellent reputation in France, and should prove equally successful in this country.

Two firms exhibit disc wheels—Messrs. Pozzy and Potron and M. L. Stier, of Villiers-sur-Marne (Seine et Oise). An illustration of the latter is given in Fig. 35. It consists of one flat disc of steel, to the periphery of which are fixed two rings, forming half-rims. One of the rings is permanently fixed to the disc,

35.—The Stier Disc Wheel.

while the other is made so that it can be readily detached to enable the tyre to be put on or taken off. The steel disc wheel is claimed to be no heavier than the ordinary artillery wood wheel, and to be much stronger. Chain sprockets and band brake drums can readily be attached; while among other advantages are that it protects the chain from mud and offers less

resistance to the air than the usual wheel. The Arbel disc wheel, shown by Messrs. Pozzy and Potron, comprises two steel discs extending from the rim to each end of the hub. A remarkable display of pressed steel frames is made by this firm, types as made for the Darracq, Mors, Clement, Rochet-Schneider, Georges Richard, and other companies, being on view.

Messrs. De Dion Bouton have two stands, one devoted to pleasure cars and one to industrial vehicles. On the former are shown specimens of the 6-h.p., 8-h.p., 10-h.p., and 12-h.p. cars. The first two have single-cylinder engines, and the latter double-cylinder. The type which is probably attracting most attention is the 10-h.p., on one of which M. Cormier recently returned from a 7,000-kilometre tour. A feature of the car is the forced lubrication, maintained by an oil pump, by means of which distances up to over 150 miles can be run without the lubrication requiring attention. Among the side-entrance cars, a 12-h.p. landaulet attracted my attention, this being most luxuriously upholstered and having accommodation for four persons inside. On the industrial stand I first noticed a sixteen-seated omnibus for public service work. This is fitted with a 15-h.p. double cylinder engine under the driver's seat, and the usual De Dion cardan axle. Three speeds forward and a reverse are provided, the maximum being twelve miles per hour. A feature is also being made of petrol lorries of 15-h.p. and 20-h.p. Fig. 36 shows the 15-h.p. two-cylinder lorry intended for loads from 2 to 2½ tons.

Fig. 36.—The De Dion Motor Lorry.

The chassis of this is similar to the omnibus. A great point claimed for this type of vehicle is the economical fuel consumption.

The exhibit of M. E. Louet, of Paris, is always an interesting one, and this year is no exception to the rule. Claiming to be a pioneer in three cylinder engines, he has now introduced a six-cylinder motor said to develop 70-h.p., while weighing only 680 lb. The crank-shaft has a bearing between each crank. The inlet and exhaust valves are all actuated off the same cam-shaft. The mixture is furnished by two Longuemare carburettors, novel in so far as they have only one float chamber between them. A 18-h.p. car is also shown, on which is an ingenious system of ignition, only one coil being used for the three cylinders. A new departure for 1904 is a single-cylinder car of 6-h.p. Perhaps the most noteworthy feature of the Louet cars is the change speed gear, in which, instead of the pinions sliding sideways into mesh with those on the parallel shaft, they are brought into engagement directly upon the face of the teeth. Without a drawing it is difficult to explain the gear, but I may mention that the clutch-shaft terminates in a bevel gear, which drives a short shaft on which is mounted a spur wheel immediately below the countershaft. Between the two is an oblong chest, within which is a carriage carrying a series of pairs of pinions side by side. According as this carriage is moved so one of the pairs of wheels is brought into mesh with the pinion on the short shaft below, while the other engages with a spur wheel on the countershaft. The way the gear can be changed from one speed to the other has to be seen to be appreciated.

Among the combination petrol-electric cars on view are the Electrogenia of the Société de Constructions Electro-Mecaniques, whose system has already been described in the *Journal*. The motive power is supplied either by a four cylinder 16-h.p. Aster or two cylinder 12-h.p. De Dion motor, this being directly connected to a dynamo, which in turn drives the electric motor. No accumulators or rheostat are used.

It has been known for some time past that the Krieger Company were at work on the production of a combination petrol-electric car (Fig. 37), and much interest is being displayed in the vehicle of this type on exhibition. Outwardly, it closely resembles a petrol car; a 24-h.p. Georges Richard four cylinder motor, with magneto ignition, supplying the motive power, is connected up through a spring joint to a six-pole dynamo, the armature of which forms the flywheel of the engine. The current thus generated is transmitted to two small electric motors, each driving one of the rear road wheels through a pinion and internally-toothed ring. A small battery weighing only 45 lbs. is carried to supply the current for exciting the dynamo and setting the engine in motion. It is not necessary to re-charge this battery, as any current used is replaced during the few moments it is connected up to the engine and dynamo. No differential is employed, while the absence of the usual clutch and change-speed gear is claimed to result in an exceedingly easy and quiet-running vehicle, at any speed from six to forty-five miles per hour. Complete with body ready for a run, the car weighs about $1\frac{1}{4}$ ton.

Still another concern exhibiting a combination petrol-

Fig. 37.—The Chassis of the Krieger Combination Petrol-Electric Car.

electric car is the Compagnie de l'Industrie Electrique et Mecanique (Thury) of Geneva, and at the time of my visit to the stand M. Jenatzy, the winner of the 1903 Gordon Bennett race, was busily engaged in inspecting the details of the vehicle, the chassis of which is illustrated in Fig. 38. The motive power is supplied by an engine with four cylinders set in the form of a V, and located under the bonnet; this is connected up to a dynamo, which, in turn, is connected by a clutch, cardan shaft and bevel gear to the rear axle. A clutch is also interposed between the engine and dynamo. The system is completed by a battery of accumulators, of 30 ampere-hour capacity, connected with the dynamo by means of a pedal-actuated interrupter. The dynamo is designed to give a voltage equal to that of the battery, at an engine speed a little below the normal, on level roads. In this way, should the speed of the engine exceed 1,000 revolutions per minute, the voltage of the dynamo becomes above that of the accumulators, the latter then receiving the surplus charge. Reversely as the speed of the engine, and consequently the voltage of the dynamo falls, the battery furnishes automatically the additional power required, the dynamo being so arranged that, when required, it can be made to act as a motor. In this way, not only can the petrol engine be automatically started, but the car can be entirely driven off the battery through crowded traffic.

Hitherto M. Chaboche has fitted horizontal engines to his steam cars, but this year he has brought out a 20-h.p. car with a double-cylinder vertical engine under the bonnet. The vehicle, which outwardly resembles a petrol car, is driven by means of a cardan shaft and bevel gear on to the rear live axle. The boiler, which is located at the rear, has been improved, in so far that should

anything go wrong with either of the last two elements it may be readily disconnected without preventing the boiler from working.

M. Ch. Mildé has a unique stand, as it is probably the only one on which the three types of cars, electric, petrol-electric, and petrol, are shown. The Mildé electric vehicles have already been described in the *Journal*. The motor is of the compound-wound differential type, carried at the centre of the hind axle

Fig. 38.—The C.I.E.M. 16-h.p. Combination Petrol-Electric Car.

and driving both rear wheels through internal spur gearing. Although larger batteries can be fitted, the standard one consists of forty-two Heinz cells of 120 ampere-hour capacity, sufficient for a run of about thirty miles on one charge. Since the Mildé petrol-electric car was described in connection with the exhibition at the Agricultural Hall, Islington, in March last, it has been considerably improved. It is being made in two sizes, 5-h.p. and 10-h.p., the first having a single cylinder and the second a double cylinder petrol-motor of M. Mildé's own construction. In this system the current generated by the dynamo is sent to a light battery of accumulators located under the rear seats, and thence to the electric motor. The car having its own power-generating mechanism, is therefore not confined to town work, but can be used as a touring vehicle, while the engine and dynamo can even be used as a portable electric lighting plant. Of these "mixte" cars, a 5-h.p. coupé is shown, as well as a 10-h.p. landaulet with side entrance, and with the engine under a bonnet, and a 10-h.p. van intended to carry a load of one ton. The construction of petrol cars pure and simple is quite a new departure for M. Mildé, who is making 10-h.p. double cylinder and 15-h.p. three cylinder cars. These are on modern lines, with mechanically-actuated inlet valves,

Fig. 39.—The Mildé 10-h.p. Petrol Motor Cab.

chain transmission, and long frames to admit of bodies with side entrance, while a novel feature is the provision to the shaft projecting from the front end of the motor, to which the starting handle is attached, of a joint by means of which it can be connected up to a permanently fixed dynamo in the garage for electric lighting purposes. I understand that a number of the Mildé combination petrol-electric cars will shortly be running in London.

The principal novelty on the stand of the Société Germain, represented in England by Mr. Theo Masui, is a *chassis* fitted with a 15-b.h.p. double cylinder two-cycle motor. This is made according to the Hardt patents, the feature being an arrangement to introduce a supply of fresh air between the exhaust gases and the new charge of mixture, and so preventing the latter from mingling together. The engine is equipped with a carburettor, which will, it is stated, work equally well with petrol, alcohol, or petroleum. As for the cars fitted with

Fig. 40.—The Germain Steel Cylinder Motor.

four-cycle engines, two sizes are being made—15-h.p. and 30-h.p. The four cylinders are each separate and are made from a solid bar of steel. The water jackets are of copper. The inlet and exhaust valves are interchangeable, and actuated mechanically off the same cam shaft. The inlet valves are provided with a device, controlled from the steering wheel, by means of which the lift of the same can be varied, and consequently the speed of the motor regulated. Both battery and Eisemann high-tension magneto are fitted, one advance and retard lever controlling both systems. The radiator is of the honeycomb type, the arms of the fly-wheel being formed to act as a fan to draw a current of air through the radiating tubes.

An extensive range of cars is being made by the Delahaye Company for next season, extending from 8 to 24-h.p. They comprise a number of special features, particularly as regards the clutch and ignition, which will require more space for clear explanation than can be devoted on the present occasion. The 12-h.p. car is provided with a twin-cylinder vertical engine (100 mm. by 140 mm.), while those of the 16-h.p. and 24-h.p. vehicles have four cylinders. The Delahaye Company, after studying the question, have decided to retain the automatic inlet valve. The lever controlling the ignition is so arranged that as the latter is retarded an exhaust valve lifter is brought into play, thus facilitating the work of starting the motor. The cars are driven by side chains, and in the 12-h.p. and 24-h.p. types the gear box does not enclose the differential; in this way, by increasing the length of the shaft between the gear box and the differential, any desired length of frame for side-entrance cars can be obtained.

The Electromobile Company, Limited, are another of the English exhibitors. The display comprises examples of their electric victorias, landaulets, and coupés. As is well known, the feature of these vehicles is the employment of a straight frame, the same as in a petrol car, enabling a low-built carriage to be produced. The Contal-Gasnier 8-h.p. electric motor drives the rear axle through spur gearing. The battery comprises forty-four cells, the capacity of which is sufficient for runs up to 40 miles on one charge. The controller, the handle of which is mounted on the inclined steering column, is adapted to give five forward speeds, reverse, two electric brakes and stop. The cars have a neat appearance and compare most favourably with some of the electrical carriages so numerous in Paris.

The relatively low price, combined with excellent workmanship, has caused a good deal of attention to be devoted to the cars of the La Société Minerve, of Billancourt, which, although handled in this country by the agents for the Minerva motor-cycle engine, has no connection with the latter. The Minerve cars are being made with one, two, three, and four cylinders, ranging from 7 to 24-h.p. The cylinders are cast separately, with the valves, all mechanically actuated, arranged one on each side of the engine. Three speeds forward and a reverse are provided, the transmission being by side chains.

The Passy-Thellier Company, of Levallois, are making cars of from 9 to 30-h.p., and are using the De Dion, Aster and Abeille engines. The frames are of stamped steel, while the transmission is by means of a cardan shaft and bevel gear on to a live axle. Among the new features of interest is an improved worm-gear steering device. The worm is what is termed a "globic screw" variety, the advantage being that in any position the worm meshes over the whole range of teeth of the sector. The engine, change gear and differential are provided with forced lubrication, the oil being kept in continuous circulation by a pump. Not only are the three brakes interchangeable, but the two rear road wheels with their brake drums may be placed on either end of the live axle.

Three splendidly made *chassis* of respectively 15, 25, and 40-h.p. are to be seen at the stand of Messrs. Charron, Girardot and Voigt, who are represented in England by Messrs. Ewart-Hall. The 15-h.p. car is on similar lines to last year's models, with the exception of a number of detail improvements, these including the new ball-bearing axle and an improved radiator with fan. The 25-h.p. car is a new model. The frame consists of a square steel tube filled with wood. The motor (Fig. 41) comprises four cylinders with mechanically-operated inlet valves. In place of the steel cylinders of last year, separate cast cylinders are now employed. They are, however, of special design, having openings in the side closed by removable bronze plates, which not only allow the engine to be built on a smaller crank chamber, but also permit of access to the water jackets. The inlet valves are driven off the same cam shaft as the exhaust valves, with which they are interchangeable; the crank shaft of this engine

Fig. 41.—The C. G. V. 25-h.p. engine.

runs on ball bearings. The gear box, which gives four speeds and reverse, with direct drive on the fourth, has been newly designed; in it ball bearings are utilised. A new design of exhaust box adds to the silent running of the car. Altogether the C.G.V. cars are of the highest class, as an inspection of the various parts cut into sections displayed on the stand fully testifies. As regards the carriage bodies, these also are excellent specimens, and include a landaulet and a side-entrance limousine.

In addition to specimens of their 16 and 24-h.p. cars, the F.I.A.T. Company have on view a four-cylinder engine developing no less than 150-h.p. at a speed of 600 revolutions per minute. The cylinders are 240 mm. diameter by 270 stroke. Petroleum is used as fuel, the exhaust being carried round the fuel vaporiser. The monster engine, which is, I understand, intended for a submarine vessel for the Italian Navy, is started by means of a cartridge fired in the top of one of the cylinders.

Considerable interest is being shown in the railless train exhibited by Colonel Renard. It consists of a train of five or six vehicles, each being connected up to and propelled by the motor on the leading car. The steering gear of the cars has been devised on the same principle. That is to say, the train is not drawn in the wake of the engine, but the latter commands the steering gear provided on each car. Thus the train forms a completely linked system, the first car distributing the motive power generated on it through a universal shaft and gearing to each vehicle in the train. Thus each car, as it were, propels itself, and friction of all the wheels upon the roadway is claimed to be utilised instead of being a useless resistance which the engine must overcome. Consequently, it is argued, a less powerful motor will, other things being equal, draw a far heavier load than is the case with a tractor. The steering gear

arrangement is too cumbersome for it to become generally adopted.

Among the minor novelties of the Show is the exhaust box or silencer exhibited by L'Usine Electro-Mecanique, of Voiron (Isere). As the exhaust gases reach the silencer, they impinge on a small fan or turbine, which is connected up to a small dynamo. The makers claim that the electric current thus generated is sufficient to light the lamps of the car or to keep the ignition accumulators fully charged. I was also informed that in the trials made with a 6-h.p. engine, the small turbine driven by the exhaust attained a speed of 5,000 revolutions per minute running light, and 3,000 revolutions when connected up to a small dynamo.

Two motor fire-engines are to be seen—one built by Messrs. Weyer and Richmond for the Paris Fire Brigade, and one by Messrs. A. Thirion and Fils, the latter being similar to the one displayed last year. It can attain a speed of 25 kilometres and throw a jet of water 110 ft. high; it is also adapted to carry ten firemen.

Les Anciens Ateliers Sage display a 30-h.p. chassis, of which the frame is of the armoured wood type. The motive power is supplied by a Filtz four-cylinder engine, having the inlet valves mechanically actuated off the same cam shaft as the exhaust

Fig. 42.—The Renard-Surcouf Automobile Train.

of each car being controlled from the leading vehicle, enables the train to negotiate practically any curve. The train has been subjected to test, a Paris-Madrid racing car being used as the source of the motive power. The train, which weighed altogether 30 tons, attained a speed of 11 miles per hour. In another trial the train, having the same motor, successfully mounted the steep hill up to the heights of Bellevue from the banks of the Seine. The development of the system will be watched with considerable interest.

Located in a somewhat quiet corner of the Grand Palais, one of the novelties of the Show has not been so largely inspected as it would had it been displayed in the main hall. It is a new kind of "mixte" vehicle—to wit, a combined petrol and compressed air motor vehicle. It is shown by La Société Française des Automobiles Thermopneumatiques, of Paris. The arrangement is that of a motor-forecarriage fitted to an ordinary victoria. On the forecarriage is fixed a petrol motor, which drives an air compressor; the air thus compressed is in turn utilised in a compressed air engine which drives the vehicle. The petrol motor is controlled by the compressor. It is claimed for the system that the control of the compressed air motor is similar to that of a steam engine. No change-speed gear of the usual type is employed, the variations in pace of the vehicle being obtained by admitting more or less air to the compressed air engine. Although the vehicle is interesting, I fear that the

valves. A useful filter is introduced in the pipe leading from the petrol tank to the carburettor, in order to prevent any impurities from reaching the latter. The Sage Company are also making a feature of petrol motor vehicles for commercial purposes, a lorry being shown fitted with a 10-h.p. Abeille motor and capable of carrying a load of about a ton.

In the heavy steam-wagon class Messrs. Boulte, Larbodiére and Co., Paris, show one intended to carry a load of ten tons. The boiler is located in front, coal or coke being used as fuel. The two cylinder vertical engine of 50-h.p. is also located in the fore part of the frame, and drives the rear axle through bevel gear. The wagon is no less than 23 feet long. Messrs. Turgan, Foy and Co. have on view a 10-ton steam wagon, chain driven by means of a 60-h.p. engine, as well as a 14-seated tramcar driven by a Brouhot 16-h.p. four cylinder heavy-oil motor. It is intended for service in the Department of Drome, where a similar vehicle has been in use for some time past. Messrs. Turgan and Foy have apparently dropped their petrol cars with horizontal engines and flywheels, and are now turning out two types of 15-h.p. and 25-h.p., on standard lines, a vertical engine and stamped steel frame being employed. In addition to a large number of their well-known cars, the Oldsmobile Company have on view a vehicle on similar lines as regards the mechanism, but fitted with a van body to carry a load of about 4½ cwt.

(To be concluded.)

PHANOMEN.

THE MOTOR CAR ACT.

—■—

FROM Dorsetshire we have received a copy of the licence which will be issued to drivers. It has been prepared in a form which might usefully be adopted by other licensing authorities throughout the kingdom. The licence is printed on a piece of parchment 4 in. long and 2 in. deep, which is folded into a neat cloth case about the size of an ordinary railway season ticket. On one of the inner covers of this is a form of renewal—and we would congratulate the Dorsetshire authorities on the intelligent way they have carried out that portion of the Act.

A meeting of the Special Committee of the County Councils Association to consider questions arising under the Motor Car Act has been held, with Lord Belper in the chair. Those present considered the question of notice boards under Sections 8, 9, and 10 of the Act. It was decided that where such notices are erected, it is most desirable that they should be uniform. It was reported, however, that several counties, Surrey and Hampshire among others, had decided to rely upon the provisions of Section 1 of the Act, and not to fix any limits for a speed not exceeding ten miles an hour. The meeting considered certain designs for notice boards which are recommended by the County Surveyors' Society, and passed resolutions thereon which will be discussed

The Up-to-Date Racing Car—Not yet Materialised.
Das Schnauferl, Munich.

at a conference to be held shortly with representatives of the Municipal Corporations Association.

The Middlesex County Council has agreed to a report of the Highways Committee recommending that the fee for registering a motor-car should be £1; for a motor-cycle, 5s.; for alteration of register for motor, 5s.; and for a motor-cycle, 1s. The driver's licence is to cost 5s.

Portsmouth was the first County Borough to decide against a speed limit or the closing of roads, a liberal view of the Act partly brought about by the fact that the town has a splendid system of electric trams—running at quite sixteen miles an hour in open roads. Several members of the council own cars, and when the question came on only one dissident was in the division. Hants and the two other County Boroughs followed, and then the Isle of Wight.

The Midlothian County Council have decided not to supply the plates forming the identification mark; that the annual fee payable by manufacturers of or dealers in motor-cars for a general identification mark be £2; and that the colouring of the plates for the latter be white lettering on a red ground. The Council have accepted the view of the special committee which reported on the subject, that the public are protected under the first section of the Act from reckless and negligent driving through villages, and they consider that no good purpose would be served by attempting to restrict the speed of motor-cars on any of the roads in the county in any other manner than by the

erection of sign-posts denoting dangerous corners, cross roads, and precipitous places. They are further of opinion that undue multiplication of the number of sign posts would tend to defeat the object which Parliament had in view in passing the Act.

Below we give our third list of the first owners of motor-cars to register their automobiles in their respective boroughs and counties:—

ENGLAND AND WALES.

HASTINGS.—Mr. Jules F. Mastin, D.Y.1.

HERTFORDSHIRE.—The Earl Brownlow, Berkhamstead, A.R.1.

DORSETSHIRE.—Colonel J. R. P. Goodden, Chairman of the Works Committee of the Dorsetshire County Council, Compton House, Sherborne, B.F.1.

BLACKBURN.—Mr. G. H. Woods, Vine House, Revidge Road, Blackburn, C.B.1.

BARROW-IN-FURNESS.—Mr. James Fisher, J.P., Barrow, E.O.1.

YARMOUTH.—Mr. Harold Chamberlin, solicitor, Yarmouth, E.X.1.

READING.—Mr. W. H. Greenhough, St. Leonards, Alexandra Road, Reading, D.P.1.

DUDLEY.—Captain W. J. Roberts, Oak House, Dudley, F.D.1.

EAST SUFFOLK.—Major R. J. Carthew, J.P., C.C., B.J.1.

NORTHAMPTONSHIRE.—The first license to drive a motor-car in this county has been granted to Mr. G. A. Alderson, of Park Road, Northampton, whose car has been registered B.D.9.

ROTHERHAM.—Mr. J. H. Pickford, solicitor and clerk to the Rotherham Rural District Council, E.T.1.

CHESHIRE.—Mr. Maurice Egerton, Rosthern Manor, Knutsford, M.1.

PORTSMOUTH.—Aldeiman T. Scott Foster, J.P., St. Helen's Parade, Southsea, B.K.1 and B.K.2.

SCOTLAND.

BUTESHIRE.—Rt. Hon. A. Graham-Murray, M.P., Secretary for Scotland, S.J.1.

PEEBLES.—Sir Duncan E. Hay, Bart., King's Meadows, Peebles, D.S.1.

KINCARDINE.—Mr. A. G. Ogston, Ardoe, near Aberdeen, S.U.1.

WIGTOWNSHIRE.—Mr. Marmaduke Fox, Polbae, O.S.1.

ARGYLLSHIRE.—Mr. J. S. Matthew, Ardfillayne, Dunoon, managing director of the Scottish Tyre, Limited, S.B.1.

MIDLOTHIAN.—Mr. J. A. Maconochie, Welwood, Kirknewton, Midlothian, S.Y.1.

IRELAND.

Co. KERRY.—Mr. W. J. Girvan, Laune View, Killorglin, co. Kerry, I.N.1.

DUBLIN COUNTY.—Mr. T. L. Plunkett, D.L., Portmarnock House, Baldoyle, I.K.1.

LIMERICK COUNTY.—Captain James D. Lyons, 13th Hussars, Croon House, co. Limerick, I.U.1.

TYRONE COUNTY.—Colonel H. Irvine, Campsie Road, Omagh, J.I.1.

WEXFORD COUNTY.—Colonel J. R. Magrath, Bann-aboo, Wexford, M.I.1.

SLIGO.—Mr. Robert Simpson, Pettigrew, Ardmore, Sligo, E.T.1.

MR. W. K. VANDERBILT, JUN., has entered for the automobile races to be held at Ormond-Daytona Beach, Florida, under the auspices of the Florida East Coast Association next month.

MESSRS. MANN AND OVERTON'S, LIMITED, are removing their business from Mortimer Street to larger and more convenient premises at 7, Lower Belgrave Street, Belgravia, S.W., where they are also opening a garage.

THE Bolton Motor Company, Limited, has been registered with a capital of £6,000 to carry on the business of manufacturers and repairers of, dealers in, and agents for motor vehicles. The first directors are Messrs. F. Eckersley, R. Slater and J. V. Madgwick.

CONTINENTAL NOTES.

THE clubhouse of the A.C. F. in the Place de la Concorde has, since its establishment, been the scene of many brilliant functions, but never has such a memorable gathering taken place as on the occasion on Wednesday of last week of the banquet given by the A.C.F. to the representatives of the foreign and French provincial automobile clubs present in Paris on account of the *Salon*. Baron de Zuylen presided, having at his right M. Quinonès de Léon, of the Automobile Club of Spain, and at his left Count von Sierstorff, of the German Automobile Club. At the table of honour were the Marquis de Dion and Comte Recope; Mr. Roger W. Wallace, of the A.C.G.B.I.; Comte Kolowrat Kratowski, representing Austria; Mr. Gray Dinsmore, for the United States; Baron de Crawhez, Belgium; Baron de Sulzer-Wart, Switzerland; Signor Enrico Marchesi, Italy, etc. Baron von Zuylen in his address traced the history of the automobile movement, and, treating the subject from an international rather than a French point of view, mentioned that between 1825 and 1835 motor vehicles were in use in England, but that, owing to the imposition of restrictive regulations and tolls, the movement was killed, to be revived in France in 1894. The international character of the banquet may be gathered from the fact that the toast of "The Foreign Automobile Clubs" was responded to by representatives of the German, Spanish, Austrian, Italian, Dutch, Belgian, Portuguese, American, and British clubs, Mr. Wallace replying for the A.C.G.B.I.

THE banquet on Wednesday was followed on the evening of Thursday of last week by a gala performance at the Opera. The scene was of the most brilliant description, the beautifully-decorated building being packed by an assembly of the leading motorists of every country in Europe and even the United States. The performance opened with a march called the "Cambridge March," M. Henry Deutsch de la Meurthe, well known in the motoring and aerial navigation world, disclosing his talents as a composer. A portion of the second act of Mozart's "Die Entführung aus dem Serail" came next, and was followed by the "clou" of the evening. This was an "automobile ballet of the nations," in which stars of the corps-de-ballet represented the different countries in national costumes. All the nations passed in a brilliant procession across the stage in electric cars, supplied by the De Dion Co., each decorated with national flags. The second act of "Othello" and the ballet of "Don Juan" were included in the programme. Fortunate were those who were able to secure an invitation to the gala, for it was a sight which will not fade from the memory for many a long year.

UNDER the presidency of Prince d'Arenberg, a meeting was last week held at the A.C.F. club-house, at which delegates were present from twelve of the French provincial clubs. After some discussion it was decided to form a Federation des Automobile Clubs de France, which will work in conjunction with the A.C.F. for the general welfare of the automobile movement in the country. Prince d'Arenberg, of the Automobile Club du Centre, was elected president of the Federation, M. H.

Franchomme, of the A.C. du Nord, being vice-president, and M. A. Damez, of the A.C. du Nord, secretary.

A MEETING of the International Committee of the Gordon Bennett race was held at the A.C.F. on Wednesday last week, when Mr. Roger W. Wallace and Mr. Julian Orde represented Great Britain, France, the United States, Germany, Austria, Italy, Switzerland, and Belgium had also delegates present, Baron de Zuylen presiding. After discussion the Committee decided that competing cars in the Gordon Bennett contest shall be driven by drivers to be named by the competing clubs, and that the course on which the race shall be held must be at least 78 miles long.

IN Paris it is being stated that in the French eliminating tests, Gabriel, Rougier and Jarrott will be the drivers of the three De Dietrich cars, while Rigolly and Duray will be at the wheels of the Gobron-Brillié flyers. M. Clement has just entered three Bayard cars for the trials. So far as the programme of the Homburg automobile week has been drawn up, it comprises, in addition to the Gordon Bennett race, a hill-climbing competition for alcohol motor-cars up the Feldberg, an elegance competition at Homburg, and a motor-boat race from Mayence to Bingen.

IN connection with the automobile exhibition which opens at Turin on the 6th February, "La France Automobile" is organising a motor-tour from Paris to Turin. The journey is expected to occupy three days, and the route includes the climb up Mont Cenis, on the summit of which the tourists will be met by a party of Italian motorists.

MESSRS. SCHNEIDER AND CO., the great French gun builders, are now constructing motor-cars at their works at Havre, to the designs of M. Brillié. They have just completed a special 20-h.p. petrol motor-wagon for the Portuguese Government. The vehicle is capable of carrying a

load of five tons, and of hauling four gun-carriages.

Two motor-vans are at present being used by the postal authorities in Berlin, one being propelled by an alcohol motor and the other by electricity. The 5-h.p. alcohol van is being employed for the carriage of mails between the G.P.O. in the German capital and the suburbs of Schöneberg, while the other is utilised in the Parcels Post service.

THE A.C.F. last week paid over a sum of £200 to Gabriel as a prize for reaching Bordeaux in the shortest time in the memorable Paris-Madrid race.

THE old horse market in Cincinnati, which has been for seventy years a noteworthy feature in the industrial life of that city, has become a thing of the past, the last of the horse market stables having been leased to the Cincinnati Automobile Company. Thus where once horses were trotted up and down to show off their good points to the throngs of prospective bidders, the whirr of the motor-car is now heard.

Motoring in the Snow—Herr H. Dieterich, the President of the Dresden Automobile Club, and his brother, Dr. K. Dieterich, on their Benz Cars.

[Allgemeine Automobil Zeitung.]

MOTOR-CYCLING NEWS.

THE new Motor Car Act compels every motor-cyclist to carry a number attached to his machine in such a manner that it can be seen from either side of the road. The Act also stipulates that these numbers must be illuminated at night. To meet this demand Messrs. H. Miller and Company have intro-

duced an acetylene lamp as shown in the accompanying illustration. The number plate, which is made of aluminium, is painted a dull black, and is made detachable to enable cyclists to have the number painted on. The plate is raised above the half diameter of the glass, and consequently there is no shadow thrown upon the road.

WE are herewith able to give an illustration of the motor-cycle brake recently introduced by Messrs. Wass and Cocks, Limited, of Ealing Dean, W., and of which several correspondents have lately written in glowing terms. It consists of a lever working in a clip, attached to the compression stay of the machine. One end of the lever is fitted with a shoe having a dovetail groove into which the brake block is fastened. The brake block itself can be supplied in V section or flat, according to the section of the belt pulley. The other end of the lever is

fitted with a pawl upon which the crank presses when back-peddalling, thus applying the brake. The pawl is so constructed that it can be instantly thrown out of action when the brake is

not required. The power of the brake can be graduated to a nicety, according to pressure used in back pedalling. The makers state that it cannot possibly jam, and that its few working parts are a safeguard against its getting out of order.

A MOTOR-CYCLING club is being formed at Staines, with Mr. G. W. Manning, of Lud Lodge, London Road, Staines, as hon. secretary. Already twenty-five riders have intimated their intention of becoming members.

A SOMEWHAT novel contest was organised recently by the New York Motor-cycle Club, viz., as to who could take the longest time over a quarter mile course, the engines to be kept in action the whole of the time. The event was won by Mr. H. Jehle, who on a 1½-h.p. belt driven machine took 3min. 52 4-5 sec. for the quarter mile, equal to a speed under four miles per hour. Nothing was said about belts, and as a result, Jehle

Mr. N. J. Tuchmann, of the Motor Volunteer Corps, as a despatch bearer.

set the belt of his machine so loosely that it just gripped or slipped on the pulley sufficiently to provide momentum. The engine itself "raced" at terrific speed, but Jehle crawled so slowly that the timekeeper, walking alongside, had no trouble in keeping pace with him.

WITH regard to the Boxing Day run to Wisley of the Motor-Cycling Club the meeting-place is at the Roehampton Gate entrance to Richmond Park, at 11 a.m. Lunch will be taken at 1.30 p.m. at the Hut Hotel, Wisley.

A NEW catalogue has been issued by the Clyde Cycle and Motor Car Company, Limited. Not only does the company make cars, but they keep several for hire and also give instructions to motor-ing novices. Among the special illustrations we notice a view of the 6-h.p. two seated Clyde car, a 12-h.p. four-seated vehicle with tonneau body, and the company's well-known motor-cycles. In connection with the latter the Clyde forecarriage and a trailer have been introduced to be used with the Clyde 3½-h.p. motor-bicycle.

HERE AND THERE.

A GERMAN contemporary refers to the Diplock "Pedrail" tractor as "a technical monstrosity."

COMMANDER PRENDERGAST, of H.M.S. Excellent, Portsmouth, has just acquired a 10-h.p. Wolseley car.

SEVERAL Midland motor-car firms, including the Duryea Company, will close from Friday to Monday inclusive.

A GARAGE for the accommodation of about fifty cars has been opened by Messrs. H. J. Storey and Sons, in Cambridge.

THE South Western Electrical Company, Limited, has a motor garage near Putney Bridge, in the Fulham Palace Road, S.W.

THE first annual dinner of the Eastern Counties' Automobile Club was held on Thursday of last week at the Great White Horse Hotel, Ipswich.

AN electrical omnibus service on the Lombard-Gerin system has just been established between Gallarate and Samarate, Italy, a distance of $3\frac{1}{2}$ miles. The vehicles have accommodation for 28 passengers.

AFTER a long discussion and a personal visitation of a site in the Commercial Road for the storage of their motor-buses, Eastbourne councillors have decided that the Electric Lighting Committee must bring up a fresh recommendation.

THE Doherty Accessories Company, Limited, have brought out a new registered design of radiator, the ordinary horizontal tubes being fitted with small transverse tubes. They are also placing on the market a combined water-tank and radiator.

A POPULAR price light two-seated car is being placed on the market by Messrs. Alf. Dougill and Co., Limited, of Leeds. It will be known as the Frick car, and is fitted with a single cylinder 7-h.p. motor and with a friction-driven variable speed gear easily operated from zero to maximum in either direction.

THE exports of automobiles and parts from the United States during the month of October were valued at £23,826, as compared with £24,524 for the same month last year. The exports for the ten months ending with October last amounted to £262,392, as compared with £184,122 for the same period in 1902.

MESSRS. HANS RENOLDS, LTD., whose productions are held in such high esteem by motorists and cyclists, have sent us a copy of the new general catalogue of driving chains and wheels they have issued. It is a most interesting production, and gives illustrations of a number of different applications of chains for driving purposes. Included in these are the use of the Renold "Silent" and roller chains for motor-cars, their employment on a Wolseley car and a Coulthard wagon being illustrated.

MESSRS. SALSBURY AND SON, LIMITED, ask us to mention that their letter box was broken into on the morning of the 19th inst., and their entire post carried away. They will be obliged if those customers who remitted by that post or thereabouts, will stop payment of their cheques, or if any of them are in a position to give Messrs. Salsbury and Son the numbers of any postal orders or money orders that should have reached them that morning they will be glad to have payment stopped and the numbers forwarded so as to assist them in tracing the perpetrator of the theft.

THE Brouhot Motor Company of Great Britain, Limited, has been registered with a capital of £2,000 to acquire the benefit of an agreement between Messrs. Brouhot and Co., of Vierzon, France, and the Graphic Motor and Engineering Company, Limited, whereby the last-named company were appointed sole concessionaires for the United Kingdom and colonies for the sale of motor-cars, motors, and parts thereof manufactured by the company first mentioned. The company will take over the business created by the Graphic Motor and Engineering Company, Limited, in connection with the aforesaid agency, etc. The first directors are Messrs. W. Tattersall and J. Farmer.

A DARRACQ and a Peugeot car are being used in connection with the automobile classes at the Battersea Polytechnic.

THE Motor Inventions, Limited, has been registered with a capital of £1,000 to manufacture and deal in motors, etc. The registered office is at 1, St. Mary Axe, E.C.

A BILL has been placed before the U.S. Congress for the creation of a Bureau of Public Roads. The object and purposes of the Bureau will be to assist and co-operate in the building and improvement of public roads.

MADAME LOCKERT has again issued her "Agenda-Buvard," made specially interesting by reason of the many excellent caricatures of motorists with which its pages are embellished. Extending to more than 200 pages, this diary is also becoming a useful directory of the French automobile trade.

THE fire brigade was called to 151, Oxford Street, London, W., on the 18th inst., where a fire had broken out on the premises of the See Motor Car Company (Limited). Several gallons of petrol had become ignited in the basement, and caused a great flare for a short time, but the firemen soon overcame the mischief.

As the manufacture of electric accumulators has been certified in pursuance of the Factory and Workshop Act, 1901, to be dangerous, the Home Secretary has made a number of regulations, and directs that they shall apply to all factories and workshops, or parts thereof, in which electric accumulators are manufactured.

THE accompanying illustration shows a new plug named the "High Ball," which has been introduced by the Gas Engine Ignition Equipment Co., of Chicago. It is claimed for it that it

never short-circuits through carbon deposits. The sparking points are located on the interior of the plug casing, which protects them against damage from a fall or in inserting the plug into the cylinder.

AT Birmingham a tramcar driver has been summoned by the police for driving his car at the rate of eight to ten miles an hour, when the Board of Trade regulations allowed only four. The case was dismissed on the ground of insufficient evidence.

MR. J. GLIDDEN, of Lowell, Mass., who this year made an automobile tour to the Arctic Circle, is planning a motor trip around the world for 1904. He expects to start about August or September next, going east and covering Southern Europe, parts of Northern Africa and Southern Asia, including India and China.

MR. GEO. IDEN, M.I.M.E., works manager of the Motor Manufacturing Co., Limited, Coventry, has resigned his appointment with that company. He is one of the pioneers of the industry, and his designs and productions in motors and cars have achieved a long list of successes, the latest to his credit being gold and silver medals in the last 1,000 miles reliability trials. The Saloon car referred to in our report of the Paris Salon is also of his design.

AT the close of Miss Marie Corelli's libel action on Wednesday of last week, the Birmingham papers were circulated in that town within a very few minutes of the pronouncement of the jury, but when the parcels were made up ready for Stratford-on-Avon it was realised that there was no train till 9.25 p.m., which would mean several hours' delay. A resourceful pressman, however, rang up the Lanchester Company, with the result that in a few minutes a 16-h.p. car was doing its thirty miles per hour with a cargo of the "Evening Despatch."

SOME USEFUL NOTES.

—◆—

THERE are still quite a large number of people who prefer to have a belt connection between the engine and the gear-box instead of a friction clutch. It is true that clutches are sometimes troublesome, but the trouble may usually be traced either to the fact that the driver does not understand how to use and adjust his clutch, or that the clutch is of inferior design and construction. Generally speaking, the driver is at fault, and makes matters worse by treating his clutch with various compounds, all of which are more or less detrimental to its life and wearing, though they may remedy the trouble for a short time.

IN the case of leather-faced clutches, in nearly every instance it will be found that the trouble is either—(a) The clutch is very fierce and engages with a violent shock, or (b) the clutch slips badly and at times refuses to drive the car. A fierce clutch is generally due to very new leather, which has not been treated with castor oil to make the leather pliable, as all new clutch leathers should be; or, again, it may be due to the fact that the male cone does not engage truly with the female—that is, the leather only bites in certain places. As above stated, the first trouble may be remedied by castor oil. The clutch pedal should be depressed and the oil laid on lightly with a small brush; it will be found that the fierceness will very soon disappear, owing to the leather becoming pliable, and as soon as the fierceness has worn off it will be advisable to slightly tighten up the clutch spring. As regards the clutch which does not engage truly, this is a more difficult matter to deal with, as it means taking the clutch right down and truing up the leather; if, however, the latter is only very slightly out of truth, the cure may be effected without taking the clutch right down: the connections must be undone, the spring removed, and the male cone pulled back; then, by turning the male cone round in the female portion, it can be seen where the leather touches; by gently rasping the spots where the leather touches the surface can be made even and the leather will touch evenly all round.

SLIPPING in a leather-faced clutch may be due to want of adjustment, and consequently remedied by tightening up the clutch spring. Very often slipping is due to the presence of grease, oil, etc., on the leather, in which case the latter should be well washed with petrol and slightly roughened with a rasp, and adjusted up a little by the spring. A light tin screen should be placed between the clutch and the gear-box from where the oil usually splashes. Of course, if the leather is badly worn and fired, there is only one remedy, and that is a new clutch leather. The latter gets badly burned by injudicious driving, such as slipping the clutch continually on the high speed on a hill, instead of changing on to the lower speed.

BEWARE of putting resin and other concoctions on the leather of a clutch; the cure by such agents as resin is only temporary and very detrimental to the leather, and resin, it should be noted, has the unfortunate property of becoming heated by the friction, and consequently sticking up the clutch so that it cannot be withdrawn when required. Beware also of having a car washed when the clutch is held out by the hand-brake, as the effect of water upon the leather is by no means good.

As regards metal clutches, there is not much to be said, as the only method of treating these till actual wear sets in is adjustment. It should be noted, of course, that oil will cause slip, which may be cured by washing out the clutch with petrol and fitting up a metal shield as described above.

MR. ROWLAND WARD, the well-known naturalist, has three motor-cars, and, in "M.A.P.," tells how in 1888 he had a number of American naphtha motor launches built in New York.

CORRESPONDENCE.

UNNECESSARY RESTRICTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask, through the medium of your valuable paper, what is being done to frustrate the absurd bigotry and prejudice of the various Urban Councils, whose recommendations, if carried out by the Local Government Board, will frustrate the intentions of the Motor Car Act, 1903, will add heavy expenses to the ratepayers for notice boards, and will render motoring a nuisance. The Godstone Council, I see, have recommended that speed on four miles of the main road be restricted to eight miles per hour; this, with the action of the Caterham Council, if passed, will result in about seven miles of the main road to Eastbourne being covered at a little more than walking pace. I am sure that there are many more as absurd proposals by Urban Councils as these I mention, and I suggest that a meeting of all motorists be called at some convenient place to discuss the proper steps to be taken.—Yours truly,
ERNEST M. STORY.

NAMING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have received a number of answers to my letter proposing that owners of motor-cars should put names on them, as is done in the case of yachts and pleasure boats. With only three exceptions, the answers I have received are favourable. I hope, therefore, that the practice will become general. It would, in addition to other advantages, be of great convenience that cars should be named, as well as described by maker's name and h.p., in programmes of contests, speed competitions, etc.—Yours truly,

J. H. A. MACDONALD.

BENZ V. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re D. Beaumont's letter in your issue of the 12th inst., I was very much interested in the same, as I purchased a 3½-h.p. Benz car about six months ago and found the same fault as he has done, viz., that I could not go up even the smallest incline without dropping to second speed or even to the crypto. I have, however, made several small improvements, and now find the car gives me every satisfaction, and would, I believe, compare very favourably with almost any other car of equal h.p. on the road. In fact, the other day I did a run of seven miles on a give and take road without dropping from the top speed once. If Mr. Beaumont would care to write again I should be pleased to correspond with him on the subject and explain what I have had done.—Yours truly,

AMATEUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think if Mr. Beaumont were to have a Star carburettor fitted to his Benz he would not complain of want of power. I have one on my Benz, and I can take any slope and even hills on top speed providing roads are good. The cost would probably be about £5. I do not think there is any car to beat the Benz for a poor man, as it is cheap to run and easily kept in order. I have run 32 miles this summer without a stop in a little over two hours, and this up roads hilly and bad in places. With regard to the crypto, I rarely use it except to start the car, as it takes the strain of starting off the second-speed belt.—Yours truly,

E. G. ARCHER, M.R.C.S.

THE RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Two things seem to stand out clearly in the Automobile Club report of the reliability trials. (1) That there is no pneumatic tyre on the market which is worth its weight in straw to a professional or business man. (2) That, except in the case of one or two firms, the advertised horse-power is very little guide to the power produced.—Yours truly,
HARRY LUPTON.

THE MOTOR-CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice you are publishing a list of those who have secured the first registration of cars in their respective districts. Some years ago I brought home the first motor-car in my district and the first motor-bicycle, and now have the distinction of securing the first registration of a car in my native county (Northampton). I am looking forward to the very material benefits the self-propelled vehicle is destined to bestow upon the progress of the country, but much regret that development should be checked by restrictive legislation. Truly, we are a conservative race, although I am bound to admit the severe penalties of the new Act have been brought about to some extent by the inconsiderate abuse of

the road by those who should have jealously protected their privileges. Its application, however, is now at hand, and I trust owners and drivers of all motor vehicles will remember that future legislation for emancipation depends very largely upon ourselves, and I would commend the good old "Do unto others as you would they should do unto you."—Yours truly,

ALFRED SMITH.

THE RAILWAY COMPANIES AND THE CARRIAGE OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The salutary effect of the outcry raised by the automobile and other industries against the prohibitive conditions with regard to the carriage of petrol which the railway companies endeavoured to enforce some eighteen months ago has unfortunately not proved of a lasting nature, and the antagonistic attitude of these companies to the new form of locomotion is once again made manifest by the issue of an extraordinary form of indemnity which they require to be signed by the consignor of a motor carriage before they will accept it for conveyance.

The actual notice and indemnity form as sent out by one of the railway companies reads as follows:—

"CONVEYANCE OF MOTOR-CARS AND MOTOR-CYCLES INDEMNITY."

"The.....Railway Company hereby give notice that they do not accept for conveyance motor-cars and motor-cycles charged with electricity, or with gas, oil, or any other inflammable liquid or vapour, and that they require the following indemnity to be signed before accepting such machines."

.....Station.
.....190

"I hereby declare that the motor.....which I require to be conveyed from.....to.....is not charged with electricity, or with gas, oil, or other inflammable liquid or vapour, and in consideration of the.....Railway Company accepting the said motor.....for conveyance, I agree to relieve the company from all risk and responsibility in respect of the same, and I also agree to indemnify the company against all damage, loss, or expense which may arise out of, or be incurred in consequence of, such conveyance."

.....Signature of Sender.
.....Address.

Witness.....

The obligation laid upon the consignor to withdraw all petrol from the vehicle prior to its despatch is perfectly reasonable, and while the need of removing or discharging the accumulators only carried on a car for ignition purposes may rightly be regarded as a vexatious and unnecessary precaution, still this point sinks into insignificance beside the indemnity involving the consignor in almost limitless responsibility in respect of any damage, etc., which may arise out of the conveyance of the vehicle.

As the railway companies refuse to accept at all a vehicle charged with electricity, gas, oil, or any other inflammable liquid or vapour, it is obvious that the latter portion of the indemnity can only refer to motors not so charged, and therefore the companies evidently intend to hold the unfortunate sender responsible for all damage, loss, or expense arising out of the mere conveyance of the vehicle, surely a most posteronous condition.

The possibilities it opens up are numberless. For example, a vehicle might break loose and cause damage to the companies' property; the consignor could be held liable. It might cause injury to an employee of the company during loading; the consignor could be held liable.

Of course, it is conceivable that the railway companies mean this letter of indemnity only to apply to losses resulting from omission to discharge petrol, etc., from a vehicle; but, if so, it should be clearly stated, and I think the words "in case it shall be found that the said motor is so charged" should be inserted after the words "I agree," in which case the complete clause would read as follows:—

"And in consideration of the.....Railway Company accepting the said motor for conveyance, I agree, in case it shall be found that the said motor is so charged, to relieve the company from all risk and responsibility in respect of the same and to indemnify the company against all damage, loss or expense which may arise out of, or incurred in consequence of, such conveyance."

It is quite evident, however, that, to rectify the present state of affair, concerted action is imperative, and I venture to hope that, not only will the various automobile clubs and trade societies take immediate steps, but that automobilists all over the country will protest in no uncertain manner against such unjust conditions of conveyance. —Yours faithfully,

E. M. C. INSTONE.

THE 5-H.P. HUMBERETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the enquiry by "Tilehurst," in the *Journal* for the 12th inst., I take this opportunity of giving my experience of a Humberette

car. The writer left Coventry in a new Humberette for Scotland on October 20th. The weather was exceedingly wet and the roads consequently heavy. The first day we went as far as Nottingham. The next morning there was no improvement in the weather, but we decided to push our way north. Leaving Nottingham at 9.30 a.m., we drove on through wind and rain, the car meanwhile giving the utmost satisfaction. Durham was reached at a late hour the same evening. The next morning, although the weather had slightly improved, the roads were as heavy as ever, but we started for Newcastle at 10.30 a.m. This was the worst piece of road on all our journey north. In some places the mud was the depth of three inches. The engine worked beautifully all the way, and gave us absolutely no trouble. Edinburgh was reached at 9 o'clock the same evening. We have up till now travelled no less than 1,400 miles, and, with the exception of four punctures and a slight defect with a sparking plug, have had absolutely no trouble whatever.

As for learning how to drive, the only lesson the writer received was while sitting beside the driver on the way north, after which he was quite master of the levers. As regards the working of the car, I always see that my accumulator is fully charged, also that all grease boxes are well packed, and every part properly lubricated. In my opinion those little details, if attended to, save a great deal of trouble while on the road. I can safely recommend this car to any one who wishes a safe, pleasant little hobby. —Yours truly,

DANIEL LAWSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Tilehurst's" query, in your issue of the 12th inst., asking for the experiences of a private user of the 5-h.p. Humberette, perhaps mine may be of interest to him and to others of "moderate means." I got the car about the middle of last August, and have covered about 700 miles on it. I have had but three stoppages on the road, for none of which I can blame the car. The first was due to a piece of leather blocking up the petrol supply pipe to the carburettor, the second a punctured tyre, and the third was due to a nut coming loose. Since then I have gone through every nut on the car, so this last should not happen again. The machine is very simple to drive, and is economical in petrol and lubricating oil. An average speed can be maintained of twenty miles an hour on give and take roads in the country, and as the car is a very good hill climber, it is rarely necessary to get on the low gear. I have yet to experience my first side-slip, my immunity from this being no doubt due to the relatively long wheel base. The seats are comfortable, as there is plenty of room for the feet. Enough luggage for a short tour may be carried under the seat, and there is ample room for tools, spare parts, &c. It is a smart-looking car and well finished, and I can confidently recommend it to anyone on the look-out for a cheap car. Needless to say, I have no interest in the manufacture of the machine.—Yours truly,

W. D. HEYWOOD.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any reader tell me how to put an 8-h.p. engine right which shows a loss of power? I have fitted a new piston and rings, ground in the valves, and have a perfect compression. The magneto ignition gives a good spark so far as I can see, and the carburettor seems all right. Is the loss of power connected with the carburettor or the magneto?—Yours truly,

LOSS OF POWER.

["Loss of Power's" trouble is probably due to the ignition being timed too late. If this were so, the engine would appear to be running all right whilst stationary, but would slow down immediately the load was put on. Failing this, the exhaust valve might be carefully examined to see that it is timed to lift at the proper time. This, if not correct, would also cause loss of power.]

SCREENS AND CANOPIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad of some information as to tops and screens for motor-cars. There seem to be varied opinions upon these and the desirability of using them. To what extent do they slow the car, and do they create so much draught to outweigh the advantages? I am about having a body built, and if I have any kind of protection, want something that is easily carried and can be used or not without much trouble. I incline to a screen which can be let down or hinged to form protection for the lower parts of occupants only when not up, and a hood that will fold back on tonneau; but these hoods, etc., appear to catch the wind very much. The question is whether the above is better than a canopy, etc., which, to be sure of having when required, must always be carried.—Yours truly,

F.

[We think "F." could not do better than use the ordinary glass screen and canopy for his car in preference to the hood. The latter is a great drawback to speed unless on a very powerful car, and even then does not add to the comfort of the occupants. There are many firms now making a speciality of bodies with canopies and screens, and "F." could not do better than apply to these for designs.]

QUERIES RE DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Would you, or any of your readers, mind informing me if it is possible to put a 4½-h.p. De Dion cylinder head and piston and rings to a 3½-h.p. base chamber and connecting rod? Would the four studs, water fittings, and induction pipe come right?—Yours truly,

J. B.

[It is quite possible to fit a 4½-h.p. De Dion cylinder to a 3½-h.p. crank case, but a new connecting rod, new piston, and rings will be needed. The holes in cylinder will require slightly easing over to fit the studs. The present water fittings and induction pipe can be used, with slight alterations.]

A MILITARY MATTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Many months ago the Secretary for War offered three prizes, of the value of £1,000, £750, and £500 respectively, for tractors which should be suitable for military purposes. It was announced that the trials would be conducted in the spring of last year, and, in order that the tractors should be thoroughly tested, they were promised to extend over a considerable time. Entries had to be sent to the War Office not later than January 1st, 1903. After a long delay it was announced that the date of entry had been postponed to considerably later in the year, and at last we are able to learn, from an announcement a week or two ago, that the first prize has been awarded. The second and third awards were not given, because of the lack of competitors. One hardly knows whether to praise or blame the War Office in this matter. True, they have of late shown considerable awakening to the value of motor-vehicles for military purposes, but the way in which this competition was conducted does not seem to have been successful in attracting a sufficient number of entries to give the results a comparative value. I would suggest that, should the War Office seriously contemplate taking up the matter, they should make their competitions known throughout the country, not only by circulars addressed directly to all the known firms likely to enter, but also by announcements in the public press which are likely to come under the notice of the many inventors now quietly at work on the subject. Furthermore, civilians being unacquainted with military methods, would, perhaps, prefer that the committee responsible for the arrangements should consist of a proportion of non-military persons. In fact, seeing the success that has attended the trials of pleasure vehicles organised by the Automobile Club, and the way in which the van trials of next year are being anticipated, would it not be well for the War Office to take the A.C.C.B.I. into association in any future experiments which may be made? With such men as Colonel Crompton, Major Lloyd, Major Holden, and others at the head of affairs, there should be no difficulty in arranging a competition which should attract general attention both at the time it was held and at the announcement of the result, instead of the whole matter being dismissed by the newspapers in a stray paragraph or two.—Yours truly,

AN INCONSPICUOUS INVENTOR.

LARGER DRIVING WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—I am interested in N.W.P.'s letter re the use of larger wheels with solid tyres on cars, as I have always thought myself that this would make a very good combination. I am afraid, however, there are difficulties in the way.

In the first place, the car, unless hung low down on dropped axles, would not be very safe at corners, and, if it were hung low down, it would not leave any extra air space underneath, and the wheels might be in the way of passengers mounting the car. These difficulties might, however, be overcome. It is certainly a great pleasure to drive a car without having to think about the tyres.

The old Daimler and Benz cars, it must be remembered, were hardly speed monsters, and when a speed of twenty miles per hour was attained the noise and jolting was generally rather excessive on all but very good roads. The idea is, I think, well worth the attention of manufacturers.—Yours truly,

A. C. E. W.

IRIS MOTOR-BICYCLE.—Replying to Mr. Thos. West, the agents for this are the Iris Motor Company, Holland Street, North Brixton, S.W.

MALTA.—Letters to "Subaltern," who wrote re an opening in Malta, have been forwarded to our correspondent.

SPARKING PLUGS.—"Toronto" asks:—"Is there any one who rectifies sparking plugs? I have several used on my motor-car which do not appear to be worn out. I should like them examined and repaired, if they could be."

SPEED INDICATORS.—Mr. W. Ritchie Smith, who enquires for makers of speed indicating instruments, is referred to Messrs. Thorpe and Salter, 225, High Holborn, W.C., and Messrs. A. Dunhill, Ltd., 145-7, Euston Road, N.

FAFNIR MOTOR-CYCLE ENGINES.—Replying to Mr. T. Baker, full particulars of these motors can be obtained from Messrs. G. Straus and Co., 211, Upper Thames Street, London, E.C.

ANTI-FREEZING MIXTURES FOR CYLINDER COOLING WATER.

WHEN cold weather came on last autumn I became interested in the subject of non-freezing liquids for cooling petrol motors, and began to inquire among builders, agents, and users as to what was a satisfactory and non-injurious solution. I had occasionally noticed in journals the mention of calcium chloride solutions and diluted glycerine for this purpose, but nothing of a definite or positive nature. The articles noted were usually nothing more than remarks that this or that substance, in indefinite and varying form, was suitable.

My inquiries proved that there was no definite information to be had from the sources tried. Among the objections to calcium chloride were the following:—"Engine got too hot," "Stuff would freeze when it was only moderately cold," "It costs too much," and, most alarming, "We have tried it at the factory and it ate holes in the tanks, pipes, and even the cylinders."

Glycerine was said to work well in some cases, but was very expensive, as it became fouled in a short time and had to be frequently renewed. Where rubber hose was used in connecting various parts these were attacked and caused failure. Inasmuch as CaCl₂ was supposed to be a neutral and inert substance, and was really cheap if not purchased in homeopathic doses, it being practically a by-product worth in large quantities ½d. per pound and purchasable in the quantities now under consideration at from 2½d. to 5d. per pound (although one wholesale chemist asked me 2s. 8d. per pound for the commercial article), I then decided that I would avail

Diagram 1.

myself of facilities in the way of assistants and apparatus ready to hand, and have a few simple and easily-made determinations carried out, so that the information to be gained might be available for the free use and information of fellow users of petrol-cars, and that the doubts now surrounding the subject might be, to at least some extent, removed from their minds.

Diagram No. 1 shows freezing points of CaCl₂ solutions, plotted from a table given in Siebel's "Compend of Mechanical Refrigeration," which will be seen to produce a slightly erratic curve. The diagram also shows freezing points of such solutions determined for me by Mr. L. H. Flanders in one of the laboratories of the Westinghouse Machine Company, the lowest point being 2° below 0° Fahr., this being where the brine tank in which test solutions were chilled froze solid. The boiling points of the same solutions were also determined, as shown in the upper part of the diagram.

I have added a curve of boiling points as given in "Dictionary of Solubilities," by A. M. Comely, which are slightly higher than those determined by Mr. Flanders, possibly due to errors of observation, as there was no effort to make extremely accurate determinations, it being unnecessary for the case in hand. It will be noted that a solution of CaCl₂ of about 1.20 specific gravity will not freeze until it has reached a temperature of about 15° below 0° Fahr., and that it boils at about 220° Fahr. This solution should, therefore, be satisfactory in any reasonable climate. As to the question of injurious action of this solution on the metals with which it must come in contact, at the temperature mentioned, I would say I now feel satisfied that there is no cause for apprehension, except, possibly, in the case of galvanised iron or of zinc.

Careful experiments to determine this question were made for me by Mr. H. C. Babbitt, chemist at the laboratories of the East Pittsburg Gas

Works, whose report in condensed form is to the effect that tests were made to find the action of commercial calcium chloride upon soft steel, cast iron, sheet copper, sheet brass, galvanised iron and zinc. From 10 to 15 grammes of clippings of each metal were carefully weighed and kept at a temperature of practically 212° Fahr. in a 50 per cent. solution for periods of from three

Diagram II

or nine days, the solution being allowed to boil during part of the time. The results were as follows:

	Per cent.
Steel lost in weight	0.07
Iron lost in weight	0.09
Copper lost in weight	0.07
Brass lost in weight	0.001
Galvanised iron lost in weight	0.16
Zinc lost in weight	0.47

These figures are extremely small, and probably, at least partly, due to the removal of a small amount of oxide or scale, and, possibly, even dirt, excepting in the cases of galvanised iron and zinc, the latter of which is evidently attacked, and therefore this metal and galvanised iron, on which

had made a similar test about a year ago with iron and copper, and that he had found, after ten hours' boiling in a strong solution, a very slight loss in the case of the iron, which is ascribed to the removal of a small amount of scale; but the losses on both metals were practically nil and negligible. No tests on galvanised iron were made, but they are now being carried out. Mr. Haynes further states that he had this solution in a car for several months last winter, and was unable to find any indications of injury. In my own vehicle, in which no galvanised iron is used, I have had this solution for a month or more, and have had careful analyses made of small samples of the solution drawn each week, with no indications of the presence of any one of the metals included in the system.

In the case where serious injury was reported from the use of calcium chloride I believe that this substance was in some way substituted by some other, and that in all probability chloride of lime, whose chemical formula is CaOCl_2 , was used. As the average automobilist has no facilities for determining specific gravities, and as making a percentage solution by weight of a deliquescent substance such as CaCl_2 is a very unreliable procedure, I append a curve (No. 2) showing parts of water to be added to one part of a saturated solution of CaCl_2 to produce approximately solutions of various specific gravities. To be fairly accurate, the saturated solution must have a temperature of 60° Fahr., and it can best be made by dissolving as much of the salt in water as the water (thoroughly stirred) will take up, with some crystals left undissolved when the solution is at 60°. Roughly, to make one gallon of saturated solution will require about one-half gallon of water and eight pounds of the commercial calcium chloride, having, usually, the chemical form of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$. It happens that approximately the best solution for our purpose in this latitude (Pittsburg, Penn.) can be made by using one part saturated solution and one part water. All that is needed, therefore, is a measure of some kind and a fairly reliable thermometer. The solution will contain some insoluble impurities and should be carefully strained or filtered.

Some samples of calcium chloride contain more or less "hydrated water" than is given in the above formula, and therefore the quantity of crystals per gallon of saturated solution may vary somewhat. In other latitudes a solution of higher or lower specific gravity may be advisable, and it is well to use as weak a solution as will be safe against freezing at the lowest temperatures to which the vehicle will be exposed. It is important that when a solution of high specific gravity, such as proposed for this latitude, for instance, is used it be not allowed to concentrate materially by evaporation, but that water be frequently added to the tank so as to keep the solution fairly normal; otherwise crystals may form in the pipes and cause trouble. A good plan is to purchase a suitable hydrometer and occasionally measure the specific gravity; but this is not really necessary.

For the use of anyone who may prefer glycerine I append a diagram (No. 3) showing curves of freezing and boiling points of various volumetric percentage solutions. Any losses from leakage should be made up by the addition of fresh solution in either case, while losses from evaporation are to be made up by adding water as above mentioned.

E. E. KELLER.

A QUESTION OF WARRANTY.

In the Glasgow Court of Session judgment has been given by Lord Kyllachy in the action by James Cowell, and Ernest Cowell and John Cowell, his sons, residing with him, against the Glasgow Motor-Car Company, for payment of £230 and £50. In March last pursuers purchased from defenders, as agents for the builder, a 6½-h.p. Peugeot car, complete, for £230, receiving with it a warranty that "this car is guaranteed for three months against any defective workmanship and material." Pursuers averred that numerous defects manifested themselves in the mechanism, and finally, on the evening of June 11th, the back axle broke near the hub, with the result that the hind wheel came off. By the occurrence of these repeated breakdowns pursuers became convinced that the car was radically defective in workmanship and material, that it thus failed to comply with the warranty, and that they were therefore entitled to reject it.

Defenders not only declined to take back the car and return the price, together with the second sum sued for as expenses incurred, but also rendered pursuers an account for various minor repairs. Defenders denied that the breakdowns were due to defective material and workmanship, and averred that they were due to recklessness, carelessness, and want of knowledge in handling the car and its mechanism. They also explained that they kept to their guarantee, viz., to replace any defective part or parts which might break by flaw or fault of workmanship.

Lord Kyllachy absolved defenders, but found neither party entitled to expense of proof, and defenders entitled to expense to date of closing of the record. It appeared certain, his Lordship said, that the various breakdowns must be attributed either to defects of material or workmanship or to gross mismanagement of the car by pursuer's sons. Mismanagement was always possible, but there was no evidence of anything of the kind, and nothing was proved. The final catastrophe was due, his Lordship thought, to faulty steel around the recess of the ball-bearings. If pursuers had confined their claim to have the proper repairs executed he should have been disposed to decide the case in their favour. His Lordship thought, however, that pursuers were not entitled to reject the car and require the price back, and repair, not rejection, was the remedy stipulated in the warranty.

the zinc would also be attacked, are not so well fitted for use in the circulating system of a motor-car. The figures would indicate that the solution had no action whatever on brass and only a very slight and negligible action on other metals than zinc. They look larger in percentage than by actual weight. In each case the weight actually lost was in fractions of a milligramme, and would be considered within the limits of error.

Since writing the foregoing I have received an interesting letter from Mr. Elwood Haynes, of Kokomo, Ind., stating that he

NO LIGHT.

JOHN GOODWIN, of 6, Beira Gardens, South Kensington, was summoned at Bow Street (London) Police Court, for driving a motor-car in the Strand at night without having a red light clearly visible from behind. The defendant had a lamp with a red glass, but owing to the splash-board it could not be clearly seen by anyone standing immediately behind the car. Mr. Marsham, after inspecting the vehicle, came to the conclusion that the regulations had not been complied with, and imposed a fine of 10s. and 2s. costs.

CLAIMS FOR DAMAGES.

AN action was brought by Thomas Milward, Meriden, in the Birmingham County Court, against the Rex Motor Manufacturing Company, Limited, Coventry, for the recovery of damages for injuries sustained by himself, his trap, and harness, arising from the negligence of defendant's servant when he was driving a motor-car in the Coventry road on May 13th last. After a lengthened hearing the jury returned a verdict for plaintiff for £75.

AT the Birmingham Assizes, Charles Willetts, Cradley, brought an action against Squire Brooks, Lye, near Stourbridge, to recover damages for personal injuries received through the alleged negligent driving by the defendant of a motor-car. According to the case for the plaintiff, on August 5th, the plaintiff, with his wife and family and a driver, drove out in a gig in the Cradley district. Near the crossing of the Pedmore and Stourbridge road the defendant in his motor-car collided with them. They contended that the motor-car was going too fast to safely negotiate the corner on its proper side, and that it came out on the wrong side of the road. No horn was sounded, and before plaintiff could get out of the way the car dashed into the gig, tilting it up, and throwing out all the occupants, with the exception of the driver. The plaintiff was seriously injured, was confined to bed for a week, and it was eight weeks before he could resume work. A large number of witnesses were called on either side as to the facts. The jury found for the plaintiff, and assessed the damages at £50.

POLICE TRAP.

At Stokenchurch, on the Oxford road, a police trap, a quarter of a mile in length, has resulted in the capture of a few motorists of late.

MOTOR-CAR ACCIDENTS.

ERNEST JAHINEAU, 26, of Old Compton Street, Soho, W., was charged at Bow Street on Saturday with driving a motor-car to the common danger. Edward Pickin said he saw three ladies crossing High Holborn, and one of them was knocked down by defendant's car, which was travelling about 14 miles an hour. She was dragged along about ten or twelve yards, and was run over. The defendant refused to stop. A constable said defendant took no notice of his signal to stop, but he had to draw up at a barricade in Little Queen Street, and was then arrested. He was remanded.

At Highgate Police Court, William Blackwell, of Coventry, appeared in answer to an adjourned summons, charging him with wantonly driving a motor-car and causing bodily harm to Robert Fletcher. The prosecutor

was crossing the Great North road near Fallow Corner, Finchley, on the evening of September 1st, when he was knocked down by a motor-car driven by the defendant and owned by a Spaniard, who was stated to be a man of wealth. Both legs and several ribs were injured, and he had to remain in the hospital for six weeks. Mr. Searle, solicitor, on behalf of the prosecutor, now asked that the summons might be dismissed as the owner of the car had made an offer of compensation. This course was allowed.

CLUBS AND ASSOCIATIONS.

SHEFFIELD.

ON New Year's Day the Sheffield Automobile Club will hold a circular run, to commemorate the coming into force of the Act which allows a speed of 20 miles an hour in the open. The meet will be at the Sheffield Town Hall, at 11 a.m., and the route via Baslow and Edensor to Rowley and Bakewell, Rutland Arms, and back to Sheffield.

Mr. S. E. Fedden will give the first Club lecture on Thursday, the 16th prox., at the head-quarters, his subject being "Electric Ignition as applied to Motor Vehicles." The non-stop certificates, which were won by Messrs. G. Lee, A. T. Dewhurst, W. James, J. T. Thompson, P. H. Dodds, W. B. Davy, J. Thompson, and W. S. Gilder in the 40 Miles' Non-Stop Trial will be presented on this occasion, and a presentation will also be made to the late hon. secretary, Mr. J. R. Wade.

With the advent of the New Year, it is proposed to have a special section for the motor-cycles, with weekly fixtures, and until the necessary arrangements can be made the motor-cycle section will meet at Leopold Street on Thursdays, and Hunters' Bar, Saturdays, at 3 p.m., for impromptu runs.

LINCOLNSHIRE.

At the annual meeting of the Lincolnshire Automobile Club, over which Sir Hickman Bacon, Bart., presided, the report of the committee was read, in which it was hoped that trials of agricultural motors would be carried out during the coming year. The rules of the club had been altered at a special general meeting, defining "the trade," and excluding those in "the trade" from participation in the management of the club affairs. It was a question whether the rule was not too stringent, and whether some change was not desirable. In regard to another rule, it was also very desirable that this should be altered, with a view to enabling the best terms possible to be obtained in negotiations with any automobile authorities. The club membership had now reached 118, which included almost the whole of the automobilists in Lincolnshire. It was suggested, in view of the heavy work done by the committee, of which the members knew nothing, except indirectly, that the secretary should once a month send to all members who desire it a short resume of these proceedings at a small annual charge to cover postage. The finances of the club were shown by the balance sheet to be in a very satisfactory condition. Sir Hickman Bacon was re-elected president.

COUNTY COURT CASE.

AN amusing story of the adventures of a motor-car has just been related at the Lambeth County Court. H. G. Elliott, trading as H. G. Elliott and Company, motor-car makers, Peckham Rye, was sued by Henry Burgess, a commercial traveller, for breach of warranty in respect to a motor-car. In September, 1902, Burgess agreed with the defendant that the latter should build him a car, but it was not until well on in the present year that the first trial trip was made. They were to go to Sevenoaks, but had a breakdown at Bromley. Subsequently there were fully fifty trials, but on no occasion did they travel two miles without stopping. Judge Emden gave judgment for plaintiff for £30 and costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE present year will be an anxious one for motorists who take the matter seriously. In this country the effects of the new legislation will have to be carefully watched, and Continental observers will follow the course of events in the United Kingdom with more than ordinary interest. Exhibitions in all the leading centres throughout the world will follow that at the Agricultural Hall, London, in March, and the season of speed trials will be inaugurated by the Algerian Club's kilometre contest on the 24th inst., and that on the Ormonde-Daytona Beach, U.S.A., on the next day. It has been decided that the race for the Gordon Bennett cup will take place over the Taunus course on Friday, June 17th—a fortnight earlier than last year—and on another page our Continental correspondent gives the latest information available with regard to that event. Altogether it will be a busy year, towards the end of which the delivery van tests of the A.C.G.B.I. will contribute an important series of events.

The Hutton Racers.

SOME brief particulars of the racing cars which have been entered for the British eliminating trials for the Gordon Bennett team by Messrs. J. E. Hutton, Ltd., have been made known. They will be on entirely new lines. The engines, which have six vertical cylinders, are nominally of 90-h.p., but will develop 150-h.p. at a speed of 1,200 revolutions per minute. The variable-speed gear is said to contain no gear wheels, and is actuated by a small lever on the steering wheel, which controls by hydraulic pressure a variable eccentric; any desired speed between zero and the maximum can be attained. One brake, brought into action by a button on the steering-wheel, is hydraulic, the other mechanical. Other new features will be found in the clutch, which is designed to run in oil, in the radiator, and in the road wheels and axles.

A Deeside Revolt.

THE advocates of the walking pace for motor vehicles in populous places are not meeting with success in every district. At the last meeting of the Deeside District Committee a recommendation of the County Road Board to the effect that the speed of automobiles passing through villages should be restricted to six miles an hour was rejected, Lieut.-Col. F. N. Innes, the chairman, pointing out that many an ordinary horse and carriage travelled at a higher rate of speed. Mr. Nicol thought it was a mistake to suggest a limit. He hated motor-cars probably as much as any man in that room, but recognised that the imposition of any limit under the speed of twenty miles an hour would simply assist motorists to get out of difficulties. By the Act as it stood, whether a motorist were

driving at twenty miles an hour or not, if he drove recklessly and negligently, or in a manner dangerous to the public, he committed an offence, and was liable to be penalised. If they imposed a limit of ten miles an hour in certain places they would have to take upon their shoulders the onus of proving that the motorist was driving faster than ten miles an hour. The motorist might say he was not driving faster than the ten-mile limit, and the result of the imposition of the limit would be to tend to reduce very much the responsibility of the driver.

More Motor 'Buses.

THE coming summer will see many changes in favourite tourist resorts throughout the United Kingdom, and motor-vehicles will ply for public hire on some of the popular routes in the Scottish Highlands. The Great North of Scotland Railway have just placed an order for several 20-h.p. Stirling's motor-omnibuses of special design, for delivery in March, to run, it is understood, between Ballater and Braemar. The interior of the vehicles will be handsomely furnished and fitted with movable windows. It is hoped the example of the Great North Railway will be followed by others interested in the success of numerous Highland coach routes. From Ireland comes the news that a company is being formed at Swords, co. Dublin, for the purpose of establishing a motor-bus service between that place and the city of Dublin. It has been decided to run a car capable of conveying twenty passengers three times each way daily between Dublin and Swords, and also to supply motor-cars for goods traffic.

Railways and Cars.

WITH reference to the subject of the conveyance of motor-cars by rail, raised by Mr. Instone in our columns last week, some dealers in automobiles have found it more economical to send vehicles by rail at owner's risk, and insure them at Lloyd's. It is a point upon which some information might usefully be given by firms who have had experience in this direction, and it might be well if the Automobile Club would arrange for a discussion on the subject at an early meeting, this being one of the topics of current interest to all motorists.

A Club for York.

LAST week we chronicled the formation of an automobile club for Berkshire; now comes news of a similar organisation, being formed in the ancient city of York. Between thirty and forty gentlemen met at the Black Swan Hotel, York, to consider the advisability of forming such a club for York and district. Dr. Noel Hood presided, and the meeting was evidence of the interest taken in motoring in and around the city. The club will have its social side, but the main object is to look after the interests of those who enjoy the popular mode of locomotion. Dr. Angove and Mr. Hopkins were elected secretaries, Dr. Noel Hood treasurer, and a committee of eleven members was appointed. The club starts with a membership of forty, and will meet every fortnight at the Black Swan Hotel.

The Sheffield Club.

THOUGH the weather was far from promising, and the prospect of favourable roads equally discouraging, members of the Sheffield and District Automobile Club participated on Saturday in a successful non-stop run from the city to Newark, and back to Ollerton, a distance of fifty-four miles. Seven cars participated in the event, the start from Surrey Street shortly after ten o'clock being witnessed by an interested crowd. Four of the vehicles entered completed the run without a stop in the following order:—Mr. Benjamin Hind, 9-h.p. Clement; Mr. Evans, 12-h.p. Darracq; Mr. B. Shaw, 6-h.p. De Dion; and Mr. Pickford, 10-h.p. Wolseley. The roads throughout the route were in wretched condition owing to the recent rains, water and mud being plentiful enough to put the cars to a severe test.

**A
Lincolnshire
Motorist.**

CAPTAIN H. E. NEWSUM, who is shown in the accompanying illustration on his Richardson car, is a member of one of the oldest and best known Lincolnshire families. He is a partner in the firm of Newsum and Sons, timber merchants, of Gainsborough and Lincoln, and is the son of one

hazard labelling which has been ordered by the Local Government Board. We have to take the Act as we find it and to accept it as the wisdom of the community.

**A Fair Trial
Wanted.**

It is to be hoped that, from the outset, motorists will comply with the regulations in a fair and honest way. Already sufficient harm has been done to the progress of automobilism by the inconsiderate and reckless conduct of a small minority of drivers; the motorist who has raced through villages and scorned the warning police signal has brought hardship and annoyance upon the whole race of motorists. It is to be hoped he will curb his fancy and let his car run at a proper speed, regarding the lives and comfort of pedestrians with something like human concern.

Register at Once.

THERE should be no delay in registration and licensing, so that the police may recognise the desire of motorists to fall in with the new order of things. After all, the Act is only to be enforced for three years, and, should the con-

Capt. H. E. Newsum on his "Richardson" Car.

of the directors of the well-known firm of Marshall, Sons and Company, Limited, of Gainsborough. Captain Newsum has been for many years an enthusiastic volunteer, and when, a few years ago a call was made for volunteers for active service, he went out to South Africa in charge of the first volunteer company from Lincolnshire. Having rendered service with distinction for about twenty months, upon his return he was presented with the freedom of the city by the Lincoln Corporation.

**The Act in
Operation.**

THE anticipations of motorists have been realised and the Motor Car Act is now in operation. Automobiles will appear in the streets with all the glory of numbers and letters, mystic symbols *caviare* to the ordinary public, but indicating a train of thought between motorist and policeman which may cause these two features of modern life to appear in the same police court—but at opposite corners thereof. It is too late to revive the suggestion that the process of identification would have been facilitated had the first two letters in the name of the counties been accepted as the index letters instead of the hap-

version of public men to motoring pursuits continue to proceed as rapidly as it has done during the past three years, there should be no fear of the future. There is no doubt that when revision does take place some of the hardship of the present position will be reduced, if not cleared away altogether.

First Registrations.

News of the first registrations in various counties continue to reach us. In the county of Waterford, the Marquis of Waterford's car was the first registered; Mr. E. C. James, of Knockdrum Castle, Mullingar, was No. 1 in the county of Westmeath; in Haddingtonshire, Dr. J. B. Ronaldson, of Ennerdale, Haddington, is L.S.1. In Newcastle-on-Tyne the first car to be registered was that of Mr. W. Dunn, of College Road, Newcastle, whose number is B.B.1. Away in Wales, Mr. Gwilym Evans, of Llanelly, was the first to register a motor-car in Carmarthenshire, while Mr. D. E. Stephens, of Trawsmanor, Carmarthenshire, was the first motor-cyclist. Mr. G. A. Alderson's registration, noted last week, was for the borough of Northampton, not the county.

An Addendum.

FOLLOWING the order of the Local Government Board under the Motor-car Act, 1903, already published in our columns, an Addendum has now been issued to the Councils of Counties and County Boroughs, emphasizing some of the provisions of the Act, and the regulations made in connection therewith. The schedule of Index Marks, it is pointed out, has been prepared in concert with the Secretary for Scotland and the Local Government Board for Ireland, and it has been arranged that no use shall be made by English and Welsh registering authorities of the letters G, I, S, V, or Z, the letters G, S, and V being intended to be distinctive of Scottish, and the letters I and Z of Irish registering "societies."

Notice Boards.

WITH regard to the restriction of speed, the Board advise local authorities to be modest in their applications for such powers, as their execution will involve both trouble and expense. The characteristics and number of any such notices are left by the Act to the discretion of the Councils. It is clear, however, that it is desirable that there should be some degree of uniformity in the kind of notice which may have to be exhibited for the above purpose, and it would be well if the authorities concerned, through the medium of central associations or otherwise, were to endeavour to arrive at some agreement on the subject. It is suggested that in the case of any villages to which the ten miles an hour limit of speed is made applicable, it might be sufficient, as a rule, if the notice board were of a distinctive colour and bore upon it in conspicuous letters on the side visible to motorists approaching the area within which the speed limit is imposed a statement to the effect that the rate of speed is to be reduced to ten miles an hour within the limits or place briefly described on the notice board. The other side of the board might be indicative to drivers coming in the opposite direction of the conclusion of the restriction.

More Regulations to be Issued.

ON Wednesday we received an intimation from the Local Government Board that "a draft of the new regulations relating to the use of and construction of cars had been sent to a limited number of motor associations and persons for their observations, but has not been issued for publication." It is generally understood, however, a motor-car will be defined as a vehicle propelled by mechanical power which is under three tons in weight unladen, and is not used for the purpose of drawing more than one vehicle (such vehicle with its locomotive not exceeding in weight, unladen, four tons), and is so constructed that no smoke or visible vapour is emitted therefrom except from any temporary or accidental cause. If the car exceeds in weight, unladen, five cwt., it will have to be capable of being so worked that it may travel either forwards or backwards.

Lamps.

THE regulations as to lamps will provide that if the lamp carried by the motor-car, when the vehicle is in use on a highway at any time during the period between one hour after sunset and one hour before sunrise is so constructed fed, and used as to exhibit a light of an intensity or brilliancy likely, by reason of its dazzling effect, to cause danger, annoyance, or impediment to any person whom the motor-car may meet or pass on the highway, the motor-car shall also carry such means and appliances as are suitable and readily available for the prevention of any such danger, annoyance, or impediment as aforesaid. The driver shall, at all times when occasion requires, use promptly and effectively the said means and appliances, and shall otherwise take all such steps, and observe all such precautions as may be necessary for the prevention of danger, annoyance, or impediment in the circumstances and from the causes above referred to.

Tyres.

A CONCESSION to motorists with regard to the width of automobiles may also be expected. Hitherto this has been limited to six and a half feet. This will probably be increased to seven feet two inches. Where the car is less than a ton in weight unladen the width of the tyre shall not be less than two and a half inches; where the weight is between one and two tons the width of the tyre must be not less than three inches, and where the weight is between two and three tons, the width is to be not less than four inches. Of course these conditions will not be applicable where pneumatic or other tyres of a soft or elastic material are used.

A Directory of Numbers.

IN a few days the new regulations will be placed on sale, and motorists will then have to study the details for themselves. Meanwhile we shall be glad to have early advice of any summonses issued under the new Act, so that the proceedings may be fully reported, and no point upon which any decisions may be given shall be missed. In this connection, too, we propose to compile a Directory of Numbers, which will prove useful as some index to the actual number of automobiles in use in this country. So that this may be compiled with accuracy and fulness, we invite readers who have registered cars to send us names, addresses, and numbers without delay, and where such intimations are accompanied with the opinion of the writer as to the new Act, they will be all the more welcome.

Mr. A. E. Major on his 20-h.p. Talbot Car. His little daughter, a future Chauffeuse, at the wheel.

Dangerous Southwark.

REPLYING to the London County Council, which asked where sign-posts denoting corners dangerous to motor-cars should be erected, the Southwark Borough Council state that, in their opinion, "the whole of the borough is dangerous for motor-car traffic." Under such circumstances the Council should at once consider the matter with a view to bringing the borough into a safe condition for a class of traffic that is being recognised as the most suitable method of locomotion in the future. This particular London borough is not the residence of the wealthy, and we do not give prominence to the subject in the interests of those to whom automobilism is merely a pastime. It must be remembered that the district is an industrial one and that the work of its manufacturers and shopkeepers would be facilitated by the adoption of speedy motor traffic. Hence the removal of the reproach that Southwark, being "dangerous" to motorists, should be advocated in the interests of all concerned in the welfare of an important as well as an historic part of the metropolis.

"An Asinine Act."

APPARENTLY the Town Clerk of Southwark has strong opinions on the subject—if the strength of his adjectives is any indication of his inner thoughts. For he says that the new Motor Car Act "is a most asinine Act so far as the densely populated London boroughs are concerned, and how can we, or say Westminster, make up a list of dangerous places? Just imagine what the Act would mean in practice. Why, the 'Elephant' would have to be painted red; every spot there is dangerous. All our streets are important and busy thoroughfares, and quite unfit and unsafe to allow motors to go racing through them at twelve or twenty miles an hour." We agree that the streets of South London are unfit for racing purposes, but would emphasize our opinion that they should be made safe for motor-car traffic.

**Protest
Wanted
at Ealing.**

WE understand that the Borough Council of Ealing has applied to the Local Government Board for a regulation limiting the speed of motor-cars passing through that suburban district to ten miles an hour. Seeing the importance of some roads through Ealing, we trust that the Board will exercise its discretion in considering this request. Fortunately motorists themselves have an opportunity to influence the powers that be, and notice of objections to this regulation should be sent in writing to the Local Government Board at Whitehall on or before the 12th inst. The same should also be sent simultaneously to the Town Clerk of Ealing. Owners of motor-cars have thus an early opportunity of putting the friendship of the central authorities to the test, and, at the same time, conferring a boon on their fellow motorists by protesting against the limitation of speed in a place which cannot be called "dangerous," in the sense that Southwark regards itself.

**Motor-cars at
Waterworks.**

BOROUGH surveyors, tramway plant inspectors, and others engaged in the details of local government are beginning to regard the motor-car as an essential part of their equipment. In rural districts its value is being daily demonstrated, and in urban localities there is no reason why it should not prove economical as well as efficient in use. Mr. Batley, the waterworks engineer of Oldham, is also desirous of putting its powers to a practical test, and, at the last meeting of his committee, reported that the horse which he had hitherto employed for business purposes would soon be unfit for work so far as hill-climbing was concerned. Consequently, he asked the committee to consider whether it would not be better to substitute an automobile for his horse and dogcart. The suggestion came somewhat as a surprise to the members of the committee. Immediately they began to give experiences, mostly, however, second-hand, and therefore, of little utility to the main purpose of the discussion. One councillor had seen men in charge of a motor-car stopped for four and five hours at a time repairing it, while the Mayor had been informed that such a vehicle would cost £5 per week for maintenance. After much discussion it was decided that the waterworks engineer should make enquiries as to the cost of a motor vehicle and report to a future meeting of his committee.

**Technical
Instruction
for Drivers.**

WE have previously drawn attention to the new venture on the part of the Battersea Polytechnic in conducting special classes for the training of motor-car drivers and attendants. The course has been very successful, over thirty students having entered. Each student has attended two classes a week for a term of thirteen weeks, the instruction given including lectures and drawing and practical work in the work-

shops, where motors have been examined, taken to pieces and assembled and put in running order; tyres taken off and replaced; gear boxes taken to pieces and put together and various small repairs made, the students working individually. Different examples of cars have been examined and handled by the students, the course ending with an examination, written and practical, of a thoroughly searching character, certificates being awarded to successful candidates. Owing to the kindness of Sir George Newnes, Bart., in lending a car, the students have been afforded the opportunity of taking driving lessons on a 20-h.p. four-cylinder Darracq car, a certificate being awarded after a proper test. Mr. Mark Mayhew, Mr. Windham, Messrs. Friwell, and the Vauxhall Ironworks have shown their interest in the classes by lending cars for demonstrations and other ways. In admitting students, preference is given to those desiring to become professional drivers. It is the hope of the Polytechnic to be able to assist persons holding its certificates to obtain posts as drivers, and, as will be seen from our advertisement columns, they are prepared to send a list of their certificated students upon application. The governors are about to purchase a car for use in demonstrations and for lessons in driving, and the next course for new students will commence on Monday next.

**The Motor-Car on
the Stage.**

AGAIN at this season of the year we are reminded that the novelty of the motor-car has not entirely worn down. It appears in some of the leading pantomimes, amuses the audience at the London Hippodrome, and has its place on the theatrical posters which adorn the hoardings. Those responsible for the prominence of the automobile on the stage seem to recognise more than they did that the motor vehicle has got beyond the playful stage, and that its stubbornness is no longer a fit subject for ridicule. As a matter of fact the leading mimes are motorists in everyday life and appreciate its utility too well to make it the topic of idle jest. The process of education is making headway on the "boards" as well as in the Commons.

WE learn that up to mid-day on the 31st ult. between 1,600 and 1,800 automobiles had been registered by the L.C.C.

MR. MARCONI, of wireless telegraphy fame, has been using his new 12-h.p. Napier in the New Forest almost continuously during the holidays.

AMONG the vehicles seen running about with numbers on during the closing days of the old year were A 21, B F 18, B Y 71, A 971, an electrical vehicle, A 1271, etc.

THE Highways Committee of the Surrey County Council has decided not to schedule any ten-mile an hour speed roads, a decision which does not, however, bind the borough councils within the area.

LAST week a 40-h.p. Mercedes and another car were travelling in opposite directions over the Hog's Back when by some means they collided, both cars being overturned and wrecked. Fortunately the occupants, among whom were some ladies, escaped injury.

THE Earl of Sefton had an unpleasant experience on Monday while motoring near Nantwich. His driver took the wrong turning, the car mounted a bank, and was overturned. His lordship was bruised and cut about the face and eye, and, as the car was badly damaged, he had to proceed home in another conveyance.

AT the Newington Sessions, before Mr. M'Connell, K.C., the grand jury has quashed the indictments against Mr. Frank Colliard, of 49, Westminster Mansions, Great Smith Street, Westminster, for wantonly and furiously driving a motor-car and causing bodily harm to William Headhouse, at Balham High Road. The accused was accordingly discharged.

The Paris Motor-Car Exhibition.

[CONCLUDING NOTICE.]

Fig. 43.—The Panhard 8-h.p. three-cylinder Car. (See page 804, issue December 19th, 1903.)

THE sixth annual International Salon in Paris finally closed its doors to the public at 11.15 p.m. on Christmas night amidst a display of fireworks and Bengal lights. Early next morning the work of destruction began and by Monday evening last there remained but few signs in the Grand Palais of the magnificent display of motor-cars, boats, and accessories it sheltered for three weeks. On Saturday night the A.C.F. at its club-house in the Place de la Concorde gave a banquet to the exhibitors in commemoration of the successful termination of the show. About 250 sat down to dinner and a very enjoyable evening was spent.

Probably the most popular Serpollet steamer during the 1904 season will be the 15-h.p. car, which has been put through its paces in recent competitions. The engine comprises four cylinders set opposite to one another in pairs, the valve seats being located in the heads of the cylinders. The number of elements in the boiler has been increased with the view of rendering the steaming capacity equal to the requirements of the most hilly road. The frame is of the pressed steel variety. Quite a new type for the Gardner-Serpollet Company is the 9-h.p. "Simplex" steam car, which has a water capacity sufficient for a run of 200 kilometres. The frame is of channel steel, the boiler at the rear being placed lower than usual. The engine is a four-cylinder one. Automatic pumps have been discarded, the water pump being actuated by an eccentric and rod from the rear axle. One lever controls a combined water and fuel distributor. The weight of the 9-h.p. chassis is between 12 and 13 cwt. Other exhibits included a steam delivery van, a hotel 'bus, and a 15-h.p. double phaeton, the latter being intended for the Shah of Persia.

A new popular priced two-seated car was shown by M. A. Christophe. At first I took it to be a French car, but closer inspection proved it to be the production of the Albany Manufacturing Company, of Willesden Junction, which has thus to

be added to the list of English exhibitors. The car is fitted with a single cylinder slow-running horizontal engine of 10-h.p., placed in the fore part of the channel steel frame. Two speeds forward and reverse are provided. The car comprises a number of special features, to which reference may be made in a subsequent issue.

Another car which comprises a number of interesting features was the 18-h.p. four-cylinder Chenard-Walcker, the British agency for which is held by the Weston Motor Syndicate, Limited. The engine is provided with mechanically-operated inlet valves located on the opposite side to the exhaust valves; a characteristic point of the motor is the peculiarly-shaped cam, by means of which not the lift, but the duration of the time the inlet valves are kept fully open, can be varied, and the speed of the engine consequently controlled. A novel form of automatic carburettor which furnishes a quality of mixture to correspond to the engine speed is used; this comprises a compound valve, part of which regulates the supply of air and the other portion the supply of petrol. As in the Georges Richard cars, the water-circulation pump has been discarded in the 1904 Chenard-Walcker, the thermo-syphon system in conjunction with a honeycomb radiator being relied upon. The latter comprises no less than 2,025 tubes, which, instead of being of the usual shape, are squared at both ends for about three-eighths of an inch, when the sections become narrowed in diameter and fluted, this being achieved by passing them through a corrugating machine. The water is thus split up into a series of minute columns, the cooling surface representing an area of 90 square feet. Magneto or high-tension ignition, with a chain-driven commutator on the dashboard, can be fitted. The special combined clutch and brake is still retained, as is also the Chenard-Walcker transmission, in which, it may be remembered, the power is transmitted through a cardan shaft to a differential shaft below and parallel with the rear axle. On the ends of the differential shaft are pinions

meshing with internally-toothed rings attached to the rear road wheels. The governor can be set to act at any desired speed from the steering wheel, a pedal accelerator cutting out the governor, no matter at what point this is set to act. The Chenard-Walker has a record for economy in fuel consumption, while the special control results in an exceedingly silent-running and flexible engine, it being claimed to be possible to run the car at any pace from $2\frac{1}{2}$ miles per hour up to the maximum on the top speed of the car.

Michelin's showed a new tyre, the feature of which is the non-slipping tread. Steel blocks flush with the rubber are moulded into the tread to prevent the edges of the latter wearing away. It is not claimed that they prevent side-slipping in themselves, Michelin's idea being that the width of the tyres prevents slipping, owing to the increased road friction. Of course, this can only be maintained by the flatness of the tread being kept up, which is the mission of the steel blocks. A tyre with a band fitted with steel rivets to prevent side-slip was also shown, as well as a tyre lever to enable the fixing bolts to be readily placed in position.

M. G. Fouillaron, of Levallois-Perret, again exhibited cars fitted with his special system of transmission by means of an articulated belt working on expanding and contracting pulleys. The system has already been described in the *Journal*, so that

Fig. 44.—The Chassis of the Fouillaron Car, showing Expanding Pulleys.

it is unnecessary to refer to it here, beyond mentioning that a good idea of it will be obtained from the illustration (Fig. 44). It is being applied to cars of from 6-h.p. to 35-h.p., a chassis of the latter power being exhibited. This has all modern features, such as stamped steel frame, four cylinder motor, with mechanically-operated inlet valves, honeycomb radiator, etc.

The Compagnie Belge de Construction d'Automobiles, of Brussels, which is represented in England by the London Motor Garage Company, Limited, exhibited four Pipe cars, a 12-h.p. brougham of special design, a 20-h.p. car and chassis, and a 30-h.p. double phaeton. The engine comprises four cylinders with mechanically-operated inlet valves. Except as regards the clutch the Pipe cars follow the general lines of chain transmission vehicles. The clutch is of the Jenatzky magneto type, in which the engine is connected with the gear box by means of discs, which become magnetised and attracted one to the other when a current of electricity is sent through them. The current is furnished by a small battery kept charged by a dynamo driven off the engine, or it can be supplied directly from the dynamo. There is no possibility of slip with this clutch, which, with but a light pressure on the pedal, makes practically a solid connection between the motor and the gear shaft. The Pipe cars have already an excellent reputation both in Belgium and

England, and the fact that cars of this type are to represent the A.C.B. in the 1904 Gordon Bennett race will bring them into further prominence.

A name well known in the early days of the industry is revived by the exhibit of Messrs. F. Rossel and Company, of

Fig. 45.—The Louet Six-Cylinder Engine. (See page 828 last issue.)

Sochaux (Doubs), who displayed a 22-h.p. four-cylinder car on modern lines. The water circulation on the Rossel car comprises a number of interesting features, not the least interesting of which is the provision in the water jacket of each pair of cylinders of an opening closed by a flexible fibre plate. In frosty weather any abnormal pressure due to the water freezing would, it is stated, cause these plates to break instead of cracking the cylinders.

At the stand of La Société des Moteurs and Automobiles Herald, of Levallois-Perret, I met M. Dubois, whose agility with a small Decauville car in the first 1,000-Miles Trials will long be remembered. The *piece de resistance* at the Herald stand was a 24-h.p. chassis, the frame of which is of stamped steel. A view of the four cylinder motor is given in Fig. 46, from which it will be seen that the cylinders are cast in two pairs, and that the inlet valves are actuated mechanically off the same shaft as the exhaust valves. The carburettor is provided with a device

Fig. 46.—The Herald 24-h.p. Four-Cylinder Motor.

by means of which the supply of air is automatically regulated. The ignition is by magneto, while another feature to which attention may be drawn is the provision made for varying the lift of the inlet valves, and thereby regulating the speed of the engine.

Among the German cars exhibited were the Benz Parsifal cars of Messrs. Benz and Co., of Mannheim, the engines of which have mechanical valves, and the Adler cars of the Adler Fahrradwerke (Kleyer), of Frankfort-am-Main. The latter are made in 8 and 12-h.p. two cylinder, and 16 and 24-h.p. four cylinder types, all having honeycomb radiators and cardan shaft transmission.

The Ader Company had a very interesting display of cars, ranging from 9-h.p. to 24-h.p., some fitted with the Ader motor.

Fig. 47.—The frame of the Ader 9-h.p. Car.

with the cylinders set in the form of a V, and some with vertical engines. The frames, too, are either of tubular construction or of stamped steel. While being exceedingly strong, the tubular frames are very light, the rods seen in Fig. 47 adding greatly to the rigidity. The 9-h.p. two cylinder V-motor is illustrated in Fig. 49. The bore is 92 mm., the stroke 94 mm., and the normal speed 1,400 revolutions per minute. The cylinders, which are at right angles to each other, have mechanically-operated inlet valves, and the connecting rods work on to the same crank. The governor is mounted on the cam shaft, and is enclosed in the semi-circular case above the crank-shaft. The water-circulating pump forms part of the motor. It can be seen in the illustration below the crank-shaft, off which it is gear driven. The 18-h.p. engine is on similar lines, but comprises four cylinders. The vertical engine, which has been introduced to meet the demand for this type, is being made in two sizes, 12-h.p. double cylinder and 24-h.p. four cylinder, the bore being 100 mm. and the stroke 110 mm. The inlet valves are actuated off the same cam-shaft as the exhaust. An automatic air-regulating carburettor is provided. The transmission is by means of side chains, a direct drive being obtained on the third or top speed. The details are all of high-class design and construction, and the 1904 models should maintain the reputation for reliability earned by the Ader cars in Paris-Madrid. Some excellent examples of carriage building were to be seen on the

Fig. 48.—The Ader 15-h.p. Four-Cylinder Landaulet.

stand, one of which, a 15-h.p. four-cylinder landaulet, with side entrance, is illustrated in Fig. 48.

One of the most imposing displays was that of M. A. Clement, the maker of the Bayard cars, the new models of which have the credit of having been exhibited in England before being shown to the French public. It is hardly necessary to add that the Bayard cars are in this country to be known as the "Talbot," their sale being in the hands of the British Automobile Commercial Syndicate, Limited. A full description of the new

vehicles was given only a few weeks ago in connection with the report of the National Show at the Crystal Palace. I may, however, refer to the new 7-h.p. two-cylinder car. This has, like the other types of Bayard cars, mechanically-operated valves, cardan shaft transmission, three speeds and reverse; it appears to be well designed and constructed, and should, in view of its moderate price, quickly become a popular vehicle.

La Société des Automobiles Belgica have two new models of 12-h.p. and 16-h.p., both having four-cylinder engines with mechanically-operated valves all on one side. The frame is of stamped steel, while among the features of interest are the special adjustable connecting rod bearings and the lubrication of the motor, a constant level of oil being maintained in the crank chamber. Bolted to the side of the latter is a reservoir containing a float, which controls a needle valve in the top. The oil passes into this reservoir through a pipe, which is taken once round the exhaust pipe of the motor, so that the oil is warmed and thinned sufficiently to make it flow easily. The

Fig. 49.—The Ader 9-h.p. Motor.

needle valve is set so that when the oil has attained its proper level the orifice in the top of the reservoir is closed. A short pipe connects the crank chamber and reservoir, and serves to maintain an equal air pressure in both. Bolted on the opposite side of the crank chamber is an ordinary gauge glass, in which the level of the oil in the crank chamber can be seen at a glance. The cars exhibited included a 12-h.p. limousine and a 16-h.p. landaulet, the engine in the case of the latter being located under the driver's seat.

Messrs. Henriod's exhibit attracted attention by reason of the novel arrangement of the change gear. Last year this was located at the rear end of the cardan shaft, the gear box and rear axle forming as it were a set by itself. The change gear, which gives three speeds forward and a reverse, is still at the rear, but is now mounted on the rear axle itself. The arrangement is certainly compact, but it remains to be seen how it will answer in practice, the general opinion being against increasing the weight to be carried by the rear live axle. Messrs. Henriod are making cars with engines of one, two, or four cylinders; the larger sizes, which range up to 24-h.p., having mechanically-operated inlet valves.

The Gobron-Brillié Company made an excellent display of 12, 18, 20, and 25-h.p. cars, the body-work of which was of the highest class. Quite a new idea in body-suspension was to be seen on a double phaeton, which by the builders, Messrs. Belvallette, is termed a *berceau*, the rear part, access to which was by side doors, being suspended on C springs. As for the cars themselves, the well-known Gobron motor, with its two pistons to

Fig. 50.—The Gobron-Brillié Motor.

each cylinder, is retained. For the majority of the cars the tubular frame construction is retained, but the 25-h.p. car has a frame of pressed steel. The four-cylinder engine, which has eight pistons, is now fitted with a jet carburettor, provided with automatic air-regulating device. The clutch is of new design, being practically in duplicate. The smaller one, which is metal-to-metal, engages first, followed by the engagement of the large one, the cone of which is leather-faced. Both clutches are controlled by the same pedal; the advantage of the arrangement is that the engine is put into gear without shock, while, to further reduce any strain on the gear-box, a universal joint is introduced between the latter and the clutch.

La Société des Automobiles Bardon confined their exhibit to a three-ton motor lorry, a class of vehicle to which they are

Fig. 51.—The Engine and Change Gear of the Bardon Motor Lorry.

now devoting much attention. Except that the engine is connected with the countershaft by a single centrally-located chain instead of through a cardan shaft and bevel gearing, the general arrangement follows the well-known Bardon lines. The motive power is supplied by a 8-h.p. horizontal engine, the explosion taking place in the centre of a long cylinder, forcing out two pistons in

opposite directions. The two crank shafts drive through bevel gear on to a shaft parallel with the cylinders: on this shaft is mounted the clutch and the change speed gear, forming, as will be seen from Fig. 51, a very compact set. Three speeds and a reverse are provided, the maximum being eight miles per hour.

An ingenious form of clutch is used on the cars of the Société l'Automotrice, who are making two sizes, 12 and 20-h.p., both with four cylinders, mechanical inlet valves and magneto ignition. The flywheel is made with arms which act as a fan to draw a current of air through the radiator. The coil clutch is somewhat on the lines of the Mercedes, but is actuated in a novel way, the coil on the clutch shaft being tightened by means of a pedal-actuated leather cone, which can be brought into engagement with the flywheel. It is only when the leather cone is rotated by the flywheel that the coil is tightened on the shaft, and the power of the engine transmitted to the gear box. A special form of internally-expanding band brake on drums connected with the hubs of the rear wheels forms another feature worthy of notice in the Automotrice cars.

Starting some years ago with a car on lines of its own Messrs. Brouhot and Company, of Vierzon (Cher), have steadily progressed towards the standard arrangement. Notwithstanding this the Brouhot cars on examination were found to comprise a number of special features. Taking the 20-h.p., of which the frame is being made sufficiently large to accommodate a body having side entrances, this is fitted with an engine, the four cylinders of which are cast in two pairs. All the valves, both inlet

Fig. 52.—The 16-20-h.p. "Argyll" Car shown at the Paris Salon.

and exhaust, are mechanically actuated off one cam shaft, and are consequently on one side of the engine. The carburettor is Messrs. Brouhot's own design and provides for the automatic regulation of the air in order to give the correct mixture at any or all speeds. Pump circulation is adopted in conjunction with a honeycomb cooler and tank, through which a current of air is drawn by a belt-driven fan. The transmission is by side chains, the drive on the top speed being direct. An ingenious form of friction clutch is employed to connect the engine with the gear box. The Brouhot four-cylinder cars, which are being made in sizes ranging from 12 to 40-h.p., are not yet known in England, but I understand that arrangements are in hand for their introduction.

For the 1904 season Les Cycles Clement are making four types of cars—9-h.p. two cylinder and 9, 12, and 16-h.p. four cylinder—the largest size having a chain drive. In the others the cardan shaft system of transmission is adopted. The engines have mechanical inlet valves and a special carburettor, in which the automatic regulation of the air is obtained in an exceedingly simple manner, no springs or diaphragm being employed. The exhaust pipes lead first to a kind of collecting chamber, where they expand ere passing to the silencer. A ribbed pipe radiator set in a frame is this year being used in place of the honeycomb type. Special attention has been paid to the brakes, a simple and useful spring device being provided to keep the band off the drum when the brake is not in use. The cars are being made with frames sufficiently long to take bodies with entrance to the rear seats at the sides.

Messrs. Montauban and Marchandier, of St. Quentin, France, whose name is well known in connection with the manufacture of change-speed gears and other automobile components, have now taken up the construction of two and four cylinder engines, to which they have given the name "Vautour." The motors illustrated in Figs. 53 and 54 have inlet valves mechanically actuated off the same cam shaft as the exhaust valves. The

Fig. 53.—The Vautour Two-cylinder Motor.

bearings are all furnished with phosphor bronze bushes, while the contact maker is located at the top of the engine, being driven through bevel gearing. The engines are provided with gear driven pump, centrifugal governor acting on the inlet, and double silencers.

The Société des Camions Automobiles Hagen showed a 12-h.p. Hagen lorry. On inspecting this I find that it has been considerably improved since described in the *Journal*; while the special system of transmission is retained. A two-cylinder vertical petrol engine is now employed. The lorry is intended to carry a load of four tons on level roads, or three tons in hilly districts, the speed ranging up to eight miles per hour. The lorry weighs, ready for the road, three tons, and is 18 ft. long.

For 1904 Messrs. Boyer and Company are making ten different cars, ranging in power from 6-h.p. to 24-30-h.p. The latter is fitted with an engine having four separate steel cylinders, with copper water jackets and mechanically-operated inlet valves. While the *Salon* was not very prolific in the way of

Fig. 54.—The Vautour Four-cylinder Motor.

small popular-priced cars, there were one or two excellent examples, amongst them being that of Messrs. Gregoire and Company, of Poissy. It has a pressed steel frame, 5-h.p. motor with mechanical inlet valve, two speeds forward and a reverse, and transmission by side chains.

Although since the death of M. Buchet not so much had been heard of the engine that bears his name, arrangements

have now been made for the carrying on of the works. The motors are being made with one, two, and four cylinders, and in sizes from 2 to 70-h.p., some excellent specimens being shown. A good display of Aster engines was made by Les Ateliers de Constructions Mécaniques Aster. The new models comprise a two cylinder and a four-cylinder engine with mechanical inlet valves. The cylinders are cast in pairs. The valves are all identical, and a new governor has been adopted, operated

Fig. 55.—The Aster 16-20-h.p. Four-cylinder Engine.

from the end of the valve shaft and controlling a sliding throttle on the inlet pipe from the carburettor. A new arrangement by means of which all the inlet and exhaust pipes can be detached from the cylinder, by the unscrewing of only four nuts, make the operation of repairs or replacement to these parts a very simple matter.

The cars of the Société des Etablissements Hautier are interesting from the many departures from standard practice they comprise. Two types—10-h.p. two cylinder and 20-h.p. four-cylinder—were shown. The valves were placed on opposite sides of the cylinders, and are all mechanically operated. The flywheel is located in front, and is adapted to serve as a fan to draw a current of cold air through the radiator. One of the striking characteristics of the vehicle is the clutch, which is essentially a planetary gear, transmitting the power from the motor to the change-speed gear box, and at the same time reducing the speed. Referring to Figs. 56 and 57, which give two views of the clutch, on the motor shaft A is keyed a spur wheel B

Figs. 56 and 57.—Sectional and End View of Hautier Clutch.

in mesh with the pinions C C' loosely mounted on studs fastened to projecting arms on the shaft D. The pinions are also in mesh with the internally-toothed ring E. The pieces E, F, G, H are bolted together to form a case for the gears, the parts F and H being loosely carried on the shafts A and D respectively. G forms with H a V-shaped groove, in which a band-brake can be applied.

When the gear E is locked in position the pinions C C' are caused to roll on the internal gear E, and thereby produce a reduced motion of the shaft D, in the ratio of one in five to the speed of the motor. The clutch brake consists of two V-shaped blocks I pivoted at J; their upper parts are traversed by a rod K, which has a right and left handed thread. At one end of the rod K is fastened a strong spiral spring contained in an adjustable box L, while upon the other end of the rod is keyed a pinion M in mesh with a toothed section N. The spiral spring maintains the blocks applied, and the motor is then in gear with the transmission. When the driver depresses the pedal O the rod K turns, spreads the blocks, and thus releases the clutch, and so disconnects the motor from the transmission. The advantages claimed for this device are that with it the speed change-gear wheels may be of small diameter, and the two bevel gears which convey the power to the rear live axle of equal size.

The Gladiator Company had three new models on view—9-h.p. double-cylinder and 14-h.p. and 18-h.p. four-cylinder. The honeycomb radiator has been abandoned in favour of one of the ribbed-pipe variety set in a neat frame. The transmission is by side chains, and among the several noteworthy features may be mentioned the carburettor, in which the quality of the mixture is automatically made to correspond with the requirements of the engine at all speeds, and this without the use of any springs or diaphragm; a branch from the admission pipe is brought to the top of a weighted valve, which is lifted to a height corresponding to the suction of the motor, and more or less air correspondingly admitted. The pump is friction driven, the leather-faced wheel being enclosed and protected from mud, except at the point of contact with the flywheel. The pump itself is mounted on a pivot and held to its work by a spring. The rear brakes are provided with a simple device which holds the bands off the drums when not in use.

La Société Mors are making no less than eight different types of four cylinder cars, viz., 8, 12, 14, 15, 19, 24, 30, and 40 h.p. The 24-h.p. is a new model, with a stamped steel frame. The motive power is supplied by a four cylinder engine having the mechanically-operated inlet valves on the opposite side to the exhaust valves. The carburettor is provided with both hand and automatically-regulated air inlets. No governor is now used, but to prevent "racing" the throttle valve is so connected up to the clutch pedal that as the clutch is withdrawn the throttle is partially closed. A lever on the steering wheel also acts on the throttle. The water-circulating pump is driven by bevel gearing off the cam-shaft. A framed ribbed-pipe radiator is used, ai-

being drawn through the same by the arms of the flywheel, which are made to act as a fan. The magneto ignition has been improved in so far as the speed at which the magneto works has been reduced to that of the motor itself, enabling the number of parts to be diminished and securing quietness in operation. A special form of clutch is employed, while the shafts in the gear box and the differential run on ball bearings. The cars exhibited comprised some excellent specimens of side-entrance vehicles, a coupé with special suspension being particularly noteworthy.

An interesting display was made by M. Prosper Lambert, of Nanterre, who, in addition to his 8-h.p. and 12-h.p. cars, has brought out a new 9-h.p. single-cylinder vehicle. In all, the cardan shaft system of transmission is adopted. Among the

features of these vehicles is a governor acting on the inlet valve in such a way that as the speed becomes excessive an additional supply of air is drawn in. Another interesting detail is the contact maker, which can not only be quickly detached but readily adjusted. The trembler blade is held in a groove in a stud which is free to revolve slightly. The blade extends beyond the stud, its upper end coming between two milled-edged screws which bear against it. These screws can be turned one way or the other until the adjustment is perfect.

The two well-known lamp firms, Bleriot and Ducellier, occupied prominent positions at the two central opposite points of the main gallery, and, by a kind of *entente*, lighted up one another's stand, notwithstanding the distance which separated them, by powerful head lights. Messrs. Bleriot had on view a new acetylene lamp, in which cartridges of acetyloid are used, while a novelty was a combination lamp and horn. Messrs. Ducellier had an improved generator and a new acetylene head light, in which, by an ingenious arrangement of reflectors, full advantage is taken of

all the rays of light. Electric and paraffin lamps are also made.

M. Rousseau, of Neuilly, showed a device which will be appreciated by those who motor in winter as well as in summer. By opening a valve the hot gases from the exhaust can be carried through a series of tubes which line the driver's footboard and the inside of the body of the car. One of the interesting exhibits to engineering visitors were the aluminium engine cylinders with cast iron liners shown by La Société des Moteurs Légers (Baltzinger and Company) of Valdore-Belfort. The Collier Tyre Company, Limited, displayed a large number of the well-known Collier tyres, which, we understand, are now being taken up by several French makers of motor-cars. The Dunlop Co. had also a range of tyres on view.

PHANOMEN.

Fig. 58.—The M. M. C. 25-h. p. Saloon. (See page 825 last issue).

CONTINENTAL NOTES.

AFTER consultation with the various authorities the German Club has fixed Friday, June 17, as the date of the Cup race. Challenges have been received from Great Britain, France, Belgium, Austria, Italy, the United States, and Switzerland, so that the race will undoubtedly be of a more exciting character than any of its predecessors.

THE Swiss Automobile Club is the latest to send in a challenge to the German Club in respect of the Cup race. It was thought that the car would be a Martini, but it transpires that it will be a new one designed by Messrs. Dufaux Freres and at present in course of construction at the works of Messrs. Piccard, Pictet and Co. in Geneva. It is said that the engine will be of 80-h.p. and comprise eight cylinders. Among the minor points settled at the meeting of the International Commission in Paris were in regard to the rule which makes it necessary for every part to be constructed in the country of origin of each respective car. On the proposition of M. Rene de Knyff it was agreed to make exceptions in the two following cases: (a) the steel of which the magnetos are constructed, and (b) the fabric employed in the pneumatic tyres.

same stand at the March Show at the Agricultural Hall, Islington. Messrs. Darracq and Company secured the gold medal offered by the Paris Municipal Council, while the gold medal of the Automobile Club of France was secured by M. Prosper Lambert. As regards the competition for carburettors to work with either petrol, alcohol, or ordinary petroleum, also held during the course of the *Salon*, the gold medal in this case was secured by Messrs. Goutreau Freres, of Dourdan.

ARRANGEMENTS are well in hand for the trial of motor-cycles which the "Gazetta della Sport," of Milan, is organising for the end of the present month. The programme is as follows:—First day, Milan to Genoa, 154 kilometres; second day, Genoa to San Remo, 149 kilometres; third day, San Remo to Nice, 57 kilometres; fourth day, rest at Nice; fifth day, Nice to Turin, 210 kilometres; sixth day, rest at Turin; and the seventh day, Turin to Milan, 143 kilometres. The trial is open for touring machines up to 3½-h.p., and the maximum and minimum speeds are fixed at 35 and 20 kilometres per hour respectively. Already twenty-six entries have been received.

THE formation of a Motor Volunteer Corps was definitely decided upon at a meeting held at the club-house in Vienna of the Austrian Automobile Club a few days ago. The corps will

A Fete Day at Chateau Thilery, France.

[Motor, New York.

I LEARN officially from the A.C.B. that, in view of the fact that only the Pipe Company responded to the invitation to enter for the Gordon Bennett race, consequently no eliminating contest will be necessary for the Belgian team. The three Pipe cars will, however, be required to fulfil the conditions laid down by the Club authorities. The names of Rene de Knyff, Maurice Farman, and Henri Farman are being mentioned as the probable drivers of the three Panhard cars in the French eliminating tests. M. de la Touloubre, who will drive one of the Bayard cars in the French eliminating trials, is credited with the statement that the motor of his racer will develop 110-h.p.

IN connection with the *Salon* there was a competition for the most tastefully decorated stand, the result of which has now been made known. The President of France's prize, a Sevres vase, was awarded to M. Clement, the builder of the Bayard cars. The stand was in the form of a triple arch and was made in wrought iron, each part of it being individually hammered out. The design represented a floral decoration, and the top was surmounted by work representing wild flowers; it was touched up with the file to give it a proper effect, and altogether was of beautiful appearance. It was lighted on the inside at night, which gave a wonderful effect. I hear that it is more than probable that Clement-Talbot, Ltd., will use the

comprise two sections, one for motorists and one for motor-cyclists.

FOLLOWING the example of Nice, the Automobile Club of Cannes now proposes to organise an automobile week next spring, in connection with which a motor-car touring competition, a gymkhana, a flower fete, and motor-boat races will be held.

THE Club Automobile de Seine-et-Oise, whose headquarters are at Versailles, is organising an anti-skidding competition. It is to be held from the 23rd to the 28th February next, during which time a distance of 1,000 kilometres will have to be covered. The competition is only open to four-wheel vehicles weighing at least 10 cwt.

A 20-H.P. Mercedes, ordered through Messrs. Spitz and Company, of Vienna, has, reports the "Allgemeine Automobile Zeitung," just been despatched from Cannstatt to London for King Edward. The body takes the form of a comfortable tonneau, painted Cannstatt red, with canopy.

THE Automobile Club of Antwerp, which held its final run of the season on Sunday last, is organising a consumption trial and a series of 500-metre races for the 9th inst.

THE HILL AUTOMATIC STARTER FOR PETROL MOTORS.

MANY inventors are at work endeavouring to devise a method of automatically starting the engines of petrol motor-cars, and so obviate the necessity of a starting handle and the back-kicks, so dangerous to the operator's hands, which frequently accompany their use. Among the concerns who have been quietly working on such devices is the Steel Ball Company, of Chicago, which has recently introduced the automatic engine starting device shown in the accompanying illustration. It is comprised of two principal elements—a pressure tank with gauge, and a small pneumatic motor. The pressure tank is, of course, of usual construction, but instead of receiving its pressure feed from a pump, obtains this directly from the combustion chamber of the motor in connection with which it is used. The combustion chamber is pierced by a pipe-tapped hole, and a direct pipe connection is made between it and the tank. This passage is controlled by an adjusted check valve which does not open except under a pressure greater than that of the compression pressure of the motor. Hence, upon the compression stroke of the motor none of the charge is forced through the pipe, but when the impulse occurs a small portion of the charge is forced past the valve and into the tank. In this way the running of the motor provides an automatically-regulated pressure in the tank. When the

pressure in the latter equals the explosion pressure in the combustion chamber the action ceases until the pressure in the tank has been reduced by starting the motor, when it recommences.

The other element, the pneumatic starting motor, is a small two-cylinder oscillating engine. There is little of novelty in its construction, except that the ports into each cylinder have been placed on the extreme outer ends or heads to lengthen the bearing, while the cross thrust bearing which maintains the substantially air-tight bearing of the cylinder against its port block face is ball bearing, to prevent excessive wear and loosening of the joint.

Between the pressure tank and the pneumatic motor is an ordinary lever-actuated valve. Pressing upon this lever opens the valve and allows the charge to pass to the pneumatic engine, which is instantly set in motion, and being connected by chain gearing and the ratchet clutch to the crank shaft of the petrol engine, the necessary initial compression is given to the latter. The valve can be quickly closed, or if the motor is in good condition only a few turns of the crank shaft are necessary to start it, and continued operation of the starting engine only serves to lower the pressure in the tank unduly. It is obvious that the necessary lowering of the pressure is made up soon after the motor has been started. A correspondent who has seen the experimental device in operation at the company's factory states that it works splendidly. The pneumatic motor occupies but a very small space, it being contained in the space of a cube of

10 inches. We may add that the weight of the entire apparatus is under 45 lbs. The makers point out that by means of the automatic starter, every time the car is stopped the motor may be stopped, since it requires no more exertion to start it again than it would to start an electric motor.

THE RELIABILITY TRIALS.

THE fortnight which has passed since the publication of the results of the Trials has been none too long a period for the digestion and assimilation of the mass of figures which compose the judges' report thereon, and which form a most valuable addition to our stock of data regarding the modern automobile. As is only to be expected, the system by which the awards were made is open to criticism, which, it must be remembered, would have been to a great extent pointless unless that system had been given a fair trial, though few will deny that the prizes have fallen to thoroughly deserving cars. The fact is that, setting aside the inevitable element of luck, the differences in merit between many of the best makes of modern cars are small, and a slight want of foresight in determining the method by which marks shall be apportioned produces no very glaring error. It has already been pointed out by other critics that while the intention of those responsible for the system was to give the factor of reliability more weight than all the minor considerations put together, this end was not attained by making the marks for this high while making the penalties for lack of it no higher; the order of an examination is not altered by giving each candidate an extra thousand marks for one subject; and, in fact, only one of the three of the cars that did complete non-stop runs throughout obtained an award. All the cars that went through obtained over 70 per cent. of the actual maximum, 9,485 marks, while 56 out of 72 obtained over 84 per cent. The fact that the awards might have been slightly altered by a wiser system of marking and examination shows that the alteration could not have been great. It does not, however, detract from the value of the report, the detailed nature of which discounts to some extent any excessive advantage that the medalist may have over his less successful, though not very much less meritorious, competitors. We could have wished, however, that more particulars as to the "condition after trial" had been available: a thousand miles is not sufficient distance to bring out in an obvious manner slight differences in quality of material that are painfully evident in, say six months' running, and the publication of the results of expert examination would have gone far to atone for this.

Comparing the 1903 trials with those of 1902, an evident and at the first blush rather disquieting fact is the large number—32 out of 104—that failed to get through. It must be remembered, however, that the conditions were far more severe, and that several of the cases were due to an incomprehensible disregard of rules and regulations. Taking those caused by serious breakdowns in the mechanism, five were due to failures in gear or differential, four to broken piston-rods, three to failures in the half-speed gear, two to broken propeller shafts, and one to broken crankshaft, while three have overheating alleged as the cause—eighteen in all, or rather less than eighteen per cent. In the 1902 Trials eighteen per cent. covered the whole of the breakdowns, of which four out of eleven were gear failures. Allowing for the severe conditions, there seems no reason for dissatisfaction with the progress shown, though improvements will no doubt be suggested as to the methods of recording and testing it in future trials. At least it may be hoped that the purely or chiefly æsthetic points—noise, vibration, vapour, dust, and finish—will be given a less overwhelming influence, and it might be suggested that awards for them might be given entirely independently of those for performance, as—*si licet parva componere magnis*—is done with poultry. The trials have their analogue more in the racecourse (or, considering the usual weather, one might rather say the ploughing match) than in the horse show, and in future performance, plus condition at finish, ought to be given the preponderance in the award of merit.

HERE AND THERE.

MR. T. C. CLARKSON has promised to read a paper on steam motors before the Society of Arts.

IN connection with the Christmas postal service between Newcastle and Sunderland motor-cars were run by Messrs. Turvey and Co.

WE are now able to give two illustrations showing an elevation and plan respectively of the new British-built 12-h.p. Duryea, of which a description was given in our issue of the 5th ult. The diagram shows clearly the canted channel steel frame; the position of the water tank and the radiators beneath

the tool box in front; the lines of the dashboard; the curved underhung front springs; the steering post and connections; the control levers; the engine; the long springs; the differential gear box and brake gear; the universally-jointed triangular forecarriage; and the direct drive by single chain to the live axle.

PROBABLY one of the longest journeys by road to visit the recent *Salon* in Paris was that of Messrs. Stoewer Bros., of Stettin, Germany, who covered the distance of 1,362 kilometres which separates the two cities in six days, on a 20-h.p. Stoewer car.

UNDER the auspices of the International Sporting Club of Monte Carlo a meeting of motor-boats has been arranged for the Easter holidays in the bay of Monaco, with £4,000 in cash for the winning competitors. The regatta will be preceded by an exhibition of motor-boats, to commence on the 10th March next.

THE first entries for the Harmsworth International Motor Boat Race are two Napier boats. The vessels are the 40 ft. boat of 100-h.p. belonging to Mr. S. F. Edge, and a 35 ft. boat of 60-h.p. It is to be hoped that English constructors will enter in large numbers for this trophy, as it is expected that a large number of foreign entries will be sent in.

THE Quadrant Cycle Co., Limited, inform us that they are prepared to supply a fixing complete with the number plate enamelled and painted in accordance with the regulations of the Local Government Board, either to fix on any lamp a motor-cyclist or motor-car owner may possess, or they can supply the lamp and number complete. The plates are made in two forms, one to be fixed rigidly to the front portion of the lamp, the other detachable.

A GARAGE for fifty cars has been established by Mr. H. E. Richardson at North Finchley.

MESSRS. W. B. FORDHAM AND SONS, LIMITED, are placing upon the market an E.G. solution for coating the silencers, tanks, pulley wheels, etc., of automobiles.

THE December issue of the Bulletin, issued by the White Steam Car Co., of Cleveland, O., is devoted to the performance of the White steam cars in the recent Reliability Trial in the United States.

MESSRS. HOOPER AND SON, carriage-builders, Liverpool, report that in spite of the advent of motor-cars they have found no falling off in the demand for horse-drawn carriages during the past year.

AT a meeting of the executive committee of the American Power Boat Association, a few days ago, it was decided to issue an invitation to the thirty yacht clubs forming its membership to contribute to a fund for the purchase of a valuable silver trophy to be awarded to the winner of an international motor-boat race to be held in June or July next, and annually afterwards.

AT the next meeting of the board of governors of the Automobile Club of America the question of nominating a motor-boat committee will be discussed and a committee probably appointed. The members of the club fully realize the importance of this new branch of automobile sport, and feel that the time has come to recognize it, as a number of prominent European clubs have already done.

THE 80-h.p. Peerless racer used by Mr. L. P. Mooers in the Gordon Bennett race last summer has been practically rebuilt for the coming season. The car has been fitted with a sheet metal hood of torpedo shape somewhat on the lines of that of Gabriel's Mors racer. The peculiar radiating arrangement is the most noticeable improvement; it consists of two batteries of $\frac{1}{4}$ -inch copper tubes held together by vertical flanges extending entirely around the side of the body.

THE Pittsburg Automobile Club is arranging for a series of lectures on automobile topics, to be given some time in February next. Several of the lectures will be strictly technical, designed especially for the instruction of automobilists. Most of them, however, will be on topics of general interest to the automobile public and will be illustrated by lantern views. The aim of the club is to start an educational campaign leading to the alleviation of the abuses of highway privileges and excessive speed.

A SIMPLE thorn and nail extractor for use in connection with the pneumatic tyres of motor-cars was shown at the Paris *Salon* by M. E. Nouzillet. It consists of a single-arm bracket

attached at such a point on the car body that the wire will bear lightly on the tyre. A spring holds the extractor to its work; it can readily be fitted to any make of vehicle.

WRITTEN by Mr. B. C. Windle and illustrated by Mr. E. H. New comes an excellent volume on Chester, a place rich in records and full of historic interest. It is one of the useful series of guide books published by Messrs. Methuen and Company, and presents as clear a view of the importance of the city in the olden days and its interest in the present as we have read anywhere.

THE Herkomer Trophy for touring cars will, we understand, be offered for exhibition at next year's Royal Academy.

THE King of Italy, himself an ardent motorist, has expressed his willingness to become the patron of the Italian Automobile Club.

THE South Hams Motor Carriers, Limited, has been registered with a capital of £5,000 in £1 shares. The first directors are Messrs. H. Brooking, W. S. Langworthy, C. G. Eve, J. H. Androw, and A. C. Pode.

MESSRS. G. T. RICHES AND COMPANY are now in a position to promptly supply oblong or square number plates in enamelled iron in sizes suitable for either motor-cars or cycles. They have also got in a stock of lamps arranged to illuminate the rear number.

THE Paddington Motor Company, Limited, has been registered with a capital of £1,000 to carry on the business of manufacturers of motor-cars, etc. The first directors are Messrs. J. Neave, W. S. Cutler, and S. G. Neave, and the registered office is at Banister Road, Kensal Rise, N.W.

THE A.C. of California is said to be in a quandary as to what use it is best to put the profits from the recent race meeting. A garage or a club house is said to be among the possibilities; but the president of the club is quoted as saying that it is more likely that they will be applied to some good roads movement, so that both automobilists and the public may participate in the benefit. The profits were between £800 and £1,000.

THE accompanying illustration depicts a 12-h.p. Gladiator lorry which is being introduced into this country by Messrs. S.

F. Edge, Limited; it is designed for loads of 2 tons, and is capable of running at any speed up to 15 miles per hour.

A COMPANY has just been formed in St. Petersburg with a capital of two million roubles to build motor-cars.

FROM New York it is reported that Mr. Alden Sampson, of Pittsfield, Mass., is likely to drive a Moyea car in the eliminating trials for the American Gordon Bennett team. Mr. W. Owen, brother of Mr. Percy Owen, will also probably be in the tests, and both a Peerless car and a Packard car are mentioned as likely to take part.

GENERAL GALLIENI, Governor of Madagascar, has written to the president of the Touring Club de France a long letter on the subject of the use of motor-cars in that island. After some early experiences with 6-h.p. and 12-h.p. cars, General Gallieni organised a postal service with 15-h.p. Panhard cars, which has been running since June of last year between Antananarivo and Mahatsara. Since that time the cars have travelled about 19,000 miles, and have been of great service for the transport of travellers as well as the mails.

THE probable production of automobiles in the United States in 1904 is estimated by the "Horseless Age" at over 35,000. "The Oldsmobile Company's output will undoubtedly be the largest, but we are unable to give a close estimate of its volume; between 6,000 and 7,000 is probably a conservative figure. The Cadillac Company's projected output comes next, with 4,000 vehicles; then follow Ford, 3,000; Jeffery, 3,000; Winton, 2,000; Knox, 1,500; Autocar, 1,500; Stanley, 1,200; Crest, 1,000; White, 1,000; Pope, 1,000; Peerless, 500; Packard, 500; Pierce, 500; and Haynes-Apperson, 500."

THE Automobile Union of Harburg and district has just been formed at Harburg, Germany.

THE Deritend Stamping Company, Limited, Birmingham, are making a speciality of high-class motor work.

"LE MONDE SPORTIF" now proposes to hold its postponed trials of electrical vehicles from the 27th to the 30th March next.

THE Hozier Engineering Company, Limited, have appointed M. Porteous Butler, 22-24, Passage de l'Opera, Paris, agent for the Argyll cars in France.

AMONG new members of the Scottish Automobile Club are Sir R. J. Griffith, Bart., Lt.-Col. W. H. Ferguson, Lt.-Col. A. C. Baillie, and Dr. Robert Bell.

A COMPANY has been formed to run a service of motor omnibuses between the Island of Reichenau and the town of Constance, on Lake Constance.

THE Road Carrying Company have acquired Messrs. Bennett and Carlisle's Liverpool business, and are taking over their premises in Renshaw Street as from January 1st.

MESSRS. VINTON AND COMPANY, LIMITED, issue their "Agricultural Diary for 1904," and also the "Live Stock Journal Almanac," each appealing to a wide section of the community.

THE University of Pennsylvania Automobile Club has been formed in Philadelphia, U.S.A. It was proposed to communicate with other university automobile clubs to suggest to them the formation of an intercollegiate club.

MR. ESTCOURT has, we hear, perfected an improved system of acetelyne gas lighting suitable for motor-cars. The ordinary carbide is used, and the gas, always ready, can be turned up or down just in the same way as coal gas, and gives less trouble to light up than a paraffin lamp.

CERTAIN engine-drivers in America have discovered that they do not like red lights on automobiles. They say that such lights on a motor-car standing at a level crossing are perplexing, as they are frequently mistaken for danger signals, and urge that he use of these lamps on such vehicles be discontinued.

AT the general meeting of the Society of Engineers recently, the president announced that the following premiums had been awarded for papers read during the past session. The president's gold medal to Mr. Douglas Mackenzie for his paper on "Motor Transport for Goods"; and the Bessemer premium of books to Mr. Robert J. Thomas for his paper on "Road Maintenance and Administration."

THE directors of the Civil Service Motor and Cycle Agency, Limited, report that the trading for the twelve months ending September 30th, 1903, has shown a gross profit of £3,839 10s. 1½d. and a net profit of £977 9s. 1d. This will be devoted to the payment of the balance of the 6 per cent. dividend on the preference shares, to pay 5 per cent. on the ordinary shares, to carry £250 to reserve (increasing that account to £1,000), and to carry forward £50 12s. 7d. It is proposed to devote more attention to the motor business, and during the past year additional premises were taken in Featherstone Buildings, which are conveniently near to 292, High Holborn, W.C.

THE Mobile Motor and Engineering Company, Limited, of Birmingham, have lately introduced two new popular-priced cars. One of these is a 6-h.p. vehicle fitted with De Dion engine, Mercedes pattern bonnet and radiator. The transmission is by a cardan shaft, three forward speeds and one reverse, controlled by one lever, being provided. On the top speed the motor drives direct on to the back axle, all intermediate gears being at rest. The other is a 12-h.p. car fitted with a double cylinder slow-running Aster engine; it is provided with a large and effective silencer, three forward speeds and one reverse on single lever, direct drive on top speed, and cardan shaft transmission. A 9-h.p. Mobile car fitted with De Dion engine, and embodying all the features of the 6-h.p. vehicles, is also being introduced by this company.

MOTOR-CYCLING NEWS.

MOTOR-CYCLISTS must remember that, in common with the owners of cars, they will have to conform to regulations. It may be noted that the term motor-car, save where the contrary intention appears, includes a motor-cycle. A licence to drive a motor-car will therefore include authority to drive a motor-cycle, but a licence to drive a motor-cycle will not, on the other hand, include authority to drive a motor-car. Hence in applying for licences owners of motor-cycles may be expected to ask for the motor-car licence in preference to one limited to motor-cycles. In the case of motor-bicycles or tricycles the illumination of the back plate may present some difficulties, and the regulations of the Local Government Board will be complied with if either the back plate or the front plate be illuminated. Amongst other suggestions that have been made, and to which the Board are giving publicity, is one for the affixing of a thin upright plate lettered on both sides, and projecting forwards from across the centre of the lens of the head lamp of a cycle.

THE Electrical Cycle and Motor Company, of Swadlincote, Burton-on-Trent, have sent us a sample of a new belt-fastener they have lately introduced for the driving belts of motor-cycles. The special feature about the fastener is its ease of detachment. It consists of two U-pieces attached to the ends of the belt by screws. The arched ends of the pieces are slotted to admit of the insertion of an I-shaped piece. To detach the fastener it is only necessary to turn the I-shaped piece parallel with the slot, when it comes apart. The fastener, which is designed for V-section belts, has, the makers state, been well tested before being put on the market.

IN the Chancery Division of the High Court, Mr. Justice Byrne has delivered his considered judgment in an action by Werner Motors, Limited, against Messrs. Gamage, Limited, claiming an injunction to restrain defendants from infringing plaintiffs' registered design for motor-cycles. Defendants denied the infringement, and contended that plaintiffs' design was invalid on several grounds. Mr. Justice Byrne, in giving judgment for the plaintiffs, held that the design was original, and that it had been infringed by the defendants. His Lordship granted plaintiffs an injunction, with costs. The damages were agreed at £5. Defendants intimated their intention of appealing.

At the last meeting of the Auto-cycle Club de France it was decided that a few minutes shall be devoted at all future meetings to a technical demonstration of motor-cycle specialities.

THE Auto-cycle Club have decided to promote a side-slip competition in order to test the various devices on the market. The competition will probably take place in March or

April, and intending competitors are requested to communicate with the secretary, Auto-cycle Club, 119, Piccadilly, W.

EVERY user of a motor-cycle is eligible for membership of the Rex Motor-Cycle Club of Coventry, the subscription to which is half-a-crown. The latest additions to the list of members are Le Comte Avvo Alfred Peracca, Le Comte di Montonaro, Signor Andrea Montu and Signor Guiseppe Corte.

THE clause in the old regulations with regard to the speed of light locomotives with trailers being restricted to six miles an hour is being dropped in the new Orders of the Local Government Board.

IN order to provide an easy means of observing the amount of petrol in the tank, Messrs. Bluemel Brothers have brought out an ingenious little gauge, consisting of a transparent celluloid tube open at both ends. On being dipped into the tank, and the finger then held over the top end, the petrol will be retained in the tube when withdrawn exactly the same height as in the tank. By filling the tank by a quart at a time, then dipping in the tube and marking it off, the exact measure can always be ascertained when desired.

THE first annual smoking concert of the Edinburgh Motor Cycling Club was held on Tuesday, last week, when Mr. William Flint, president of the club, presided over a large gathering. Mr. Trevor proposed the toast of "Success to the Club," to which Mr. Flint replied in an interesting speech.

SOME useful hints for motor-cyclists are given in the new handbook issued by the Minerva Motor Company, from which we take the following:—Failures of ignition are more commonly from the following causes:—

Running down of accumulator, damaged or dirty sparking plugs. Trembler broken or out of adjustment, wires becoming loose or disconnected, and lubricating oil on the platinum tips of the trembler and screw. The first two general causes are now entirely obviated by the fitting of twin accumulators and a plug with central wire. Examine first of all the terminals, see that the wires are well fixed, then examine the trembler. Try if all connections are in order, by again connecting to thick wire and resting the steel case of plug against the frame of the engine, then take off belt and (with the handle-switch on) rotate the engine several times. If a spark is produced every other revolution of the engine, all is in order, provided either of the accumulators give 4 volts, when tested by a voltmeter. The motor might even work with the accumulator as low as 3.8 volts, but it is then time to have the battery re-charged. After the examination see that everything is put back in its proper place.

MR. U. Stratton, late of Compton Grange, near Wolverhampton, and of Marina Court, Bexhill-on-Sea, has been appointed London manager of the Daimler Motor Co., Limited.

Mlle. J. Herven, the Lady Motor Cyclist, who took part in the Recent Trials in France.
(La France Automobile)

CORRESPONDENCE.

COMMERCIAL MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some considerable time past I have been convinced that the mainstay of the motor industry in the future will consist in the manufacture of the commercial motor-vehicle. Whilst the industry in this country is labouring under the absurd road regulations that it is, it will be a considerable time before we are able to catch up our foreign competitors, so far as the pleasure type of vehicle is concerned; but we can, and will, beat them on the ground of good strong, substantial design and workmanship, such as is required in the commercial type of vehicle. It only requires a few of our prominent manufacturers to devote their skill

enterprising commercial firms that have endeavoured to take up this type of vehicle, what treatment have they met with at the hands of the manufacturers or dealers to whom they have applied? These gentlemen, with a view to obtaining immediate profits only, have supplied these firms with an ordinary pleasure chassis with a lorry or van body fitted. Now, how can a vehicle, designed in the first instance to carry some four or five passengers only, be expected to satisfactorily perform the task of conveying from one to two tons of goods about? The engine, the gearing, the diameters of the journals were all totally inadequate for this purpose, and constantly required renewals and repairs, with the result that, after trying to run the vehicle for about six months, these firms came to the conclusion that the cost of upkeep was about twenty times that of the horse, and gave it up in disgust, calling motors generally a total failure.

Of course, we have the heavy steamer with us (which has been primarily designed for business purposes), and in its way I am bound to admit that

to designing a satisfactory vehicle of this type to start a branch of business that has no limit.

Up to the present time all vehicles offered to the commercial community have not been primarily designed for that purpose (I here except the heavy five-ton steamer), and of late I have observed various illustrations of vehicles for commercial purposes. It would not be fair or right to stigmatise all these vehicles as being useless for the purpose they are suggested, but I have no hesitation in saying that many of them will prove to be absolute white elephants to those firms who are unfortunate enough to purchase, as they are evidently merely the usual pleasure type of chassis fitted with a lorry or van body.

One reason why so few commercial vehicles are to be seen in use at the present time is that nearly all attempts that have been made to provide such a vehicle—at any rate of the petrol type—have been made in such a manner that disaster was bound to follow. Taking, for instance, those

it is a very excellent vehicle, and with a few further improvements will answer very well, and prove profitable to those that are bound to move loads of five tons at least at one time; but my conviction is that where one vehicle of this type will be purchased by the commercial community generally, thirty, aye fifty, of the lighter and smaller vehicles, capable of carrying from, say, one to two and a half tons, will be purchased, and it is for this section of the trade that manufacturers ought to lay themselves out, and design a vehicle that will have, to say the least, a small chance of proving itself to be useful and serviceable. Until the day arrives for electricity, the internal combustion engine will be found, for all-round purposes and for loads up to two and a half tons, to be far and away the best.

For many years I have had cars running in public service work, and, like many others, I had at first to use what I could get hold of. What was the result? Exactly what everyone else found, that the cost of

upkeep was enormous. After putting up with this for some time, I set to work to design something capable of standing all the hard work of service use, and to do this I found that most of the wearing parts had to be practically doubled as to their surfaces. That is the essential point in any car or anything—the part to be used must be designed for the purpose for which it is intended, and unless this is the case, disaster is bound to follow.

There is now coming a great demand for the commercial motor-vehicle, and I hope that our manufacturers will not offer for sale to the commercial community vehicles which, from their very design and inadequate bearing surfaces, cannot stand the severe work of business requirements. Experience has proved that, given sufficient strength of parts and sufficient bearing surfaces for the work it will have to do, there is no reason why the commercial motor-vehicle will not do its work as well as any other reasonably-constructed piece of machinery. But unless manufacturers will carefully consider the great strains that commercial vehicles have to undergo, and do all that is necessary to construct their cars on reasonable lines for this class of work, I am afraid it will be a long time before this type of vehicle is seen in our streets in any quantity. On the other hand, if manufacturers from the very first will only supply the right vehicle, I am certain that the amount of business to be done with this class of automobile is practically without limit.—Yours truly,

FRANK MORRIS.

BENZ v. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, "Amateur," most kindly offers the benefit of his experience *re* Benz cars, of which I would gladly avail myself if he would kindly send his letter to your office to be forwarded. What I particularly want to know from a disinterested amateur is whether the great weight and extreme difficulty of reaching the vital parts of a Benz, compared to the lightness and easily-reached working parts of a light voiturette, are compensated for by the working and quantity of petrol required to move it.—Yours truly,

D. BEAUMONT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a Benz car owner I should like to know what are the small improvements "Amateur" has made to improve the running of his car. As regards the mechanical inlet valve, I found this quite useless—in fact, I think it slowed the car; but I use a very light spring on inlet valve. I should also like more information from a user of the Star carburettor.—Yours truly,

JOHN HENRY KNIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in "Amateur's" reply in the last issue to Mr. Beaumont's letter of the 12th ult., *re* shortness of power in 3½-h.p. Benz cars to climb hills or even slightly rising ground on top speed. I have now been using a Benz car for over three years, and should be pleased to hear "Amateur's" explanation as to how he has improved the power, as I, too, am troubled in the same way as Mr. Beaumont and a great many others, who I know would be pleased to hear of any means of improving the hill-climbing powers of their cars, as it takes away much of the pleasure of motoring to have to merely crawl up the slightest hill or rising ground.—Yours truly,

AN OLD SUBSCRIBER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I for one of your readers would be glad to hear what improvements "Amateur" has been able to make in his 3½-h.p. Benz. My car will not take a slight hill without altering speed.—Yours truly,

A. F. FURNISS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest "Amateur's" letter, "Benz v. Light Car," in the MOTOR-CAR JOURNAL of the 26th ult. I also have a 3½-h.p. Benz car, and have experienced the same difficulty in going up slight inclines, having to invariably drop to the second speed or crypto. I should esteem it a great favour if your correspondent would kindly let me know what are the small improvements he has made.—Yours truly,

A. SIDNEY RANSOME.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Amateur" would kindly extend to me the obliging offer which he has made to Mr. Beaumont, to correspond with him about some improvements he has made in his 3½-h.p. Benz, I should be very glad to reciprocate. May I ask, *inter alia*, has "Amateur" contemplated the risk of illuminating his back plate, judged by its proximity to the carburettor and the heaviness of petrol vapour.—Yours truly,

C. A. PALMER.

LIGHT CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of the readers of your valuable journal give me their experiences of the following light cars—Speedwell, Vauxhall, Baby

Rochet, and Gordon Miniature? I am wanting to get a light car at a moderate price, say from £125 to £135, and would be much obliged if any of your readers would help me in the matter.—Yours truly,

ENQUIRER.

WATER CIRCULATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be greatly obliged if you would inform me whether, as regards the water circulation in my car, the water should flow from the bottom of the tank to the pump, from the pump to the top of the radiator, then from the bottom of the radiator to the lower portion of the cylinder water-jacket, and from the top of the latter back to the top of the tank. Is this right, or should the water flow from the pump to the lower part of the cylinder water-jacket, then from the top of the cylinder water-jacket to the top of the radiator and from the latter to the top of the water-tank?—Yours truly,

F. J. R.

["F. J. R." will probably obtain much better results with his circulation if he adopts his last-mentioned plan of connection, viz., from the tank to pump, thence to the bottom of cylinder water-jacket, from top of cylinder to top of radiator, and from the bottom of radiator to top of tank. By this method "F. J. R." would be constantly getting a supply of cold water into his engine, provided he had efficient radiators. If connected up in the first-named manner a constant supply of hot water would be contained in bulk, and his water-tank practically giving the radiator no chance of doing its work.]

INLET VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would explain why in some makes of petrol engines inlet valves with flat seats are employed, while in others inlet valves with bevel seats are used? I should also like to know which is the easier type to grind in, etc.—Yours truly,

MARBEUF.

[The reason that some makers of petrol engines make flat seats to their inlet valves is simply a matter of opinion, but the majority are now using the bevel seat. The great trouble is that any small piece of deposit either from the cylinder or from the incoming mixture is likely to remain on a flat seat and cause a loss of compression, whereas with the bevel seat it has every chance of being taken into the cylinder. The grinding of both forms of valve is practically the same.]

THE MOTOR-CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You recently gave particulars of the Motor Car Act. I should like to know, in case of selling a car and buying a new one, how the registration is effected. Would a fresh number have to be obtained, or can the number be transferred to the new car?—Yours truly,

L. R. A.

[Should the ownership of a registered car be changed the new or the old owner must give notice to the Council with which the car is registered, and an application be made either to cancel the registration or to continue it under the new ownership. The new owner may continue the registration on payment of a fee of 5s. for cars, and 1s. for motor-cycles.]

BORES AND STROKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just noticed a letter by F. L. Ferguson in your issue of the 19th ult., and have to point out that an error occurred in reporting what I said with regard to the relation between bore and stroke. It reads in the report ¼ in. I meant that the stroke should be one-fourth greater than the bore, and the reasons for this opinion are clearly stated in my paper.—Yours truly,

ALEC GOVAN.

SCREENS AND CANOPIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "F.'s" letter in your last issue, the question of canopies and hoods for cars depends very much on the power of the car. With a small car, a hood, if used at all, would only be employed in very bad weather, and when speed was quite a secondary question. With a 10 or 12-h.p. it might be expected to cut down the average quite two or three miles per hour or more, if against a head wind in level country; while with a high-powered car the loss in pace would be a small consideration, at any rate over English roads. A hood folding back over the tonneau is most useful when down as a dust screen, and, if reasonably light, is what I should recommend for a moderate-powered car; it shelters all the occupants remarkably from cold winds, even without a front screen; moreover, it can be entirely removed, if not required, more easily than a canopy. The latter is heavier, and while better suited to stand continuous bad weather, is more agreeable in hot weather as a protection from the sun; but it is more applicable to cars of higher power. The front screen is rather difficult to see through at times in bad weather. The form due to Mr. Estcourt, with curved or sloped side glasses, has the merit of giving

a better chance of a clear view. A hood, if this form is preferred, should have removable back and side curtains, so that these may be dispensed with when not needed.—Yours truly,

R. W. B.

LIGHT CAR TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some considerable amount of discussion has taken place recently as to the need for further trials for light cars. An excellent opportunity will be offered to manufacturers who really desire such trials to obtain an Automobile Club certificate for 100 miles non-stop run, together with a record of fuel consumed and speed on hill climbs, by entering for the next quarterly trials, which will be held on February 12th, starting from the Automobile Club Garage at 9 o'clock. The last day on which an entry can be received will be February 6th. The entry fee is ten guineas, of which six is returnable if the vehicle actually starts, and this fee includes the registration of driver and vehicle.—Yours truly,

BASIL H. JOY,

Technical Secretary, A.C.G.B.I.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Puncture Tired," my 8-h.p. car, when bought, had solid tyres. The thumping when running is far from a pleasant experience, and in my case, with a mileage of about 300, resulted in a broken back axle in the country, miles from any station. My next mishap happened in town, where, owing to shocks received over rough paving, one front wheel came off; broken axle again. These, together with minor troubles, determined me in having pneumatics fitted, since when I have had no further trouble. I should hesitate before changing to solids, as, with all the inconveniences of punctures, they are not so bad as broken axles, or as costly.—Yours truly,

SOLIDS TRIED.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 12-h.p. double-cylinder Aster engine in my car which has a loss of compression. I have fixed new inlet valve springs and washers and ground inlet valves, but with very little gain. I have run about 2,000 miles without any trouble (less punctures), till a few weeks since. Will the piston rings have become worn with wear, or has the cold weather any contracting effect on the rings to cause this loss? How long should the piston rings last?—Yours truly,

B. E. BOLTON.

UNATTENDED HORSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your *Journal* of December 26th a case is reported in which Judge Lumley Smith dismissed the action for damages committed by an unattended horse in a cart, thereby admitting the right of people to let their carts be unattended while calling for orders or delivering parcels. This decision seems opposed to all common sense. If it is necessary to leave carts unattended, surely the owners of those carts should lock the wheels to prevent accidents not only to motor-cars, but to the general public.—Yours truly,

J. M.

STARTING HANDLE FOUND.—Mr. Dennison, 3, Horbury Mews, Notting Hill Gate, W., writes, that he picked up a starting handle at Notting Hill on Christmas Eve, and will be pleased to hand it to the owner on application.

INTERNATIONAL AUTOMOBILE CONGRESS.—The American Motor Car and Vehicle Company, of Perth, Western Australia, which enquires for a report of the proceedings of the above, is referred to the Automobile Club de France, 6, Place de la Concorde, Paris.

IMPORT DUTIES ON MOTOR VEHICLES.

IN the last issue of the "Board of Trade Journal," the following particulars relating to the import duties levied on motor-vehicles in certain foreign countries are given:—

SWEDEN.—Automobiles are assessed for import duty in Sweden under the heading for "vehicles of all kinds not specially mentioned," the rate of duty on which is 15 per cent. *ad valorem*.

PERU.—Automobiles are free of import duty.

ARGENTINE REPUBLIC.—Automobiles are subject to a duty of 62 per cent. on their value, as assessed by the Customs Authorities.

BRITISH POSSESSIONS.

INDIA.—Motor-cars pay 5 per cent. *ad valorem*.

CEYLON.—Motor-cars not used for traction are liable to duty at the rate of 5½ per cent. *ad valorem*. Motor-cars used for traction are free of duty.

MAURITIUS.—Automobiles pay duty at the rate of 10·4 per cent. *ad valorem*.

FALKLAND ISLANDS.—Motor-cars are free of import duty.

SOUTH AFRICAN CUSTOMS UNION (Cape Colony, Natal, Orange River Colony, Transvaal, Southern Rhodesia).—Motor-vehicles pay duty at the rate of 5 per cent. *ad valorem*, but a rebate of one-fourth of the duty leviable is allowed if the goods are of British manufacture, and accompanied by a certificate to that effect in due form.

CANADA.—Automobiles are not specifically named in the Canadian Tariff, but carriages and vehicles not specified pay 35 per cent. *ad valorem*, with a reduction of one-third of the duty leviable if they are accompanied by a certificate proving them to be of British manufacture. The duty on automobiles, not new, in use by tourists going temporarily to Canada is refunded on re-exportation within a period fixed by the Collector of Customs, not exceeding six months.

NEWFOUNDLAND.—Motor-carriages are dutiable at the rate of 30 per cent. *ad valorem*.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED. M. P. H.	RESULT.
Guildford.....	S. A. Young, Twickenham	—	£3, etc.
"	H. Strakosch, London	—	£3, etc.
Bristol	C. H. Wilson (driver to Mr. G. White)	25	£1, etc.
Edinburgh ...	W. Rutherford, Portobello	—	£5.
Shoreham ...	J. Chapon	29	£3 6s.

COUNTY COURT CASES.

ARTHUR SOUTH, electrical engineer and bicycle and motor-car repairer, 132, Manchester Road, Nelson, sued Dr. Moore, Colne Road, Burnley, for £13 9s. 6d., in respect of repairs done to a steam motor-car and a petrol car. There was a counter claim of £10, in which Dr. Moore sued South for alleged damages sustained through the repairs being done. After considerable evidence had been heard, his Honour, in giving judgment, said he thought the plaintiff had made reasonable charges. With regard to the petrol car, he would deduct 15s. from that account, and give judgment for the plaintiff for £12 14s. 6d., with costs. The counter-claim would be dismissed.

At the Newent County Court the case of E. Pitt, Son, and Company, of Gloucester, v. Alfred Parker, of Newent, has been heard. This action, which had been transferred from the Gloucester Court, was brought to recover £11 3s., balance of the price agreed to be paid for a motor tractor. The defendant counter-claimed for £41 10s. expenses, etc., he had been put to owing to the motor being defective. Ultimately the judge gave judgment for the plaintiff for the amount claimed and dismissed the counter-claim.

"ACCIDENTAL" SMOKE.

MR. GEORGE MONRO, Jun., of the Motor Carriage Works Exeter Street, Strand, was summoned at Lambeth Police Court on Tuesday under the Locomotives on Highways Act, 1878, for using a locomotive which did not consume as far as possible its own smoke. Mr. Helman-Pidsley supported the summons, and said he anticipated the defence would be that this being a light locomotive the Act of 1878 did not apply, and that the offence, if any, came under the Light Locomotives Act of 1896. If Mr. Monroe could satisfy the court that the emission of smoke was temporary or accidental, according to the wording of the Act of 1896, then the summons would fail. The evidence was that the locomotive was stopped on November 11th on the top of Brixton-hill to take in water. Smoke accumulated in the smoke-box, and as the engine went down the hill by its own weight there was no blast of steam. Smoke was emitted for three minutes. The light locomotive was constructed to consume its own smoke. The magistrate regarded this as "temporary or accidental" smoke and dismissed the summons.

TO CORRESPONDENTS.

All communications intended for insertion in this *Journal* or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JANUARY 9, 1904.

[No 253.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

OUR DIRECTORY OF NUMBERS.

In an early issue we propose to commence the publication of our Directory of Motor Car Numbers. We have received a large number of Names, Addresses, and Numbers, and shall be glad to have additions to the list as early as possible, so that it may be full and comprehensive.

COMMENTS.

The Motor-Car Act.

ELSEWHERE we give the first of a series of notes on the working of the Motor-Car Act, in which we hope to chronicle any important decisions which may be made during the early operation of the new legislation. It will be noticed that the Bradford Corporation intends to follow the example of London, Manchester, Liverpool, West Bromwich, and Birmingham, in not adopting any regulation restricting the speed at a lower rate than is provided in the Act, recognising that Section I. adequately protects the public. On the other hand, several smaller places intend to limit the delights of motorists in a way that should warn all drivers to exercise caution, taking care to do nothing to warrant the re-imposition of the measure in three years' time. On page 864 we give the number of automobiles registered up to the time of going to press.

The South Lincolnshire Club.

IN the historic town of Boston, in Lincolnshire, a motor club has just been formed, and at the inaugural meeting, reported on another page, Dr. Miller said there were sufficient motorists in and about the town to warrant the formation of such a society. A low subscription has been suggested, so that motor-cyclists may be encouraged to join. In the development of these small provincial associations there is much hope that a healthy opinion may be created among motorists in favour of showing full consideration to other users of the road.

The Supply of Drivers.

AN experienced driver, who is also capable of doing all kinds of motor-car repairs, writes to deprecate the views of those who speak of the difficulty of obtaining efficient drivers of automobiles. He declares it to be quite a mistake. There are many good men who cannot obtain situations, and he suggests a warning should be given to young men who contemplate leaving other callings to become motor-car drivers. They may spend money—they will certainly spend time—in learning to drive, and then discover their talents are unwanted. This is a state of things that must almost inevitably occur. We would, however, point out that we have not expressed strong views as to a dearth of experienced drivers; our complaint has been with regard to the manners and methods of many who have been employed. The motor-mechanic should remember that he is the driver, and not the owner, of the car upon which he sits.

Potatoes and Petrol.

A NATIONAL Potato Society is the latest organisation which has been formed in this country, and with Mr. Walter P. Knight, the horticultural superintendent to the Kent Education Committee, as hon. secretary, a good beginning has been made. But is not Mr. Wright too sanguine as to the possibilities of the tuber with which the enterprise of Sir Walter Raleigh will always be associated in the popular imagination? He has told a credulous newspaper correspondent that "there is a possibility of manufacturing petrol out of potatoes. An eminent professor has declared that this could be done out of potatoes which, under ordinary conditions, possessed little or no market value." Seeing that petrol is a mineral product, this is a wonder of science that was hardly expected even in an age of the marvellous. But perhaps the secretary of the National Potato Society has alcohol in his mind—figuratively, of course. And the day of the alcohol motor is not yet—at least in this country. But there is no reason why the potatoes should not be grown ready for its development.

The Public Use of Private Cars.

THE decision of the executive committee of the A.C.G.B.I. to prosecute in a case where the car of a member was let out on hire while in the keeping of the proprietor of a garage, will be welcomed by private gentlemen who have to trust their vehicles to the care of such concerns. This is not an isolated case—both in London and the provinces instances have occurred where automobiles, placed in the keeping of firms having convenience for the storage of cars, have been allowed out by unauthorised persons as well as by the employees of the garage. Such unwarrantable liberties with expensive carriages should not be allowed, and it is to be hoped that the publicity given to the evil will tend to check its growth.

The Motor-Van and Wagon Users' Association.

THE first fifty members of the Motor Van and Wagon Users' Association comprise a representative selection of the leading commercial houses of the country. Several branches of industry are comprised in the membership, including Bass, Ratcliffe and Gretton, the Schultz Gunpowder Co., Lever Bros., Debenham and Co., Pickfords, Ltd., Pullar and Sons, Cadbury Bros., Harrod's Stores, and other equally well-known firms. For the new association there is a wide and growing sphere of utility, and not only can it do much to protect the interests of those already employing motor-wagons, but it can help to educate those who do not to a knowledge of the increasing efficiency of the motor-vehicle.

North of the Tweed.

THE Lord Provost of Edinburgh will preside at the annual dinner of the Eastern Section of the Scottish Automobile Club on the 21st inst., when the guest of the evening will be the Right Hon. A. Graham Murray, M.P., the Secretary for Scotland. In thus securing the support of Mr.

Murray Scottish motorists are to be congratulated, for he is a practical motorist—S.J.1 is his identification mark—and is not likely to sanction many of the rash suggestions that have been made by prejudiced local authorities in Scotland. In many respects the Scottish Club is in a very enviable position, and the way it has been supported by all the leading public men in Scotland has been a great contributory factor in its success.

New York's Riverside Drive.

No city in America possesses such a magnificent stretch of boulevard as skirts the beautiful Hudson river in New York. The famous riverside drive was not constructed in a day, and the improving of it is yet far from complete. Starting at Seventy-second street, the drive will continue, when finished, for a distance of four and one-half miles and offer a panorama to the New York automobilist and pedestrian such as they cannot find elsewhere. Hills are interspersed along the drive, such grand monuments as the Soldiers' and Sailors' Memorial and Grant's Tomb adorn it, and across the river the cliffs of the Palisades add to the beauty of the scene. On any pleasant morning, especially Sundays, the Drive is, states the "Motor," of New York, crowded with vehicles of all kinds, while processions of

In South Africa.

THE first prosecution for the alleged furious driving of a motor-car in South Africa took place at Cape Town early last month, Mr. E. A. Curtis being the defendant. From the evidence, it appeared that the motorist exceeded the speed limit of eight miles an hour, and rounded a corner at a greater speed than three miles an hour. There was a third charge against the defendant for having no light attached to the vehicle. The magistrate found the defendant guilty on all charges, and fined him on the first charge £1, and for the second and third he was fined £5, making £6 in all. Evidently the South African magistrate is not unlike his Surrey brother in some respects.

Post Offices and Names.

OFTEN have motorists been worried at the absence of the names of the villages above some of the smaller post offices in the country districts. These public institutions should have the name of the locality in which they are situated clearly painted in a conspicuous position, and it is the practice of the postal authorities to require the exhibition of the names. We shall be glad to hear from readers as to villages and ham-

A Snapshot on New York's Riverside Drive.

pedestrians line both sides of the thoroughfare. The Hudson river is covered with pleasure craft—there being several yacht and boat clubs located on its banks—and the entire scene shows the energetic American in the keenness of his enjoyment.

Motor-Cars and Electrical Tramway Work.

IN the course of an article by Mr. L. E. Harvey on Tower wagons for use in connection with the maintenance of the overhead conductors of electrical tramways, in a recent issue of the "Electrical Review," the author points out that "Automobile emergency wagons are now coming to the fore, and there is no doubt that they are very suitable for this class of work, as they are very speedy, their under-carriage is heavy and low down, and they can be shifted back or forward very steadily, to say nothing of their running costs being much less than those of two horses, and of their taking less stable room and being quicker started out. Leeds, Bradford and Aberdeen have now got these wagons. Bradford was the first in the field, and they found it so handy and economical that they recently purchased a second. This is a four-cylinder Milnes-Daimler chassis, the superstructure being designed and made at the tramway depot. Leeds got a precisely similar truck and fitted a superstructure on the same lines as the Bradford one, and the writer has been assured that they are far better than horse-drawn wagons in every way."

lets where this duty has been neglected. The matter is a minor one, but upon such a multitude of minor matters the pleasures of touring greatly depend.

The Marine Motor.

IN its excellent Winter and Mediterranean issue the "Yachting World" has an article on the future of the motor-boat. Although Daimler fitted his V-shaped twin-cylinder engine to a launch before trying it on a car, the marine motor owes its chief features of design to the Pygmy motor of M. Leon Lefebvre, with its large accessible crank-case, its equally accessible valve-chest, and its general simplicity of construction all round, to say nothing of its compactness and low-carried centre of gravity. The writer discusses the technical details of the subject with ample knowledge, and on the much-discussed subject as to whether the high tension and jump-spark, or low-tension with make-and-break, will be the system of ignition used on the marine engine of the future has opinions which coincide with the practice of several leading British, French, and American makers. The low-tension plan, he points out, is far less liable to short-circuit than the high-tension, while it gives an increased size of spark, and ensures the non-fouling quality of the electrodes. It is said that half a dozen different motor engineers are now experimenting with the view

of using paraffin, and the writer of the "Yachting World's" article expresses an emphatic opinion in favour of heavy oil as "the fuel of the future."

English Advance.

WE learn that the Wolseley Tool and Motor Car Company, Limited, contemplate putting a "night shift" into operation at their Birmingham works, and that the average output of finished cars during the past year was at the rate of nine per week. This is not taking into account the large amount of work which was carried out for the War Office. The new works which have been acquired at Crayford, Kent, have been installed with a plant of machinery capable of giving an output at the rate of twenty cars per week. They will be devoted to the manufacture of the 6-h.p. light car and other special types. The works and ground attached thereto occupy twenty-five acres, and a track for testing the cars is being prepared.

To Devon and back.

NOT often do motorists keep a log of their travels with the exactitude with which Mr. Beadle filled his book on the trip to Devon he details on another page. His running expenses worked out to less than a halfpenny a mile, and evidently his experiences were pleasurable indeed. Such a record dispels the idea that the automobile is an extravagant sort of beast. Well cared for and well driven it has few vices and can be relied upon to take folks to the end of their journey without loss of temper and at a considerable gain in time.

Motoring and the Eyes.

IN a recent number of an American medical journal Dr. A. Edward Davis states that during the past year he has observed several cases of conjunctivitis, acute and chronic, which could be attributed to no other cause than rapid riding in motor-cars with the eyes unprotected. The direct causes of the inflammation are said to be the friction of the wind against the sensitive covering of the eye and chilling of the eyeball. As the wind and the cold are the specific causes of the inflammation, it will be recognised that when out for extended automobile trips, during the late autumn and winter particularly, it is important to protect the eyes with goggles or eye shields. The remedy for this sort of eye inflammation, according to Dr. Davis, consists in the application of cold compresses to the eyes for fifteen minutes at a time, three or four times a day, and the application of mild astringent washes by means of an eye cup twice a day. Latent and chronic inflammation of the deeper eye tissues may be made active again by driving in the cold, and in such cases riding in the open must be discontinued, the active use of the eye for close work discontinued, and an oculist consulted.

Municipal Motor-Cars.

It is clearly evident that all experts who have charge of any large undertakings, whether trams, roads, water, electric light, or anything else of the kind, recognise the facilities that they can obtain from the use of the automobile. The time will shortly come when every municipal authority will possess a motor-car for the use of those officers who require to get quickly from place to place, and we should like to see the question considered from the point of view of convenience of all such departmental officers rather than the immediate necessities of any special branch. Friends of automobilism on Borough Councils can do much to assist the movement by pressing this matter to the notice of their colleagues, and thus preventing the sectional discussions which have not always had the desired effect up to the present. There is no doubt as to the value of the motor-car for inspection work. Its reliability has been fully tested in public trials as well as by private experience, and it only requires tactful advocacy to secure a motor vehicle for the use of every municipality throughout the country, such car to be available for whatever department requires it most.

Co-operative Garage.

A DISTINCTLY novel idea in connection with automobilism has just been adopted in Havana. It appears there are thirty-eight motor-cars owned in that place by some twenty-six persons. Seventeen of the latter have formed the Havana Garage Company, with a capital of 10,000 dollars. This has been started with a view to storing and doing all cleaning, etc., for the vehicles owned by those who constitute the shareholders. In addition, qualified engineers will be engaged for repair work, and it is also hoped, by the adoption of this co-operative plan, to secure supplies of fuel, oils, etc., at comparatively low rates. The development of the idea will be watched with considerable interest, and there are localities in this country where, with efficient organisation and someone willing to take the initiative, something of a similar kind could easily be carried out.

Mr. Mawdsley Brooke Piloting a Brooke Car to London.

A Driving Manual.

ALTHOUGH experience is the best teacher of the art of motor-car driving, some useful hints can be gleaned from manuals when they are written by practical people—a reflection that comes to us after a perusal of a book of nearly two hundred pages just issued by the Lanchester Engine Co., Ltd. This is the second part of a pocket manual they propose to publish, the first section being a description of the car and the third, not yet issued, dealing with the vehicle from the engineer's or repairer's point of view. Thus will be provided a serviceable handbook primarily for owners of Lanchester cars, but of practical utility to motorists generally. The second part contains full instructions for drivers' and attendants' use, and the lucid letterpress is made even more clear by scores of drawings and illustrations of working parts.

Motor-Cars for Military Purposes.

GENERAL GREELY, chief signal officer of the U.S. army, has just made his annual report, in the course of which he refers to the question of motor-cars as follows, "In view of the prospective value of motor-propelled vehicles to telegraph and balloon trains, the chief signal officer of the army has continued experiments with automobiles. The signal corps' experiences have demonstrated the practicability of self-propelled vehicles for such military purposes. While the good points of electric and steam vehicles are thoroughly recognised, yet the internal-combustion type, using kerosene or other oil, seems

preferable for war purposes. This type has especially valuable features from a military standpoint in its small fuel and water consumption, essential qualities to any army in the field.

Dangerous Roads.

IN our correspondence columns a resident of Cambridgeshire calls attention to a dangerous bridge on the main road from Chatteris to Ely. In the Fen district there are many such places of which motorists had better beware. Beyond Boston we know of several drains—relics of the old enthusiasm for draining the fens—which are quite unprotected, and into which motorists, unaccustomed to the peculiarities of that part of the country, might easily fall. There is plenty of work for the newly-formed South Lincolnshire Club, as well as for the Eastern Counties and other automobile organisations in that part of the country, in arousing the interest of local authorities. We are always open to receive intimations from our readers of such dangerous spots as those indicated by our correspondents, because there is no doubt that the publicity thus afforded frequently has a good effect on the local authorities concerned. Too often they allow their energies to become lax, and a little newspaper warning, backed up by keen agitation on the part of local motorists, may do much to urge them to a greater sense of their public duty.

Mr. Winthrop E. Scarritt, President of the Automobile Club of America.

English Entries for the Gordon Bennett Cup.

THE last day for the entries for the Eliminary Trial to select the British team in the Gordon Bennett contest having expired, we are now able to announce that four firms will struggle for the honour of representing this country at Homburg in June. Last week some particulars of the Hutton racers were given. Reference had previously been made to the Napier vehicles, and we are now able to announce that the Wolseley Tool Company have entered three cars. Two of these will be of 96-n.h.p. and the third of 72-n.h.p. In the design the surface exposed to the wind pressure will be reduced to the lowest possible point, while the centre of gravity will be brought extremely low. The horizontal four-cylinder type of motor will be retained, it being claimed by the makers that this enables the car to negotiate corners and bends in the roads at a very high rate of speed. The Darracq Company, which has now an

English factory, has also entered, and, in all probability, fourteen British built vehicles will take part in the eliminating test.

Travelling in the Dark.

A CORRESPONDENT—No. D. 38, to give his official title as recorded in the chronicles of the county of Kent—suggests that drovers should be compelled by law to carry lights when driving cattle on the roads. He nearly ran into some sheep and bullocks a short time ago; fortunately they were on their right side of the road, or the consequences might have been serious. The difficulty, and it is a very real one for those who motor after daylight, might be minimised if the old sheep bells could be revived, and there was something of a reversion to the days of poetic delight in the country. But the rural districts are losing their rusticity, and utilitarianism has laid a heavy hand on country ways and customs. Otherwise the sheep bell would still warn motorists as to the presence of flocks and herds and other terrors of the highway.

The Motor on the Farm.

PROFESSOR JAMES LONG, an agricultural authority of recognised repute, has been advocating the claims of the motor as a friend to agriculturists. In the columns of the "Manchester Guardian" he claims that the adoption of the motor by British farmers would effect an annual saving of six millions sterling—an economy that should bring the smile of prosperity to the decadent agricultural interests. He contends that in the average season there is a stupendous loss in English farming entirely owing to the slowness of the methods employed. By the aid of the motor "we shall not only reduce the cost of cultivation per acre and indeed of harvesting as well, but we shall get through our work with infinitely greater speed and reduce direct losses and risks to a minimum." On the financial side Professor Long's calculations are equally important. The total cost of harvesting and threshing on the present lines is said to be 17s. 2d. an acre, whereas the motor can reap and thresh at a cost of 9s. 4d. an acre. It is also claimed that ten acres can be reaped and threshed in a day by the aid of the motor and eight men. In the ordinary way the same work would require four men and a pair of horses for cutting; seven men and five horses for carting; six men for stacking; three men and two boys for thatching; and for threshing ten men and a pair of horses; or, in all, a single day's work for thirty men and boys and nine horses.

THE International Motor Car Company, Limited, of High Street, Marylebone, is in no way connected with the International Automobile Company, Limited.

MESSRS. S. R. BAILEY AND LAMBERT, LIMITED, have been registered with a capital of £5,000 to adopt an agreement with Messrs. S. R. Bailey and L. Lambert, and to carry on the business of manufacturers of, dealers in, and agents for motor-cars, etc.

THE Electric and General Assurance, Limited, has been registered with a capital of £10,000 to insure against loss or damage arising from tramway, light railway, motor-car, and similar accidents. The first directors are Messrs. P. Carvill, J. H. Albright, J. Devonshire, and G. Cornwallis-West.

THREE entries have been received by the Automobile Club of America for the Gordon Bennett race—one by the Peerless Motor Car Company, of Cleveland; one by Mr. Alden Sampson, of Pittsfield, Mass., and one by Mr. Peter Cooper Hewitt, of New York. Mr. Sampson's car will be built by a firm in Pittsfield, Mass. Mr. Hewitt's machine is being built by the Trenton Iron Company, of Trenton, N.J., and is said to be nearly completed. The racing committee of the A.C.A. has decided to hold the eliminator trials at least six weeks prior to the date of the Cup race, and some time between April 15th and May 15th. The nature of the trials and the course on which they will be held have not yet been decided.

THE MOTOR CAR ACT.

—v—

A DEPUTATION from the Yorkshire Automobile Club, consisting of Messrs. W. Jackson, A. Lingard, and H. A. Jones, has waited upon the Watch Committee of the Bradford Corporation, to urge the committee not to fix any regulations restricting the speed at a lower rate than

dangerous to the public, having regard to the circumstances of the case, including the nature, condition, and use of the highway and the amount of traffic which actually is at the time or which can reasonably be expected to be on the highway, he becomes subject to the penalties under the Act." This has been adopted by the London County Council and the City Councils of Liverpool, Manchester and Birmingham.

◆ ◆ ◆

The Prince of Salm-Reifferscheidt, the Honorary President of the Rhenish-Westphalian Automobile Club.
[Allgemeine Automobil Zeitung.]

the Act provides, subject, of course, to the proviso of driving to the public safety. Mr. J. Moorhouse, chairman of the committee, presided; and it was decided to postpone the making of any regulations for six months, and to allow the Act to work out by itself, subject to Section 1, which reads:—"If any person drives a motor-car on a public highway recklessly or negligently, or at a speed or in a manner

The Leeds Corporation Watch Committee at a meeting have received a joint deputation from the Yorkshire Automobile Club and the Leeds and District Motor Cycling Club with reference to the powers sought by the City Council for the restriction of the speeds of automobiles within the boundaries of the city. The Watch Committee propose to limit the speed of all motor-cars

and cycles within a radius of two miles from the centre of the city to ten miles an hour, and within a radius of one mile to seven miles. The deputation contended that the proposed regulations would be more stringent than was justifiable, and pointed out anomalous conditions which would obtain under them. The Committee afterwards discussed the points raised, and eventually decided to abide by the original regulations proposed.

At Huddersfield the Corporation have asked the Local Government Board to fix the speed limit at seven miles per hour for a radius of one mile from the Market Place, and ten miles for a radius of between one and two miles.

Great dissatisfaction is said to prevail among the more narrow-minded section of the people of the chief towns in Buckinghamshire in reference to the decision of the Bucks County Council with regard to the working of the new Act regulating the speed of motor-cars. The Act provides for applications to be made to the county council from urban districts for the speed of cars to be limited to ten miles an hour when passing through urban areas. Applications for this restriction have been made by Slough, Marlow, Beaconsfield, and other urban councils in Bucks. The County Council, however, have decided not to apply to the Local Government Board to prescribe a reduced speed limit under Section 9 of the Act, being of opinion that the stringent clauses and ready means of identification which the Act provides will be found a sufficient protection for the general public.

Superstition as to the ill-luck attaching to the number thirteen has made itself apparent. A Shropshire journal reports in that county this number fell in the ordinary course to a lady motorist. She promptly had it sent back, and said she would prefer a change. The request was acceded to. This, however, was not the end of the difficulty. A driver sent to register his master's car accepted the discarded No. 13, but came back next day with the message that his master's daughter would be better satisfied with another number! "Thirteen" after this was not tried again with cars, and is now cancelled so far as the county of Salop is concerned.

As a general rule cars have been registered in the localities in which their owners reside, but in Scotland this has been departed from in several cases. At Glasgow there have been a number of registrations of motor-cars from Dumbartonshire, Stirlingshire, Renfrewshire, and Edinburgh.

In our next issue we propose to commence the publication of a list of owners of motor-cars whose vehicles have been registered in their respective districts. In order that this may be made comprehensive motorists are invited to favour us, not later than Tuesday next, with their names, addresses, and registered numbers for publication in the list, which will be of interest as the first attempt to obtain an authentic record of British motorists.

Earl Cottenham and other local leaders in the Uttoxeter district have become motorists, and the movement is becoming very popular in that part of Staffordshire. The Stafford County Council are acting very well towards motorists, and, as far as we can learn, are not making any restrictions about closing roads and limiting the speed through towns and villages, leaving it to the good sense of the motorists themselves. The police, too, are very reasonable in their attitude.

Notice of intention to apply to the Local Government Board for a ten-mile-an-hour limit of speed for motor-cars has been given by the authorities of the following places:—St. Helens, Oxford, Winchester, Wallsend, and Barry.

In most cases the drivers' licences issued by the county and borough authorities outnumber the registrations of cars. Brighton

seems to have been an exception, for whereas up to the 31st ult. 107 cars and motor-cycles had been registered only ninety-three drivers' licences had been issued. At Hastings, forty-six cars and cycles were registered and fifty-eight licences issued. In Sussex, where 332 automobiles were registered, licences were issued to 375 drivers.

The Act came into operation on the 1st inst., and within four days one motorist had cancelled the registration of his car. Mr. G. T. Langridge, of Epsom, registered his automobile in two places, receiving in East Sussex the identification mark A.P.26, and in the other district a number he liked better. Thereupon he decided to cancel A.P.26, and thus achieved the distinction of being the first motorist to cancel a registration.

One of the first matters that will occupy the attention of the County Purposes Committee of the City of London Corporation, at its first meeting this year, at the end of the month, will be the question of the speed of motor-cars in the City. Numbering and licensing are dealt with by the London County Council, but "within any limits or place referred to in regulations made by the Local Government Board, with a view to the safety of the public, on the application of the local authority of the area in which the limits or place are situate, a person shall not drive a motor-car at a speed exceeding ten miles an hour." The Committee will therefore have to determine whether, in its opinion, any and what streets within its jurisdiction should be included in such restrictions—a matter of more than general interest in view of the narrow and tortuous City thoroughfares.

The Holland Quarter Sessions were held at Boston on Monday, Mr. W. Garfit, M.P., presiding. The Chairman, in charging the Grand Jury, drew attention to the Motor Act. He said they all knew that there were some scorers who had brought motorists rather into disrepute, but he thought they must all admit that motor-cars generally were driven with care. Like bicycles, automobiles had come to stay, and therefore Parliament had passed an Act for their regulation.

In continuance of the lists previously given of the first motorists to register their vehicles in their respective towns and counties we now publish the following "No. 1's."

ENGLAND AND WALES.

BRIGHTON.—Mr. F. H. Nye, Broadwater, Worthing, C.D.1.

BURTON-ON-TRENT.—Mr. G. F. Reading, L.D.S., Nunneley House, Bridge Street, Burton-on-Trent, F.A.1.

SHROPSHIRE.—Captain Foster, Woodcote Hall, Newport, A.W.1.

HUDDERSFIELD.—Mr. F. W. Mills, Thornleigh, Huddersfield, C.X.1.

LEEDS.—Mr. A. Currer Briggs, Lord Mayor of Leeds, U.I.1; Mr. Rowland Winn was the first to take out a dealers' license in Leeds.

SCOTLAND.

ROXBURGHSHIRE.—Dr. W. Blair, Abbey Green, Jedburgh, K.S.1.

BERWICKSHIRE.—Sir G. Houston Boswall, Bart., of Blackadder, Edrom, S.H.1.

LEITH.—Mr. G. W. Mackie, Trinity Grove, Leith, W.S.1.

RENFREWSHIRE.—Mr. W. Todd, Lithgow, Drums, Langbank, H.S.1.

FORFARSHIRE.—A. M. White, Middleton, Friockheim, S.R.1.

MESSRS. R. MARTIN AND SON have a garage to accommodate twenty cars in the King's Road, Newbury, and recently supplied a car for the use of the local postal authorities. They have every facility for the repair of cars, the charging of accumulators, etc.

MOTOR-CAR REGISTRATIONS.

BELOW we publish the number of cars and motor-cycles registered and drivers' licences issued in various counties and boroughs up to the time of going to press; in our next issue the list will be brought up-to-date.

Owing to the large number of applications for registration and licences under the new Motor Car Act, it has been found impossible for the authorities to immediately cope with them. The consequence is that many cars are still on the road unnumbered, and on Wednesday the Commissioner of Police for the Metropolis issued instructions to the effect that no proceedings were to be taken at present with regard to the cars which were still unnumbered.

A conference was held on Thursday of the Motor-Car Committee of the County Councils Association and a committee representing the Association of Municipal Corporations and County and Non-County Boroughs to consider the question of sign-posts.

It was believed that no difficulty would be experienced in formulating a uniform scheme that would prove acceptable to the Government.

THE "STANDARD" 12-15-h.p CAR.

A NEW car, which, while outwardly following the usual lines, comprises a number of interesting features, is that which is now being turned out by the Standard Motor Company, of Coventry, and of which an illustration is given herewith. The object of the builders has been to produce a car which will not travel at a greater speed than twenty-five miles per hour on the level, and yet possesses sufficient power to

adjustments are automatically accomplished by the governor, although a hand-lever, mounted on the steering-wheel, enables the governor to be cut entirely out of action at any desired speed. The water circulation is maintained by a pump and honeycomb radiator, a fan driven from the engine shaft inducing a strong blast of air through the cooling tubes.

Passing now to the transmission, four speeds forward and a reverse are provided. The clutch is of the self-contained type, so designed that no end thrust is put on the crank-shaft bearings

Figs. 1 and 2.—Part Sectional Elevations of "Standard" 12-15-h.p. Motor and Clutch.

climb ordinary gradients at a speed of from sixteen to eighteen miles per hour, so that on a long run a very good average speed can be maintained. The frame of the car is built of I section steel, tapered and bent at the ends and electrically welded by a special process, a strong and rigid frame being thus secured. The motive power is supplied by a two-cylinder engine of 12-15-h.p., a novel feature of which is the short stroke in relation to the bore, the cylinder dimensions being 5 in. diameter by 3 in. stroke. It is claimed that this enables the engine to be run at as low as 250 revolutions per minute without jumping or knocking, and at the same time permits the speed to be accelerated to over 2,000 revolutions without excessive wear, the piston speed at the latter rate, owing to the short stroke, being comparatively low. The normal speed of the engine is 1,200 revolutions per minute. The crank shaft and connecting-rod bearings throughout the engine are of large size, and the big end is readily adjustable through inspection doors in the base chamber. The cam shaft is parallel with the engine shaft, and actuates the tappets of the valves, which are all mechanically-operated, and so arranged that any one of them may be removed without interfering with the others. On an extension of the cam shaft driven by a claw coupling are the pump and contact breaker. The latter is of the wipe self-adjusting type. The governor, which is mounted on an extension of the crank-shaft, actuates a sleeve connected with the extra air supply and throttle-valve of the carburettor. The latter is of an improved design, and is so arranged that all

whilst power is being transmitted from the engine to the gear-box. Between the engine and clutch is arranged an Oldham coupling, which allows of the power being transmitted at constant speed without throwing undue stresses on the shafts should they be slightly out of line. From the gear-box the power is transmitted to a live axle through a universally-jointed shaft and bevel gearing. The change-speed gear is of the sliding type, with a direct drive on the top speed, none of the gear wheels being in mesh. The whole movement, from reverse right through the various speeds, is effected by means of one lever. The bearings of the gear-case are adjustable without interfering with the joint. An inspection cover is fitted, so that the gears may be readily examined. The bevel gear and back axle bearings are of special design. The small bevel pinion shaft is not only

mounted on a double row of large adjustable ball bearings, but a cage is also fitted to the end of the thrust-block; this cage carries a bush which forms a bearing for the outer end of the bevel pinion shaft, so that the pinion is held in absolutely pitch alignment with the larger bevel, it being claimed for the arrangement that not only is a perfect drive secured, but freedom from the humming noise usually given out by bevel gears running at high speeds. The road wheels are of the artillery type, 32 in. diameter. A set of four brakes is provided, the drums being attached to the rear hub flanges by bolts. An internal expanding brake in each drum is applied by a pedal actuated by the right foot of the driver, while for emergency purposes a hand-lever

Fig. 3.—General View of "Standard" 12-15-h.p. Car.

controls contracting brakes working on the outer surface of the drums. No brake action is taken through the driving pinions or joints, thus excessive stresses are not suddenly applied to these parts. The body of the car is of the double phaeton type, and is comfortably upholstered and mounted on easy springs.

A few days ago we had a twenty-five miles' run over a hilly course on the car illustrated, and can testify to the "picking up" powers it possesses on the hills. We may also remark that it is very quiet when running, and, owing doubtless to the long-wheel base, is very free from vibration.

SOME USEFUL NOTES.

WE saw a simple but exceedingly useful device on a car recently, by means of which the amount of petrol in the tank can easily be gauged. The plug or cap closing the inlet hole in the tank has attached to it a thin strip of hard red fibre, about an inch wide, the length being such that when the cap is screwed home the strip just reaches to the bottom of the tank. Thus whenever the plug is removed the strip which is withdrawn with it at the same time shows clearly the height of the petrol in the tank. By going to the trouble of emptying the tank and then filling it quart by quart or pint by pint, testing with the fibre strip after each addition and making a sharp notch with a three cornered file to correspond to each pint or quart, a useful and easily applied gauge will be obtained.

IN the course of a circular issued by Messrs. Brandes and Company, they point out that the re-charging of an accumulator needs a great deal of care; only experience and a high voltage dynamo will do it successfully and economically. Re-charging does not mean simply placing on the charging board and turning the current on—care must be taken to see that the acid is of the proper density, all sulphated plates taken out, cleaned and replaced, terminals perfectly clean. Great care is also required to see that the charging itself is done at the proper rate, otherwise there is danger of bent plates, resulting in short circuiting. A plating dynamo will not do the work, because the charge the accumulator is actually receiving cannot be controlled; the result is that charging becomes irregular, inefficient, and sometimes disastrous to both cell and plates.

OWNERS are sometimes puzzled by a sudden loss of power apparent in their cars, so a few words concerning this may not be out of place. In the case of atmospheric valves, the inlet valves are very frequently the source of loss of power, and it must be remembered that the temper of the valve springs is not a certain quantity, as it is liable to be affected by the heat. The inlet valves should be looked at first of all.

THE best method of getting at an unknown trouble, *e.g.*, loss of power, is to estimate the different probable sources of trouble one by one, as by this method the cause of the difficulty can always be found. After trying and renewing, if necessary, the inlet valves, do likewise with the exhaust, and whilst with the exhaust examine the timing and make sure that this has not been interfered with. Next pass on to the accumulators and see if they are fully charged, or, at any rate, showing four volts. Many a time have weak accumulators been found at the bottom of an "unknown trouble."

UNLESS the car is missing fire badly the contact may be left alone, as this cannot alter; but, of course, if the car has been in other hands, it is well to see that the firing cam is correctly set. The carburettor is an article which, unless it is either stopped up, or floods, cannot alter itself. A thorough cleansing of a carburettor with petrol is, however, a very good thing. Recently, loss of power has been frequently caused by indifferent petrol. This is more noticeable in the smaller cars (up to about h-h.p. two-cylinder) than in the larger four-cylinder cars,

MOTOR-CYCLING NEWS.

ONE of the new features of the Minerva motor-cycle set is an improved form of sparking plug, of which an illustration is given herewith. The practice adopted in 1903 of placing the plug immediately over the inlet valve, where it is scoured by the inrushing gas and protected by a partition from the burnt products of combustion, having proved most satisfactory, it is being retained. In the new plug, the porcelain and the projecting pieces of bent wire have been eliminated. The insulating portion of the plug is composed of compressed mica so adapted that it can be secured within the metal body of the plug with extreme

firmness. Through the mica body a perfectly straight wire runs, terminating flush with the dome-shaped inner end of the body. The latter has a hole in its centre just large enough to accommodate the extremity of the straight wire and to leave a ring-shaped space of about 1 mm. around it, across which the spark jumps. The force of the explosion being met by the dome, which is of strong metallic construction, there is, it is claimed, no tendency for the mica block to be loosened in the body. With ordinary usage the plug may be regarded as almost everlasting, as there seems to be nothing about it that can be liable to derangement, provision being made for scouring and cleansing the plug to any extent that the user may deem desirable.

THE E. M. Bowden's Patents Syndicate, Ltd., ask us to give publicity to the fact that they are the sole agents in Great Britain and Ireland for the F.N. motor-cycle engines.

THE members of the Motor-Cycling Club spent a very enjoyable evening on Tuesday last at the Frascati Restaurant, the occasion being the annual dinner of the club. The annual general meeting is to be held at the same place on the 28th inst.

Bonnard and the Werner Machine on which he competed in the recent Motor-Cycle Trials in France.

AT Sheffield the police have had the assistance of several motor-cyclists in some experiments with regard to the reading of numbers. A speed of over twenty miles was allowed, and there seemed great variety of view on the part of the constables as to whether the figures could be read when passing at that speed.

CONTINENTAL NOTES.

THE Mors, Gobron-Brillié, Georges Richard, Hotchkiss, and Gardner-Serpollet companies have each entered three cars, and the Turcat-Mery Company two vehicles, for the French eliminatory tests for the Gordon Bennett team. The Mors vehicles will probably be driven by Messrs. Salleron, Leger, and Jeandre. The Georges Richard cars will, it is said, be fitted with engines of 80-h.p. Altogether ten firms have entered for the French eliminatory tests, viz.—Panhard, De Dietrich, Clement Bayard, Darracq, Mors, Georges Richard, Hotchkiss, Gardner-Serpollet, Turcat-Mery, and Gobron-Brillié, representing altogether twenty-nine vehicles.

THE Italian Automobile Club has recently removed into large and well-appointed new quarters in Milan, where every convenience for motorists is available. The new premises were inaugurated by a dinner, at which over 300 were present. In proximity to the clubhouse, a club garage has also been established. This, as will be seen from the accompanying illustration, for which we are indebted to the *Rivista* of the Italian

be done in France in each department, if only a little energy were thrown into the business.

THE coming season promises to be a busy one, not only as regards motor-car competitions, but also in connection with the motor-boat movement. At Cannes, Monaco, and Nice, as well as other pleasure resorts, races are being organised. M. Paul Meyan, of "La France Automobile," has just offered a cup to the Club Nautique de Nice, which is to be competed for on the 17th April next. To become the winner's own property the cup must be won two years in succession. The race, which is to be over a distance of 100 kilometres, is international, each country being, however, only permitted to have in the race one boat, the length of which must not be more than 40 ft. Any number of entries can be sent in from each country, and a series of eliminating races will be held to select the boat to compete in the cup race. Entries are to be sent to the Club Nautique de Nice, 93, Quai du Midi, Nice, before the 30th March next.

THE Ersten Bayrischen Motor-Omnibus Gesellschaft, which started a public service in March last between Nuremburg and

The Garage of the Italian Automobile Club in Milan.

Touring Club, is a spacious building well adapted for its purpose and having accommodation for about seventy cars.

SLOWLY, but let us hope surely, British motor firms are gradually opening up connections in France. The Wolseley, Napier, and Hozier Companies have now their French agents, while recently the Electric Ignition Company, the Auto Machinery Company, and Messrs. John Marston, Limited, have appointed French representatives for their respective specialities. Brampton's motor chains have for long had a big sale in the country, and we learn that the Renold chains are now to be pushed in France. The Parsons anti-skid arrangement is already very popular in Paris, while, in addition to the Dunlop, the Collier tyre is being introduced to the French trade. Thus in all branches signs are not wanting of the development of the British motor industry. Glancing back at the recent *Salon*, the memory of which will not fade yet awhile, the only regrets we have are that none of the British builders of heavy steam wagons were represented, and that none of the big motor-cycle firms in England deemed it advisable to participate in the Show. In both these branches there can be no question that England leads the way, and we are sure that a good trade could

Heroldsberg, is gradually extending its operations. A service has lately been established between Nuremberg and Eschenau, while a contract has now been arranged with the Postal authorities for the conveyance of the mails between the places named from the 1st January.

THE Renard road-train, which was one of the features of the Paris Show, was put to a practical test on the streets of the French capital, last week. As a result, the inventors claim that their two theories of continuous traction and automatic steering have been proved to be practicable. A few trifling stoppages occurred, but these were due to the fact that the powerful motor carried by the first car had just come from the builder's works and was not running at its best. The train started from its shed at Vaugirard, loaded with passengers, followed the left bank of the Seine to the Alexandre III. Bridge, then crossed over to the Champs Elysées, and travelled up the Avenue Marigny by the side of the Palace of the Elysées. Progress so far was easy, but when the convoy reached the Faubourg-Saint-Honore an almost inextricable block ensued. After some delay, the train, with a fine sweep, entered the courtyard of the President's Palace, where the inventors were presented to the

President, who warmly congratulated them. The convoy, which afterwards turned into the Rue Royale, and performed various serpentine evolutions on the Place de la Concorde, threaded its way as easily as a single car through the maze of traffic, though it is true that the latter remained at a standstill to let it pass.

A PUBLIC service of motor-cars has recently been established between Leipzig and Merseburg, Germany. The vehicles, one of

which is illustrated herewith, have been supplied by Messrs. Stoewer Brothers, of Stettin; they are provided with 10-h.p. double-cylinder engines and have accommodation for twelve inside passengers. The transmission is by means of side chains and the road wheels are shod with solid rubber tyres. The distance between the two places is sixteen miles, the journey occupying about one and a half hours.

M. JEANTAUD, of Paris, who has long been known for his electrical motor-vehicles, is taking up the construction of petrol cars. Three types are to be built, viz.:—12-h.p. double cylinder, 18-h.p. three-cylinder, and 24-h.p. four-cylinder, the general arrangement of modern automobiles being followed.

THE Continental Caoutchouc and Gutta Percha Company have lately published a most useful handbook, which, while being intended for the use of German motorists, will be found exceedingly useful by all British automobilists visiting Germany, as, in view of the Gordon Bennett race, many are likely to do this summer. It extends to, roundly, 1,000 pages, within which are given full instructions as to the proper use and handling of Continental tyres, complete particulars of the regulations regarding motor-cars in Germany, customs duties, routes between the leading towns, German and foreign motor-car clubs, German motor-car builders, repairers, and petrol depots. The main feature of the book is, however, the guide to all the more important cities, towns, and villages in the Fatherland. No less than 600 pages are devoted to this section; the places are arranged in alphabetical order, and under each are given the names of the principal hotels, motor repairers, and petrol depots, and much other useful information. Altogether, much time and money must have been spent by the Continental Company in the compilation of the book, which is almost indispensable to the motorist who includes Germany in his touring.

IN a recent issue of "La Locomotion Automobile," M. Lucien Fournier gives an interesting *resumé* of the history of the well-known motor-car concern, the Panhard-Levassor Company, from which we take the following:—"The firm was originally founded in 1855 by M. Perin, the inventor of the band-saw. In 1867 M. Panhard became associated with M. Perin, and Panhard et Cie. was organised, to be succeeded in 1886 by Panhard and Levassor, and in 1897 by the Société Anonyme des Anciens Etablissements Panhard et Levassor. In 1875, the manufacture of gas engines was added to the regular business of the firm, and in 1886 the construction of internal combustion motors was begun, the firm having acquired the French patents of Gottlieb

Daimler. The first automobile from the Panhard works made its appearance in 1891, from the designs of M. Emile Levassor.

SINCE that first vehicle left the works on the Avenue d'Ivry much progress has been made there and many improvements originated. The Panhard firm claims the credit of having introduced the practice of locating the motor in front; hand wheel steering; flanged radiators; the general transmission arrangement now commonly used, and armored wood frame construction. In France it has been the practice to build new vehicles for the great annual races, and for this reason many of the improvements were first seen at some particular race. Thus the Paris-Dieppe race, 1897, was characterised by the first appearance of the coiled radiator; Paris-Amsterdam, 1898, by the introduction of wheel steering and four-cylinder balanced motors; Paris-Bordeaux, 1899, radiator in front; Paris-Toulouse, 1900, reverse gear without shifting bevel gears; Paris-Berlin, 1901, cylinders and heads cast integral and mechanism with three point suspension; Paris-Vienna, 1902, steel cylinders and double-acting hub brakes. The Panhard Co. also claim to have been the first to have used nickel steel in automobile construction (for gear pinions and crank shafts), its first order for nickel steel being dated June, 1901. At the present time the production of Panhard cars is said to be 120 per month. The total number of workmen employed in the works is 1,400. Besides automobiles the company still build wood working machinery and explosive engines for electric generating sets and motor-boats.

WE hear that the Société Decauville, of Paris, have commenced proceedings against the Darracq Company to restrain the latter from using upon the Darracq cars a copy of the Decauville metal shield which supports the motor and also protects the mechanism entirely from the mud and dust encountered upon the road.

A FEATURE of the recent *Salon* in Paris was the great variety in carriage bodies and the marked increase in those of

the covered type with entrances at the side. The accompanying illustration, reproduced from a circular issued by the Mors Company, is interesting as showing the many designs of bodies this concern is now in a position to fit to its chassis.

A RUN INTO DEVON AND BACK.

—■—

HAVING received an invitation to spend a fortnight with some friends in North Devon, I decided to drive down on my 6½-h.p. Regal light car, going what I thought was the nearest way, and making a short tour back along the south coast.

Leaving Blackheath at 3.5 a.m. on a Saturday, I made my way as best I could over the various obstructions of the South London tram-lines to Wandsworth, and from there to Kew Bridge, where I joined the main road to Bath. I reached Hounslow at 4.20 a.m., and made my first stop to plug the holes for the screws which fasten the petrol tank to the dash-board. This delayed me twenty-five minutes, and while repairing a motor-bicycle and trailer passed me. Making a start again I soon came across the motor-bicycle, the rider of which was hard at work repairing a puncture. I ran into Maidenhead at 5.30 a.m., and, making up a little for lost time, reached Reading at six o'clock. Here I went wrong twice, and, before I got on the right road, lost ten minutes making enquiries. Some way out of Reading I came on a little group of cyclists round a motor-car, and, thinking something was wrong, I pulled up to enquire,

The Curiosity of the Natives.

but received as reply a very surly "No." I found out soon after that a road race was in progress and that they were waiting for the riders.

Travelling along a beautiful road I reached Marlborough at 7.55 a.m. and decided to stop for breakfast. This successfully accomplished, I left at 8.45 a.m. and ran on to Devizes, where I took in two gallons of petrol, which just filled the tank again. Staying at Devizes ten minutes I departed at 9.45, and reached Frome at 10.50. After resting forty minutes, I found the ascent out of Frome is very steep, but not long, and, running on through beautiful country and very level roads, Sedgemoor was reached at 1.45 p.m., and here I made a lengthy stop for lunch.

Starting again at 3 p.m., Tiverton was reached at 5.10 p.m., having had a twenty-minute stop a little way out to readjust contact screw and blow up one of the tyres which appeared to be a trifle slack. At Tiverton I bought up all the available stock of petrol, amounting to 1½ gallons, and started again for South Molton. Tea was taken at Exeter Inn, six miles from Tiverton, and I departed at 6.30 p.m. for what proved to be a very lonely but very lovely ride. Following the banks of the Exe for a mile or so, I crossed the river and began a very long climb, which took me far above the water, of which I caught occasional glimpses glimmering in the valley below.

South Molton is reached by climbing a very long, steep hill, which, however, presented no terrors to my stout little car. On reaching the town I filled up with petrol, only requiring about one and a half gallons, and went on to Barnstaple, arriving at 8 p.m. I was now only about nine miles from my destination, Kentisbury, but was directed a long way round via Bratton Fleming. There I found the only hill which was any trouble at all on the whole journey, and I had to get out and let the car run up by itself for a few yards. I finally reached my friend's house at 9.45 p.m.

There was a great lack of signposts in the various towns. At Frome, Devizes and Glastonbury, to mention only three, it would be almost impossible to find the way without enquiry. There was no trouble throughout the entire journey with horses, dogs, or policemen, all of whom seemed well accustomed and well disposed to the motor-car.

Leaving Kentisbury for the return journey on a Thursday at 10.40 a.m. we ran to Barnstaple via Shirwell, where there is a very long, steep hill about halfway, winding round and round so that at one time the road appears like a white streak right underneath. Barnstaple was reached at 11.15 a.m., and here, while purchasing two gallons of petrol and some oil, it came on to rain in torrents. We waited until it eased up a little, then made a start for Exeter. The road to that town, however, is a side turning off the main road, with no signposts or other indication that it leads to anywhere in particular. The result was we missed it and went four miles out of our way, having to go right back to Barnstaple, the rain pouring down all the time. We finally got away at 12.10, and, following the river Taw and the railway, made a fairly quick run to Lafford, where we had lunch, — a poor meal at an extortionate price. Leaving Lafford at 2.27 p.m., we continued to Exeter *via* Crediton, the seat of Sir Redvers Buller. The scenery here is very fine, the road rising very high and giving a view for miles round. Exeter was reached at 3.30 p.m., and, obtaining petrol after some difficulty, was left at 4.10 p.m. A nice road brought us to Honiton at 5.5 p.m., where, after tea, we had a stroll; the yearly fair being in progress made it very interesting. Leaving Honiton at 6.25 p.m. we proceeded to Axminster, the road out of Honiton being very steep with bad surface, and through a toll gate Axminster was reached at 7 p.m. and left at 7.7 p.m. There is a very long climb out of the town and a terribly steep descent to Charmouth. From Charmouth to Bridport is a fair road with the exception of one very high hill leading down into Chidwick. We stayed the night at the Greyhound Hotel, Bridport, having reached there at 8.5 p.m. Starting from Bridport the next morning at 9.5 a.m., we made for Dorchester over a series of steep and precipitous hills, of which there are no less than nine in nine miles. They are not very long or winding, but simply gradients of about one in six to one in ten. In five miles, after leaving Bridport, the road rises from 250 feet to 700 feet. Dorchester was safely reached at 10.5 and left at 10.45 a.m., Poole 11.45 and Bournemouth 12.5, where we had lunch after a very pleasant spin.

Leaving Bournemouth at 2.20 p.m. we ran through to Fareham, arriving 5.10 p.m. and leaving at 5.55. Travelling via Havant, Chichester and Arundel, we arrived at Warne's Hotel, Worthing, at 8.5 p.m. Leaving there the following day at 11.15 a.m., and taking the road through Brighton and Lewes, we reached Uckfield at 1.5 p.m., and after lunch left again at 2.50, arriving at Tunbridge Wells at 3.45, Tonbridge, 4.5 p.m., and our destination at 4.35 p.m.

The expenses of running the 750 odd miles were as follows:—
18 gallons petrol at 1s. 5d. per gallon (average price), one quart lubricating oil 1s., soldering lamp 2d., and soldering petrol tank 1s.: total 27s. 8d.

LEONARD BEADLE.

THE Cosi Car Company, Limited, has been registered with a capital of £5,000, to carry on the business of manufacturers of and dealers in motors and carriages of all kinds. The first directors are Messrs. E. Klaber, A. D. Klaber, and W. T. Smedley.

HERE AND THERE.

THE annual dinner of the Nottingham Automobile Club is announced for the 8th inst.

IDENTIFICATION plates are being supplied in permanent enamel by the Scottish Tyre, Limited.

THE fifth annual dinner of the Automobile Club of America will be held in the Waldorf-Astoria, New York, on Saturday, the 23rd inst.

IN the county of Londonderry, a steam lorry, the property of the Midland Railway Company, was the first motor-vehicle registered under the new Act.

THE Liverpool Engineering Society will consider motor vehicles at their meeting on Wednesday next. Mr. W. Norris, A.M.I.C.E., will open the discussion.

THE Motor Club of Nova Scotia has just been formed at Halifax, U.S.

THE Deritend Stamping Company, Ltd., of Birmingham, are making a speciality of motor-car work.

INCLUDED in the preliminary programme of fixtures of the Ranelagh Club are automobile races on May 11th.

THE South Hants Motor Company, of Portsmouth, have recently increased their plant of machinery and staff of workmen.

MR. STANLEY SPENCER'S latest airship is shown at the Sports and Pastimes Exhibition now in progress at the St. James's Hall, Manchester.

FROM Minerva Motors, Limited, comes a calendar for the present year, in which the surprise of Dutch natives on the appearance of a motor-cyclist is set forth in colours.

The 20-h.p. Germain Landau, with side entrance.

THE Monarch Motor Syndicate, Limited, has been registered with a capital of £500 in 1s. shares, to manufacture and deal in oil, gas, electrical, and other motors.

THE Motor Castings Company, of Gray's Inn Road, W.C., are bringing out a detachable water-cooled head for motors with mechanically-operated inlet valves. They are also making arrangements whereby present possessors of De Dion and M.M.C. motors up to the 3½-h.p. air-cooled size can have the inlet valve converted at a small cost to the mechanically operated type. The diameter of the valves can practically be made to any size, as several allowances are being made for alteration.

A COMPREHENSIVE catalogue of motor-car materials and supplies has been issued by Mr. O. C. Selbach, whose business embraces everything required by the trade. Several pages are devoted to gears, the illustrations being clear and complete. Then follow fully illustrated descriptions of chassis, motor-car frames, etc., succeeded by particulars of Longuemare carburetors, "Loyal" radiators, lubricators, acetylene lamps, ignition accumulators, electric testing apparatus, batteries, pumps, jacks, automobile baskets, and the many other motor-car parts and accessories handled by Mr. Selbach.

A COMPANY has just been formed in Hamburg, Germany, to be known as the Motor and Motor Transport Wagon Company, to undertake the transport of goods in South Africa by means of motor-wagons.

A PRESENTATION has taken place at a dinner given at Coventry to Mr. Percy Richardson, on the occasion of his leaving the Daimler Company after six years' service. The chair was taken by Mr. G. T. Grant, secretary of the company, who also made the presentation.

THE B. F. Goodrich Company has issued a new catalogue of rubber goods, in which attention is specially drawn to the firm's outer cover for motor tyres and their motor bucket—the latter being made of canvas and rubber with a fine wire screen in the spout to prevent dirt and other foreign matter from passing into the water tank.

IT is reported that the London and South-Western Railway Company are completing at their Nine Elms locomotive works a motor-car which will shortly be experimented with in order to see whether the road motor-car can be profitably utilised in affording increased transit facilities in districts served by the South-Western Railway.

SIR HUGH H. SMILEY, BART., J.P., of Paisley, has joined the Western Section of the S.A.C.

THE Railways Association is to be asked to receive a deputation from the A.C.G.B.I. on the carriage of motor-cars.

MESSRS. BRANDES AND CO., of St. John Street, Coventry, who undertake the repair and recharging of ignition accumulators, have issued a circular giving some useful hints on the subject.

THE Marquis of Linlithgow has just purchased a 24-h.p. Panhard from the British Automobile Commercial Syndicate, Limited, from whom Sir Humphrey de Trafford has also ordered a 27-h.p. Talbot car.

THE Kent Motor Company, Limited, has been registered with a capital of £5,000, to acquire the business of motor-car proprietors and motor engineers carried on by Mr. H. L. Cosh at Gravesend, and by Mr. G. Senior at Rochester.

THE Vehicle Equipment Co., represented in this country by the Anglo-American Motor Car Co., Ltd., have lately completed the novel electrical vehicle illustrated herewith for a New

York firm of trunk makers. The van is used for delivery purposes and at the same time serves as a travelling advertisement, the body being made in the form of a huge travelling trunk.

SIDE-ENTRANCE cars appear likely to become as popular in this country as in France. During the last few days Messrs. J. Rothschild et Fils have received a number of orders for such bodies, including one from Sir Thomas Freaque, Bart., for a Roi-de-Belge body, with side-entrance, to be fitted to a 35-h.p. Panhard car.

THE North British Rubber Company, Limited, are issuing a new price list of Clincher and Clincher-Michelin pneumatic motor tyres. This is a handy booklet for motorists to keep by them, and, with the firm's "Useful Hints and Instructions," should prove useful. The work is practical in design, and the hints given will save many an anxious hour, if acted upon by users of pneumatic tyres.

A USEFUL Handbook to the Motor Car Acts and Regulations has been compiled by Mr. James O'Connor, and published by Messrs. Meccredy, Percy and Company, Limited, of Dublin. Mr. O'Connor's annotations are excellent, and his references to cases will be helpful to motorists who are unfortunate enough to come within the sphere of magisterial authority. The differences that occur in the application of the Act to Scotland and Ireland are clearly set forth, and the regulations for each country find a place in its pages. The Index Letters for English, Welsh, Scotch, and Irish counties and boroughs are given in a convenient form, and Messrs. Meccredy, Percy and Company are to be congratulated on the publication of such a practical handbook.

THE Duke of Devonshire is adding a Wolseley 20-h.p. car to his carriages.

MESSRS. ATKINSON AND SON have now a garage for 100 cars in North Road, Lancaster.

A NEW motor-bus with a 20-h.p. engine has just been placed upon the road by the Hastings and St. Leonards Bus Company.

THE Alnwick Motor Garage and Cycle Company, Limited, has been registered with a capital of £5,000. The first directors are Messrs. T. Pringle and C. B. Ford.

MESSRS. HUGGINS AND CHAMBERS, High Street, Uttoxeter, are in a good position to undertake motor-car repairs, and also supply accessories, motor spirit, etc. They have also an inspection pit.

THE Zone Dynamo and Motor Patents Company, Limited, has been registered with a capital of £2,700. The first directors are Messrs. H. Edmunds, L. W. Holmes, H. F. Joel, and J. H. St. H. Mawdsley.

THE Birmingham Aluminium Casting Company, Ltd., have issued an aluminium calendar for the new year—in which the metal background has an appearance of glossy silk when placed on the wall.

MESSRS. LACOSTE AND BATTMAN, LIMITED, has been registered with a capital of £160,000 to acquire the business of motor-car manufacturers carried on at 16, Rue Chaptal, Levallois-Perret, near Paris, by Messrs. Lacoste and Battman, and to develop the same.

MR. TUDOR OWEN, a Salopian motorist, lost control of his motor when motoring at Shrewsbury, and it dashed at tremendous speed down the Old Castle Hill, at the bottom of which stands the Traitors' Gate. The machine tore down wooden posts and beams, then mounted a high wall, and fell into the Severn. Mr. Tudor Owen succeeded in jumping off the car just as it leaped the wall. He was unhurt.

MR. A. E. REYNOLDS, who for the past two years has been manager of the Aberdare Motor Company, Limited, has relinquished that post and has taken a similar position with the South Wales Motor Company, Cardiff, of which Mr. Parker Thomas is proprietor. Mr. Thomas was manager of the Aberdare Motor Company some years ago, and was, we believe, one of the few who has been able to earn a dividend for a public service motor company.

OWING to the pressure of orders during the last two months Turner's Motor Manufacturing Company, Limited, have been obliged to double the plant to enable them to keep pace with the orders for Miesse steam cars that they are receiving. Even that, however, has not been sufficient, and we learn that they have just purchased the freehold works lately known as the Wulfruna Cycle Works, in Wolverhampton. It is satisfactory to learn that the company have more Miesse cars on order at the present time than at any time since the vehicle was introduced into this country.

THE Duryea Company having to deliver two motor-cars in the neighbourhood of the Crystal Palace recently, sent them by train to the Low Level Station, and, finding petrol difficult to obtain the drivers concluded it would save time if they drove one of the vehicles only and towed the other. One was a capacious wagonette, with hood, and loaded with a couple of hundredweight of baggage, the other being a light two-seated 10-h.p. phaeton of 3 cwt. They started on Anerley Hill on the small car, towing the larger one. The road was very greasy, and when they got to the worst part of the gradient, which is said to be something in the neighbourhood of one in eight, they struck a particularly bad bit of surface and the procession came to a halt simply because the driving wheels were spinning round in the mud. The little car was kept going, however, and gradually slid sideways until it got out of the mud patch, and then, getting a hold on firmer ground, got both itself and its heavy charge once more moving, and, after other experiences of a similar nature, triumphantly reached the top.

THE NEW PALMER CORD TYRE.

IN a recent issue we published an article in which some general particulars were given of the new motor tyre recently introduced by the Palmer Tyre, Limited. The tyre is such a radical departure, and so much interest has been shown in it, that a few details of the method of manufacturing the fabric may not be out of place. One of the difficulties which have to be contended with by tyre makers is the presence of air in the canvas or materials used in conjunction with rubber. In the vulcanising chamber the air contained in the fabric or canvas expands considerably under the increased temperature, and by its expansion the rubber is prevented from making a good contact with the thread. During the experiments carried out at the Silvertown Works it was discovered that the larger the thread or cord used the more air such cord contained, and the greater the difficulty in vulcanising. Finally, however, an apparatus has been devised to enable the production of a cord from which all air has been expelled, each thread of the cord being coated with indiarubber solution under pressure. The machine which expels the air and at the same time coats each thread with indiarubber solution is provided with six orifices, through which the threads are passed. The threads completely fill the orifices in question, with the exception of the upper one, which permits of the air escaping from the solution chamber. The threads pass through the tubes into the high-pressure cylinder. As the threads slowly enter the tubes they meet with a gradually in-

A SPECIAL THREAD. Before treatment.
(Shown highly magnified.)

B SIX THREADS as they leave the vessel containing RUBBER SOLUTION under very high pressure. The air is expelled from between the fibres, and rubber solution takes its place.

C The same as **B** after passing through drying chamber. As the solvent evaporates the rubber contracts on the cords.

D The same as **C** after passing through the twisting machine.

creasing pressure of rubber solution, which forces the air backwards from between the fibres of the threads, the place occupied by the air being taken by solution. The threads pass across the cylinder to another very long tube having a rather larger bore. Before passing through this second tube the threads are led through a die which spaces them equally, and when they leave the tube they appear as shown at **B**. The accompanying

illustrations show different stages in making a cord composed of twenty-four unit threads and one wrapping thread. After emerging from the tubes in the form shown at **B**, the cords then pass through a chamber (about 120 ft. long) alongside hot steam pipes, which evaporates the solvent from the solution. As the solvent evaporates the rubber shrinks very considerably, and in doing so it contracts the fibres of the threads closer together, so

E Four cords as **D** passed through a larger high pressure solutioning apparatus similar to that employed for **B**.

F The same as **E** after passing through drying chamber.

that when the cords reach the end of their journey through the drying chamber they appear somewhat as shown much enlarged at **C**. While still warm, the cords are then passed through a twisting machine driven by an electric motor, after which they appear as shown in **D**. The whole process is then repeated over and over again as many times as may be necessary to produce a cord of the desired size, a larger set of apparatus being used for each succeeding process. After the last twisting process a widely spaced spiral wrapping of fine thread is wound the reverse way to the twist of the cord, which prevents the cords from untwisting, and also keeps them straight, and makes it easier to manipulate. After this spiral wrapping thread has been applied, the cord is passed through another hydraulically-operated solutioning apparatus to expel the air from between the fibres of the wrapping thread and to apply an extra coating of rubber, when it is ready for use. Special automatic apparatus is employed to ensure that every individual thread is of exactly the same tension in the cord, and by this method of building up every thread in the cord is insulated from every other one by indiarubber.

If all the stories are true with regard to the fleet of motor-cars supplied to the Chinese Royal family, the lot of the *mecaniciens* in charge of the same is anything but an enviable one. According to a German contemporary, should any accident befall the Chinese Emperor or Empress, when in their car, the driver will be punished with death!

FROM the Elsworth Automobile Company, Bradford, comes a copy of the catalogue of the new models of Spyker cars for which they are British agents. As mentioned in our report of the Paris Salon they comprise a number of interesting features and are being made in three sizes—12-16-h.p., 20-24-h.p., and 30-36-h.p., all having four cylinder engines. Apart from the fact that the makers of the Spyker cars give a guarantee with each vehicle for twelve months, we note that each purchaser is supplied with a chart showing the exact h.p. which the car gives.

CORRESPONDENCE.

BENZ V. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When I replied to the previous letter of D. Beaumont it was with the intention of privately corresponding with him on the merits of a Benz v. Light car, but, as so many have come forward who are experiencing the same difficulty, I will do my best to give my experience, although it is rather a tall order for a novice. When I bought my car a few months ago, the top speed was practically useless unless put on a down gradient; in fact, the engine would invariably stop if I put it on a level road. So at last I let the engine stop with the top speed belt still on and tried to find the cause. After some time I found the second speed belt, instead of running quite on the loose pulley, was just touching the edge of the fixed pulley, so I now arrange my belts so that the top part which goes through the guides is on the inside; consequently it pushes the outer part of the belt quite clear; a very small fault, perhaps, and one I recently saw committed by a motorist of twelve months' standing, but quite sufficient to stop a car. In fact, I now use the second speed as a brake when going down a steep hill on top speed by putting it on just a little very slowly. It must not be put on too far or it will stop the engine. I have also found an extra compression plate about one or one and a quarter inches thick a great advantage by increasing the compression, therefore the power. It should be fixed in the cylinder head, not on the piston end, as, in my opinion, by increasing the weight of the piston, it gives more wear to the bearings at the end of the piston rod. Next I noticed a peculiar whirring noise when running on top speed, which I attributed to the crypto gear requiring oiling, so I took off the countershaft and packed the crypto drum with thick gear oil and grease (not ordinary lubricating oil, as that runs out too quickly) and then found I had made a decided improvement in the running of the top speed. It also stopped the lifting of the front part of the car when the crypto was put on, a common fault, I believe, with a Benz car when the crypto is dry. I have now had made what I consider the greatest improvement. Upon looking at the cam that lifts the exhaust valve I found it was getting worn, so I have had a piece brazed on about one-sixteenth of an inch at top, and three-sixteenths of an inch at top of side; by so doing it opens the exhaust valve rather earlier and keeps it open a trifle longer, but at the same time it does not open it wider than was originally intended. Of course, the amount put on would depend on how much the cam was worn, but I have certainly found it has increased the power of my car considerably; in fact, where I used to go up small hills and over railway bridges on second speed, I now do them on top and can go within a radius of eight or nine miles from my home and not do more than half a mile on second speed. My car was previously fitted with American cloth underneath, from side to side to protect the belts in wet weather. I have now reduced the width of that so as just to cover the pulleys, by that means allowing the air to get to the engine and so assist the cooling. I shall be glad, however, if any reader can suggest an improvement in the water-cooling arrangement, as I do not consider that sufficiently good. As regards the quantity of petrol used, at a rough estimate I can go about thirty miles on one gallon. With regard to the remark of C. A. Palmer *re* the illuminating of back plate, it is certainly worth attention, and I should like to hear the opinion of your readers on the subject.

In conclusion, do not omit to oil the differential gear occasionally, as that has a considerable effect on the easy running of a car.—Yours truly,

AMATEUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am another who would very much appreciate the information "Amateur" has offered Mr. Beaumont. My 3½-h.p. Benz absolutely refuses top speed on the slightest incline, or if the road is the least bit heavy. I have spent a lot of money in the endeavour to get 3½-h.p. out of the engine, and my experience of the M.O.I.V. was that it decreased the power.

I do not think there is any risk to be apprehended in illuminating the back plate, as the carburettor is on the other side; at all events, I have been running for two years with a back lamp placed over the hole where the starting handle was.—Yours truly,

RATHBONE WAINWRIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being the owner of a 3½-h.p. Benz car, which I have had for over two years, I should, like your other correspondents, be interested to hear what are the improvements that "Amateur" has made to his car, and trust that he will let us know publicly, through the medium of your paper. I have myself made several alterations to my car with good results, such as fitting a plate about ¼-inch thick on the inside of the cylinder cover to increase the compression; a larger induction valve and casting complete (obtained from Messrs. Hewetson's); and boring out the exhaust valve seating so as to take a larger valve. I have been informed that it is an advantage to make the flywheel heavier by shrinking an iron band on to the periphery, but have not tried this yet. With these cars it is important to take up play, resulting from wear, in the exhaust valve gear, and see that

the opening and closing of the exhaust valve is correctly timed. All the three valves must close tight and the piston rings fit well, so that there is no loss of compression. Like Mr. Knight, I have tried the mechanically-operated induction valve arrangement, and found it to be useless (although, if properly fitted, it does not slow the car), and noisy in action. My car now surmounts slight inclines on top speed with three up without any difficulty.

If Mr. Palmer illuminates his back plate by means of a 4-volt electric lamp, placed in a small bull's-eye lantern, run off his ignition accumulator, he need not be afraid of danger from the petrol vapour.—Yours truly,

J. K. BRYDGES.

HONEYCOMB RADIATORS AND NATURAL CIRCULATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your last issue, in your report on the Paris Salon, a slight inaccuracy in reference to the Chenard and Walcker radiator, and we therefore take the liberty of drawing your attention to the same. You state that, like a car of another make named by you, the Chenard and Walcker is fitted with a thermo-syphon radiator. We should like to point out that, unlike the car in question, ours is a honeycomb radiator of unique design, which you were good enough to describe, and is, so far as our knowledge goes, the only honeycomb cooler with which it has been found possible to satisfactorily dispense with the pump. Hitherto it has only been found practicable to adopt the thermo-syphon principle with fin-type radiators, which are not nearly as efficient as the honeycomb; and hitherto, moreover, it has equally been found impossible, until the advent of our 1904 cars, to produce a honeycomb radiator which would work without a pump.—Yours truly,

THE WESTON MOTOR SYNDICATE.

BAND BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to hear if there is an efficient substitute for leather on band brakes. I live among the Cotswold Hills, and the brake leather on my 16-h.p. Gladiator gets worn out in any time between ten days and three weeks. A long hill will burn the leather of the brake and make it dangerously useless. If any reader, or you, Sir, yourself, would be good enough to suggest some means of avoiding this wastage, I should be much obliged.—Yours truly,

X.

["X" would probably find that if he were to line his brake bands with small hardwood blocks or even vulcanite fibre, it would greatly improve their efficiency. No doubt the bands would need to be slightly lengthened for this to be done, but the cost of doing this would be very slight compared with that of continually fitting new leather.]

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was greatly surprised to read "Solids Tried's" letter in the last issue of the *Journal*. He evidently has had the wrong kind of solids or a very bad car, and it may interest him to know the experience of a user of Buffer solid tyres. My two cars are first-class makes and well sprung, they are fitted on all four wheels with these tyres, and have not cost me a penny for repairs while driving thousands of miles in England and Wales, both on country and town roads. I have driven owners of pneumatic-tyred cars in mine, and they were greatly surprised at the ease of running on solids.

Many of my friends have similar tyred cars, and always speak in the highest praise of their solids; some of their cars were formerly pneumatic tyred, but were converted to solids owing to the expense and uncertainty of pneumatics. I could give your correspondents, "Puncture Tired" and "Solids Tried," the names of about a dozen or so good cars that are properly sprung and guaranteed by the manufacturers to run just as well on solids as on pneumatics, or perhaps those manufacturers or their agents will, if they read this, enlighten the public through their advertisements in your *Journal*; such information would, I feel sure, be a great help to would-be motorists and users of motor-cars.—Yours truly,

AN EXPERIENCED USER OF SOLIDS.

LOSS OF COMPRESSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Bolton's letter in your last issue, I should advise a thorough examination of the piston rings for loss of compression if he is quite certain that the valves, sparking plugs, etc., are perfectly tight. The piston rings may be slightly worn, so that the joints do not come close together, thereby admitting the gas to pass. If this is the case new rings would be advisable, but if they appear to be in good condition and bearing on all points, I should advise leaving the old ones in, as it requires a great deal of running before a new set of rings would become properly worn into the cylinder. To ascertain if the rings are fitting tight at the joint it would be necessary to take them off the piston and try them in the cylinder, each one at a time. If this means

one can easily see if the joint is tight. The life of piston rings vary according to the manner in which they have been treated—for instance, if the engine has been running badly lubricated the result may be disastrous to the piston rings, even if just new.—Yours truly,
J. T. H.

DANGERS OF THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly allow me, through the columns of your paper, to call the attention of all motorists to a bridge on the main road from Chatteris to Ely, and warn them of the dangerous condition which it has been allowed to fall into. It is situated on the outskirts of Mepal (a small village), and has been in a bad state for a very long time, and the other day, while passing over with my car, I noticed it had got much worse, and I could not help wondering why some steps are not taken to make the same safe? Are the authorities waiting for an accident before they will open their eyes to the danger of it? There is only room for one car to pass over at a time, and one of the sides (which was built of bricks) has fallen clean away, and there is nothing to protect a stranger, who might leave the track a little, from running straight into the drain (or cut) and thereby perhaps meet his death! It is not only dangerous to motor-cars, but to all vehicles that pass over it. Such danger spots as that are a disgrace to those who are responsible for public safety, and steps should be taken at once, I think, to make them safe.

Trusting this warning will not be in vain, and hoping that it may even meet the eyes of those that are responsible for that bridge.—Yours truly,

H. L. DRAKE.

THE MOTOR-CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was contemplating the purchase of a motor-car; but since the passing of the law as to numbering, etc., I have given up the idea for the present.

Probably there are not a few in a similar position. I am a shareholder in motor companies, and naturally hope for their success; but, even so, I will not consent, as the price of owning a motor-car, to be placarded dangerous, and differentiated from all other road-users as a probable scoundrel. With all deference to the Automobile Club officers, I fear they have mismanaged things from beginning to end of this wretched legislation. If all vehicles alike had to be registered and numbered, motorists could not object. Why not press this point?—Yours truly,

SWITCHED OFF.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think the most objectionable parts of the Act are the minimum age limits and the licensing of drivers. I very much wish that motorists would try hard to get these regulations repealed, at any rate for motor-cycles and small cars. It is very hard on a boy of fourteen not to be able to give his brother a year or two younger a ride on his motor-cycle. If licences cannot be done without, why not have family licences, or, better still, issue auxiliary licences to members of the same family at a shilling each?—Yours truly,

CECIL JACKSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think the new Act will work fairly well if liberally interpreted. I have one suggestion to offer, and that is that motorists themselves offer to supply danger boards to borough and county councils gratis, these boards to be placed by such Councils at special points.

There are two in Croydon on the main road. A small subscription per head could effect this, and while rubbing the councils the right way, would, I think, in a large manner obviate the ten-mile limits. Any motorist who drove fast past such boards would deserve anything he received.—Yours truly,

R. F. WOOD SMITH.

HEATING MOTOR-CAR SHEDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the recent correspondence on the above subject, I am using one of Portway's patent gas stoves, which is simply hung over an ordinary gas flame, and with which apparatus I have kept my motor-car shed at a temperature of from 40 to 45 degs. during the recent cold weather.—Yours truly,

HENRY J. ROGERS.

LIGHT CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Enquirer," I give my experiences of 4½-h.p. Baby Rochet which I ran last season for about 800 miles before getting a larger car. It is a very simple vehicle indeed and will carry two passengers and a small amount of luggage easily. It climbed every hill I met with at about six to eight miles an hour, and I found it impossible to have a side-slip on account of the engine weight being at the back. I only had one

puncture, and that while running the tyre deflated. The wear of tyres is very small indeed on account of light weight of car. The only objection is the mode of starting, which is done by winding a strap round the pulley at back. The petrol consumption I found to be about one gallon to forty to fifty miles.—Yours truly,

B. E. BOLTON.

VALVE SEATS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Marbeuf's" enquiry in your last issue, the use of the flat or bevel seat inlet valves is greatly a matter of preference on the part of the maker. A flat seat inlet valve does not require as great a lift as a bevel seat valve, to give the same area of opening, but a bevel seat valve is easier to regrind and keep in condition than a flat seat valve. It is, moreover, more commonly used than the flat seat type.—Yours truly,
F. H. L.

COMMERCIAL MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Morris's letter in your last issue is most *apropos*, especially in view of the fact that the coming competition for motor vehicles for commercial purposes will once more direct public attention to the possibilities of the motor-car in commercial work. Even in trade circles the vastness of this field is as yet not fully appreciated. It needs no extended argument to show that a large amount of capital is invested in business vehicles—i.e., lorries and delivery vans of all kinds. If the automobile can successfully supplant the horse-drawn business vehicle, of which there is no doubt in my mind, we have the foundation for a very large and permanent industry, which should prove a very attractive field for investors, inasmuch as it will be entirely independent of fashions and popular fancies. As Mr. Morris points out, however, the work commercial vehicles are called upon to perform is severe, and needs special provision in every part of the design if it is to prove successful. It is to be hoped that the trials which are to be held this year will bring forth some cars on these lines which will put this country in the fore-front as regards this class of vehicle, just as we are with the heavy steam vehicle for loads of five tons and upwards.—Yours truly,

PROGRESSION.

NOTICE TO CORRESPONDENTS.—We wish to remind our readers that no notice can be taken of any letters intended for publication unless the name and address of the correspondent, not necessarily for publication, is appended.

ALUMINIUM FORE-CARRIAGE BODIES.—"C. J." asks for the name and address of a firm capable of building small fore-carriage bodies or similar goods in aluminium.

THORN AND NAIL EXTRACTOR.—Replying to several enquirers the maker of the thorn and nail extractor illustrated in the last issue is M. E. Nouzillet, 71, Rue de Rome, Paris.

A MILITARY MATTER.—With reference to the letter from "An Inconspicuous Inventor" in our issue of the 26th ult., we would remind our correspondent that announcements of the trials were made in the leading journals a considerable time before they took place.

PETROLEUM SPIRIT.—In answer to "Petrol," who enquires for the name of the firm in the north supplying '680 spirit, the concern in question is Messrs. Whitaker and Company, Montague Street, Lower Broughton, Manchester.

CATALOGUES WANTED.—Messrs. Donald Brothers, of Lowry Road, Capetown, write that they would be glad to receive from manufacturers of motor-cars, parts, and accessories, copies of their latest catalogues and price lists.

How Did It Happen?

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED, M. P. H.	RESULT.
Marlborough Street (London)	Marquis de St. Maurs, Oxford Street, W.	—	40s., etc.
Birmingham High Wycombe	W. W. Davies, Birmingham	25	20s., etc.
Exeter.....	E. R. Coles (driver to Mr. E. Otter, J.P.)	—	20s. etc.
Westminster	H. R. Anderson, Burton Crescent, W.	—	10s., etc.
Conway	R. Forsyth	—	Adjd.
	H. M. Baler (driver to Marquis of Anglesey)	—	£10.

ERNEST JAHINEAU, a Frenchman, of Old Compton Street, Soho, should have surrendered to his bail at Bow Street (London) to further answer a charge of driving a motor-car furiously and to the common danger. He failed to do so, and Mr. Fenwick ordered a warrant to be issued for his arrest.

CLUBS AND ASSOCIATIONS.

SOUTH LINCOLNSHIRE.

A MEETING of motorists resident in Boston and the district was held at the Red Lion Hotel, Boston, last week for the purpose of considering the advisability of forming a local motor club. Dr. Miller, of Wrangle, was voted to the chair, and the chairman said it might be thought that as there was a Lincolnshire Automobile Club nothing further was needed, but as there were so many motorists in Boston and the district several members of the Lincolnshire Club thought they were strong enough to form a club of their own. Another point was that they thought sufficient attention had not been paid by the Lincolnshire Club to the protection of the members, and they believed that a club with that as one of its principal objects would be an advantage. He referred to the legal defence of members, but he did not mean that a motorist who was continually scorching and breaking the law would be defended. With regard to affiliation, the Lincolnshire Club was affiliated with the Automobile Club of Great Britain and Ireland, for which they had to pay half-a-guinea per head. That was what had cramped them. They, he took it, would not affiliate, for he thought they would agree with him that the advantages were practically nil.

After discussion, it was decided to form the South Lincolnshire Motor Club, with headquarters at the Red Lion Hotel, Boston, and an annual subscription of one guinea. It was decided to ask Mr. W. Garfit, M.P., to become president of the club, and Lord Willoughby de Eresby, M.P., the Marquis of Exeter, the Earl of Ancaster, the Mayor of Boston (Ald. Joseph Cooke), Mr. H. R. Mansfield, M.P., Mr. G. H. Faber, Mr. E. M. Pollock, Mr. R. W. Staniland, and Mr. Meaburn Staniland, to act as vice-presidents. Dr. Miller was appointed Chairman of the Committee. Mr. F. Richardson, of Sibsey, agreed to act as hon. secretary and treasurer, and Messrs. South, H. C. Johnson, Mason, Crompton, A. H. Holland, and A. W. Holloway were appointed as a committee.

YORKSHIRE.

THE annual general meeting of the Yorkshire Club will be held on Thursday next, at 7 p.m., in the club-room at the Great Northern Hotel, Leeds, when the election of officers and committee for the ensuing year will take place. Any member desirous to make nominations for officers or committee, or to introduce or suggest new rules, or any other subject, is requested to notify Mr. Alf. W. Dougill on or before Tuesday, so that the same may be included in the agenda. A lantern lecture by Mr. E. Faiers, of Bradford, will follow the general meeting, at 8 p.m., when a large selection of slides of motoring interest will be exhibited.

AUTOMOBILE RACING IN FLORIDA.

THE Florida East Coast Automobile Association's race meet, which is to take place on the Ormond-Daytona Beach, Florida, on the 27th, 28th, and 29th inst., is already an assured success, and the programme of events indicates that some very exciting racing may be anticipated. The meet is to be held under the rules and auspices of the American Automobile Association. The Mors electric timing apparatus will be used. The entry list will close on the 15th inst. On the 27th inst. the following races are to be held:—One mile open for the A.A.A. championship; ten-mile handicap; five-mile invitation; one-mile record trials; five-mile American motor-cycle championship; five-mile, for members of the American Motor League, connected with the automobile trade exclusively, and a special race for Florida automobile owners. The feature of the second day's programme is a fifty-mile open race for the A.A.A. championship, to which all cars weighing not less than 1,000 lbs. are eligible. Other events are a one-mile race, five-

mile open, five-mile handicap, five-mile for vehicles costing £130 and under one-mile invitation, and a ten-mile handicap for motor-cycles. On the third and last day the first event is to be a ten-mile open, for the A.A.A. championship, followed by a one-mile race for racing cars, and a series of kilometre and mile record trials; a twenty-mile handicap, ten-mile invitation, five-mile race for two passenger runabouts, one-mile motor-cycle handicap and tire-detaching contests divided into two classes, for vehicles weighing under 1,000 lbs., and for cars weighing from 1,500 to 2,500 lbs. All competing cars are to be classified according to the rules of the American Automobile Association. On the 28th inst. new record trials of various distances will take place, and on the 30th inst., following the close of the race meet, a floral parade through Ormond and Daytona will be held. The special invitation races are to be restricted to amateur drivers. The Ormond-Daytona course is an ideal natural track, sixteen miles long and 100 yards wide at low tide.

ALLEGED THEFT.

ERNEST HENRY JONES, an engineer, of 4, Grange Road, Canonbury, was charged at Clerkenwell on Monday, before Mr. Bros, with stealing from a showroom at 18A, Church Street, Islington, a number of motor-car fittings, valued at £500, the property of the Automobile Components (Limited). Mr. Travers Humphreys prosecuted, and Mr. Ricketts appeared for the defence. Detective-sergeant Smith proved the arrest of the accused, who said he had supplied some of the materials, and had been working on them. Mr. Ricketts said the prosecutors rented their premises from his client. Ultimately a remand was granted, bail being allowed.

MOTOR-CAR ACCIDENT.

ROBERT FORSYTH was summoned at Westminster for driving a motor-car to the common danger in King's Road, Chelsea. On the evening of December 22 defendant was driving eastwards, and on reaching a very narrow portion of the King's Road, near a police station, he met other vehicles, which caused him to apply the brake suddenly. The police alleged that the car got out of hand and dashed on to the pavement, knocking down a woman and seriously injuring her. Mr. Horace Smith adjourned the further hearing, agreeing to accept bail for defendant, whose case was that his car skidded through the greasy state of the road, in two securities of £25 each.

In connection with the mail service between Sunderland and South Shields 5-h.p. Roots cars were employed. A small van body was fitted and the car sometimes loaded up with 7½ cwt. of mails. During the Christmas holidays a spare car, which was kept in reserve in the event of the possible failure of the running car, was carrying a similar overload during the day, so that both have been running regularly night and day without a hitch.

THE Daimler Motor Company, Limited, are introducing a new tonneau car fitted with a 7-h.p. double-cylinder engine. The vehicle is a reproduction in miniature of the large Daimler cars and has three speeds forward and a reverse, and side chain transmission. The motor, which has cylinders 90 mm. by 120 mm., is fitted with a governor acting on the admission and runs normally at 720 revolutions per min. The details have all received careful attention with the view of the production of a reliable light car.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JANUARY 16, 1904.

[No 254.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

DERBYSHIRE folks have seen many Royal and ducal motor-cars lately, and on Saturday a motor-trip from Chatsworth to Hardwick Hall and back via Chesterfield gave delight to many. The Duke and Duchess of Devonshire, with the King, the Queen, the Princess Victoria, and fifteen or sixteen of the house party, left Chatsworth shortly before noon. They travelled in four motor-cars—those of the King, the Duke of Devonshire, Consuelo Duchess of Manchester, and Lord Charles Montagu. In the King's roomy car, with its glass sides and roof, were the King himself, the Duke of Devonshire, and half-a-dozen others. The Queen and the Duchess of Devonshire were in the second car; the Princess in that of Lord Charles Montagu. Although the roads were still heavy with the rains of the last few days, the weather was delightful, and the start was made in a burst of bright sunshine. The highway to Chesterfield passes through a rough, uncultivated tract of country which has a wild charm of its own. From the point of view of the motorist it has the further advantage of being practically uninhabited. The cars, therefore, were able to make excellent progress, and forty minutes after leaving Chatsworth they were passing by Chesterfield church, just ten miles distant.

A Doctors' Automobile Club.

THE Physicians' Automobile Club of New Jersey has been organized in Newark, U.S.A., with about twenty members. None but physicians owning motor-cars will be admitted to membership. Among the objects of the club is the discussion of subjects pertaining to automobiles and their use. The club also hopes to secure the benefit of reductions of prices on supplies and sundries by making purchases in quantity, and may later on arrange for a club garage.

The First Case.

IT is unfortunate that in the first case heard under the new Motor-Car Act the defendant should have been so tired as to give the policeman who charged him the impression that he was drunk. The case occurred in the Strand, London, and not only did the motor-car driver cause his vehicle to "wobble from side to side," but he had left his licence at home. For driving negligently a fine of £10 was imposed, the absence of the licence costing the defendant another five shillings, as well as endorsement.

Imprisonment for Motorists.

PARLIAMENTARIANS are being credited with a desire to revise the legislation now on its trial, and it is stated that Sir Carne Rasch contemplates an amendment empowering magistrates to imprison motorists for a first offence instead of the third, as provided for in clause 6 of the Act. Sir Carne has advocated many things in his time and is the champion of short speeches in the House. Surely he would not suggest long sentences for those who seek to get over much ground in the shortest possible time. He can't be serious in the idea.

A Railway Motor Service.

THE Midland and South-Western Joint Railway intend to revive motor-car services between Cirencester, Fairford, and Lechlade. It is reported that a Clarkson steam car will be employed to carry sixteen passengers and 10 cwt. of luggage. The headquarters are proposed to be at Lechlade, and the car will start from there in the morning in time to meet the 8.5 a.m. train from Cheltenham. The return journey from Watermoor will be begun at 9 o'clock, reaching Fairford in time for the G.W.R. 10.30 train to Oxford. Leaving Fairford station at 10.30, the car will return to Cirencester market-place, delivering parcels, etc., *en route*, and connecting with the 12.58 North express from Watermoor station. Another journey will be begun at 1.5, connecting with the 2.40 G.W.R. train from Fairford to Oxford, and going on to Lechlade; returning from Lechlade at 5 o'clock, connecting with the Oxford train due at Fairford at 5.36, and reaching Watermoor station in time for the 7 o'clock train to Cheltenham. The car will then run back to Lechlade for the night. In addition to this regular service, it is intended to organise periodical excursion trips to Burford, Faringdon, Birdlip, and other places.

British Racers Handicapped.

BRITISH competitors in the Gordon Bennett contest have had comparatively few opportunities of accustoming themselves to the high speeds that will be demanded of the winner in this year's contest. This undoubtedly places them at a disadvantage as compared with their rivals, and it is rather unfortunate that some stretch of country—such as the 1903 course—cannot be obtained for their use. Otherwise they will have to go to the Continent—an additional expense which will cause some to think twice before venturing once.

The Worth of Sergeant Jarrett.

SERGEANT JARRETT, of the Surrey constabulary, may not be worth his weight in gold, but he is certainly a remunerative investment for the county exchequer. Last year he obtained many convictions against motorists in his county, and secured the infliction of fines amounting to £230. As a catcher of motorists he has proved the possession of superb qualities, and it is a pity that his splendid powers of calculation and observation cannot be utilised to better advantage. Now, however, that the speed limit has been raised to twenty miles an hour we shall watch with unusual interest the reports that reach us from the Ripley road.

In East Africa.

IN some of our Colonial possessions the automobile is making creditable headway, and in Uganda Mr. G. Wilson, C.B., the Deputy Commissioner, is using a 6-h.p. car with evident satisfaction. The roads in Uganda are fairly good, railways do not yet penetrate the out-stations, and correspondence has to be carried by road. In such circumstances the advantage o

the motor-car is apparent, and already some of the officials are urging the responsible authorities to provide motor-bicycles, so that delay in communication between the various depots may be avoided. As in the case of municipal authorities at home Colonial stations will have to consider the automobile an essential feature of their equipment.

Motor Corps Uniforms.

It has been proposed to the War Office that the uniform of officers of the Motor Volunteer Corps shall be as follows: Olive-green cloth tunic, with white facings; collar trimmed with black astrachan, and ornamented with silver Russian braid at the bottom; cuffs trimmed with black astrachan and silver Russian braid. Trousers also of olive-green cloth, with white welt $\frac{1}{4}$ inch wide down the side seam. Busby of black astrachan with white crown; badge in silver in centre of the front; plume dark green below and white above, with silver ball socket; the height of the plume to be six inches from the top of the busby, the sword to be of the Infantry pattern. Motorists with busbies and plumes should appeal to the popular fancy on windy days.

The 15-h.p. Gardner-Serpollet Steam Car, built for the Shah of Persia, and exhibited at the recent Salon in Paris. (Le Chauffeur.)

Motor-Cycles and Medicoes.

MANY of the pioneers of automobilism have belonged to the medical profession, which has, as a body, shown a consistent and sustained interest in the movement. A large number of those who, for various reasons, have not yet been converted to the modern method of locomotion are now being attracted within the charmed sphere by the motor-bicycle, and we have been somewhat surprised at the number of doctors making inquiries after this type of machine. It certainly has many claims on their attention. The country practitioner frequently does a proportion of his work by bicycle, and the substitution of a motor-bicycle is an inexpensive and instructive way of beginning automobilism. Moreover, a trivial stoppage due to inexperience will not delay him as with a car or even a tricycle, as the removal of the belt will enable him to pedal his machine with no great difficulty, and postpone its diagnosis till a convenient opportunity.

To Drive, or not to Drive.

AN international discussion is waging around the position which has been brought about by the suggestion of the German Automobile Club with regard to the employment of professional drivers in the Gordon Bennett race. It must be confessed that we should prefer a clause being inserted in the rules

by which the drivers—whether professional, trade, or amateur, is a matter for later consideration—should only be permitted to race as representing "countries of their birth." Last year the race was won by a Belgian on a German car owned by an American. It was a fine display of cosmopolitan courtesy and afforded a small degree of satisfaction to the three nations thus able to share the honours of the day. But the event would have been far more keenly interesting had the drivers, like the cars, to be wholly of the nationality under whose colours they raced. This is a point upon which more is likely to be heard in the future.

Australian Antipathy.

THE bucolic mind is full of prejudice and difficult to accustom to modernity. In this country it has developed its passion against motorists in letters to the editors of country journals and to the adoption of vehement resolutions at meetings of agricultural clubs; but in the Colonies it seems to assume a more violent attitude. A few weeks ago the Dunlop Motor-cycle Race was to have taken place at Warrnambool. As the day of the event drew nearer the rancour of the horse-breeders of the district became more strongly expressed, until, the day before the projected race, several of the farmers along the route threatened to turn all their stock on to the road. Following on this determination on the part of the farmers, a local councillor has given notice of his intention to advocate a restriction of the speed of motor-cars and motor-cycles in that region in the future.

History Repeats Itself.

SUCH action is lamentable, especially as the urban centres of Australia have shown themselves friendly to the automobile. The motor is likely to be a friend to the farmer, as Professor James Long has shown, and although it may seem to have an undesirable effect on the immediate future of his business, its helpfulness will have to be acknowledged in the end. But the incident serves to show the immutability of human nature. Just as the old turnpike-keepers blocked the roadways to upset the early steam vehicles that plied upon British roads in the pre-Victorian days, so do the farmers of our Colonies breathe forth threatenings which will prove as ineffectual as were Canute's commands to the sea waves to cease their billowy progress.

Our Varied Contents.

How the contents of the motor press vary with the season of the year? Glancing through the *Journal* for the last year this has been forcibly brought to mind, and even if the dates were omitted from each issue it would not be a difficult matter to supply the missing calendar by merely watching the pages. In the summer accounts of races and trips loom large; in the winter—and especially such a winter as this—they are conspicuously absent, and descriptions of the improvements that makers are introducing provide interesting reading until "the sunshine comes again."

For County Officials.

THE Essex County Council, recognising the merits of the motor-car, have decided to purchase one of larger power than that hitherto employed by their County Surveyor. Following upon that pleasant intimation comes the news that at the Northallerton Quarter Sessions the report of the Joint Standing Committee stated that the committee had decided to allow Major Bower, the Chief Constable, the sum of £300 towards the purchase of a motor-car in lieu of the present allowance of £60 per annum for his railway pass for the next five years. Sir Henry Beresford-Peirse, Bart., proposed, and Alderman J. T. Hansell seconded the adoption of the report, and this was agreed to. Such propositions are meeting with a lessened opposition than was the case even a year ago—ample proof of the headway automobilism is making in official circles.

Uniformity in Lighting.

FREQUENTLY have we urged the necessity for uniformity in dealing with traffic problems. If horse-drawn vehicles are allowed to career about in narrow lanes and sinuous roadways, why should automobiles be prohibited? And, similarly, it would appear equally right that the law should be sternly administered as to the provision of lights on all vehicles. Mr. Lucas D'Oyley Carte has done well in drawing prominent attention to this matter at the present juncture. The provision of lights on automobiles is intended to show up dark objects on the highway as well as to indicate the oncoming automobile. Surely it would seem reasonable that horse-drawn vehicles should be compelled to similarly disclose their presence.

Motors and Social Problems.

INDUSTRIAL decentralisation as a factor in the solution of the housing problem was discussed at the Surveyors' Institute on Monday night, after an address on the subject by Mr. Herbert T. Scoble. It was urged that model villages like Bournville and Port Sunlight, being semi-philanthropic and started with unlimited capital, were not generally practicable, and

Colonial Clubs.

THE South African Automobile Club, whose doings have been frequently referred to in these columns, has become affiliated to the A.C.G.B.I., and we understand that the New Zealand Club is enquiring as to the terms upon which such a connection can be made with the old country. There are evidences that automobilism is becoming a moving force in the Colonies as well as at home, and doubtless news of the formation of automobile associations in Australia and in India will reach Piccadilly before long. The movement is thus girdling the Empire—a fact which should be of interest to those British makers who are longing to see a substantial export business in automobiles.

Names for Cars.

SOME time ago, the Lord Justice Clerk of Scotland suggested that owners of cars should name as well as number their vehicles, a course which had been adopted and anticipated in the case of "Antrona," "Sir Charles," and other cars famous in the earlier days of the movement. A motorist at Tunbridge Wells seems to have fallen in with the idea, and a motor-

In a recent issue we mentioned that M. Cormier had returned to Paris from a long tour on a De Dion 8-h.p. two-cylinder car. Altogether over 7,000 kilometres were travelled, and Algeria, Spain, Italy, Germany, Switzerland, and Belgium visited. M. Cormier took quite a large number of snapshots during the tour, two of which are reproduced above. The first was taken near Palermo, Sicily, and the other in Italy.

that the best solution of the housing problem was in the extension of the electric tramway system, with cheaper fares for the working classes. Mr. Douglas Mackenzie pointed out that the development of the motor industry would have a marked effect in decentralising industries. Motor transport for goods could be done cheaper than by railways, but at present our roads were unfit for locomotive traffic—a point which cannot be too often emphasized.

Haulage at Docks.

THE chairman of the Mersey Docks and Harbour Board, Mr. R. Gladstone, is looking forward to the time when horses will entirely disappear from the Mersey Docks estate. In an annual review of the Board's operations for the past year, at the annual meeting just held, he said that three motor lorries had been added to the two already in use, and all had proved most successful in operation. In this and similar ways motor-vehicles will prove the friends of the horse, relieving him from the burdensome duties which have fallen to his lot in the past. Often have horses struggled up inclines with heavy loads, resulting in pain and suffering. With the advent of the motor for heavy haulage, much equine agony will be prevented.

wagonette named the "Fontenay" and a voiturette known as the "Windapiel" are frequently to be seen in the neighbourhood. Motorists continue to send their numbers, names and addresses; those who have christened their cars are invited to similarly favour us.

Cordingley's Exhibition.

OUR Continental readers are reminded that Cordingley's Ninth International Automobile Exhibition will be held in March at the Royal Agricultural Hall, London. As in previous years, this event will attract a large number of visitors from the Continent, who recognise it as a splendid opportunity of observing the progress that is being made by British firms. More than two hundred and fifty exhibitors have already booked space, and not only will the galleries be filled with representative exhibits, but the various adjoining halls will also contain interesting displays. As previously intimated, the Aero Club is organising what should prove a popular feature of the Exhibition, which will open on Saturday, March 19th, and close on the following Saturday. Particulars of the few spaces still vacant can be obtained from the offices of the Exhibition at 39-40, Shoe Lane, E.C.

The Luxury of Signposts.

THE district councillors of Droitwich were alarmed the other day when their surveyor reported that there were ninety-seven points at which sign-posts as to speed limits would have to be erected if the suggestion as to the restriction of the speed of motor-cars was adopted. What with white rings, red discs and green triangles at the head of poles eight feet high, the town—now splendidly uneven in its surface—would present a kaleidoscopic effect, adding another attraction to the magnetic influences of the town, at present limited to brine baths. Under such circumstances Droitwich had better fall into line with Horsham and Tiverton in depending upon Section 1 of the Motor-Car Act for the protection of the public.

Widening Roads.

OUR Notes on the New Act are continued on another page, but we would here give publicity to the suggestion made by Mr. Moresby White, a Lincolnshire motorist and barrister, who directs attention to certain provisions in the Highway Act of 1835 which might, he thinks, be of service in restraining an over-zealous local authority. Section 82 of the Act named states that:—"Where it shall appear, upon the view of two Justices of the Peace, that any highway is not of sufficient breadth and might be widened and enlarged, such justices shall and they are hereby empowered, within their respective divisions, to order such highway respectively to be enlarged in such a manner as they shall think fit, so that the said highway, when enlarged, shall not exceed thirty feet in breadth." According to Mr. Moresby White's interpretation of the Act, the justices could take action upon their own initiative, but he advises that such action had better be taken on the instigation of a third party. The matter is one to which provincial clubs should give their early attention. In the event of a test case being tried the central body might lend useful aid.

A Novel Car.

PARTICULARS of an exceedingly novel car have just reached us from New York. The vehicle has been built by Mr. W. Christie, of the Christie Iron Works in that city; its most striking feature is that of having no front axle, the motor taking its place and driving direct into the hubs. The whole front end of the car, the engine and front wheels included, weighs only 780 pounds, although the engine is of 35-h.p. The entire vehicle, in racing trim, weighs about 1,250 pounds. The frame is built low, the forward wheels being only twenty-eight inches diameter, and the lowest part of the mechanism escaping the ground by eight inches. The engine, which comprises four vertical cylinders, is placed forward in alignment with the axle arms of the front wheels, connection being made with a sliding universal joint, which permits of the direct drive into the hubs. A steering box containing a combination of steering device and spiral spring is placed directly over the hub of either front wheel. The countershaft is placed behind the motor, and on it are the differential, reverse and change gear. It is probable that the vehicle will take part in the races to be held on the Ormond-Daytona beach, Florida.

Motor-Car Imports and Exports.

THE last month of 1903 closed with the smallest importation of foreign automobiles into this country during the whole of the past year. The number of cars and cycles imported during December was 240, the value of the same being returned at £63,747. The value of the "parts thereof" is given as £23,335, so that we get a combined total for December of £87,082 as compared with £123,980 in November last and £62,473 (representing 170 cars) in December, 1902. Some of the imports were of only a temporary character, being reshipped to foreign destinations. Thus last month the reshipments comprised 59 vehicles, amounting in value to £14,345, bringing

down the net imports in December to £72,737. For the whole of the past year the net import of motor-cars, cycles, and parts stands at no less than £1,810,645 (representing roundly 6,133 vehicles). As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to 143 vehicles, of a value of £40,722. Of parts the exports attained a value of £13,996, making a combined total for December of £54,718, compared with £33,395 (representing 83 vehicles) in December, 1902. During the whole of 1903, 957 motor vehicles of British manufacture were exported, these, together with the "parts," representing a sum of £344,325, or exactly double those in 1902.

Irish Railway Enterprise.

EVIDENTLY the Irish tour of last year left its impressions on the railway magnates of the country, and the Belfast and County Down Railway Company have become a convert to the view of motorists as to the value of the motor-vehicle in connection with their business. From the Lancashire Steam Motor Company they have received a steam wagon, which has also a trailer. It is now daily engaged in conveying goods and parcels between Newcastle—the station for Castlewella—and Kilkeel, a distance of twelve miles. Intermediate deliveries are also made, and its utility has already received ample demonstration.

Motorists Must Protest.

THERE must be no delay on the part of motorists in protesting against the recommendations of local bodies for the restriction of motor-car speed within their areas to ten miles an hour. We are glad to hear that the Hampshire Motor Union has sent in an objection to the Local Government Board with reference to the proposed ten mile limit in Winchester, and we hope that other organisations of automobilists will be equally alert. Where no local associations exist, the individual motorists should consult each other and make combined protest. Unless such action is fairly general some cases of unjust treatment may secure official sanction. Hence we would emphasize the warning we recently gave in connection with the Ealing proposals, and urge an adoption of the policy of the Hampshire Motor Union throughout the country.

THE inaugural dinner of the Berkshire Automobile Club will take place at Reading on the 5th prox.

Up to the 7th inst. no motor-cars or motor-cycles had been registered with the County Council of Orkney.

MR. J. E. HOPKINSON, of the Para Rubber Mills, West Drayton, has been placed on the Commission of the Peace for the County of Middlesex.

MR. DRURY, who presides in the Southern Police Court, Dublin, has declared his intention of severely enforcing the provisions of the new Act.

THE name of Lieutenant-Colonel Arthur F. Mulliner, V.D., has been added to the Advisory Motor Board of the General Accident Assurance Corporation, Limited.

THE Cuckfield Rural Council has decided to prohibit Stoney Lane, Balcombe; Pilatye Lane, Cuckfield; Cleavers Lane, Cuckfield; Pyecombe Street, and Church Lanes, Pyecombe, to motor-cars, and to put warning notices on the road in Brantridge Lane, and on the cross roads at Warninglid Village, by the Half Moon Inn, three dangerous hills.

THE Walsall Corporation does not propose to apply to the Local Government Board to proscribe any particular roads or streets against a speed exceeding ten miles an hour, but has decided to apply for motor traffic on Longwood Lane to be prohibited altogether. Notice boards are advised to be fixed in Cartbridge Lane, Little Bloxwich Lane, and Goscote Lane, cautioning drivers to go steadily to prevent accident.

The First 1904 Gordon Bennett Racer.

Lieut.-Colonel Mark Mayhew on his Napier's Racer.

THE above illustration shows the 100-h.p. Napier racing-car, with Lieut.-Colonel Mark Mayhew, L.C.C., who will drive it in the forthcoming eliminating trials for this year's Gordon Bennett race, at the wheel. Mr. Mayhew has long been a most enthusiastic motorist, and is a Vice-President of the Automobile Club. He is one of the founders and now commands the Motor Volunteer Corps. He is by no means unaccustomed to the racing track, and took part in the Paris-Madrid race of last year with conspicuous success, passing eighty-three other competitors in the first five hours, until that ill-fated event was abandoned. Should he get through the eliminating trials satisfactorily, it is Mr. Mayhew's intention to drive for England in the great International contest of the coming summer.

The new car, which is of the chainless type, embodies many unique and interesting features. While claimed to be capable of a speed of over 90 miles an hour, it may be stopped and re-started with remarkable celerity. The engine, which is of the four-cylinder type, can be run at from 150 to 2,000 revolutions per minute. The frame is of rolled steel, tapering at either end, where the strain diminishes. It is carried out in front to obviate having long spring hangers, and the radiator and engine are placed well behind the front axle to enable more weight to be placed on the driving wheels. The front axle is a steel forging of H section. The radiator is of the Albany type, with an enclosed fan, driven by a belt off the crankshaft. Even should the pump stop working the water would still circulate on the thermo-syphon principle, only, of course, it would be used up sooner. As will be seen, the radiator filling cap is of very large proportions, enabling additional water to be put in very quickly. The centrifugal water-pump is driven by a chain from the crankshaft of the engine. The crankshaft is hollow, with the view of obtaining extreme strength with minimum weight. The inlet valves are mechanically-operated off the same camshaft as the exhaust valves, by a rod and lever, with an adjustable tappet; the valves are so arranged that they can be inspected by undoing the valve caps only. The lubrication is by a drip to all engine bearings, which ensures every bearing being thoroughly oiled. The

petrol feed can be either by gravity or pressure. A throttle lever is fitted on the steering wheel, by which the car can be very easily handled in traffic. The clutch is of the metal to metal type, no leather or other perishable material being used in its construction, and it is self-contained. It is extremely easy to work, being pushed out by the pressure of three fingers only. Push pedals are fitted. These, together with the position that the driver occupies, enables the clutch to be operated almost without exertion, taking off a great deal of strain from the driver in a long race. All thrusts are taken by ball bearings, and the clutch is fitted with three springs, which can be readily adjusted. The gearing is run through hollow shafts working on roller bearings. On the top speed the drive is direct, with no intermediate shafts running. The universal joint runs in an oil bath inside the gear-box, and the back compensating square shaft is specially constructed to run without lubrication. The vehicle is fitted with a live axle running throughout on roller bearings in a bath of oil. The brakes are extremely powerful, while the steering is of the usual Napier adjustable type.

MRS. FRASER, of Daviot Lodge, Inverness, has taken out a licence to drive a motor-car.

THE first of the new Leon Bollée 24-h.p. cars has just been supplied to the Earl of Derby.

M. LEON SEE, agent for the Samson-Hutchinson tyre band, has removed from 9, Hills Place, Oxford Street, to larger premises at 8, Snow Hill, E.C.

THE Wantage Engineering Company have lately completed a steam motor lorry for Messrs. W. G. Phillips and Sons, Limited, Tower Brewery, Oxford.

At the King's Heath (Birmingham) Police Court, Charles Showell, of Moseley, was fined 10s. and costs for riding a motor-car without exhibiting the red light behind.

THE British agency for Tony Huber cars has been secured by the Paddington Motor Company, Limited, which have opened a large garage and repair works at Banister Road, Kensal Rise, W.

THE MOTOR CAR ACT.

THE size of the licence issued by the various authorities varies as much as do the fines inflicted upon motorists in different parts of the country. It is a pity that uniformity could not have been established, and it might be well if the Local Government Board would furnish the various registration authorities with a hint as to the advisability of issuing the licences in a convenient and handy form. At present these range from the needlessly large sheet of the Middlesex County Council to the neat leather bound parchment licence of Dorsetshire, upon the style of which we would congratulate the clerk to the County Council. As intimated a few weeks ago, this can be readily put away in the waistcoat pocket. It might well be made the standard form of licence.

The "man in the street" has taken much interest in the number on the car, and his curiosity has scarcely yet exhausted itself. He cannot understand why some plates should have a red background and others a more sombre hue. The location of the letters—in some cases to the left of the figures, and in others above the numerals—has also presented its complexities. Many have wondered why the numbers are needed at all, and a car standing outside an auction room in Holborn a few days ago was regarded as one of the "lots" by a suburban dealer in "sacrifices." Again, the numbered vehicles have been associated with the long-promised public-service vehicles in London; and, altogether, the new means of identification have provided a "nine days' wonder" of an unexciting kind.

At the Winchester quarter sessions Mr. C. A. Garland, the Recorder, referring to the Motor Car Act, said an important section was that which now enabled petty sessional justices, after the second and third offences, where they found that the infliction of a fine was no terror and worked no good, to send the defaulter to prison. There were one or two rather curious sections which would be dealt with, no doubt, when they came up. Section four gave the justices the power to suspend a licence in cases where the speed limit was exceeded, and the justices also had power to take the licence away entirely. There were other sections which would lend themselves to a good deal of difficulty in working, and might require the services of their excellent clerk to the justices. Section six, which dealt with the duties devolving upon a person who caused an accident, required that person to stop and give his name and address, and if he refused, it made him liable to punishment. There again there seemed to be room for difficulty, because it said nothing about the man on a cycle who might be run over, and what would happen if a motor ran into a flock of sheep he did not know. That might become a serious matter in that neighbourhood.

Restrictions of the speed of motor vehicles to ten miles an hour are being proposed in East Grinstead, Newport (Mon.), Grange over-Sands (Lancashire), Gainsborough, Worthing.

The returns for Ireland with reference to the number of motor-cars are interesting, showing that 270 cars and 344 motor-cycles have been registered in the country where the Gordon Bennett race of 1903 was run. Drivers' licences to the number of 578 have also been issued. It must be remembered that these figures are the official returns obtained from the registrars, and result from the numbers published in last week's *Motor-Car Journal* being added to those given in the present issue. It will be safe to say that there are more than 600 automobiles in use in the Emerald Isle.

The working of the new Motor-Car Act in Hampshire is causing considerable friction between the County Council and the local authorities. A short time ago the County Council requested the Borough and Urban District Councils throughout the county to schedule the dangerous roads and corners in their respective areas. The local authorities complied with the request, has submitted to the County Council schemes for

marking places at which the speed of cars should be reduced to the lowest limit. The County Council ignored all recommendations, but had now appealed again to the local authorities to erect danger signs where they are needed. At a meeting of the Andover Town Council it has been unanimously decided to take no notice of this request, and a resolution received from the Christchurch District Council protesting in strong terms against the treatment of the County Council was adopted.

Lord Lindley, in charging the Grand Jury at the Norfolk Quarter Sessions, referred to the Motor Car Act of 1903. He said he wished to prevent the acceptance of an idea which he was afraid would be common among drivers—that because they could never go beyond twenty miles—he was speaking of highways—they might go up to twenty miles, and so long as they did not exceed twenty miles they were all right. That was entirely an erroneous view. The point to be borne in mind was not so much the maximum speed beyond which they could not go, but the duty to take care, whatever the speed might be.

The suggested regulations with regard to signposts now under the consideration of the Local Government Board are as follows:—(1) For ten miles or lower limit of speed: a round white ring, 18 in. in diameter, with plate below giving limit in figures. (2) For prohibition: red solid disc, 18 in. in diameter. (3) For caution, dangerous corners, cross-roads, or precipitous places, hollow, green, equilateral triangle. (4) All other notices under the Act to be on diamond-shaped boards. All notices to be on one side of road and facing approaching driver. All prohibition or caution boards to be fifty yards from spot to which they apply. It is considered not desirable to make any regulations as to material, size, or colour of posts, provided that the under side of signs are at least eight feet from ground level.

The table we published last week giving the registrations up-to-date showed that 11,418 automobiles had been registered. Below we give particulars of the registrations which have been made in counties and boroughs not then enumerated, and to these figures have been added bringing last week's returns up-to-date. Thus we have been able to secure official returns showing that 14,000 automobiles have been registered by the authorities empowered to register motor vehicles.

CONTINENTAL NOTES.

THE German Club has decided that all the cars competing in the Gordon Bennett Cup race shall carry a shield bearing the number and the letters G. B. It has also been decided to establish both telegraphic and telephonic communication over the whole course. It is probable that the German eliminating test will be run over a course in the Luneburg district. Although the Circuit de l'Argonne is being spoken of as the course for the French eliminating trials, nothing has so far been definitely decided. It is announced that Thery, who formerly drove a Decauville, will steer one of the Georges Richard racers in the test.

BRITISH motorists who contemplate visiting the Gordon Bennett course are warned to keep clear of Wiesbaden, where a number of streets have been closed to automobiles. The notices are so small that they can easily be missed, and the police are on the alert.

So far little or no information has been allowed to transpire with regard to the Mercedes racers which the Cannstatt-Daimler

De Dietrich racer driven by Mr. C. Jarrott in Paris-Madrid. In order to secure a larger entry, the date of the race for the Sneden Cup has been postponed until the 14th February.

A GOOD deal of dissatisfaction is being shown with the awards of the jury in the carburettor competition held in connection with the recent *Salon* in Paris, two of the competitors—De Retz, and Moisson, the maker of the Sthenos, having protested against the decision, which, it is stated, is not in accord with the results obtained.

THE programme of the meeting which is being organised by the Italian Automobile Club to take place from May 11th to 15th will include a reliability trial over a distance of 130 miles, a fuel consumption trial, a speed trial, and a hill climb; all of these events will be open to touring cars, four classes being established for each.

ON Sunday last, the Antwerp Automobile Club held a series of speed trials over a 500 metre course from a standing start and a stopping finish. Elskamp on a 20-h.p. Gobron made the best time, viz. 50 3-5 sec.; Joostens on a 12-h.p. Clement was

His Excellency Gobeimer Rath Alexander Pallavicini, a prominent Austrian Motorist, at the wheel of his 16-h.p. Spitz Car. *[Allgemeine Automobil Zeitung.]*

Company are building for the Cup race. It is known, however, that the engines will be of greater capacity than the 80-h.p. cars of last year, almost all of which were destroyed in the fire. For the 1904 season the Mercedes cars are to be built in the following sizes:—18 to 24 h.p., 24 to 28 h.p., 28 to 32 h.p., 40-h.p. and 60-h.p. No important change is being made in the brakes and change speed gear on last year's models, but the 1903 type of motor, except as regards the 60-h.p. cars, is being given up and a return made to that employed in 1902, the latter having proved superior to last year's engine from the point of view of quietness and regular firing. It is probable that the first of the 1904 models of Mercedes cars will make their bow to the public at the forthcoming exhibition at the Agricultural Hall, London.

THE motoring season in Algeria is now in full swing. Among the latest arrivals is Mr. C. Gray Dinsmore with his 60 h.p. Mercedes, while the Barons Joseph and Pierre de Crawhez are daily expected with powerful cars. An Algerian motorist, M. Pierre de Malglaive, is reported to have purchased the 45-h.p.

second in 59 2-5 secs.; De Benkelaer on a 16-h.p. Vincke third in 1 min. 1 2-5 secs.; Knoops on a 8-h.p. Vivinus fourth in 1 min. 4 sec. and Cogels on an 8-h.p. Germain fifth in 1 min. 53 4-5 secs. The speed trials were followed by a consumption test, each competitor being given an amount of spirit equal to one litre to every 1,000 kilog. of complete weight of car. This event was won by Joostens, who on his Clement, weighing 1,090 kilog., covered a distance of 11 kil. 850 metres.

LA SOCIETE DES ETABLISSEMENTS POSTEL-VINAY is, it is announced, at present engaged on the construction of a combination petrol-electric motor-car in which a number of new features will be incorporated.

UNDER the name "Warm Salt," a French firm, Les Usines Durandal, of Lecluse (Nord), have lately brought out an anti-freezing compound for use in the water tanks of petrol motor-cars, and also the generators of acetylene lamps in winter. It is claimed to have no deleterious effect on the metal of the tanks and pipes, and to dissolve any "fur" which may have formed in the cylinder jackets.

D

General View of 16-h.p. Miesuset Car, with Racing Body.

THE "MIEUSSET" CAR.

THE Farman Automobile Company, Limited, has secured the agency for Great Britain and Colonies for the petrol motor-cars made by Les Ateliers de Construction Mecanique et d'Automobiles Miesuset, of Lyons. These cars are being built in a variety of types, with one, two, four and six cylinders. The other day we had an opportunity of inspecting the first of these cars to reach this country—a 16-h.p. four-cylinder vehicle, of which an illustration is given above. The general arrangement is similar to that adopted in the Panhard type of vehicle. The frame is of channel steel, the engine and gear-box being carried on a secondary frame of the same material. The motor comprises four vertical cylinders cast in two pairs; the inlet valves are mechanically actuated and are interchangeable with the exhaust valves, which are located on the opposite side of the cylinders. The bore is 103 mm., the stroke 130 mm., and the normal speed 800 revs. per min.; the latter can, however, it is claimed, by means of the throttle and ignition and cutting out the governor, be regulated from 50 to 1,200 revs. The ignition is by magneto, while a gear driven pump maintains the circulation through the cylinder jackets and the combined honeycomb radiator and water tank. Each tube in the latter is riveted over, no solder being used, so that should a tube or tubes be accidentally damaged, the cost of repair is very small.

A large adjustable fan is provided to induce a current of air, through the radiator. The carburettor is of the float feed type with a piston form of throttle valve controlled by the governor; the spraying chamber is surrounded by a jacket, through which part of the exhaust gases may be caused to pass.

From the engine the power is transmitted through a large diameter leather-faced clutch to a gear box adapted to give four speeds forward and a reverse. The shifting gears are in two trains on the lines adopted in the Mercedes, the change gear control being also practically the same. From the differential countershaft the power is transmitted to the rear road wheels through side chains. A pedal actuates a band brake on the countershaft, while a hand lever at the side controls band brakes on drums connected with the sprockets on the rear road wheels. On applying the hand brake the first action is to withdraw the clutch and so disconnect the engine from the transmission.

The steering wheel is inclined and has the latest type advance ignition and throttle control levers working from its centre, a hand accelerator being also within convenient reach. The steering worm is endless and the levers are irreversible. Any back lash can easily be taken up, while the front radius rod can

also be adjusted should any accident throw the front wheels out of line.

The lubricator is belt-driven off the engine; it can be easily regulated and is positive in its action, the oil being forced to its destination. A universal greaser is also mounted on the dash board; from it branch a series of pipes each with a lettered tap, so that any particular bearing can, if necessary, be given an extra supply of grease.

Altogether the Miesuset cars, without embodying any startling departure from what may be termed standard practice, give evidence of being the result of careful design. Although the illustration shows only a two-seated car with a long box at the rear for tools and spare parts, of which, by the way, a very ample supply is furnished with the car, it will be understood that any desired type of body—tonneau, double phaeton, etc.—may be fitted to the chassis. We may add that the Miesuset Company have lately completed a 50-h.p. 6-cylinder racing car, which will probably take part in the forthcoming racing events in the South of France.

THE motor-car belonging to the Director of Public Works at Kinta, in the Straits Settlement, is said to have proved somewhat of a disappointment.

MOTORING in the Bolton district is likely to receive an impetus from the establishment of the Bolton Motor Company, Limited. Some fine premises have been acquired in the town, and Mr. E. J. Hartenfeld appointed general manager.

MESSRS. CLEMENT TALBOT, LIMITED, who are erecting the extensive new works in North Kensington for the manufacture of automobiles, have become the possessors of all the patents owned by Messrs. A. Clement, of Paris, and are, we understand, about to take action against a large number of infringers.

The restriction of the speed of motor-cars on certain specified highways or within certain specified limits or areas in the West Riding is occasioning the authorities much trouble. Recently the County Council sent out a circular inviting expressions of opinion from the local authorities. In reply, in the aggregate the prohibition of motor-cars was suggested upon 372 highways, and restriction of speed upon 620 highways, in addition to which it was desired that the maximum speed of ten miles an hour should apply to a considerable number of areas. It has been decided that any application to the Local Government Board for regulations to prohibit or restrict motor-car traffic on highways should be postponed for the present. The County Council is wise in thus overcoming a difficulty.

END TO END ON AN ARROL-JOHNSTON CAR.

IT will no doubt be remembered that three of the Arrol-Johnston cars manufactured by the Mo-Car Syndicate, Limited, of Paisley, were entered for competition in the 1903 Reliability Trials, but, owing to a delay on the part of the railway authorities, they were delivered too late. It was only a question of minutes, but the committee had to adhere to their rules, and the cars were debarred from competing. It was naturally a great disappointment to the company, and, as an alternative, Mr. Johnston decided to have a non-stop run from Land's End to John o' Groat's, under practically the same rules as governed the Automobile Club trials. After coming to this decision, Miss Murison, a young Irish lady, and a friend of Mr. Johnston, proposed to him that she should drive one of the cars, and her offer was accepted. The

of a succession of short, steep hills, which, however, could be rushed, and which merely served to "tune up" the motor. There is a long run down of about four miles through Penzance, and all along this we made good speed. Near Connerton we came upon the first of a long series of steep hills. Surely Cornwall must be the most bumpy county in England. No sooner had we rushed down one hill, than we were plodding our way up another, gradients of 1 in 12 to 1 in 15 being very common occurrences.

These and the winding nature of the lanes made fast travelling an impossibility. It had been dark over two hours when we reached Bodmin at 8.30 p.m. With the exception of a halt to light up lamps, we had come right through—some sixty-one miles without stopping.

We left Bodmin at 6.45 the next morning, with the firm intention of making Bristol that evening. At the outset we lost our way and wasted thirty-five minutes, having to go right back into the town to find it. Skirting Dartmoor on the west

The Arrival at John o' Groat's.

vehicle was a six-seated, 12-h.p., two-cylinder car, with wheel steering. The load consisted of five passengers, with a plentiful supply of luggage, for the storage of which the cars have a good capacity. Miss Murison was quite a novice at motoring, for three weeks before she had never driven a car, and, in spite of the great aptitude she showed for driving, it speaks volumes for the strength and simplicity of the Arrol-Johnston car, that it could thus easily be mastered by a lady with only a few weeks' experience of driving, and could be driven for about 1,100 miles, with, practically nothing to be done to either the car or engine in the way of repairs.

At a quarter to three on Tuesday afternoon, September 22nd, we, says a writer in the "Coach Builders' Journal," left Land's End, and started on our journey North. Two other cars of the same make, driven by members of the opposite and presumably stronger sex, were going to take longer runs each day, so we left them in Penzance, intending to start the following evening. From Land's End to Penzance the road consisted

and north, we ran through Launceston, arriving at Okehampton at twenty-five minutes past ten. On the road from Exeter to Taunton we encountered several very steep hills, but a stiffer climb met us at Wells, on the road from Taunton to Bristol, a hill over five miles long and in some places as steep as one in 9, tested the hill-climbing qualities of the car. After a run down to the old level and several more climbs, we pulled up at the George in Bristol at 6.20 p.m., having travelled 145 miles since morning.

Thursday morning gave promise of another brilliant day, which promise proved to be delusive. It was five minutes to seven before we wheeled out of the yard gates, but the country was level, and we made good time to Gloucester. Thence through a portion of the Black country to Kidderminster, where it became more hilly, and on to Bridgenorth, where we stopped for refreshment for man and beast in the shape of lunch and petrol. We arrived at 12.30 p.m., having done ninety miles since breakfast, and we were again on the road at 2.15. Up to now the weather

had been perfect, but from Bridgenorth to Whitchurch (Shropshire), our enjoyment of the lovely scenery that ride affords was somewhat marred by a blinding rainstorm. At Whitchurch we stopped for some little time, and here the other two cars caught us up, having accomplished the journey in two stages. Land's End to Taunton, and Taunton eventually to Warrington, which lay thirty-two miles further on from Whitchurch. Thence onward the three cars kept, more or less, together all the way to John o' Groat's. The latter part of this day's journey necessitated very careful driving, the country being more populous, and the roads very greasy. Owing to Miss Murison's careful driving, we escaped, with one or two slight exceptions, from that bugbear of motorists—skidding. We arrived at Warrington at 7.45, having done the longest day's run as yet, namely, 158½ miles.

We left Warrington at a quarter to seven the next morning. It was pouring with rain, and the first thirty miles of road through the mining district seemed most doleful. The road between Preston and Wigan consists mostly of granite sets, with tram lines in the centre of the road. From Preston to Kendal we went warily, as we had heard rumours of police traps. On through Lancaster, Carnforth, and Kendal, we commenced to climb the "Shap," ascending, in a little over nineteen miles, over 1,200 ft., at gradients up to 1 in 11. Then a hilly drive through magnificent scenery to Carlisle, which we reached for a late lunch at three o'clock. This finished, we were quickly over the Border by way of Gretna Green, and, driving fifty-seven miles, we pulled up at Abington Inn at 8.30 p.m.

On Saturday morning we made an early start, leaving at a quarter past six, and reaching Stirling at 9.15. We then journeyed on to Perth, through Dunblane and Auchterarder. Passing through Perth without a stop we commenced, perhaps, the most beautiful part of the journey. Proceeding by Bankfoot to Dunkeld, we followed the course of the Tay through some beautifully wooded mountains. Past Ballinluig, Pitlochry, the Pass of Killiecrankie and Blair Athol we went, the scenery getting every moment wilder and more beautiful. From Struan to Kingussie the mountains were bare and bleak, and the roads were of the roughest description. During the journey we had climbed from a level of 250 ft. to 1,500 ft. above the sea in a stretch of twenty-five miles; we rested for about twenty minutes at Kingussie, where we learnt that the other two cars were about an hour ahead of us. Between Kingussie and Inverness occurred the solitary mishap of the journey. About sixteen miles out of Inverness we detected signs of the petrol tank being empty. On examination it was found to be not quite empty, and the car was started again, only to stop half a mile further on—fortunately in a village. There it was found that the float of the carburettor had sprung a small leak, but this was soon put right. Anyway, we had to have more petrol to get to Inverness, and so a telegram was sent for one of the other cars to bring some. By this we were delayed 3½ hours and reached Inverness in a thick fog half an hour after midnight, having done 203 miles in a net running time of nine hours.

The next day was Sunday, and we spent it in resting and exploring the beauties of Inverness. On Monday morning we left Inverness at ten minutes to five, some time before sunrise. We travelled through Beaulieu, Dingwall and Allness, where we turned to the left, leaving Tain on our right. So far the road was flat, with some slight undulations. The sun was just rising over the black Isle as we travelled by the Cromarty Firth, a really grand sight. From Wick we made a quick run of seventeen miles to John o' Groat's, stopping on the way twenty minutes at Keiss to inspect some old cave dwellings. We had lost our way on the moors, but arrived at our destination at 3.40 p.m.

Our car arrived first and the other two came in within a few minutes. The entry was a triumphal one. A new record had been made. Miss Murison, who had driven every yard of the way from Land's End, was the first lady to accomplish a very arduous task. It needs no effort to drive a car forty or fifty miles, but to take a heavy car with five passengers from 150 to

200 miles a day for six days, over all roads and in all weathers, is an undertaking requiring both determination and coolness, and Miss Murison is to be congratulated on her achievement. The journey had been done in a net running time of 57½ hours, at an average speed of 15½ miles an hour. The amount of petrol consumed averaged a gallon for every twenty miles. On the return journey Miss Murison drove far enough to complete her thousand miles. Driven by an amateur continuously for six days, nothing went wrong except the float feed—which, by the way, is almost the only part of the machinery not made by the Mo-Car Syndicate. The roads were very rough, and the tyres solids, yet, in spite of these conditions, the engine and all the parts were working as sweetly on the evening of the last day as on the first.

SOME USEFUL NOTES.

SINCE the general adoption of electric ignition for motor work the dangers involved in the use of petrol have practically disappeared. Whenever there was a flame or incandescent tube in the vicinity of the petrol tank the risk of it catching fire was very considerable, especially in case the vehicle got overturned. Serious accidents have even occurred on cars through the petrol leaking out through a joint or overflowing and coming in contact with the burner or hot tube, and thereby practically ruining the car. Although the danger is now very slight, a few words of caution, however, will not be out of place, in case the novice might unthinkingly bring his oil lamp too near the petrol tank or carburettor to examine them at night. It is advisable to keep it at least 2 ft. away; in fact, it is an excellent plan to have a small electric lamp of four volts and a few feet of conducting wires to attach to the ignition battery for this purpose. It is quite safe to examine any part of the motor with this.

IN the remote possibility of the petrol getting on fire by some means or other, remember that it cannot be put out by throwing water on it. As it is so very much lighter it simply floats on the water and burns as strongly as ever. The only effectual way to extinguish it is to smother it, or to prevent the air getting to it, such as by throwing a coat or rug over the flame; sand or something of the same nature would also do.

ANOTHER word of advice is this: Avoid working with petrol in a closed stable as much as possible. In any case have a window wide open, because, apart from the smell produced, it is quite conceivable that an explosive mixture might be formed by the petrol evaporating and mingling with the air of the room. If these few hints and precautions are observed, petrol will be quite safe to handle in every respect.

WHEN a boiler of a steam car is not to be used for some time, all water should be drawn off. It is also advisable to take a small quantity of sal soda—about a cupful—dissolve it in warm water, and pump this into the boiler. Then fill the boiler nearly full of clean water, start a slow fire, gradually bringing the water to the boiling point, and continue the fire for about ten minutes. Turn out the fire and blow off the boiler until dry. This leaves a coating which prevents further rust, and thus prolongs the life of the boiler. The water system should be carefully drained. This can be done by opening the valve at the bottom of the water column, and the small pet cock which is usually placed below the pumps in steam cars of the Locomobile type. If the car is equipped with steam water pumps, great care should be taken that they are thoroughly drained, and oil worked into the cylinders and valves. When the car is to be used again it should be fired up and blown off before beginning to use it regularly, as otherwise the deposits of soda will cause foaming in the boiler, incorrect registration in the gauge and priming through the engine.

MOTOR-CYCLING NEWS.

THE accompanying illustration shows Mr. A. T. Chapman, of Georgetown, British Guiana, on the "Brown" motor-bicycle purchased by him in May of last year. Special interest was

shown in the machine in Georgetown, as it was the first motor-cycle used in the district. It has been much admired, and has given great satisfaction to its owner.

"MOTOR-CYCLISTS' CLOTHING" was the topic discussed at a recent meeting of the New York Motor-Cycle Club. There was quite general agreement that the leather garments which have been the vogue have about run their course. If they are warm in winter they are unsuitable for summer wear, and at all times they are not such as an average man desires to wear in a hotel dining room. They show the dirt readily, and, when old or creased, appear disreputable. All agreed that the light, flat cloth cap, with flaps that lap over and are secured on the crown when not in use on cold days, is not only "dressier" but more comfortable and more generally serviceable than the so-called automobile cap.

THE only thing of leather that was favoured was leggings. Those of the "overall" type that reach to the hips were disapproved of, and short flexible ones reaching only to the knees were recommended. Snap clasps instead of straps and buckles were favoured, and the legging generally was considered worthy of encouragement because it permitted men to ride on short notice and did not necessitate a change of trousers. The proper cloth for motor-cyclists' wear provoked much discussion. The need for a material that would not readily show dust was generally appreciated, and the opinion of the meeting was that a "pepper and salt" mixture was the one adapted to best serve the purpose.

GOGGLES constituted another feature of the motor-cyclists' outfit that was discussed at some length. A small minority held that they rarely were really necessary, and at all times were hideous. All agreed that the mask or half-mask was in this category, but most of the speakers maintained that an eye protector of some sort was essential. Several of those present who wore spectacles said they found them to be all the protection needed, and while the opinion was not unanimous, it was in the majority, that enlarged spectacles with concave lenses of plain glass would prove ample for all practical purposes.

UNDER the name "Picrator" Messrs. Guy and Wheeler, of Liverpool, have brought out a device for use in connection with the engines of motor-bicycles. It is an arrangement to make

use of picric acid to obtain greater power than when using petrol alone. It is not intended for continuous employment, but only to facilitate the starting and for climbing hills when more power is required. It is designed to work in connection with spray carburettors, and is interposed between the latter and the petrol tank by means of a three-way cock. The "Picrator" itself consists of a chamber in which is placed some picric acid, and a gauze cartridge filled with glass wool. By means of the three-way cock the petrol supply may be (1) shut off (2) sent through the "Picrator" to the carburettor, and (3) direct to the carburettor. The inside of the picric chamber is coated with a substance upon which, it is stated, the acid will not act.

At Long Eaton Petty Sessions, Everard Wilson, Beeston, has been fined 5s. and costs for riding a motor-tricycle on the 21st December without a light. From several sources we hear of police activity in this respect in other places, and motor-cyclists should take warning in time.

ON Boxing day, Mr. H. Patten, of the Electrical Lighting Depot, East Ham, made the journey from that place to Bournemouth, a distance of 118 miles, on his Rex motor-bicycle with surface carburettor, the consumption of petrol being only six pints. This for a 3 h.p. engine must constitute almost a record.

A TELESCOPIC foot-rest for motor-cycles has lately been introduced by Mr. A. B. Clark, of the Curfew Ironworks, Sandwich. The special features of the device are that the ends of the rest, which carry rubber-covered foot plates, telescope into the main tube, which is provided with a clip to fit round the down tube of the frame. The foot plates are mounted on springs so as to absorb vibration, and a trigger attachment is combined with them, so that by slight pressure on the plates the telescopic ends are forced out by internal springs, the rider's legs being thus clear of the engine. When the footrest is not required, it is only necessary to apply slight pressure to the ends, when the tubes collapse to normal dimensions.

MR. T. SILVER, of Bristol, has just returned from South Africa, where he accomplished the feat of riding 6,000 miles in sixty days on his Quadrant motor-bicycle. In the course of the trip he visited all the well-known battlefields, slept in native kraals, and was laid up six weeks with the fever.

THE accompanying illustration shows a section of a new friction and pulley wheel for motor-cycles which has been devised by Messrs. Higgins and Murray, of Catford, S.E., and for which special advantages are claimed. The pulley is made in halves and may be of any metal, the back half containing the boss and key-way. The front flange is fixed to the back by means of screws. The special feature of this wheel is the application of the discs, e.g., various fibres, leather, etc. The discs are moulded into the shape of the flanges, the inner faces of which are serrated and are secured by the clamping of the two halves of the wheel, the screws passing through the fibrous lining. The fibre discs are thus firmly held in position by clamping, and cannot give in the least. It is claimed that a belt will work on this pulley in wet as well as in dry weather without slipping, that

changes of temperature have no effect upon the transmission of power, and that the pulley being V shaped with a fibrous lining, the fibrous discs can be inexpensively and easily replaced. The patent includes several forms of gearing with the application of fibrous discs, amongst these being parallel and bevel friction wheels, for use in motor vehicles.

AN AUTOMATIC TYRE INFLATER.

TO pump up a large motor tyre is an arduous piece of work, and when a tyre fails to hold air and has to be pumped up every few miles the motorist's position is not an enviable one. Some automobilists have got over the difficulty in fitting up devices on their cars by means of which the motor is made to operate the tyre inflater. In a recent issue our contemporary, *La France Automobile*, described an ingenious automatic tyre-inflating arrangement known as the "Girip," in which the burnt gases of the petrol engine are employed in inflating the tyres. Referring to the accompanying illustration, it will be seen that the apparatus consists of three main parts, as follows:—A valve fitting A about the size of an ordinary sparking plug, which is made of pure nickel and screwed into the wall of one of the cylinders; a "purifier" B consisting of a reservoir the size of a grease cup, which is fastened to the dashboard of the car; and a small diameter helical steel tube for connecting the valve fitting to the purifier. To the top of the purifier is fitted a pressure gauge E, and near the top of the same may be

attached at D a long rubber hose for connection to the different tyres.

The operation of the apparatus will be readily understood. After a tyre has been repaired and is to be inflated, the ends of the long rubber hose are fastened to the tyre valve and the purifier respectively. The motor is then put into operation, and as soon as an explosion occurs in the cylinder the automatic valve in the nickel valve fitting A opens and allows some of the burnt gases to pass through this valve and the helical steel tube to the purifier, and from there to the tyre. The products of combustion from the cylinder contain a certain amount of moisture, and this is condensed in the steel tube, the water collecting at the bottom of the purifier, from which it may be drawn off through a cock C.

In inflating the tyres the motorist need only watch the

pressure gauge on the purifier and shut off the connection with the cylinder when the proper pressure has been reached. It is said that by means of the apparatus only about two minutes are occupied in inflating a 920 by 120 tyre.

DEVELOPMENTS IN LONDON.

CONVENIENTLY situated in the Tottenham Court Road, London, W.C., the new premises of Milnes-Daimler, Ltd., demonstrate the strong position which is being obtained by the motor-car industry in this country. The show-rooms have capacity for half-a-dozen large cars, while the whole of the upper floors are devoted to the commercial side of the concern. In the basement are store-rooms, where spare parts of the Mercedes cars are kept, a system of numbering being adopted to ensure an order of arrangement that should prove a considerable factor in the satisfaction of clients. A large stock of tyres is also kept. Passing from the block of buildings facing the Tottenham Court Road, Mr. H. G. Burford, the managing director, recently conducted us through the petrol stores, where 200 gallons can be accommodated. A gap at the rear of the premises separates the show-room from the works, and materially assists the excellent lighting arrangements of both divisions of the buildings.

In the works is a 5-ton lift, communicating with six floors, and having an entry direct from Alfred Place in the rear. On the ground floor we noticed one of the great delivery vans utilised by Messrs. Nelson and Sons, while in the street outside was a G.W.R. van, of which several have been ordered from the firm. Opening thus into a quiet thoroughfare, the works have a facility of access that is exceptional in the centre of London. On upper floors are machine rooms, the assembling department and capacity for storage. Mr. Burford has systematised the place on modern lines, and the way in which every tool is entered when taken from stock by the workmen is characteristic of the thoroughness with which all details have been thought out. The tools and machinery are all of the latest type, and with its electric lighting, its adequate sanitary arrangements, the hot water system of heating and general equipment, the works should convince every motorist of the evident intention of Messrs. Milnes-Daimler, Ltd., to be in the forefront of motor repairing firms. As is well known, they are supplying motor-buses to several southern places, the latest being Brighton, while last week similar orders were executed for South Africa. Corporation overhead motor trolleys are also a speciality with the firm, and several of their types of these vehicles are in active service in the North of England.

In North Street, Grantham, Mr. J. Smith has opened a garage and provided a repair shop for automobiles.

At the Tiverton Quarter Sessions the Chairman said the town was wise in not making bye-laws for the local modification of the Act.

MANY complaints have been appearing in the Scottish journals as to the speed at which motor-cars are driven in Princes Street, Edinburgh.

MESSRS. WM. BEARDMORE AND COMPANY, LIMITED, Parkhead, Glasgow, have lately put down a plant for the production of pressed steel motor-car frames.

THE War Office has consented to a grant of £250 to members of the Motor Volunteer Corps for exceptional wear and tear of cars used in last year's Army manoeuvres.

MESSRS. J. S. CRITCHLEY, LIMITED, is the title of a company registered with a capital of £3,000 to adopt an agreement with Mr. J. S. Critchley, and to carry on the business of makers of motor-cars.

MR. J. W. FRINGS, of 183, Stoke Road, Gosport, has a stock of both Carless's and Pratt's petrol, and charges accumulators. He has storage accommodation for a few cars, and undertakes repairs thereto.

HERE AND THERE.

THE Viscountess Galway has ordered a 20-h.p. Talbot car from the British Automobile Commercial Syndicate, Limited.

THE Taff Vale Railway Company have decided to place six motor coaches on their branch lines. Tenders are to be invited forthwith.

THE City of London Electric Lighting Co., Limited, is now undertaking the charging of batteries at its power station at Love Lane, Sumner Street, Southwark, S.E.

ON Monday next, the 18th inst., at a meeting of the Western Section of the Scottish Automobile Club, Mr. C. Jarrott is to read a paper on "Reminiscences of the Road."

THE Samson Leather Treads and Tyre Company, Limited, has been registered with a capital of £8,000 to carry on the business of manufacturers of and dealers in pneumatic and other tyres.

THE accompanying illustration depicts an amusing scene in the pantomime now being presented at the London Hippodrome.

COLONEL CROMPTON, R.E., is preparing a paper on "British Progress in Mechanical Road Traction"—one of a series now being arranged to be read before Chambers of Commerce and suitable institutions in the British Colonies. The Board of Trade and other Government departments are rendering assistance in the matter.

MESSRS. H. E. HALL AND COMPANY, of Tonbridge, have been appointed sole agents for Clincher-Michelin tyres throughout Kent and twenty miles round Tunbridge Wells, which extends into Sussex. They hold a large stock of these tyres, and can give immediate delivery of the standard sizes. Messrs. Hall are also about to open a new motor garage in Tunbridge Wells.

MR. J. K. BRYDGES, borough electrical engineer at Eastbourne, has asked the Town Council to relieve him of the duties of manager of the motor-bus service. Mr. John Allcock is now performing these duties, and the Town Council proposes to seek the advice of Mr. Brydges, himself a motorist, whenever technical questions arise.

THE Kidderminster Motor and Cycle Company, Limited, has

The length to which the absurdities are carried out is well depicted by the enormous spanners and other articles lying around. Needless to say, motor-cars have reached such a state of reliability that such incidents do not now occur on the roadside. Nor does the Gamage's light car depicted need the tools, for it has "come in" and "gone off" at each performance without a hitch or breakdown of any kind.

MESSRS. JAMES OGILVIE, LIMITED, has been registered with a capital of £1,500, to acquire the business carried on by Mr. J. Ogilvie, 128, Renfield Street, Glasgow, and to carry on the business of factors and manufacturers of motors and accessories.

AT the last meeting of the directors of the Notts and Midland Merchants and Traders' Association, attention was called to the number of accidents arising through drivers of drays, waggons, and heavy conveyances not keeping on their proper side of the road, particularly at night.

MESSRS. J. E. HUTTON, LIMITED, have obtained the sole agency for Brooke cars for London and district. In addition to the three-cylinder standard type and light type cars, they are putting on the market for 1904 a four-cylinder 20-h.p. car. This car will probably be exhibited at the Automobile Exhibition at the Agricultural Hall in March.

been registered with a capital of £5,000 to carry on the business of motor-car proprietors, carriers of passengers and goods, manufacturers of and dealers in motor-cars, etc. The first directors are Messrs. H. M. McAllister, T. W. Bowen, R. S. Brinton, D. S. Bowen, R. Woodward, A. S. Thursfield, and W. P. Yates, and the registered office is at Mill-street, Kidderminster.

To meet the demand for a popular-priced two-seated motor-car, Phoenix Motors, Limited, are introducing a new vehicle, which we have had an opportunity of inspecting. It is fitted with a 6-h.p. De Dion engine, three speeds forward and reverse, and cardan shaft transmission. The car, which is to be known as the "Phœbus," appears to be well built, the differential gear on the rear axle being of the spur wheel type, while the road wheels are shod with $3\frac{1}{2}$ inch tyres.

FROM Messrs. Butterworth and Company comes "The Law Relating to Motor Cars," a handbook to the Motor Car Acts and the Local Government Board Regulations, by Mr. H. Langford Lewis and Mr. W. Haldane Porter. This has a brief introduction by the Hon. Rupert Guinness, who expresses the view that the volume will prove useful to motorists, an opinion to which we readily assent. A useful index and a series of explanatory notes add to the value of the work.

MR. BROOK SHAW, of the Crescent Motor Works, Sheffield, has issued a neat calendar for the year.

A MELBOURNE firm is stated to be building two 16-h.p. motor-coaches for a public service in Tasmania.

THE Blackpool Motor Garage is shortly to be removed from Rugby Road to larger and more central premises in Abingdon Street, Blackpool.

It is reported that the Great Western Railway Company, are considering the advisability of introducing a motor service on the Oswestry branch of their system.

THE Birmingham Aluminium Castings Company, Limited, have appointed Messrs. J. L. Carty and Company, 219, St. Vincent Street, Glasgow, their sole agents for Scotland for the sale of aluminium castings.

THE latest Brooke 12-h.p. light car, of which an illustration is given herewith, departs in a radical manner from the design of the standard Brooke car, in that the engine, which gives nearly 15-h.p., follows popular practice, occupying a position at right angles to the wheel axles and that the transmission is by means of spur wheels and bevel gear to the countershaft, and thence by chains to the driving wheels. The engine has mechanically-operated inlet valves, both inlet and exhaust valves being on the same side of the cylinders and equal in diameter. The Eisemann

high-tension magneto ignition is fitted. The frame is straight, and of pressed steel, and a Mercedes type radiator is provided. The car weighs only 14 cwt., yet the wheel base is 7 ft. 3 in. and the gauge 4 ft. 8½ in. This, combined with the exceptionally long springs, makes the running of the car over rough roads exceedingly smooth. The engine runs silently, and it is claimed to be so flexible that the car can be driven anywhere on the top speed.

THE West Midland Motor and Cycle Company, Limited, has been registered with a capital of £3,000 to adopt an agreement to acquire the business carried on at New Road, Stourbridge, as the West Midland Cycle Company, and to carry on the business of manufacturers of and dealers in motor-cars, etc.

FROM Messrs. Elliott Brothers, of Lewisham, S.E., we have received a pamphlet illustrating and describing a new combined speed indicator and odometer for use on motor-cars they have lately introduced. It is known as the "Motormeter," and indicates on the large dial the speed from five to fifty miles per hour at any moment; separate dials register the mileage on each trip and the aggregate covered by the car.

FROM the Packard Motor-car Company, of Detroit, Mich., U.S.A., we have received a catalogue of the Packard 1904 voiture legere, a vehicle which outwardly closely resembles the European type of automobile. It is equipped with a four-cylinder motor developing 22-h.p. Three speeds forward and a reverse are provided. It is claimed that the elasticity of the engine is such that the vehicle may be driven on the top direct speed at any rate from four to forty miles per hour.

THE Motor Castings Company are supplying numbers for motor-cars.

THIRTY-TWO entries are said to have been received for the races on Ormond-Daytona Beach, Florida, which are to be held at the end of the present month.

MESSRS. D. STEWART AND COMPANY (1902), Limited, London Road Iron Works, Glasgow, are taking up the construction of heavy steam wagons.

THE authorities of Schleswig-Holstein have issued a regulation that no one under the age of twenty is to be permitted to drive motor-cars in that district of Germany.

A MOTORIST has been summoned by the Wimbledon and Putney Commons Conservators for driving a motor-car along a footpath traversing a portion of Putney Heath. He was fined 10s. and costs.

A PRELIMINARY meeting of those interested in the Dublin and Swords Motor-Car Company, Limited, has been held at the Courthouse, Swords, with Mr. J. P. Cuffe, secretary, in attendance. Tenders for the cars will be invited as soon as the company has been registered.

ALTHOUGH not definitely decided, it is the general impression in automobile circles in the United States that the Automobile Club of America will hold its eliminating trials on May 1, so that the successful candidates for competition in the race would have six weeks in which to cross the ocean and make preparations for the contest. The eliminating trials will probably be held on a track, owing to the difficulty of securing speed privileges on the highway.

THE Imre Engineering Company, Limited, are bringing out an improved exhaust silencer based on entirely new and scientific principles. The device, which is the invention of Mr. Nathan Sharpe, who has recently joined the Imre Company, has been fitted to a 12-h.p. Boyer, and alongside it is fixed the silencer originally provided. Two valves control the exhaust, which can be directed into either silencer, so that the relative merits of the two forms can readily be judged.

FROM Messrs. John Child Meredith, Limited, we have received a sample of a new cam for wipe contact breakers they have just introduced; it is made of a new material which is claimed to possess many advantages over fibre, being non-absorbent and frictionless. The disadvantage with fibre is that a film of metal will form upon it, a drawback not found in the new material. The new cam is being made for various contact breakers, including one for converting the De Dion contact breaker to wipe pattern.

MESSRS. DENNIS BROTHERS, LIMITED, have sent us a few particulars of their 1904 models, chief among which will be a 20-h.p. four-cylinder car, the engine of which will be provided with mechanically-actuated inlet valves. The new details include a special type of worm gearing at the rear axle instead of bevel gear, new change speed gear box with the secondary shaft not revolving, and with direct drive on the top speed; encased brake drums; road wheels with double artillery spokes, pressed steel frame with the bottom encased, and phaeton bodies with side entrance.

MESSRS. PETO AND RADFORD have recently introduced a new terminal cap and connection for use on accumulators to prevent corrosion of the terminals. The cap consists of a thimble-shaped bonnet of vulcanite, through which the end of a short piece of flexible wire is passed. This end is solidly attached to a brass block, which is pressed into the end of the cap. This is drilled and tapped with a suitable thread to engage a screw stud provided on the end of the metal pillar to which the positive and negative plates of the accumulator respectively are attached. In order to ensure an acid-tight joint to the cell, rubber blocks are placed around the terminals where they pass through the top of the accumulator case. The end of the short flexible wire is provided with a pipe terminal, to which the ends of the low tension wire are attached in the ordinary way.

CORRESPONDENCE.

BENZ v. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had such great success with a 3½-h.p. Benz car, and have rendered various assistance to users of these cars when on the road, that I thought perhaps some of my experiences might be of service to those of your correspondents who have trouble with their cars of similar make. I have had mine nearly four years, have travelled many thousands of miles, taken extensive trips, such as London to Blackpool, but have experienced none of the troubles of which your correspondents complain, my worst trouble having been to repair a band that got broken.

Soon after I purchased my car (new), I found that the cam operating the exhaust was not of the best form to obtain the maximum power, so I fitted a brass band around it in such a manner as to slightly broaden the sides of the exhaust cam, so that the valve opened a little earlier and remained open longer than hitherto. I also found the trouble spoken of by "Amateur" with the second band dragging on the fast pulley when it was supposed to be on the loose pulley only. This I rectified by crossing the band in the opposite direction, doing away entirely with the troublesome handle-starting arrangement, and extending the length of the engine shaft pulley by turning and fitting thereto a piece of hard wood.

I was once ascending a hill on second gear when I came across a stranded Benz car; I stopped to see if I could render assistance, when its owner informed me that as he was going on the crypto when the engine suddenly stopped, and that he could only with great difficulty turn the flywheel round, he presumed the piston had jammed in the cylinder. Investigation, however, proved that although his first band was turned to off, it was in reality a little on. This was found to be caused by an accumulation of grease and dirt upon the loose pulley, which prevented the band from sliding on to it; it would not mount the ridge of dirt that was collected. After suggesting to clean all this filth off with petrol, matters were at once remedied, for it was the first band dragging on its fast pulley that was the cause of the engine stopping when the crypto was at work.

"Amateur's" suggestion of using the second band slightly on in addition to the first when descending hills is not a wise one. In his careful handling it may be all very well, but it is apt to end one of those days in a broken band. If the hill is only an ordinary one, the foot brake with first band on and throttle shut should be sufficient; if the hill, however, be too steep, then it is wiser to descend on the second band.

"Amateur" is, I venture to say, mistaken when he asserts that after he refilled his crypto box or drum with lubricant this prevented the front of car lifting up when the crypto was put on. This lifting up is caused by the crypto being put on too quickly, for the moment the band encircling the crypto drum stops its revolving, tremendous power is suddenly applied, thus giving such a pull on the top of the chain that the front of the car is lifted before the vehicle itself has time to move forward. If this band be lubricated, it permits of a little slipping as it is being clamped, and the front will not then lift up. Oil applied to this answers but for a short space of time, after which it only adds to the trouble—blacklead is the most lasting. Personally I adjust my crypto lever so that it will not quite pull right up, and always keep the lever tight by pressing it upwards with the left hand, and never use it fixed.

Some cars I have seen make a great deal of clattering noise; to obviate this, users should see that the bearing at crank is kept sufficiently tight. This is easily done, but at the other end of the crank rod and inside the piston there is another bearing which is capable of making a great noise when even a little slack, and unless the mode of tightening this were explained to the user, he might fumble about for a long time before finding out how to set to work, for, strange to say, the book of instructions issued with these cars is silent upon this point. When the piston is out to its furthest, insert the band so as to grip the bearing inside the cylinder, and move the flywheel slightly, when any shake will at once be apparent, and should there be any, matters should be remedied. On the under side of this bearing a nut will be seen; this acts the part of a lock nut, and must be slackened a little. On the upper part what may appear to be another nut will be seen; this, however, is the head of a screw bolt. When this bolt is screwed down further, it pulls the wedge-shaped bearing upwards, thus bringing the two parts of the bearing closer together. When sufficiently tight, still keep the spanner on the bolt to prevent its moving, and at the same time tighten the under lock nut.

As regards the mechanical inlet valve, this is more trouble than it is worth. See that the inlet valve spindle is always quite free, and there will be no trouble on that score. The chief difficulty with respect to want of power may be looked for in connection with exhaust valve arrangements; those who are troubled in this way should ascertain if there is any play between the cam and the little wheel that surmounts it. If there is, this must be taken up. A simple and ready means of doing so is to give the rod connecting the wheel arrangement with the valve a smart blow with the hammer (do not be afraid, it will not break) so as to bend it a little until the play between the wheel and the lowest part of the cam is not more than one-sixteenth of an inch. I have known instances where after repeated grinding of the exhaust valve, the stem has been rendered so long that it touches the lifter before

it can seat itself. If a little be ground off the end of this stem matters will be righted.

If users will make sure that their valves are free, properly ground, are capable of seating themselves, and that the exhaust opens in proper time, there is no occasion to resort to plates fixed inside of cylinder or to boring out for larger valves, as suggested by Mr. Brydges. If everything is in proper order the small Benz car will travel along practically without noise, will do fair rises on top gear, and the user can rely on getting back without a hitch when once he starts on a journey.

In the case of my car, I made sides extending from the dashboard, and from these sides secured doors to the body of the car; thus I have practically two lockers, each of which will hold a Pratt's motor-spirit can set on its side, and on top of this locker I mount a cylindrical petrol container. In practice, however, I generally use these lockers for holding odds and ends. From the top edge of this locker a waterproof apron hooks up around the occupants of front seat, and with a detachable hood and a portmanteau on the back seat, one has a comfortable car with which two people can take a trip to (say) Edinburgh and back without fear of spending the night in the open air, through breakdowns.

I omitted to mention about the springs—these cars are improved by stronger back springs. This I had done soon after buying the car, and from London often take a fifty-mile trip with four people of a total weight of forty stone, and with this load can easily ascend such hills as Barnet Hill on second gear (or band).

From Mr. C. A. Palmer's fear about the lamp at back of car, I would be inclined to think that his car was one of those in which the petrol was contained in the right hand side tank, and water in the left, only. If this be so, he will find it advantageous to connect a small piece of tubing to the air valve on the top of his tank and conduct it forward and to the open air somewhere close under the seat at the side of the car.

The number difficulty with cars containing a foot-board and back seat can be solved as follows:—Hinge the number to the foot-board so that when the board is fastened up (as when not in use) the number plate will hang flat against it, whereas when it is down the hinge enables the number-board to hang in a vertical position. There must, of course, be two eyes, to suit either position, in which to hook the lamp. This is the manner I adopt, and find it all that can be desired. I may add that I have ridden in many cars, but for steady progress, reliability, etc., I still stick to my small Benz car. True, it may not be the fashionable shape just now, but with wired-on solid tyres, and easy springs, it gets "there and back" as soon as the majority of cars.—Yours truly,

J. HAY TAYLOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following account of how I fitted a compression plate to my 3½-h.p. Benz may be of interest to users of this useful little car.

Remove the cylinder head, take the valve away, get a local engineer to make an iron plate, ½ in. thick by 4-3-8 in. diameter, screw a pin into the centre, turn the pin up large enough to fit through the hole in the centre of cylinder head, and pass it through. Cut a plate, 3-8 in. thick, drill three holes, the centre one for the pin, the other two to fit over the studs of the old valve plate; cut a thread on the end of the pin, and screw up with two nuts. An asbestos packing, painted each side with blacklead and oil, should be placed between the new compression plate and the old face of the cylinder head to make a tight gas joint. As a safeguard against the compression plate getting loose, I had a small hole drilled through it and ¼ inch into cylinder head, but not through; a pin is fixed tightly in the hole in the compression plate, but drops easily into the other; this ensures any possibility of the plate turning round.—Yours truly,

THOMAS H. BUSH.

The above illustration is a reproduction from the artistic cover of the German Company's Catalogue. It depicts a German Car in Holland surrounded by a number of interested natives.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the correspondence anent the Benz in the *Journal*, how can one expect a 3½-h.p. car to climb hills, no matter how good condition it may be in? I have, myself, used a 4½-h.p. car for eighteen months, but found it impossible to climb hills at anything like a decent speed; the weight of the car is too much for the h.p. We have a 3½-h.p. Benz in town in first-class condition, but it simply will not climb a hill; the weight is about 9 or 10 cwt. No small improvements in the world will alter it. I have now an 8-h.p. Darracq, which takes three or four of us at a good speed up hills where my small 4½-h.p. used to jib—when I say jib, that is I mean it crawled up at about six miles per hour. The only cure is to get rid of a 3½-h.p. Benz, and buy a light car with a 5 or 6-h.p. engine.—Your truly,

B. WILKINSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the letters on this subject. Two years ago I had a 9-h.p. Benz car, and experienced the difficulty of driving the car at a decent speed up hill. I got over the trouble by making the second and top speed pulleys on the countershaft a larger diameter by having a bent wood ring ½-inch thick fixed to the pulleys. I should like to have had an inch ring fitted, which would have made the pulleys two inches larger, but there was not room. The difference in going up hills was simply marvellous, for where I formerly had to drop down to the second speed I could go up on top, and where I used to drop down to the crypto I could drive on the second. It is not difficult to take out the countershaft and fix on wood bands by drilling and tapping pulleys, using ½ inch Whitworth screws slightly riveted over to prevent unscrewing. With valves well ground in and the spring on induction valve not too strong these 3½-h.p. Benz cars ought to satisfy their owners. If the car has been in use some time, the cylinder has no doubt got very much furred up with deposit from hard water. This can be cleared out with spirits of salts. To do this the water pipes from top and bottom of cylinder should be disconnected, the bottom of cylinder closed with a cork, and the acid in strength of one part acid to four of water poured in at top. When acid is quite destroyed, run out at bottom and proceed again until cylinder is quite clean, then wash out with clean water. Of course when this job is done the engine will run a little quicker on level roads, but that will not do any harm.—Yours truly,

R. F. LANE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Permit me to preface my remarks by stating that I am a motorist of about six years' standing, that I am in no way whatever connected with the motor or tyre trades. The correspondence re Benz car brings to my mind the letters that were written in your *Journal* and one of your contemporaries some five years ago. Then it was my misfortune to possess a 3½-h.p. Benz Ideal, and I shall never forget the anguish of mind and the money that car cost me to replace careless, bad workmanship, and to make good glaring defects to enable me to get any real use out of the car.

I am surprised that anyone, when there are really nice reliable English-built cars on the market, should ever dream of buying what I found to be such an accumulation of worry, annoyance and expense as the Benz Ideal—but there! in my tyro days I actually believed advertisements and agents' fairy tales, only to learn, when too late, that "Things are not what they seem."

It may be of some practical use to inform your correspondents that in order to maintain good compression in my Benz cylinder, I had to have:—All the valve seatings on valves and valve box refaced in the lathe, all the joints of cylinder head refaced, exhaust valve stem shortened by 1-82 in., and always, after grinding in the exhaust valve, I was compelled to file away a little of the end of the valve stem and nut. I may further add that I spent fully £70 on my Benz ere it was any good at all, and after a few months' further partial use—by the way, it either carried me or I and my man pushed it along; very good exercise, but rather tiresome and provocative of much bad language—I joyfully sold it for half what it cost me. I would strongly advise your correspondents to sell as soon as possible and then buy a real motor-car, English built.—Yours truly,

MEDICUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some nine months ago I purchased a second-hand 3½-h.p. Benz car, and since first getting it into good order I have had none but the most trifling hitches with it. It is always ready to go anywhere. It is a particularly comfortable machine to ride in, in spite of solid tyres, and will climb any hill I have met with. Its faults are, slow at hills and excessive consumption of petrol and water. At this time of the year, with heavy roads, I can only get about twenty miles out of a gallon of petrol; the water boils away and makes a lot of steam when running on second speed or crypto. I appear to be getting quite as much power as some other correspondents. The car will take slight inclines on the top speed with three up when the roads are good. It will go anywhere and average as much as a good pony, and, of course, a great deal more in the long run. I have often gone seventy or eighty miles without stopping the engine, and then only stopped because the destination was

reached. The expense and trouble of upkeep is only a fraction of that of keeping a pony and trap.

As to back number, the County Council made no objection to its being placed at back of seat, right hand side, high up; it is conspicuous enough there, and easily and safely lighted by a little bicycle lamp showing white light in front and red behind, placed some nine inches more to the rear, and somewhat lower; this is a cheap and satisfactory arrangement. Apart from danger of lamp low down at back, it would have to be removed when letting down footboard for third passenger. My advice to anyone going in for one of these machines is—do not have one at any price without the crypto gear, or with the early weak back axle. I think anyone not wanting to spend more than about £45, and not caring for speed, will get, as I have done, much pleasure and satisfaction out of a good 3½ Benz.—Yours truly,

A.R.15.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the correspondence on this subject, I for one would not use any other after my experience of pneumatics. I would sooner give up motoring altogether than return to pneumatics. I had my Benz shod with Connolly's; they answered splendidly. My 5-h.p. Wolseley was shod with the same make of solids. My present 7½-h.p. Wolseley is shod with Falconnet solids. I used my 5-h.p. Wolseley in a large county practice during the winter months, over wretched roads. The tyres never caused a moment's anxiety, and my car was so strongly built and so beautifully sprung that I have averaged twenty miles comfortably and only experienced jolting over very rutty and stony rounds.

I am now using my 7½-h.p. Wolseley in a London suburban practice, and find that for every practicable purpose solid tyres answer every requirement. Given a really good reliable car carefully thought out in every detail, well built and beautifully sprung, like the Wolseley, and I am certain that any motorist who is contented with twenty miles an hour would never trouble about pneumatics after trying such a car, fitted with good solid tyres.

In conclusion, I would strongly recommend the makers of the Wolseley Car at the next 1,000 miles reliability trials to endeavour to enter cars that will really require frequent adjustments during the trial, cars incapable of making absolutely non-stop runs, that at the end of the trial will require replacements. Then they may be able to carry off the gold medal by satisfying the experts; but whether their cars will then appeal so forcibly to the man in the street, who actually requires an honestly built, absolutely reliable car, is another matter.—Yours truly,

MEDICUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—First let me state that I am not interested to the extent of one halfpenny in either pneumatic or solid tyres. Secondly, I have, after nine months of expense and worry with Clipper Continentals, discarded pneumatics on the driving wheels of my 7½-h.p. Wolseley in favour of 2½ in. Royal Buffer solids. I believe there is no better pneumatic tyre on the market than the Continental, and mine were of ample section. I say emphatically that I shall never go back to pneumatic tyres on my driving wheels, whatever cars I may own in future. My car is geared to a top speed of about 25 miles per hour, and neither in this nor in climbing power is there the slightest difference. In the tonneau, at high speeds, there is certainly rather more vibration, but not much. It seems to me that we men of moderate means should insist on having cars strong enough and with long enough springs to run on solid tyres, at least on the driving wheels. I am convinced that the cheap and reliable solid tyre will be universally used in a short time on the ordinary car, in which reliability is so absolutely essential, and excessive speed unnecessary.—Yours truly,

SOLID SATISFACTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent, I think he would find Falconnet solid tyres to give him the best result on his back wheels. I have run a 10-h.p. Wolseley for a year now with these tyres behind and have never had the least bother with tyres, axles, or engines. He should not go over 20 m.p.h. with solids behind. If one does, I find it cracks the paint round the spokes of the back and wheels. Up to 20 m.p.h. I don't think you find much difference as to comfort, but if over this speed on bad roads, such as in my district, it becomes rough and pneumatics are best. I have done close on 4,000 miles and the tyres wear well.—Yours truly,

P.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The new Motor Act is vexatious, unnecessary, and detrimental to the advancement of the trade, and is annoying enough to turn waverers from purchasing cars. Living on the high road, I see cars pass constantly to and from West Somerset, Devon, and Cornwall, but I have never heard of a single complaint of fast driving or ungentle-

manly conduct in this district, nor am I aware of one instance of a motor case being before the local magistrates for four years, during which time I have been interested in motoring.

This is more noteworthy when it is known that there are fifteen to twenty privately owned cars in the town of Bridgewater, and during the summer and autumn twenty to thirty, and often many more, touring cars, pass daily.

The local authorities, horse-owners, and country folk have been most kindly disposed towards motorists, but their carriages *only* having been branded with a number (implying danger and recklessness), will, I fear, result in the growing feeling of confidence in this docile, harmless, and faithful vehicle being severely checked, necessitating a deal of motor education being gone over again.

To test the new tail lamp on rear number the writer drove 42 miles on New Year's Eve—roads dry but not dusty—results—lamp and number almost obscured with dust, although there was none apparently on the road. What may we expect in the dry future?—Yours truly,

E. W. HILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think that the restrictions will disappear, if all reasonable care is used by drivers. Quiet compliance with the terms of the Act will do more than any outcry or endeavour to evade its provisions. But it still remains for all motorists to use their best endeavours to see that the parliamentary representatives in each constituency pledge themselves to see justice done in all future legislation, and to use their best endeavours to do away with absurd regulations on the part of local authorities. If all motorists work together with this end in view there will be little to trouble us.—Yours truly,

LAURENCE MILES.

LIGHT CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some little time back I purchased a 9-h.p. Prosper-Lambert car, and, after running the vehicle for some time now, using it every day, I have had absolutely no trouble at all; in fact, for the first 500 miles I never noticed even a misfire, and my only trouble has been with an extra accumulator I got with the car. I must say I have been agreeably surprised with the result, as all my friends were absolutely certain that the car was too cheap to be good. It is an excellent hill climber, and I have done several good runs on the car with five up. I should like to hear from some other owner of a Prosper-Lambert car through the medium of your columns.—Yours truly,

A. L. WALTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Enquirer's" letter in the *Journal* for the 2nd inst., I purchased one of the early Speedwell light cars, and so far it has given me every satisfaction and appears to be a thoroughly well-built and durable little vehicle. When supplied it had the old form of ignition and of course I had some trouble to start the engine at times and the usual misfires. I then had the new system of ignition with trembler coil fitted, and could wish for nothing better.—Yours truly,

"SCORPION."

MOTOR TYRE QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I venture to ask if you, or some of your readers, will give me information on the following matters:—(1) Is the Martin tyre suitable for a belt-driven voiturette, with 5½-h.p. vertical engine running 700 revolutions top speed, to 1,400 on slowest? It is very expensive; is it worth the extra cost? What are its advantages and disadvantages, if any, and with fair wear, averaging say twelve miles an hour, how long is it likely to last in mileage? Do cuts and punctures materially shorten its life, and is it easy to repair?

The recent correspondence about solids *versus* pneumatics has been interesting but absolutely useless as a guide to make a choice. Would solids suit a voiturette as described in Question 1, at any rate on rear wheels, and with Martins on front ones? Would this be a successful combination, and would it make any perceptible difference in case of hill climbing compared with other pneumatics.

What are all the possible causes of "knocking" in a motor-car engine, and how is the noise produced?—Yours truly,

VOITURETTE.

SIX-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of December 12th I noticed the very thing I was looking for, "The Firing of a Six-Cylinder Motor." There is one thing I should like, if you would, made clear—from which end are the cylinders numbered, radiator or dashboard end? I believe the cylinders are numbered from the radiator end in the Napier, and from the dashboard end in the Darracq, but I cannot say which is the general way. Perhaps you

can enlighten me. I think from your explanation that everything else was clear; cylinders 1, 2, 3 (firing in the order named) in the first revolution and cylinders 4, 5, 6 in the second revolution.—Yours truly,

ENQUIRER.

[In answer to "Enquirer," the engine may be numbered either from the dashboard end or from the radiator, according to the setting of the valves. The most usual practice is to number from the radiator. A six-cylinder may also be fired 1, 3, 5 on the first revolution, and 2, 4, 6 on the second. The firing of a Darracq from the radiator is 1, 3, 4, 2, and in the Napier 1, 3, 2, 4.]

A SCHOOL OF AUTOMOBILE ENGINEERING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under separate cover, I have the pleasure to send you a copy of our automobile school prospectus, also outline of the shop course in steam cars. In view of the great interest expressed by the American journals in this school, I take pleasure in giving you a brief synopsis of the work we are undertaking. It is interesting to note that the Young Men's Christian Associations of America, with thousands of branches in every town and city throughout the Republic, is conducting the most extensive and systematic evening school work in the United States, and that Boston has the honour to have the largest school of the kind. We have 119 courses, 100 instructors, lecturers and assistants, and shall register the present year between twelve and fourteen hundred individuals, almost wholly pursuing technical lines. In accordance with our aggressive policy of being of the greatest possible help, we established a school of automobile engineering—the present year, for the benefit of prospective owners, mechanics, draughtsmen, inventors, and those who desire to study the subject as a science. The lecture and draughting courses are given in our own building; the shop and laboratory work and demonstrations being conducted in the great automobile station No. 1—the largest in America.

The work is outlined under several courses, as follows:—(1) A series of lectures by leading engineers, fully illustrated by lantern slides, blue-prints, tracings, and parts of cars. (2) A draughting course of 200 hours, giving complete instruction in the development of the details and assembly of a two-seated petrol car. (3) A shop or laboratory course two evenings per week at the Auto Station, where a course illustrated by blackboard, parts of car, tracings, and blue-prints is given; followed each evening by a demonstration on the floor of the garage, the cars being jacked up and run with the mechanism exposed before small groups of students. On each Saturday evening a "quiz" is held in the Association building by the one who delivered the first lecture, reviewing thoroughly all the work of the week. The students are provided with an outline for the shop courses, and as each subject is taken up and thoroughly discussed, it is checked upon the outline, and the Saturday night "quiz" is based upon this checking.

Written work is required of the students, with rough freehand sketches of the boilers, engines, and other parts of the car, and a written thesis is to be required from the students on the completion of each type of car, which will count towards his graduation from the school. A text-book has been prescribed for definite reading, and students are examined upon this part of the work. Arrangements have also been made for road lessons for those who desire the absolute road experience. Students completing the course in this school, passing the examination and having direct experience on the road, will be given a certificate by the Advisory Board, which consists of the president of our leading automobile club and representatives of the larger manufacturing concerns.

The School of Automobile Engineering is in its scope, we believe, the most extensive of the kind that has ever been established. It certainly is the first school of its kind in America, and is being largely attended. Nearly 200 persons are enrolled, representing the society and moneyed classes and the machinists, and others who wish to become mechanics. Being a new work, we have had no data to guide us, or experience of others, but have been obliged to thresh out the problems as they presented themselves, and thus far we have done so with success. We feel that with the growing development of the automobile industry the school will be sustained, and I am pleased to say that we have received the cordial support of all the manufacturers, dealers, and publications, and the lectures are being printed in some instances in full.—Yours truly,

FRANK P. SPEARE.

Educational Director Young Men's
Christian Association.

Boston, U.S.A., December 2nd, 1903.

DRY BATTERIES AND ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Among the features that I noticed during the course of a brief visit to the recent Salon in Paris was a slight tendency to return to the use of dry primary batteries in place of accumulators. Personally I believe this is a step in the right direction; the cost may be slightly more, but, on the other hand, all the troubles connected with the recharging of accumulators, the internal short circuits, buckled plates, etc., are avoided. To my mind, too, one of the great advantages is, that it is possible to use three, or even four cells in series, and so obtain either about 4½ or 6 volts respectively. I firmly believe that many of the ignition troubles one hears

about are due to the fact that a pressure of 4 volts is insufficient for reliable ignition. Although I am thus inclined to adopt dry batteries in place of accumulators, I should like, if possible, to hear the opinion of any motorist using the same.—Yours truly,

J. F. FOX.

BAND BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A new leather for brakes and clutches was recently brought under my notice, for which special qualities of resistance to friction and the effects of oil was claimed, and of which I have heard good reports. I am not aware if it is yet on the market, but could put "X" in communication with the makers, if he cares to write to me, c.o. *Motor-Car Journal*.—Yours truly,

R. W. B.

THE REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The scarcity of competent repairers and the high-handed methods of some of the firms engaged in the business still remain one of the rocks in the path of the average motorist. In regard to charges, motorists must, of course, remember that if they require repairs in some out-of-the-way place, and these require special facilities and equipment, they can hardly expect to have them made at the same figure as in a large

carburettor. I am sure it would interest many of your readers to know the experience of those who have used the carburettor in question, as the price of paraffin is so much less than petrol that it must be a great advantage from a financial point of view to run a car on the former, providing the result is satisfactory.—Yours truly,

G. MABER.

HOW MANY CYLINDERS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question, "How many cylinders?" is one of the great questions of automobilism, which, like the main questions of politics, are always with us. The new cars for the 1904 season which have so far been announced include several additions to the three-cylinder variety, while engines with six cylinders are making their appearance. Three-cylinder construction undoubtedly represents very good engineering practice: a three-cylinder vertical motor is far better balanced than a two-cylinder one, and it requires a much smaller flywheel. As regards balancing, the three-cylinder is about equal to the horizontal engine having two opposed cylinders. The latter type seems quite a favourite at present for light cars in America, but for heavy cars the total length is necessarily great and the engine somewhat inconvenient to place. The three-cylinder engine is inferior to the four-cylinder in all the good qualities which are sought by multiplying cylinders—viz., mechanical balance, constancy of torque, etc. The difference is slight, however, and as the simplification of one less cylinder is a consideration, it is not unlikely that some of the builders

Miss Jessie Brown, a well-known Singer, on her 10-h.p. Decauville Car

repairing establishment in a centre where there is a continuous run of business. While these conditions justify an advance on the usual rates, there is certainly a limit to the charge which can reasonably be made for any given service, and there is nothing more detestable than taking advantage of the tourist's predicament to fleece him. If automobilists in the same community or members of clubs would inform each other of their experiences with different repair firms, or at least make known through your columns the concerns which can be relied upon not only to do repairs properly, but at a reasonable charge, they would, I am sure, be doing a service to more of your readers than—Yours truly,

L. W. R.

IS THIS OBSTRUCTION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Suppose I was travelling on a motor-car going at ten miles an hour, and an electric tramcar came along, nearly overtaking me. Should I be bound to make way for the car? If I did not, could I be proceeded against for obstruction?—Yours truly,

H. E. F.

EXPERIENCE WITH PARAFFIN CARBURETTOR WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I saw advertised a carburettor for using either petrol or paraffin for driving motor-cars. The makers claim for it that any make of petrol car can be driven with paraffin if fitted with the "Trusty"

of four-cylinder cars will eventually change over to three.* As to the six-cylinder idea, I am inclined to the opinion that the manufacturers who have embodied it in their new models were actuated more by a desire to have some conspicuously exclusive feature in their design than by a view to actual improvement. I do not deny that a six-cylinder engine gives a more steady torque and better balance than one with four cylinders, but the difference must be so infinitesimal as to afford no compensation for the added complication.—Yours truly,

G. F. BARKER.

PETROL.—"Careful" writes:—"Several new brands of petroleum spirit have lately been introduced, notably one by a Bristol firm and one by a concern at Manchester. Will any motorists who may have used either of these kindly oblige with their experience of the same?"

D. H. writes:—"I should esteem it a favour if any of your readers can give me some information through your columns as to 'Spyker Cars'—simplicity, reliability, speed, silence."

AUTOMOBILE EVENING CLASSES.—Mr. Colin Defries, who asks for particulars of evening classes in connection with motor-cars, is recommended to write to the Principal of Battersea Polytechnic, Battersea, S.W.

"L." writes:—"I am about purchasing an Argyll car, and should like to have the experience of any of your readers who may be users of this particular make."

ALUMINIUM FORE-CARRIAGE BODIES.—In reply to C.J.'s request in last week's *Journal*, Messrs. J. Rothschild et Fils, Limited, 45, Horseferry Road, Westminster, S.W., inform us they are able to build the aluminium fore-carriages he requires.

OUR DIRECTORY OF "NUMBERS."

[All rights reserved.]

BELOW we publish the first instalment of our Directory of Numbers, which will be continued in subsequent issues until we have given a comprehensive list of motorists throughout the United Kingdom. The present selection goes no further than the letter N; when we have completed the alphabetical order a second list will be prepared commencing again with owners whose names begin with A. Those who have not yet sent their names and numbers are invited to do so without further delay.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED, M. P. H.	RESULT.
Kingston-on-Thames ...	W. J. King, London	19½	£1.
Dublin	F. Batchelor, Dublin	—	40s., etc.
Marylebone...	A. McCormack, Regent St., S.W.	—	£4.
Marlborough Street	T. Wilson, Gloucester Mews, S.W.	25	40s., etc.
Bow St., W.C.	Major Sellar, Bury St., St. James', S.W.	—	Dismissed.

At Bow Street (London), Major Sellar, of the 9th Lancers, appeared to a summons charging him with driving a motor-car to the common danger. Mr. Firth defended. Police-constable 174 E said that on December 23rd he saw the defendant driving along Shaftesbury Avenue. On reaching High Street he went to the wrong side of the refuge and nearly knocked down two ladies whom the officer was assisting across the road. He denied that he went on the wrong side of the refuge, and said he did not see any ladies crossing. Sir Albert Rutzen said this was one of those cases where the danger was more technical than real. He did not impute blame to anyone, but there was some doubt as to whether the defendant did drive on the wrong side of the refuge, and the summons would be dismissed.

THE SALE OF A PICK CAR.

In the high Court of Justice, before Mr. Justice Ridley, the Pick Motor Company, of Stamford, have sued Major Charles Leslie, of Slinning, Sussex, to recover £208, the price of a motor-car and accessories. According to plaintiffs' case Major Leslie called at their works at Stamford in October, 1902, and was shown some cars. He selected a 6-h.p. voiturette, and asked whether it was a good hill climber. The manager replied that the car could climb hills very well, but of course this depended on the skill of the driver. Shortly afterwards Major Leslie sent his son to Stamford, and he was driven in the car to Sussex. Major Leslie declined to pay for the car on the ground that it could not climb hills. Ultimately his Lordship gave judgment for the plaintiffs on the claim and counterclaim for the amount mentioned, holding that the machine answered the purposes for which it was required.

THE NEW MOTOR CAR ACT.

HARRY SMITH, of Coliseum Terrace, Regent's Park, N.W., was charged before Mr. Marsham, at Bow Street Police Court, on Tuesday afternoon, with being drunk while in charge of a motor-car and with not producing his licence as a driver when asked to do so by a police-constable. Police-constable 18 E stated that at eight o'clock that morning he saw Smith in charge of a motor-car in Bedford Street, Strand. The car was only going at a moderate pace, but it was on the wrong side of the road, and as it was wobbling from side to side witness called on Smith to stop. He did so, and as he was drunk witness took him into custody. At the police station Inspector Preston asked Smith for his licence, and he said he had left it at home. Mr. Marsham pointed out to Smith that under the new Act he had incurred a penalty by not producing his licence when requested to do so by a police officer. Smith replied that he was not aware of that regulation. He was very tired but not drunk. Mr. Marsham.—I shall deal with you under the 1st Sub-section of the new Act. That makes it an offence to drive recklessly or negligently, or at a speed or in a manner dangerous to the public. It is a serious offence, and you must pay a fine of £10. You are really liable to a fine of £20. I shall only fine you 5s. for not producing your licence, but future offenders will not get off so lightly.

HILLS AND THEIR GRADIENTS.

The Collier Tyre Company, Limited, have issued a neat calendar for 1904, a central feature of which is a reproduction of one of their well-known motor-tyres as used on the Prince of Wales's electric carriage. Accompanying comes a pocket log-book; this, in addition to the useful information contained in such a volume, gives lists of towns with names of petrol agents, etc., the text of the Motor Car Act, a chart showing the weekly mileage run, and some useful tips for motorists.

As an example of the utility of the book the following extract, giving a list of steep hills with their gradients, is a good illustration:—

Aston	on High Wycombe Road	1 in 21

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JANUARY 23, 1904.

[No 255.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE President of the Local Government Board has appointed a departmental committee to inquire and report with regard to any regulations which should be made under Section 6 of the Locomotives on Highways Act, 1896, and Section 12 of the Motor Car Act, 1903, as respects any class of vehicle for the purpose of increasing the maximum weights of three tons and four tons mentioned in Section 1 of the former Act, and with regard to any conditions as to the use and construction of the vehicles which should be made by any such regulations. This committee was promised a short time ago, and it is to be hoped that its deliberations will result in the adoption of regulations that, if they do not directly encourage the industry, will not hinder its advance.

The Personnel of the Committee.

THE chairman of the Committee will be the Right Hon. Henry Hobhouse, M.P. for East Somerset, and the vice-chairman of the Somerset County Council. He is also the author of a work on local government and the duties of county councillors. The other members of the Committee are Sir W. Arrol, M.P. for a Scotch constituency, whose name is familiar in connection with the construction of the Forth and Tay bridges, and who is also a director of the Mo-Car Syndicate, Limited; Mr. H. C. Monro, C.B., who has been assistant secretary of the Local Government Board since 1897; Mr. H. G. Harris, of the Council of the Institution of Mechanical Engineers, and Mr. G. F. Deacon, of the Council of the Institution of Civil Engineers. The latter has been associated with many important water supply undertakings, and is also the author of several works on scientific subjects. Mr. R. J. Simpson, of the Local Government Board, will act as secretary to the Committee whose deliberations will be followed with keen interest by commercial men as well as by motorists. It is certainly a very representative selection.

A "Sample" Car and the Inland Revenue.

MR. WALTER CROWDUS, residing at Barkston Gardens Hotel, Kensington, has been summoned at the West London Police Court, at the instance of the Commissioners of Inland Revenue, for keeping a carriage without a licence. Mr. H. Pierron, who represented the defendant, raised the point that the carriage in question, which was, in fact, an electric motor-car, designed by himself, and termed the "Crowdus motor-car," was not liable to duty because it was only a sample car. The defendant brought it over from America for the sole purpose of selling the patent connected with it. A syndicate took the car for eight months, with the option of purchasing the patent, and that syndicate

did take out a licence for the time that they used it. At the end of the eight months the syndicate decided not to purchase, but meanwhile the defendant had incurred certain expenses at the hotel, and he accordingly arranged with the landlord of the hotel that the latter should hold the car as security for his hotel bill. Since then the only occasions on which Mr. Crowdus had "used" the car was for the purposes of showing it for sale. He (Mr. Pierron) submitted two points:—First, that the car was not "used" in the ordinary acceptance of the word, but was in the same category as those carriages kept for show by Long Acre coach builders; and secondly, that if anyone was the keeper or user of the car, it was the landlord of the hotel. The magistrate (Mr. Rose) observed that the case presented interesting and peculiar features. From the very straightforward account given by the defendant it appeared that the car was really being kept and used not by the defendant, but by the landlord, to whom it was either mortgaged by some deed or who possessed the landlord's ordinary right of lien over it. The case was too full of doubt for decision against the defendant, and the summons would therefore be dismissed. Would that country justices were equally tolerant where motorists are concerned.

Who's for Germany.

A SPECIAL Committee has been appointed by the German Automobile Club to deal with the question of finding accommodation for the many thousands of visitors who are expected to journey to Germany on the occasion of the Gordon Bennett race. According to one report, all available rooms at the hotels at Homburg have already been booked, while those in the small towns in the neighbourhood are rapidly being taken up. It is stated that the A.C.G.B.I. has already booked a hundred bedrooms in one of the large hotels in Frankfurt-am-Main. There can be no question that early application should be made by all who intend to go to see the race, otherwise they will probably find difficulty in securing rooms, except at exorbitant prices. Already it is announced that after May 1st the hotel keepers will put up their prices for any rooms disengaged. We understand that Herr Christ, of 20, Oderweg, Frankfurt-am-Main, will answer any enquiries on the subject on behalf of the above-mentioned Committee. Meanwhile the Hotel Proprietors' Syndicate have issued a circular as to rates, compared with which the charges made in Ireland last year appear modest and almost insignificant.

Numbers for Everybody.

ARE "numbers" so popular that they will be suggested for vehicles of every description? In a case just heard at the Bromley (Kent) County Court, in which a collision between two vans was the cause of the trouble, Judge Emden pointed out that the evidence proved that motor-cars were not the only things that should be numbered. Later, His Honour again emphasised the need for such conveyances being numbered, remarking that it was only one of thousands of cases. It would be a strange turn of fortune if owners of horse-drawn vehicles,

B

having advocated the labelling of motor-cars, should have to be numbered as well.

Through Lovely Surrey.

SATURDAY being almost the first fine day this year, we took advantage of the sunshine and frozen roads for an afternoon run through Surrey by way of Putney, Kingston, Ripley, Merrow Downs, Shere, and Gomshall, to Abinger Hatch, where a halt was made for tea. The air was keen and exhilarating, the roads in fine condition, and the sensation of being once more on the car after an interval of more than a fortnight was most enjoyable. The homeward trend was *via* Dorking, Leatherhead, Epsom and Wimbledon. Darkness came on suddenly, and lamps had to be lit before five o'clock, although lighting-up time was not till 5.18. Numerous covered vans belonging to firms like Messrs. Derry and Toms, John Barker, the London Parcel Delivery Company, etc., had no tail lights, and their presence all over the road was both inconvenient and dangerous.

where our ancestors sadly took their pleasures and their meals. The present age is all for everything open and light and bright, and men and women are no longer ashamed of being seen in one another's company in a public hall. For this consummation we are indebted to our American cousins.

Colonial Clubs.

LAST week we referred to the South African and New Zealand Automobile Clubs, and expressed the view that ere long all the important colonies would have their motor-car organisations. Confirmation of such a view has not been delayed, for the last mail brings an account of the opening run of the Automobile Club of New South Wales, which is published on another page. Already the owners of thirty cars have become members, and there is every likelihood of a successful career. Some amusement is also being caused among the Cornstalks by a local association in Auckland, N.Z., taking unto itself the title of "The Automobile Club of Australasia." The first combined motor-car and motor-cycle run held in Melbourne

The First Automobile Meet in Victoria. The party at Mordialloc.

To Brighton and Back.

ON Sunday, again, the sun shone still more gloriously; the frost continuing, the roads were even in finer condition, and the journey to Brighton without incident was much enjoyed. Very few people were met on the roads, and the man in blue was conspicuous by his absence, but on the return journey all the world and his wife, with their families, were out, and policemen in numbers and in pairs were suspiciously plentiful. Cars, to our astonishment, were few, and the "Old Ship" garage was not half full. Very few motorists indeed came in to lunch, and the beautiful sea front was empty of all forms of traffic, although the sun was shining resplendently. At the top of Reigate at least half a dozen cars were stationary by the side of the road, and about twenty more were met or passed on the way to London, one old "six" groaning piteously as it slowly ascended Wimbledon Hill, with its two passengers and a boy. At the "Old Ship," by the way, an adjoining house has been acquired and a sumptuous lounge is being fitted up.

Lounges.

TALKING of lounges reminds us that at the Royal Bath Hotel, Bournemouth, where the writer and family spent a pleasant Christmas with the car, a beautiful lounge was opened at this charming hotel on Christmas Eve. An hotel, in our opinion, without a lounge is an abomination and should be avoided. The old rule of the ladies to the drawing room and the men to the smoke room is as obsolete as the little musty boxes

was successfully carried out on December 6th, the weather being most pleasant for motoring. The run was to Mordialloc, where about sixty motorists sat down to dinner. Amongst those who drove down were:—Dr. Merrill (Winton), Dr. W. Atkinson Wood (Benz), Dr. Officer (Oldsmobile), Messrs. T. Rand (Deauville), J. Wallace (Benz), O. Schumaker (De Dion), W. H. Lewis (De Dion), C. B. Kellow (Humberette), H. Stevens (Knowles), W. Warden (Oldsmobile), J. M'Kenzie (Oldsmobile); the motorcyclists formed a big contingent, about thirty being present.

Chief Constables and the Car.

THE conversion of chief constables to automobilism is progressing rapidly, and they will soon be among the most ardent motorists in the country. During the late visit of the King and Queen to Chatsworth, Captain H. C. Holland, the Chief Constable of Derbyshire, accompanied the Royal motorists throughout their excursions on his 9-h.p. Beaufort phaeton, which he has driven since October last. On the occasion of the Royal visit to Hardwick, it kept up with the high-powered cars carrying the King and his party despite the heavy state of the roads owing to the wet weather, and Captain Holland has expressed his satisfaction to the Beaufort Co. A similar testimonial to automobilism has been forwarded to the Hozier Co. by Major Bower, C.M.G., a Yorkshire Chief Constable, who has just completed his first 500 miles on his 10-h.p. Argyll car, which has far exceeded his expectations. He recognises it as "a really good traveller"—a fact which should make him careful should he ever venture southwards. But probably Mr. Govan, who saw

the Hampshire police methods during the Reliability Trials, has already warned him on that point.

The Registrations.

FOLLOWING the information given last week as to the number of automobiles registered, we received official intimation from the London County Council, too late for earlier publication, that, up to the 6th inst., 1,907 motor-cars and 772 motor-cycles had been registered within the Metropolitan area, while 3,200 licenses to drive had been issued. From the county of Middlesex come official statistics showing that of the 639 automobiles registered there up to the 18th inst., 352 were cars and 287 motor-cycles. No less than 1,002 licences to drive had been issued, of which 813 were to drive cars, the remainder being applicable to motor-cycles only. At Hastings, up to the same date, thirty-two cars and twenty-five motor-cycles had been registered. One hundred and sixty nine licences have been granted by the Chief Constable of Portsmouth, who had also registered 71 motor-cars and 73 motor-cycles. Other belated English returns are those from South Shields and Bradford, where the registrations of automobiles have numbered twelve and 104 respectively. Up to the 13th inst. twelve motor-cars and thirty-two motor-cycles had been registered in the city of York, where fifty-seven licences to drive had also been issued. In Cardiganshire six motor-cars and ten motor-cycles have been registered. Lately received returns from Scotland show that in Govan four motor-cycles have been registered and five drivers' licenses issued. In the county of Wigtown eight automobiles and nine licences have been reported. Eight cars and nine motor-cycles have been registered in county Carlow, three automobiles in Monaghan, and eight in county Mayo, where only four licences to drive have been issued. It is therefore clear that the number of registered automobiles is between 16,000 and 17,000, a number which should be swelled into the twenty thousands when the fine weather comes again.

New Clubs.

THE latest automobile organisation is the Peterborough and District Motor Club, with Messrs. F. T. Highton, of Peterborough, and P. Mays, of Bourne as secretaries. At Hartlepool, too, a local automobile club has been formed, with Mr. G. Jones as president and Mr. C. C. Brown as hon. secretary. The formation of two such clubs in one week is significant of the keenness with which motorists are regarding the new position brought about by the Motor Car Act. The strength that comes from such union should do something to prevent any unnecessary harshness on the part of local authorities.

Heavy Traffic.

IN our last issue reference was made to the value of automobiles in helping towards the solution of many social problems, and publicity was given to the insistence with which Mr. D. Mackenzie pleaded the cause of good roads at a meeting of the Surveyors' Institute. Mr. Mackenzie, who is the managing director of the Motor Transport Company, said that he had found in practice that motor vehicles were able to transport goods more cheaply than the railway even, in certain cases, where private sidings were provided, because the railways were eaten up by terminable charges, and consequently their rates for short distances were out of all proportion. He regards the paying load for motor transport to be 5½ tons. Therefore the factory owner must bear in mind that if his manufactures are such that he cannot send out such loads, it will pay him better to do his cartage by horses. It must, however, be borne in mind that not only so far as trades, loads, and bulk of manufacture are concerned do we have to consider each case on its merits, but also on the nature of the roads leading to the suggested sites. Unfortunately in some districts motor transport is still met by active hostility on the part of the local authorities. In Hornsey, for instance, the police have informed

Mr. Mackenzie that they have instructions from the local authorities to persecute mechanical transport in every possible way.

Alleged Police Perjury.

POLICE evidence has often been so unsatisfactory that the fact that an application for perjury against a police-constable has been made in a London police court will occasion no surprise. In the Bow Street Police Court, on Monday, Mr. Staplee Firth applied to Mr. Marsham for a summons for perjury against the police-constable who recently gave evidence against Major Sellar when he was accused of driving a motor-car to the common danger in Shaftesbury Avenue. The case was dismissed by Sir A. De Rutzen. Mr. Marsham said he would consider whether a summons should be granted, and let him know his decision in due course. The fact that such applications may be made should prove a deterrent to some of the exaggerations in which policemen too frequently indulge.

Dr. R. Von Marx, the Oberbürgermeister of Homburg, who is taking an active part in the preparations for the 1904 Gordon Bennett Race. (Allgemeine Automobil Zeitung.)

The Coming of the Napier.

IN May, 1900, that triumph of organisation the first 1,000-mile Trial was held, and the success of that event was the 9-h.p. Napier, the first car designed and built by Mr. D. M. Napier. Since then the merits of "England's Premier Car," have never been allowed to be forgotten, nor has the designer permitted the Napier car to be other than amongst the most up-to-date of vehicles. With the large demand naturally came the necessity for larger works; we must confess, however, that we were not prepared for the busy scene which greeted our eyes when we visited the new works at Acton Vale a few days ago. The grounds cover more than seven acres, and the buildings, with splendid roof lights, occupy nearly two acres. The tools used are all of the most modern description, and between 600 and 700 men are engaged, the orders being so numerous that night and day "shifts" have to be employed. In the works motors were seen about in numbers, and between twenty and thirty chassis were in course of erection. The first batch of the new six-cylinder cars was amongst the number. The firm of Messrs. D. M. Napier and Sons is an old one, and their previous business was chiefly, we understand, supplying

the plant used for minting purposes. This included the most delicate of balancing machines, etc., and no doubt this fact accounts for the fine work for which the firm is famous. At all events the sight of the busy hive of industry was a gladsome one, and it is satisfactory to know that such fine motor-cars can be turned out in this old country of ours.

Activity of the Provincial Clubs.

PROVINCIAL clubs have had a busy and, on the whole, a useful time during the last few days. At Sheffield local automobilists have had the advantage of a lecture on electrical ignition as applied to the automobile by the general manager of the Corporation Electric Light Department, who is a motorist himself and was able to give a practical turn to his discourse. Nottingham automobilists have been indulging in a ball, the first motorists' event of that kind that has taken place in this country. Clubmen at Wolverhampton have been dining, with the head constable of the borough as one of the company. At this gathering Mr. Rhodes, the hon. secretary, reported that the value of the automobiles owned by members was £14,420, a substantial sum in view of the fact that the club has only been in existence three years. The Halifax Automobile Club has also held a social gathering of members within the last few days, and has issued to members a useful set of notes on the Motor Car Act, which should enable them to avoid pitfalls. Elsewhere we record the second stage in the formation of a club in the city of York, and also the annual meeting of the County organisation. In Scotland the society for the Western Section has had a visit from Mr. Jarrott. Altogether it will be seen that the second session of the winter season has begun well with the provincial clubs, whose virility is an earnest of the good influence they are likely to exert.

Discouraging Industry.

THE discouragement of British industry assumes various forms—magistrates, councillors, and other people who ought to know better, seem to agree on the idea of placing difficulties in the way of useful progress. At the last meeting of the Hove Town Council some councillors took exception to an arrangement which had been suggested that the Southern Steam Transport Company should be allowed to take water for their steam wagon at a guinea a year. A doctor-councillor said that the steam wagon was an intolerable nuisance, and should be discouraged in every way. This attitude, so reminiscent of the early days of the last century, is strangely out of keeping with the progress of the age.

Licensing Motor-Vehicles.

AT Bristol, too, a case of discouragement has nearly occurred. This was happily frustrated by the legal acumen of Mr. Staplee Firth, who appeared for the defence, and secured a dismissal. The Western Road Carrying Company were summoned for using a locomotive which had not been licensed by the County Council for Somerset on the highway at Long Ashton on December 8th. A constable stated that he saw a driver of the defendant company driving a locomotive with a trailer. The engine was emitting smoke and steam. Witness spoke to him about it, and he said that he tried to stop the smoke and steam as much as he could, but if he did not blow it off sometimes they could not get along very fast. Witness asked him if he had a licence, and the defendant answered that he did not think it was necessary. Hence the summons. For the defence it was contended that the locomotive was built under sub-section 1 of section 1 of the Act of 1896. It was admitted that the vehicle was a light locomotive and not a traction engine. In point of weight they came under that section of the Act. The other side in the case would have to satisfy the Court that this vehicle was deliberately constructed so as to emit smoke or visible vapour from the funnel, and that no attempt was made to prevent the emission

thereof. The vehicle was not a carriage under the meaning of the Customs and Inland Revenue Act of 1888, and a tax was not necessary. Under this exemption from the Act of 1898, under which the proceedings were taken, was pleaded. The Act of 1898 only referred to vehicles of more than three tons, or four with a trailer. The Bench ultimately came to the conclusion that the machine in question was a light locomotive constructed according to the Act. Seeing that the company has eighteen similar vehicles the importance of this decision can be easily gauged.

Views of a City Father.

BEFORE the London Traffic Commission Alderman Sir H. E. Knight, who has sat as a City magistrate for thirty years and had unique opportunities of studying the problem, has been giving his views. The main causes of obstruction in the streets were, he said, concentration of traffic at centres, vans and carts standing for loading and unloading in front of houses; omnibuses, empty cabs, heavy goods traffic, and tramways. The remedy for vans and carts was the substitution of motor traction for horse traction, which would reduce the existing obstruction by from 25 to 33 per cent. No dray, lorry, or van should exceed 7 ft. in width and teams should be forbidden, motor power being used for coal vans and brewers' drays. All omnibuses should also be motor driven, and concentration at stopping places should be avoided. Where possible omnibuses going in opposite directions should use parallel streets.

The Automobile Club Show.

AS the date of Cordingley's Ninth International Automobile Exhibition draws near the interest of the trade and public alike increases. Already more than 250 exhibitors have taken space, and the success of the display is fully assured. Now comes the intimation that once again the Automobile Club's name will be associated with the Exhibition. At the meeting of the Committee of the A.C.G.B.I. on the 18th inst. it was resolved—we quote from the official record in the minutes—"That the Club do give its patronage to the ninth Automobile Exhibition, to be held at the Royal Agricultural Hall, Islington, from Saturday, March 19th, 1904, until Saturday, March 26th inclusive, for the year 1904." This decision will be welcomed by motorists as a recognition of the good work done for the movement in the preceding eight exhibitions, and as setting the seal of official authority on a thoroughly representative show, which will eclipse in general interest any previous display held in this country.

THE discussion on "The Cost, Upkeep and Care of a Motor-Car," to be introduced at the Western Section of the Scottish Automobile Club by Messrs. J. Hunter Steen and John Adam, has been postponed to February 29th.

AT the moment of going to press we learn that the Automobile Components, Limited, have withdrawn the charge against Mr. E. H. Jones, of Canonbury. The company have agreed to pay £375 in discharge of the defendant's claim against them, and Mr. Jones, on the other hand, has agreed to allow the goods which were now in possession of the police to be returned to the company. Mr. Bros, the magistrate, in allowing the case to be withdrawn, was understood to say that the defendant appeared to have acted under the belief that he had a title to the property.

THE business of the Blieriot lamps for Great Britain and the colonies, carried on at 54, Long Acre, W.C., has been bought by the English firm of C. Weldhen, makers of carriage lamps and coach benders and platers, of 36, Seymour Place, Marble Arch, W., who will carry it on under the style of Weldhen and Blieriot. Messrs. Frank Ward and William Ward, the directors of C. Weldhen, will continue to devote their time to the new undertaking, while Mr. Charles Weldhen will manage the works. The services of Mr. Norbert Chereau, who has brought the Blieriot lamps so prominently before the British public during the last twelve months, have also been retained.

THE "RYDE" PETROL CAR.

WE are this week able to give an outline illustration of a 14-h.p. petrol car which is being built by a new concern—Ryde Motors, Limited, of Ealing, W. The object of the designer, Mr. F. W. E. Ryde, has been to build a quiet, comfortable car of comparatively light weight, with ample power, having a motor balanced as far as possible, with a regular turning moment or series of impulses and great flexibility; the gearing to have ample tooth surface and arranged for medium speeds with a view to practically all the running being on top speed. The frame is of pressed channel steel stiffened with cross members and gusset plates, the ends being shaped to form horns. No underframe is employed, the engine and gear box being supported from the main frame. The motive power is supplied by a vertical three cylinder engine. The cylinders are 4 in. diameter by 5 in. stroke. The inlet and exhaust valves are mechanically operated and interchangeable, arranged on either side of the cylinders and set so that the crank shaft receives an impulse every two-thirds of a revolution. The engine is rated at 14-h.p. but is stated to develop 15.8-h.p. The crankshaft runs in four long bronze bearings. The cam shafts are enclosed in the crankcase, which is bolted to the main frame and so arranged that

are made of hardened steel, are all $1\frac{1}{4}$ inch wide on the face; they are arranged on short shafts running in long bronze bearings. The gears are enclosed in a dustproof oil-containing aluminium case, which is provided with a large inspection door. From the gear box to the rear live axle the power is conveyed by a cardan universally-jointed shaft and bevel gear. The propeller shaft is of strong construction, having universal joints with large wearing surfaces. The brakes are of the metal to metal double-acting external type. The brake shoes are easily adjusted, interchangeable, and are supported by special non-rattling brackets. The body is suspended on long flat springs hung on low shackles, the rear springs being outside the frame. The front axle is of the dropped variety with open forged ends supporting the steering pivots at top and bottom; the top ends, which take the weight, have ball bearings, with a view to easy steering. The rear axle runs on plain phosphor-bronze bearings and ball thrusts. The road wheels are of the artillery type with steel hubs and flanges, all being 32 in. diameter shod with $3\frac{1}{2}$ in. tyres. The standard speeds of the car are seven, fourteen and twenty-one miles per hour at normal engine speed, the maximum, with the motor accelerated, being thirty-two miles. With this ratio of change speed gearing practically all the driving is, the makers state, on the top speed, this conducing to silence and great ease of running. The

Outline Elevation of "Ryde" Petrol Car.

the bottom portion can be removed, and, if necessary, the big ends of the connecting rod disconnected and pistons removed without disturbing the crankshaft or main bearings. The engine, which is fitted with a special automatic carburettor and is governed on the throttle, runs at a normal speed of 750 revolutions per min.; it can, however, be accelerated to 1,200, or retarded to 180 revolutions. The carburettor and pump, &c., are all mounted on the arms of the crankcase, so that, in case of repair, the engine and its accessories can be lifted out of the car intact without the breaking of a number of joints. The lubrication of the engine is effected by a sight-feed positive oil pump on the dash board. The ordinary high tension system of electric ignition is adopted, the sparking plugs being over the inlet valves. The commutator, which is on the dashboard, is of the internal wipe contact type, it is chain driven, and is so arranged that the contact may be instantly removed for inspection or cleaning without disturbing the timing gear. A combined radiator and tank fills up the front opening in the bonnet. It consists of two flat tanks connected by compound ribbed pipes. A fan is stated to be unnecessary, so is not employed, a rapid circulation being maintained by a centrifugal friction-driven pump arranged out of the way of road obstacles.

Coming now to the transmission, three speeds forward and a reverse with a direct drive on the top speed are provided. An aluminium leather-covered cone clutch transmits the power to the gear box. It is so arranged as to be easily adjusted, and, if necessary, completely removed on its short shaft without disturbing any other part. The change-gear wheels, which

engine will allow of much higher gears, if desired, necessitating, however, more frequent changing of the speeds.

MR. ALEX KENEALY has retired from the "Daily Express" and is now associated with Messrs. Harmsworth.

A NEW garage has been opened in Worcester Street, Gloucester, by Mr. A. C. Stretton. Stocks of petrol, oils, etc., will be kept.

SIR ANDREW NOBLE'S motor-car collided with a tramcar in Newcastle the other day. The latter was uninjured, the former lost its front wheel in consequence.

THE contest committee of the Automobile Club of America has fixed March 15 and 16 as the dates for the second annual test of commercial motor vehicles.

FOR the second time within a few months Judge Emden, the judge at the Lambeth County Court, has declared how useful in his legal work has been the experience of traffic he has gained as a motorist.

SIR GEORGE NEWNES has taken a great interest in the class for drivers at the Battersea Polytechnic, and, as the result of a generous offer on his part, the institution has been able to acquire a large car for the purpose of giving driving lessons.

MR. JAS. MILNE, of Inverurie, N.B., has brought out an arrangement for illuminating the rear number plate at night. It consists of a combined rectangular lamp and number plate which, when lighted, shows the numbers in white on a black ground. The red rear light required by law is also shown.

CONTINENTAL NOTES.

THE first house dinner of the 1904 season of the German Automobile Club was held in Berlin on the 14th inst., among those present being Prince Frederic Charles of Hohenlohe and the Duke de Ratibor. During the evening Herr Levin gave an address on the state of the automobile pastime and industry in Germany, and referred at length to the forthcoming Gordon Bennett race. In this connection he stated that most careful arrangements were being made for the safe carrying through of the race, and that a series of precautionary measures were being prepared and which would be strictly enforced. As in Ireland, Westrumite is to be laid at the corners on the route to lay the dust. Work has already been commenced at Saalburg on the widening of the road near the starting point of the race.

ALTHOUGH nothing definite has yet been settled regarding the course for the German eliminating trials, it is reported that the three German De Dietrich cars will be driven by Messrs. Mathis, Bugatti, and De Beukelaer; the two Benz cars by Messrs. Barbaroux and Ricordi; the Dürkopp car by Dr.

MORE than ever does the automobile form a predominating feature of the season in the South of France. Just now Nice, Mentone, and Cannes are crowded with visitors from every country in Europe, and powerful cars are flying about in all directions. The Grand Duke Nicolas Michailovitch of Russia is one of the recent arrivals, bringing with him a 60-h.p. Mors. The Promenade des Anglais, at Nice, which has been closed to motor traffic for some time, has, at the instance of the Nice A.C., been provisionally re-opened to motor-cars, with the condition that a moderate pace shall be maintained, in order that no dust may be raised or to prevent the public making any reasonable complaint. The Nice Club has just had posted in all the local garages a notice drawing attention to the concession of the local authorities and asking all drivers to conform fully to the regulations which have been drawn up.

AN Odessa correspondent reports that the automobile movement is making steady progress in that city. At present there are about thirty motor-cars and cycles in the district, mainly of French origin, the favourite types being Peugeot, Darracq and

In a recent issue reference was made to the fact that a 20-h.p. Stoecker car was driven from Stettin, North Germany, to Paris, a distance of 1,362 kilometres, conveying two members of the firm of Messrs. Stoecker Brothers to the Salon, the journey being done, in easy stages, in six days. We now learn that the return journey was safely made in five days. The above illustration shows the vehicle which performed this long journey, with Herr Bernhard Stoecker, jun., at the wheel.

Lehwess; and the Protos car by Herr Fuchs. The entry fee has been fixed at £150 for each firm, irrespective of the number of cars entered, the limit, however, being three vehicles.

THE question of the hour in France is as to where the French eliminating trials shall be held. The Circuit des Argennes, in the French Ardennes, is first favourite, but the consent of the Government has yet to be obtained. During the past week quite a number of well-known motorists, including M. Rene de Knyff and several A.C.F. officials, have been over the course, which starts from Flize, and returns to the same spot *via* Chemery, Beaumont, Carrefour de Stenay, Buzancy, Carrefour de Vouziers, Le Chesne, Carrefour de Poix, a total distance of about 130 kiloms., through sparsely populated country.

It is now announced that Messrs. Rene de Knyff, Henri Farman, and Teste will drive the three Panhard cars and Baron de Forest one of the De Dietrich cars in the French eliminating trials.

Decauville. Recently, however, a few cars of German, Belgian and American make have made their appearance.

THE death occurred last week of M. Henri Lachambre, at whose works at Vaugirard, one of the suburbs of Paris, the balloons of practically all the modern airships in France have been constructed, including those of Santos Dumont and the late Baron Severo and M. de Bradsky.

THE court at Chateaudun has concluded the hearing of a case arising out of the Paris-Madrid race. In the course of that ill-fated event the car occupied by Mr. Leslie Porter and Mr. William Nixon, of Belfast, broke down in taking a turning at the level crossing at Bonneval. The petrol reservoir of the car caught fire, and Nixon, who was acting as mechanic, was caught and pinned down under the vehicle and burned to death. Mr. Porter, who was charged with homicide, caused by recklessness, was sentenced to pay a fine of 200fr., the Berenger law to apply, which virtually means that no blame attached to him.

THE Automobile Club of Cannes proposes to organise a touring competition to be held from the 13th to the 29th March next. It is also arranging for a tour to Turin in connection with the exhibition which is to be held there next month. The distance is about 190 miles.

THE Austrian-Daimler Motor Company, of Vienna, have lately completed and despatched to London some petrol motor-wagons to the order of the British War Office.

THE latest competition which "Le Velo" proposes to hold is one intended for motor-carriage body builders, the object being to improve the design of bodies for touring cars.

ONE of the novelties shown by Messrs. Michelin, the makers of pneumatic tyres, at the Paris *Salon*, was the tyre lever illustrated herewith, which has been designed to overcome the two difficulties which have hitherto presented themselves—fitting the security bolts in position, and putting the air valve in its place without damaging it. The two prongs of the fork are made of suitable lengths and shapes, according to the size of tyre, so as

to enable the security bolt to pass through the prongs. The method of using the fork to replace the bolt in the rim is shown in the left illustration, and requires no description. The fork will also be found useful in replacing the air valve, which is generally a matter of some difficulty. The handle of the tool is tapered off so that it can be used as an ordinary lever in removing the outer cover.

THE third International Automobile Exhibition in Brussels opens in the Palais du Cinquentaime on Saturday, the 23rd inst., and promises to be a brilliant success, there being about 150 exhibitors. In connection with the *Salon*, which will remain open until February 4th, a number of competitions are being organized, notably an international one devoted to anti-skidding devices.

A NEW Swiss company to take up the construction of petrol motor vehicles for commercial purposes is the Automobil-Fabrik Orion Gesellschaft, of Zurich, whose cars are about to be introduced into England by Mr. W. C. Moss, of London. While testing a single-cylinder car on Friday, last week, Mr. Moss, with M. Zurcher, the designer, and a workman passed the foot of the Netliberg mountain. An attempt was made to see how far the car could be driven up the hill, not in the least expecting to reach the top (873 metres) owing to the bad condition of the roads from the snow and frost. However, the car with its load managed it, and arrived safely at the station on top of the mountain. In view of the fact that the roads were narrow and covered with frozen snow, through which the driver had often to pick a way to get a grip for the driving wheels, and at sharp corners to prevent skidding over the side and reaching the bottom again by the quickest possible road, the performance is certainly a creditable one for the new vehicle. At certain parts of the ascent the party had to take it in turns to handle the pick and shovel borrowed from one of the stations to dig a way for the car. The gradients were very steep all the way up,

and at some of the corners exceedingly difficult and bad. No trouble was, however, experienced beyond the slipping on the snow. We understand that, in addition petrol motor-wagons, the Orion are at work on a motor-bus intended for service in London.

The "Orion" Petrol Lorry ascending the Netliberg Mountain.

THE Italian Minister of Public Works has appointed a Commission to consider what modifications are necessary in the regulations for the circulation of automobiles, and the means to be taken for the establishment of motor-car services in districts where railway facilities are lacking. The Presidents of the Italian Automobile Club and the Italian Touring Club will sit on the Commission.

IN connection with the international exhibition to be held in Vienna from the 16th April to the 31st May next, under the auspices of the Austrian Automobile Club, two competitions are being organised, one for passenger cars using alcohol or benzine as fuel, and one for motor-omnibuses and delivery wagons.

The "Orion" Petrol Lorry at the summit of the Netliberg.

THE Dutch Mechanics' Union has just been formed at Grafenhausen, Holland. Among its objects is to give diplomas to motor-car drivers who successfully pass the Union's examination.

THE Lake District Road Traffic Company, Limited, has been registered with a capital of £25,000. to carry on the business of carriers and hirers of motor-cars and wagons. The first directors are Messrs. W. P. J. Fawcus, R. Rig, F. Fowkes, R. Bounass, T. Taylor, J. S. Harker, A. Jackson, and J. Cowperthwaite.

THE MOTOR CAR ACT.

In our next issue we propose to publish answers to several queries received with regard to the operation of the Act, questions of licensing, etc. Readers who experience any difficulties in interpreting the provisions of the new legislation are invited to communicate without delay.

The Works Committee of the Edmonton District Council has instructed its engineer to specify alleged dangerous places within its area, and recommends that the limit of speed for motor-cars within the district be restricted to ten miles per hour. We would urge all local motorists to unite in an attempt to prevent such an order being made.

The different attitudes with which various local authorities are viewing the operation of the Motor Car Act are interesting, ranging from the intolerance of Winchester to the common sense shown by the Derbyshire County Council. The Winchester Rural District Council have passed a resolution protesting strongly against any additional charges being imposed on the public for the purpose of carrying out the Motor Car Act, and declaring that motorists should provide the whole of the

Returns have been received from all local authorities within the jurisdiction of the Lancashire County Council, pointing out where signposts are, in his judgment, necessary. These have been considered by the county surveyor, and, after careful deliberation by his committee, have been referred back for further consideration, with a view to their reduction in number, and consequent saving of expense, which appeared likely to be no less than £2,000.

The Middlesbrough Corporation has decided to ask its Hackney Carriage Committee to reconsider the regulations it had drawn up in connection with the Motor Car Act, with a view to the prohibition of automobiles from certain streets in the town.

The Surrey County Council have written to the district councils within their area stating that the Committee charged with the duties under the new Motor Car Act have recommended the Council not to advise any speed limit upon motor-cars, at all events for the present, upon any of the Surrey roads, having decided "to rely upon the provisions of Section 1 of the Act of 1903, which made the driving of motor-cars recklessly or negligently, or at a speed in any manner dangerous to the public, punishable with heavy penalties." Further, at present no steps are to be taken to prohibit the use of motor-cars on any

Schmidt on the Packard-Gray Wolf, on which he lately covered a mile in 46 2-5 sec.

Netman on the light Stevens-Duryea, which has done a mile in 57 1-5 sec.

RECORD BREAKING ON THE ORMOND-DAYTONA BEACH, FLORIDA.

[Motor Age.]

necessary money for the purpose. Seeing that the Act was adopted by the Legislature in opposition to the wishes of more motorists than was generally supposed, the idea that they should pay for the ordinary services rendered by the local authorities is absurd. Signposts for travellers have always been a common charge, and so must be the warning boards to motorists. If those responsible for the roads had done their duty in the past, such signals would have been unnecessary.

In pleasant contrast to such a suggestion is the decision of the Derbyshire County Council, which, upon the motion of Colonel Cavendish, has decided to rely wholly upon Section 1 of the Act with regard to fast driving. In the discussion Mr. Waddington, of Glossop, said his local council had decided to apply for the ten mile limit, but the County Council proved wiser than the Glossop local body and would have none of such restrictions. Mr. F. Strutt then expressed the hope that the Council would see to the erection of danger posts and signals, pointing out that Derbyshire was the centre of England, and travellers from one large place to another had most frequently to pass through the county. It was explained that this matter was already in the hands of a sub-committee, and that the subject would have careful consideration.

Surrey highways. The letter adds that the matters of dangerous corners, cross roads, and the erection of sign posts are under consideration.

On Sunday morning the Cobham representatives of the Surrey police, under the direction of Inspector Marks, of Hersham, commenced their operations against automobilists under the new Act. The energetic inspector took up a position from which it was alleged that it was possible to time a car from the moment it passed a certain point on the Fairmile. Mr. S. F. Edge, who happened to be coming along on a 6-h.p. De Dion, immediately stopped on seeing a car drawn up at the side of the road, with a police guard standing round, and after enquiring innocently enough what the trouble was, did his best to convince the timekeeper that it was hardly possible to time a car when he had to look round a bend in the road to see the Fairmile at the commencement of the measured stretch! It is said three or four cars were stopped and names and addresses taken. There is a strong feeling amongst the leading residents that to pay 3½d. in the £1 for police who appear to have little else to do now but parade on the main road, is somewhat of a waste of money. It is clear that if the local police en masse are out motor chasing on Saturdays and Sundays, there can be no protection for the villagers at night.

THE "SHARPE" SILENCER.

IN our last issue we briefly referred to a new silencer which has been devised by Mr. N. Sharpe, and which is being put on the market by the Imré Engineering Company, Limited. We have since had an opportunity of inspecting the device and seeing it in operation on a 12-h.p. Boyer car, on which it is fitted side by side with the original silencer. By means of valves the exhaust can be made to pass into either, and we are bound to say, from the demonstration afforded us, that the exhaust emerges from the Sharpe arrangement with but only a tithe of the pressure compared with the other; and while in the latter it is extremely noisy, little or no noise can be heard in the new form.

The arrangement of the new silencer will be seen from the accompanying illustrations, Fig. 1 of which gives a longitudinal sectional view of the apparatus, while Fig. 2 is a cross section through A B. The object of the designer has been to produce a silencer in which the gases shall have every facility for expansion without meeting with obstructive baffle plates. For cars from 8 to 12-h.p. the silencer takes the form of a cylinder 21 in. long by 6 in. diameter. Within the cylinder, which is made of seamless brass, are three hollow aluminium bulbs fitting closely together by means of flanged faces, and held to one another by the bolt seen in the illustration (the latter shows the three bulbs in one piece, but they are being made singly as above described). The exhaust pipe terminates in a nozzle, in which are 20 5-16 in.

Fig. 1.—Longitudinal Section of Silencer.

holes, inside the first bulb. The latter fit tightly in the cylinder, but at the point of contact with the latter short narrow grooves are cut in the outer surface of the bulbs, these forming the passages between the cylinder and bulbs shown in black in the cross section (Fig. 2) and indicated in dotted lines in Fig. 1.

Coming now to the action of the device, the exhaust emerges from the side holes in the nozzle into the first bulb, where they undergo a first expansion; to be again contracted ere passing into bulb No. 2. A further expansion here takes place followed by contraction and then expansion in bulb No. 3. From the latter the gases emerge through the holes into the space between the bulbs and the cylinder and then pass through the channels formed in the outer surface of the bulbs. This process of expansion and contraction alternates until the gases pass into the atmosphere and through the holes in the nozzle end of the cylinder with little or no pressure and without the usual obnoxious odour and noise. Not the least useful feature of the apparatus is the facility with which it can be taken apart for cleaning purposes. After disconnecting the exhaust pipe the two ends of the cylinder can be removed by unscrewing the nut on the end of the bolt removed, when the nozzle and three bulbs can readily be withdrawn. We may add that the new silencer is also being made in sizes suitable for motor-cycles.

SIR THOS. FRAKE has recently purchased a 35-h.p. Panhard car from the British Automobile Commercial Syndicate, Limited.

THE EFFICIENCY OF THE FAN.

WHEN the fan as an auxiliary to the water cooling apparatus of petrol motor-cars was first made use of many criticisms were levelled at it. The first charge was that it was unnecessary as well as inefficient. Next, it was asserted that it was unmechanical, inasmuch as it imposed extra labour upon an already overworked part—the engine. With the latter charge we shall not deal, further than to remark that in this case, as in so many others, theory is apparently not borne out by practice. If the regular cooling apparatus does not perform its function properly, and the engine becomes overheated in consequence, a remedy of some sort must be provided, and while a fan may be unmechanical in principle, it is undoubtedly, if it performs the duty allotted to it, a highly important adjunct and vastly better than no remedy at all.

The thing to determine, therefore, is whether fans are necessary with some cars. It is self-evident that no maker would fit one unless he felt apprehension that the ordinary method of cooling the water, be it by cellular or tubular devices, would on occasions fail to keep the water down to the desired temperature. In all probability he knows that such is the case. What is of most importance, therefore, is whether it successfully accomplishes the task set it. There is some data touching on this point available, sufficient to almost conclusively establish the contention of the advocates of fans, authenticated cases having

Fig. 2.—Cross Section of Silencer through A B.

been instanced where heating of the water in the cooler proved, upon investigation, to be due to the stoppage of the fan in consequence of some disarrangement of its operating gear. The cooling apparatus performed its other functions in a normal manner. The water was conveyed to the water jacket of the engine, thence returned and cooled so far as this could be done without the aid of the fan. But the latter having stopped, the water did not cool, and the engine heated and gave trouble. It is to be regretted, remarks the "Horseless Age," that a more exhaustive examination of the subject—through observations of a number of fan-equipped cars—is not possible. Perhaps in time it will come about, in which case probability will give way to certainty. But our present knowledge is sufficient to prevent any further talk of the dismissal of the fan as "unmechanical."

MR. JOHN MALCOLM has opened a garage for automobiles at Bilsden, Cockburnspath.

THE Century Engineering Company have acquired the entire business and works of the Century Engineering and Motor Company, Limited, at Cumberland Park, Willesden Junction, W. Mr. R. W. Leader will manage the concern.

THE Roots 5-h.p. oil car, which so successfully carried the heavy mails between Newcastle and Sunderland at Christmas, has been engaged nightly for four months in the postal service in the north. Thus far, it has travelled 14,400 miles with satisfactory results to the authorities, a severe test of reliability.

THE ELECTRICAL FITTINGS OF CARS.

By R. W. BUTTEMER.

IN the early days of automobilism—which some of us yet look back to with a feeling of regret—the question, when we went out, as to what would happen before we returned, was a perennial source of interest. But now, if anything happens (and we seldom admit it does) it is, in nine cases out of ten, due to tyres, ignition, or police; and if the latter be barred, the odds are on the ignition. This, in fact, including under that head all the electrical appliances necessary to it, is more unfamiliar, in the absence of special training, to the average motorist than the mechanical details of a car, which must be my apology for the following rather elementary collection of notes and hints on the subject.

As ignition by accumulators and coil is far more universally in use than that by magneto generators, I will confine my remarks for the present to this form. And first as regards accumulators. These are at best somewhat fragile and tender articles, and it is really surprising how satisfactory they are under very far from ideal conditions of work and attention. The majority are of the pasted-plate type, and vibration combined with irregular charging is apt to lead to the separation of the active material from the plates. As long as this has room to settle, as powder, at the bottom, little harm is caused, and it would be advantageous if more clear space were left below the bottom edges of the plates for this purpose; but if this powder, or larger fragments, succeed in making contact between two plates, short-circuiting and consequent running down is the result.

The only remedy is a thorough cleaning out, fresh acid, and recharging, which generally involves removal of the plates, though sometimes in celluloid-cased ones it can be managed without.

The acid should always be kept above the level of the top edges of the plates; neglect of this, more frequent in those cells in which a gelatinous electrolyte is used, leads to sulphating. In stationary accumulators the loss of liquid is chiefly due to evaporation, so water alone is needed to make up the level; but on cars, the chief loss is due to splashing, and fresh acid is required. This may be made up by mixing one part of sulphuric acid—pure “brimstone” acid, *i.e.*, acid made from sulphur, and not from iron pyrites, should alone be used—with about four parts of water. The specific gravity of the mixture should be 1.18. Convenient hydrometers for testing this, enclosed in a pipette, can be got from most instrument makers for about four shillings.

If an accumulator is left long uncharged, it is sure to deteriorate; and as it runs down gradually by leakage, it should, even if not used, be recharged every month or six weeks, as a rule. If a cell charges all right, showing the necessary 2.2 to 2.5 volts per cell, but soon runs down, it is either due to internal short-circuiting unless external ditto exists, which should not occur, *i.e.*, generally to loose paste falling between the plates, or else, and perhaps this is more common, to sulphating. The outward and visible sign of this, when the plates can be seen, is a white scale on them, which enormously reduces their capacity. There is no cure but, in mild cases, frequent and repeated charging, or, in bad ones, removal and scraping of the plates; but the addition of ten grains of washing soda to the pint of acid solution is to some extent a preventive of it.

It is perhaps superfluous to remark that the terminals and top of cell should be plentifully rubbed with vaseline to prevent corrosion and creeping of acid, and where the cells are in a metal case, as often on cycles, blotting-paper soaked in washing-soda solution and subsequently dried is a useful packing round them.

Coils now are of such good quality, as a rule, that there is little to say regarding them. A large proportion are furnished with one or other form of quick-break trembler, and sometimes these, especially the B. and M. type, give some trouble in adjustment. In the case of this latter, it is generally due to the black

soft iron armature being a little too far from the end of the ore, which is only adjustable by careful bending; while in one case that came under my notice it was due to some of the numerous little rivets uniting the parts of the trembler not being riveted up tightly. Of course one should be assured that the adjustment of the trembler screw fails utterly to mend matters before setting to work on the trembler. The wiring of cars is generally better carried out than it used to be, but too often the wires are carried in positions where oil is thrown on them from the mechanism. This should always be avoided, or some additional protection given them, as oil ruins the rubber covering. Perhaps the neatest is vulcanised fibre tube, which can be obtained in suitable sizes, and allows of some bending by the aid of moist heat.

As to plugs, their name is legion, and whereas most of them are good, those that have a large extent of surface between the two sparking points, obtained by a cavity or ridge in the insulator, such as the Oleo and Pognon, are particularly useful where an engine persistently soots its plugs.

A most useful electrical fitting is a four-volt lamp with a yard or so of flexible connection, which, besides serving to some extent the purpose of a voltmeter, is most handy for inspection purposes at night. Such a lamp uses about four-fifths of an ampere, and an ordinary thirty-ampere hour accumulator would therefore light it for about thirty-seven hours. Under these circumstances, and considering the propensity of the common tail-lamp to go out or leave its bracket for a journey on its own account, it may be considered whether an electric tail-lamp of this kind may not be worth adopting under the new regulations, and one might hint that a suitable, not too high, resistance, capable of being switched in or out of circuit, might be added to cut the light down to the very lowest limit that a decent respect for the law permits.

THE Austrian Automobile Club has appointed a committee to arrange for a club tour from Vienna to Homburg on the occasion of the Gordon Bennett race.

MESSRS. THORPE AND SALTER, 235, High Holborn, W.C., and St. George's Works, Eden Grove, Holloway, N., have equipped themselves for the repair of motor-cars, etc.

GOODALL'S AUTOMOBILE AGENCY has been appointed sole agent for London and the Home Counties for the “Achilles” cars of Messrs. B. Thompson and Co., of Frome, Somerset. The cars are being built in various sizes, including 6, 8, 9, and 12 h.p., every part, with exception of the ignition equipment and tyres, being of the firm's own construction.

MOTORISTS are always interested in any new departures which will tend to lessen their pneumatic tyre bills, and therefore some particulars of the products of the Glasgow Motor Tyre Company may not be out of place. This concern claim that they have got over the difficulty of punctures with Cassell's non-puncturable band, in conjunction with a special corded fabric with which they line the tyre; they go so far as to guarantee tyres provided with these to be as reliable as solids, and claim that the band and lining does not in any way affect the resiliency and comfort which are the distinguishing benefits of pneumatic tyres. They have sent us two sample sections, one of the fabric of a beaded-edge tyre showing that the tyre is rebuilt from its foundation; the other is a section of the tyre built up in the Glasgow Company's special way. First there is a thick tread of para-rubber; next to this is a whitish insertion; this is asbestos, preventing the inner tube heating; then comes the canvas lining of the tyre, after which is the non-puncturable fibre-band vulcanised in position; next and last is the inside lining of the special-corded fabric, which is said to stand a pressure of 300 lbs. to the square inch. This lining is brought round the beaded edges of the tyre, thus preventing, it is claimed, side bursts, in addition to strengthening the bead. We have not so far tested the band and lining ourselves, but from various sources we have evidence of it having proved successful in practice.

HERE AND THERE.

THE Local Government Board have advised the Oswald-twistle Urban Council that under their present powers they cannot purchase motor omnibuses for passenger traffic.

MESSRS. G. T. RICHES AND CO., of 4, Gray's Inn Road, W.C., are introducing the useful little fitting for petrol motors illustrated herewith. It is a combination compression release tap and paraffin valve, the top being cup-shaped to enable a small quantity of paraffin or petrol to be injected into the cylinder to unstick the piston rings. The tap is provided with the De Dion thread.

THE Board of Agriculture inform us that the Ordnance Survey have recently issued a folding pocket map of Saffron Walden and the surrounding district. This is one of their useful series of maps of certain areas in England and Wales on the scale of two miles to one inch, to which appreciative reference has already been made in these columns.

THE date of the first meeting of the Motor Van and Wagon Users' Association has been provisionally fixed for Wednesday, the 24th prox.

MESSRS. R. REYNOLD JACKSON AND COMPANY, of Knightsbridge, are removing, after the 1st prox., to 11 and 13, High Street, Notting Hill Gate, W.

A PUBLIC motor service across the island of Porto Rico, from Ponce to San Juan, has lately been established. Connection is to be made with the steamers from the United States, and the Government mail carried.

FORT RINGGOLD, a U.S. military post in Texas, which is seventy-five miles from Hebbroville, the nearest railway station, is to be supplied with fresh vegetables and other perishable necessities by means of a motor-wagon.

THE value of the exports of motor-cars and accessories sent from the United States during the eleven months ending with November last is returned at £283,896 as against £205,216 in the corresponding eleven months of 1902.

A PHOTOGRAPH that has reached us illustrates what some agents can do in the way of handling motor-bicycles even in mid-winter. It depicts a consignment of twenty Rex motor-bicycles which had just arrived outside the premises of Mr. H. Garner, Nantwich, Cheshire.

MESSRS. JOHNSON, HURLEY AND MARTIN, Gosford Street, Coventry, make a speciality of launch and high-powered motors. In going through their works we recently noticed a four-cylinder 24-h.p. launch-motor under test and a four-cylinder 34-h.p. motor for railway trolley work in course of construction.

THE Coventry Motor Fittings Company, Coventry, have removed to larger and more commodious premises, situate in Lower Ford Street, their old factory being too small to cope with the growing demands of the trade. This firm make a speciality of radiators, lubricators, bonnets, etc.

THE Milnes-Daimler omnibus which the Brighton and Hove Omnibus Company intend running between Brighton and Portslade has arrived at the popular seaside resort. Apparently there will be more motor-buses on the road before long, the company's motor shed at Hove being built to accommodate four.

A VERY complete catalogue of the latest models of the Chenard and Walcker cars has been issued by the Weston Motor Syndicate. The various novel features of these vehicles, notably the valve control, radiator and carburettor, reference to which has already been made in these columns, are fully described and illustrated.

THE Aix-les-Bains "automobile week" is this year to be held from 22nd to the 31st May next.

MR. A. G. MOFFAT was the first Swansea motorist, and the machine he rode in January, 1899, is still running.

ON the Daytona Beach, Florida, on the 2nd inst., Mr. Charles Schmidt, with the Packard "Gray Wolf" racer, established a number of new speed records. The American mile record was reduced to 46.25 seconds; the American kilometre record to 31.15 seconds, and the five mile American record for cars under 1,800 pounds to 4 minutes 21.35 seconds.

L'AGENCE GENERALE DES AUTOMOBILES FRANCAISES, LTD., has been registered with a capital of £15,000 to carry on the business of wagon, carriage, motor-car, cart, and cab builders, etc., builders and manufacturers of and dealers in launches, yachts, ships, or boats, and to construct, on the Thames or elsewhere, a dock, with patent and other slips, workshops, buildings, machinery, warehouses, and other conveniences.

THE Columbus Motor Vehicle Company, of Columbus, O., U.S.A., has entirely departed from its previous practice in the design and construction of its cars, and for the 1904 season is bringing out a light touring car driven by a four-cylinder vertical air-cooled motor of 20-h.p. placed under the conventional bonnet. The makers claim that the engine has an unusual amount of radiating surface on the cylinders, each of which is said to have 650 square inches of cooling area.

SATISFACTORY trial trips with the motor-battery wagon and forge built as an experiment for the U.S.A. Army, and illustrated in a recent issue, have been made in Washington. Officers have driven the machine up and down all the steep hills in the vicinity of the Capitol, while at Fort Myer a practical demonstration of its value as a travelling forge was made in the manufacture of horseshoes. It is intended to send the wagon with a battery of field artillery on a practice march through the country in the spring.

IN view of the recommendation by the Local Government Board requiring powerful acetylene head lights to be provided with some means of diminishing the brilliancy when driving in crowded thoroughfares, Messrs. J. G. Statter and Company ask us to mention that some months ago they brought out a head light provided with an arrangement meeting this requirement. The screen which lessens the light is controlled from the driver's seat, and the arrangement has, we understand, given great satisfaction in practical working.

MESSRS. GROUVELLE AND ARQUEMBOURG, of Paris, who make a speciality of fittings required in connection with the water circulation of petrol motors, have recently introduced the centrifugal pump illustrated herewith. It is made in three sizes

suitable for engines of from 6 to 30-h.p. The pump, which is fitted with a chrome leather or rubber-covered friction wheel, is intended to be driven off the fly wheel of the engine, and, in the case of the 6-h.p. type, will deliver thirty-nine litres of water per minute at a speed of 3,000 revolutions.

THE other day we had an opportunity of going over the extensive premises of Messrs. Friswell, Limited, in Albany Street, N.W. It is some time since we made a tour of the building, and in the meantime many alterations have been made. One department has been beautifully fitted up as a show room for motor clothing, while, in addition to the garage, auction room, and accessories department, there are departments for mechanical repairs of all kinds, carriage body painting and upholstering, etc. The building is lighted throughout by electricity, which, by the way, is generated on the premises.

MOTOR-CYCLING NEWS.

At the last meeting of the Kildare County Council a discussion took place in connection with the regulations under the Motor Car Act. After a lengthy debate as to the powers of dealers to allow customers to use their identification marks, the Secretary said he had an application the other day from a man

A German motor-cyclist—Herr J. Smeddinck—has recently devised the novel combination of motor bicycle and sleigh depicted above, and with which he is stated to have recently made the journey from Munster, in Westphalia, to Amsterdam. Judging from the two wheels carried behind the trailer it would appear that the sleigh under-carriage of this can be removed and the wheels fitted in their place whenever desired.

whose motor-tricycle weighed four cwt. That was as heavy as a small motor-car. He thought when over 3 cwt. it ought to be registered as a motor-car, because the power of that must be four or five horse power. The matter was referred to a committee.

ONE of our Australian readers, Mr. E. Phillips, writes us as follows:—"In semi-tropical or tropical countries pedalling a cycle up-hill in the hot months is too fatiguing. The photo sent you under a separate cover shows an 'Excelsior' in Australia. It was a present to the writer who is in the saddle, and

Mrs. Phillips in front, from his brother in London. In this country of vast distances such a means of conveyance is of inestimable value. Though Australia's bush roads are not as flat as a pancake, yet the 2½ h.p. machine photographed will take some of the roughest without panting."

MESSRS. JOHN C. FULLER AND SON, of Bow, E., are bringing out a new size of their mercury-bichromate battery specially intended for the recharging of the ignition accumulators of motor-cycles. The capacity of the new set is equal to charging a couple of 20 ampere-hour accumulators, or an equivalent number of spare accumulators, in succession, without itself requiring to be recharged. It is supplied complete with the necessary materials for charging, and requires no attention while the process is going on.

THE motor-bicycle has found a welcome among the natives of Ceylon, who appreciate the rapidity with which it can "swallow" distance. Mr. G. Thain Davidson, of Morawak-korale, who lives fifty miles from a railway station, finds his machine extremely useful.

A NOVEL form of motor-bicycle has recently been completed by M. Meijer, of Velp, near Arnhem, Holland. As will be seen from the accompanying illustration, the rider, instead of having to mount a saddle, is provided with a comfortable spring-supported seat and footrests, available for a lady or gentleman.

The frame is of strong and rigid construction. The wheel steering connections are clearly shown in the illustration; the accumulators and coil are located under the seat, while the petrol tank is behind the basket-work piece between the seat and foot-board. The power of the motor is transmitted to the rear wheel by a belt, in conjunction with which is a jockey pulley controlled by a hand lever. In addition to enabling the belt to be held clear of the basket work, the jockey also permits of the belt being kept at the requisite tension, and to allow a free engine. Thus the motor can be started by a handle before mounting. The maker claims the machine to be as easily controlled as an ordinary motor-bicycle and at the same time much more comfortable.

WHEN ignition wires are cut exactly to length and fitted in position the ends should be twisted up tight, and sweated up solid with soft solder, using resin only as a flux. All the wires on the top bar, when connected to the two-way switch, should be screwed very firmly, lest the screws might work loose through vibration.

IN accordance with the resolution of the Bloemfontein Convention, a tariff preference of 1½ per cent, on British motor-cars is given.

OUR DIRECTORY OF "NUMBERS."

[ALL RIGHTS RESERVED.]

Below is our second instalment of Motor Car Numbers. This List will be continued weekly, and Motorists who have not yet communicated with us are invited to forward their Names, Addresses and Numbers, with any observations they can offer as to the working of the new Act.

Newlyn, Henry, J.P., Royal Exeter Hotel, Bournemouth...	E.L.	1
Neill, John, Keills, Lochgilphead	S.B.	2
Nye, F. H., Broadwater, Worthing	C.D.	1
Newington, Frank E., Ticehurst, Egerton Park, Rock Ferry	C.M.	4
Newall, Capt., Liphook	A.A.	272
Neame, Gerald T., Kilshane, Cole Park Road, Twickenham	H.	163
Neame, Harold B., Kilshane, Cole Park Road, Twickenham	H.	117

Ogston, A. G., Ardree, near Aberdeen	S.U.	1
Oswald, George H., Winsley Chase, near Bradford-on-Avon	F.B.	36
Ogston, Dr. Alexander, 86, Rosemount Place, Aberdeen ...	R.S.	11
Orton, Dr. G. H., 7, Campden Hill Road, Kensington, W.	A.	48
Owen, William, Wolverhampton	D.A.	11
Onions, J. T., Wolverhampton	D.A.	31

Price, T. E., Upwell, Wisbech	E.B.	3
Parker, W. F., 68, St. Giles, Oxford	F.C.	26
Pickford, J. H., Clerk to Rotherham Rural District Council	E.T.	1
Plunkett, T. S., D.L., Portmarnock House, Baldoyle ...	I.K.	1
Pearce, Dr. A. Channing, Chartham, near Canterbury	F.N.	1
Preston, E. U., Shirley Hurst, Shirley, near Croydon	B.Y.	1
Parry, Mrs. Branksome, Palatine Road, West Didsbury ...	N.	175
Pinder, William, The Avenue, Linthorpe, Middlesbrough ...	D.C.	2
Phillips, J. A., Mansfield Villa, Stoke, Coventry	D.U.	8
Pughe, Rev. K. U., Drigg, Holm Rook, Cumberland ...	A.O.	11
Peake, C., The Sycamores, Whitkirk, near Leeds	U.	33
Portwine, John, 25, Lancaster Road, West Norwood, S.E.	A.	76
Perry, H. A., 22, Western Road, Brighton	C.D.	6
Price, A. E., Wolverhampton	D.A.	2
Parker, W. Howard, 2, Wellfield Road, Cardiff	B.O.	21
Parry, E. Morant, Caldicott, Mon.	A.X.	61
Plumbridge, A., Wheathill Lodge, Croydon Road, Anerley	D.	651
Powell, George Herbert, 79, Lemon Street, Truro, Cornwall	A.F.	21
Pickup, W. R., Scholes Bank, Horwich, near Bolton ...	B.	207
Parkinson, Mrs. E. K., 3, Havelock Street, Spalding ...	D.O.	10
Plummer, W., 16, The Crescent, Maidenhead	E.Y.	19
Pattison, B., 294, Kennington Park Road, S.E.	A.	1088
Pattison, C., 294, Kennington Park Road, S.E.	A.	1089
Pattison, F. C., 294, Kennington Park Road, S.E. ...	A.	550
	A.	551

Roberts, Capt. W. J., Oak House, Dudley	F.D.	1
Rhodes, S. R., Wolverhampton Automobile Club	D.A.	1
Ramsay, W., The Bungalow, Dyce	S.A.	1
Robertson, D., 1, Hermitage Place, Leith	W.S.	11
Rawson, Lt.-Col. R. H., Woodhurst, Crawley, Sussex ...	B.P.	15
Richards, G. B., Ashbridge Road, Leytonstone, E. ...	F.	290
Ryman, G., 20, Devonshire Street, All Saints, Manchester	N.	314
Rich, Harry, Helford Villa, Redruth	A.F.	9
Rich, William, Trevu, Camborne	A.F.	31

Robinson, H., 318, Harrow Road, Paddington, W. ...	A.	345
	A.	655

Robinson, J. Hedley, 31, Percy Gardens, Tynemouth ...	X.	4
Robinson, Joseph, Ingleside, North Shields	X.	42
Robinson, Walter, Addycombe Villa, Rothbury	X.	46
Russell, Earl, Raymond's Buildings, W.C.	A.	1
Reading, G. F., Bridge Street, Burton-on-Trent	F.A.	1
Russell, T. W., Holmfield, Ripon	C.	71
Rogers, J. G. F., High Street, Malpas, Cheshire	M.	105
Roberts, John and Sons, Bridgwater	Y.	28
Rodger, Dr., Yeltielin, Kelso, N.B.	K.S.	2
Ronaldson, Dr. J. B., Ennerdale, Haddington	L.S.	1
Robinson, M. A., Richmond Street, Londonderry ...	U.I.	1
	U.I.	3
Rogers, W. E., Rugeley	E.	27
Rhodes, Mr., Halifax	C.P.	9
Roberts, Dr., St. Albans, Herts.	A.R.	57
Rowe, W. F., Cliff House, Penzance	A.F.	35

Street, F. 23, High Street, Hitchin	A.A.	15
Somerville-Large, P. T., Carnalway, Kilcullen, Co. Kildare	I.O.	1
Smith, C. A., The White Lion Hotel, Cobham, Surrey ...	A.	576
Smith, Edwin, Avenue Bank, Kirkdale, Sydenham, S.E.	A.	14
Smith, H. B., Ferndale Cottage, Cliftonville, Margate ...	D.	87
Searle, A. H., Canterbury Villa, Flitwick, Ampthill ...		
Stent, A. L., Havant, Hants	A.A.	108
Stent, A. and Sons, Havant, Hants.	A.A.	137
	A.A.	138

Scott, A. T. H., 18, Rylett Crescent, Shepherd's Bush, S.W.	A.	63
Scott, Henry, Brentwood, Rochdale	D.K.	8
Stainthorpe, W. W., M.D., J.P., "Lulworth," Saltburn ...	A.J.	9
Sylvester, Rev. W. C., Chitterne Vicarage, Codford, Wilt.	A.M.	61
Simpson, Robert, Pettigrew, Ardmore, Sligo	E.T.	1
Sheldon, P. J., County Surveyor of Essex	F.	1
Streatfield, Capt. H. S., Ryhope Hall, near Sunderland ...	V.	1
Sandwich, Earl of, Huntingdonshire	E.W.	1
Smith, A., Midland Road, Thrapston	B.D.	1
Scrutton, Councillor C. E., West Ham	A.N.	1
Smith, R. J., Hon. Sec. Scottish Automobile Club, Glasgow	G.	1
Smith, Harold, Netherheys, Colne, Lancs.	B.	2
Stanton, H. V., 41, North Street, Dudley	F.D.	2
Smith, S., 20, King Edward's Road, Birmingham	O.	78
Shaw, W. P., Keewaydin, Prenton Hill, Birkenhead	M.	20
Stent, H. C., Acton Engineering Works, Acton Vale	H.	175
Spanton, W. D., Chatterley House, Hanley	E.H.	5
Storey, J. A., Underfell, Lancaster	B.	59
Smith, P. Caldwell, M.D., Dryburgh House, Putney, S.W.	A.	125
Spowart, Rev. James, Lambourn, Berks	B.L.	70
	S.Y.	14
Stitt, Charles Alfred, Hornelen, Cluny Gardens, Edinburgh	S.Y.	2
	H.	87
Staley, Alfred E., 27, Duke's Avenue, Muswell Hill, N. ...	D.P.	3
Stansfield, F. W., M.D., 120, Oxford Road, Reading ...	B.J.	28
Smith, H. C., 154, Denmark Road, Lowestoft	A.E.	170
Smith, Graham, 38, Chesterfield Road, Bristol	E.X.	8
Shalders, C. E., 43, Northgate Street, Great Yarmouth ...	B.Y.	8
Smith, R. F. W., 20, Broad Green Avenue, West Croydon }	B.Y.	9
	D.A.	16
Scott, J., Wolverhampton	A.	1409
Slee, Arthur F., Rowanhurst, Atkins' Road, Clapham Park	F.	175
Swann, Arthur, Brunswick Hotel, Clacton-on-Sea	F.H.	55
Stretton, A. C., 4, Worcester Street, Gloucester	C.H.	15
Simkiss, James, Derby	I.K.	21
Sexton, William, Dublin	M.	38
Stubbs, Thos. J., Forton Bank, Winsford, Cheshire ...	E.	13
Stevens, W. H., Rugeley	C.P.	8
Sagar, E., Halifax		
	H.	189
Taylor, J. Hay, Bleak House, Wightman Road, Hornsey, N.	E.E.	1
Tickler, T. G., Grimsby	B.	180
Threlfall, A. P., Moorlands, Colne, Lancs.	B.L.	263
Theobald, Claude J. T., Sutton Courtenay, near Abingdon	A.N.	24
Tupper, H. F., 10, Gurney Road, Stratford, E.	M.	81
Taylor, Frank W., The Firs, Lingdale Road, West Kirby ...	H.S.	1
Todd, W., Lithgow, Drums, Langbank, Renfrew	H.	71
Thompson, Oscar, 17, Seymour Street, W.	C.P.	6
Thomas, Mr., Halifax		
	C.R.	31
Vincent, W., 4, Cavendish Grove, Avenue, Southampton ...		
	S.R.	1
White, A. M., Middleton, Friockheim, Forfar	A.R.	72
Wickham, Dennis, Ware, Herts.	A.E.	135
Willows, C. E., 92, Queen's Road, Clifton, Bristol	E.B.	1
Welchman, W. W., Upwell, near Wisbech	H.C.	9
Woodward, J. V., "Naimi-Tal," Belper Road, Derby ...	C.Y.	25
Williams, John, 71, High Street, Swansea	E.C.	16
Walker, B., The Grotto, Kirkby-Stephen	A.L.	75
Watson, Henry Norman, The Post Office, Tuxford, Notts	E.C.	1
	E.C.	2
Wilson, C. W., Rigmaden Park, Kirkby Lonsdale	C.B.	1
Woods, G. H., Vine House, Revidge Road, Blackburn ...	D.K.	1
Walker, Robert, Fairlight Villa, Spotland Road, Rochdale...	B.A.	1
Wheatcroft, Councillor F. W., Salford	A.B.	1
Walker, Lieut.-Col., Worcester	D.U.	1
Welch, C. K., Park House, Warwick Road, Coventry ...	C.P.	1
Wright, Dr. Crossley, Halifax	D.W.	1
Watson, Geoffrey L., Newport, Mon.	E.D.	1
Woods, Edwin, Longford Wire Co., Limited, Warrington ...	W.	13
Watts, W., Sheffield	E.K.	28
Walls, James H., Westby House, Hall Lane, near Wigan...	A.	1105
Walford, H. R. S., 120, Finchley Road, N.W.	K.I.	1
Waterford, The Marquis of, Waterford	H.	100
	H.	101
Wainwright, Dr., Pembury Lodge, Tottenham	E.T.	4
Woodman, J. U. S., West Leigh, Rotherham	C.M.	17
Warren, H. B. G., 12, Hamilton Square, Birkenhead ...	T.S.	1
Watt, Alex., Primus Villa, Arbroath Road, Dundee ...	F.	205
White, F. I., King Edward's Avenue, Chelmsford	C.W.	3
Watts, J., Burnley	A.	498
Wybrant, A., 56, Portman Mansions, W.	C.	23
Wadsworth, G. B., Bank View, Goole	O.	255
	O.	256
Wynn, W. Lea, 2, Barnsley Road, Edgbaston, Birmingham }	A.	2
	W.	135
Waterlow, David S., L.C.C., Spring Gardens, S.W. ...	C.P.	1
Whitehead, H., 94, Middlewood Road, Sheffield		
Wright, Dr. Crossley, Halifax		
	D.A.	3
Young, Trevor F., Wolverhampton	F.E.	20
Yeates, John, Carholme Road, Lincoln		

(To be continued.)

CORRESPONDENCE.

BENZ V. LIGHT CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with very great interest the letters in your *Journal* "Benz v. Light Cars," more especially Mr. Hay Taylor's. I fully endorse his remarks with one exception, *re* mechanically-operated inlet valves. Since I have fitted mine up I have experienced a great increase of power, especially on hills, and long slight gradients where I used slow speed my car will now take them on top speed. The fitting of a plate inside cylinder I strongly condemn as useless. I had one in my car when I purchased it, and as I seemed to be short of power I took it off to see the result without it, and the difference was so marked that I keep it now as a curiosity. I think the greatest fault with a 3½-h.p. Benz car is the crippled exhaust silencer; this is far too small, and I found this out as follows:—One evening, about eighteen months ago, I had a call to Selby, and on the way my silencer dropped off. Being in a hurry I did not trouble to pick it up, so on I went, and was rather surprised to find I had never run so easily before, and had such an increase of power, although more noise, which did not trouble me. I found the silencer on my return. I soon after set to designing another, which I still run with; it is 9 inch diameter by 15 inches long. Some will say, I have no doubt, a big affair, but it is not any more noticeable than the old one, and at the same time gives far better results, and with it my exhaust is hardly audible. I contend that a 3½-h.p. Benz is a useful little car, and, although slower than many others in a tour, it will often come home in good time, leaving others more powerful behind for repairs, etc. It is a case of "slow but sure wins the race."

The severest test I have put my car to was a 3½ days' tour through the Dales, starting from York in the middle of May last at 9 a.m. in pouring rain. I went by way of Wetherby, Harewood, Otley, Skepton, Settle, and Ingleton to Windermere, and by Sedburgh through Wensleydale by Askrigg, Leyburn, Bedale, and Borobridge to York, and it rained nearly the whole time. We covered 200 miles and reached home by 3.30 p.m. on the following Saturday, and should have done better, but one of the front tyres came off and we ran home from Bedale on the rim. Surely that was not bad for a Benz. I am an engineer, and my humble opinion is that under good management and with the engine kept in good repair (I do all my repairs myself), an old two-speed Benz without crypto is as reliable as any small car on the market, and if those who have already expressed themselves in your columns on the subject, and also other owners, will keep their cars in good order and take as much care of them as a groom does of his horse, I think they should be able to make as good runs as I do.—Yours truly,

ARTHUR WADDINGTON.

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent number of your paper you mentioned the difficulty of obtaining efficient drivers of automobiles, and I notice in your issue of the 9th inst. an experienced driver writes to you pointing out that this is a mistake, and that many good men cannot obtain situations. Now, as an employer of drivers, I think myself that what you stated was absolutely correct, and when one refers to good drivers one means naturally responsible men who carry out their duties in all ways in a reasonable satisfactory manner. There is no real difficulty in getting men who can drive and steer an automobile. That is fairly easy, but to get a man who is reasonable and who will drive it in a proper way and keep it so that it costs the least possible amount for up-keep, that class of man I find it very difficult to get.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your remarks regarding the above in your issue of the 9th inst. you mention that the motor mechanic should remember that he is the driver and not the owner of the car on which he sits. I might mention that there is always this class of men in every sphere of life, no matter what vocation they follow. If some owners were more considerate to the drivers, the men would show more respect. We all know that the life of the motor driver is not so bright as it looks. He may have a bad car and his people keep nagging at him when the cause is often neglectful work of the builders or repairers' workmen. I say this because I have experienced it more than once. When I have my employer's car at the shop for overhauling, I do part of the work myself and watch that others do not do slipshod work on the car.

I have seen masters who own some very good cars, and, let them have who they like as a driver, they could not be pleased. I know a case on hand here in Scotland. One owner has had no less than eight men (Frenchmen, Englishmen, Scotchmen, etc.), in ten months. Happily the exception does not prove the rule, and, thank goodness, there are car owners in this land of ours who are really gentlemen. In a good many cases a feeling exists among owners that the mechanic cannot wash and polish his car as well as an ex-coachman. This is a square case of six of one and half-a-dozen of the other. I have seen coachmen who

could show you how to wash a carriage and I have seen mechanics who could show a coachman how to wash a motor-car.—Yours truly,

SUB JUDICE.

[Evidently the point we raised is of general interest, and the views of both owners and drivers will be welcomed for publication. Our correspondent suggests more consideration on the part of the master; does not that exist already? As a matter of fact, there is a view of the relations between the motor-car owner and his mechanic not generally made public. The latter receives more consideration from the owner, and is more closely in his society than the coachman or any other servant. Hence the good feeling which is necessary for the owner's real enjoyment of motoring, and unless the man reciprocates the confidence shown the pleasures of travel are minimised. Mr. Edge's experience is extensive and coincides very largely with our own.]

RED HOT EXHAUST PIPE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you, or some of your readers, could tell me why the exhaust pipe of my motor gets red hot so quick. A new nipple was put on not long ago, but to no good, and the engine will only run on little or no air. The car is a 6-h.p.—Yours truly,

BERKSHIRE.

[This trouble is undoubtedly due to too rich a mixture in the case of "Berkshire," although on almost all engines this is likely to occur, more especially when the car is stationary. We should advise a thorough examination of the engine to see that the compression and ignition are in proper condition, as if either of these are not right it would necessitate a much richer mixture, which in this case is no doubt the cause of the trouble.]

DIFFICULTY IN STARTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me to congratulate you on publishing a most useful up-to-date journal, not the least interesting feature of which are the letters from novices. We learn by others' experience. I may mention one little thing that does not seem to be generally known. Some machines (mine among them), are sometimes rather difficult to start if they have been idle a few days. I have found that if I put the mixture and ignition levers in proper position, shake the float of the carburettor, hold the inlet valve open and give the starting handle two or three turns of the same time, then switch on, the engine will start with the next pull on the handle. Previous to finding this out I have often been half an hour, with quite a little crowd round me, trying to start my machine.—Yours truly,

A. SWANN.

TIMING A TWO-CYLINDER CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Suspecting loss of power from improper timing of explosion, can you tell me how to correct this? On the front of my car is a pinion with two electric connections like tremblers. Do you call these commutators? If so, please tell me if the platinum points ought to touch the steel spring during the whole revolution of the pinion or only when the eccentric portion of the pinion is approaching. Is it wise to keep altering the tension of inlet valve spring, by readjusting the nuts on pin, in order to get more power?—Yours truly,

SIMON.

[The two connections on the front of the engine, which "Simon" terms "like tremblers," are usually known as "contact blades," the commutator being an insulated disc fixed on the two-to-one shaft, but this is only used in the case of a wipe contact. The blades ought only to touch the contact screw when the cam lifts them and not during the whole revolution of the engine, otherwise there will be great waste of current and also premature firing. It is very unusual to alter the tension of the inlet valve spring, especially if giving good results. Of course if backfiring occurs in the carburettor the valve spring may be at fault.]

DRY BATTERIES AND ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I can strongly advise J. F. Fox to go in for dry batteries. I have now used them for the last two years, although being laughed at by my motor friends and called old-fashioned. When using accumulators I was always in trouble with the ignition, and I have not the least hesitation in saying that more than half the stoppages on the road are caused by the accumulators having a little bit of fun on their own. My engine always starts readily, and a misfire or failure of spark I am a stranger to. I am now running with three cells in series, which give about 4½ volts, with every satisfaction. My last set of cells ran the car till they were thoroughly exhausted, lasting about a year. When using accumulators I always had to be cleaning the platinum points on screw and trembler, as they got badly burnt and spotty, but since using dry cells I clean them once about every five to six hundred miles, thus saving expense of new screws and tremblers, which became necessary after cleaning them two or three times.—Yours truly,

D.651.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. J. F. Fox's letter *re* dry batteries in the last issue, I have on several occasions tried these, but in each pair found them to fail, although they were perfectly new on each occasion. Owing to this I have had to return to accumulators. Undoubtedly, if the dry batteries were somewhat improved, they would do away with a deal of trouble. I have never had any trouble whatever from my accumulator, but always make a practice of carrying a spare fully-charged battery. I myself think that a number of the ignition troubles are due to dirty contacts, as many users of cars never think of cleaning the wires and terminals; this, of course, would be sufficient to need extra voltage.—Yours truly,

T. F.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Dry batteries, in the writer's experience, are expensive, uncertain, and tricky. The expense is out of all proportion to that of a good accumulator; they deteriorate considerably by keeping, so that one cannot be sure of one's spare set, while it is more difficult to estimate how much one has left in them. It is also generally easier to find a place where one can get an accumulator charged than one where a good new battery can be obtained, when on tour. I agree to some extent with Mr. Fox that rather more powerful ignition arrangements would often be an advantage; but some of the coils in the market will stand being run with three accumulator cells, and if one has both sets of accumulators run down it is generally possible to get home by coupling up three of the cells instead of two, a resource not of much use with dry batteries, owing to their high internal resistance. Sufficient care is not always taken that accumulators on a car shall be as much as possible protected from vibration; slenderly-supported accumulator boxes, with the cells wobbling about inside them, are too common, with resultant spilling of acid, loosening of paste, &c. It did not strike me that dry batteries were much in evidence at the *Salon*, but charging dynamos on the car certainly were. Irregular and casual charging is the principal source of accumulator troubles.—Yours truly,

R. W. B.

BAND BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 9th inst. one of your correspondents, who signs himself "X," complains of the brake leather on his 16-h.p. Gladiator getting worn out in a very short time. I note that he speaks of the leather lining of the brake. If leather is used as a lining for the brakes, it is only to be expected that it will wear; the lining which we use on Gladiator cars is not leather, and if your correspondent will kindly communicate with me I shall be very pleased to forward him some lining of the correct material. His trouble is no doubt due to having had his brakes re-lined with leather instead of with proper material.—Yours truly,

E. H. ARNOTT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not think that "X" will find hard wood blocks to be satisfactory as a lining for his band brakes, as, if the brake is kept on for long at a time, the drum gets hot and the blocks will char from the heat. If he will try lining his steel bands with Gandy cotton belting he will have no further trouble. The Wolsley and other car manufacturers use this material exclusively.—Yours truly,

J. K. B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to a letter in your valuable *Journal* of the 9th inst. under the above title, I can strongly recommend "X" to try lining his brake bands with Gandy's belting. This material can be obtained from The Gandy Belting Company, Queen Victoria Street, E.C., and is sold in various breadths and thicknesses. It is fitted to the bands like leather, no alteration being necessary. This material is on the differential brake of my 14-h.p. Brooke car, weighing 19 cwt., and I have used it for eleven months, daily driving about town and country over 6,000 miles. I would suggest to "X" that when descending a long hill it is good practice to use first the side brakes, then to change to the foot brake, so giving each less wear and time to cool down. I might add that I have used this belting twisted round the tyres, and find it acts as an anti-skid, but damages the wood felloes and soon cuts through.—Yours truly,

CLAUD WOAKES.

SPEED LIMITS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I believe that in the majority of cases where demand has been made for the further limitations of the speed of motor-cars, the main purpose of those advocating it is to prevent the automobile frightening horses. While instances are reported every now and then in which the disregard of the public rights shown by some few individuals has brought about a desire for this further restriction in speed, yet these cases are comparatively few in comparison with the number of "foot passengers" and motor-cars involved. It is quite possible to run a motor-car too fast, even on an

open road, for the safety of the occasional other vehicles to be met with. Moreover, the temptation to drive too fast, given a fairly good road, is much greater in this case than in the city, because of the greater distances, the absence of cross roads and the smaller traffic. But, although the temptation is greater, it is a distinct misfortune that it should be yielded to. Driving at a speed which is made reckless or inconsiderate by the attendant conditions is not less reprehensible in the country than in towns, and it can do quite as much to damage the prestige and check the progress of the motor-vehicle. Again, it may be very likely true that a horse is frightened more by the rush of a vehicle past him at high speed than when a policy of delay is adopted. This does not appear to be proved, however; and many motorists claim that their experience has been directly the contrary, arguing that they get well past the horse before his terror has time to develop. Whichever course a driver of a motor-car has found to frighten the animal less he should feel morally bound to pursue in all cases where a horse shows alarm. It must not be forgotten that the horse is our almost universal beast of burden. Many people could not discard him if they would, and if they did they would not be able to manage a motor-vehicle. The horse is with us of necessity more than of choice, and while the motor-car owner may pity the horse owner, he is yet bound to treat him with reasonable consideration.

The point I wish to make, however, is the futility of a legal speed limit on motor-cars as a preventive of horses being frightened and running away. Who, to begin with, is prepared to say that the equine species will usually take fright at a car driven, let us say, at fifteen miles per hour, but will not take fright at one driven at ten miles? And if this, or something equivalent, were asserted, what would be done with the intermediate speeds? In a large number of cases of trouble with horses, especially in the country, the blame lies with the driver of the animal, who is giving more attention to the motor-car than to his horse. Certainly a reduction in the former's speed would not diminish the number of "accidents" such as these. In many cases the horse will take fright even at a standing car with quiescent machinery. Considered simply as a means of preventing horses being frightened, a speed limit is certainly as crude a device as could well be imagined.—Yours truly,

CONCORDE.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Puncture Tired" asked for the experience of any gentleman who had tried both solids and pneumatics on the same car; I give mine. My car is of good British make, and well sprung, having elliptic springs back and front, and I cannot attribute my broken axles to anything but the solid tyres, and I am very well satisfied with the change I made. Perhaps "Experienced User" resides south, where, I believe, the roads have far better surfaces than ours more north. I might say that my solids were not the Buffer.—Yours truly,

SOLIDS TRIED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have watched with interest the correspondence on the above subject. I quite agree with "Medicus," "Solid Satisfaction," and "P." as regards the solid tyres, but I find the great drawback to their use on Wolsley cars is that they are the cause of broken balls in the axles sometimes. I would like to hear from your correspondents, through the medium of your columns (as I know that it will be of interest to more than myself), if they had any difficulty in the matter of ball races on back axle, fitted with solid tyres; if so, how they have overcome it.—Yours truly,

ROLLER BEARING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been greatly interested in the correspondence appearing in your journal with reference to solid and pneumatic motor-tyres.

Several of your correspondents appear to be quite satisfied with solids, and I shall be very glad to know if any of them have solid tyres fitted to cars constructed with tubular frames.—Yours truly,

TONNEAU.

PICRIC ACID AND PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is so long since anything was heard of using picric acid in conjunction with petrol that I thought the idea had been dropped. I

Slow Progress.

see, however, from the "Motor Cycling Notes" in your last issue, that this is not the case, but that a Liverpool firm is making a device for use on motor-cycles, in which the petrol to be carburetted is passed through picric acid "when more power is required." I should be glad to hear from any motor-cyclist who may have used the device if the advantages claimed are borne out in practice. In fact, I am sure that the experience of any motorist who may have used picric acid would be interesting to your readers.—Yours truly,

A. J. H.

EXPERIENCES WITH PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I, like Mr. G. Maber, in last week's *Journal*, am thirsting for information respecting the "Trusty," or other paraffin carburettor. Perhaps the reader who is kind enough to reply will also say what the total cost of conversion would be, and the cost of running, compared with petrol? Also what would have to be done away with and the parts (such as tank, etc.) retained in a gear-driven Benz to effect the change from petrol to paraffin.—Yours truly,

A MAN IN BLUE.

AN AMATEUR-BUILT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I send you herewith a photo of my car H.23, which is of my own construction, and has a two-cylinder Aster engine and gear, tonneau body, the latter also built by myself. I ran the car 4,000 miles last year without one stop from engine troubles, the only delay being due to a burst tyre, which stopped me one and a half hours. I have always had a passenger

of one kind or another, and they can testify to the truth of this statement. I have long made a pastime of building model express engines; this gave me an idea to build a motor-car. I made the tubular radiator frame, steering pillar, brass tanks, bonnet, sprocket bearings, and fitted all parts with levers, etc., complete.—Yours truly,

W. BASHFORD.

SANDING ROADS IN AND AROUND LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No doubt many motorists, passing through London streets, have lately had cause to complain at the shameful way the authorities of the various boroughs, especially Marylebone and Westminster, have been sanding, or, I should say, stoning the roads during frosty or greasy weather. Instead of using a fine sand or crushed granite, as they have hitherto done, they have been using the coarse siftings of flint gravel, consisting of small flint pebbles, which when thrown down on the hard wood paving and asphalt splinter up into sharp, razor-like pieces under the iron tyres of buses and heavy vehicles. On returning from a half-hour's run, making calls round the West End, and covering not more than two miles, I abstracted not less than fifteen pieces of this flint from one set of tyres, which before leaving home were quite new. It is quite time steps were taken to stop this shameful practice; not only do motor-tyres suffer, but all vehicles, whether automobiles or horse-drawn, having rubber tyres on their wheels. I send a sample taken at random from the barrow from which the men were so-called "sanding the roads" in Great Portland Street, London, W., on Saturday, the 16th inst.

Anyone throwing glass, nails, or any other refuse likely to cause damage to horses or vehicles is liable by law to be prosecuted, and it appears to me that the borough authorities are causing equal offence in

this act. I trust your readers will do all in their power to oppose this. I, for my share, shall give in charge the next roadman I see throwing such material over the road outside my depot.—Yours truly,

E. J. COLES.

THE INVENTOR OF THE BAND SAW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that the invention of the band saw is attributed in one of your recent issues to M. Perin, of Paris. This is an error, as it was really the invention of an Englishman—one William Newberry, who, in 1808, patented a machine for sawing wood, in which an endless band or ribbon saw strung over two wheels was used. Owing to the difficulty, however, of obtaining saw blades that would withstand the strain put on them, the machine remained in abeyance for many years till M. Perin, about 1855, introduced a much-improved machine, on which he used specially tempered saw blades of French manufacture, and thus made the machine a practical commercial success.—Yours truly,

F. J. WILLIS.

ANTI-FREEZING MIXTURES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Since writing the article reproduced in your issue of the 25th ult., experience has not indicated any trouble from calcium chloride cooling mixture, except possibly in systems where considerable galvanised iron is used or where aluminium tubing forms a part of the circulating system, in which cases there might be a possibility of trouble. There is, however, no clear evidence of it, provided that the calcium chloride solution is maintained in a neutral or alkaline condition. Commercial calcium chloride is not always perfectly pure, and it is well to add a few handfuls of air-slaked quicklime in making up a solution. One of the important requisites in using this solution successfully is that any evaporation must be replaced by adding water, and not by additional solution, as the latter, of course, would result in making the solution gradually more and more dense, and, therefore, running the chance of crystallisation in the cooling tubes when the outfit is standing idle in low temperature. These crystals would clog up the tubing so that there would be no circulation until the crystals had been removed or dissolved. If evaporation is carefully replaced by pure water, and leakage replaced by additional solution, there will be no trouble. In some cars it is difficult to determine how much of the loss in the cooling system is due to leakage and how much to evaporation. In such cases it would be necessary to draw off a sample of the solution occasionally and measure its density with a hydrometer, so that the density at 60 deg. Fahr. can be corrected by the addition of calcium chloride or water, as may be necessary.—Yours truly,

E. E. KELLER.

RACING AT FLORIDA.—Replying to "A. F. B." all particulars of the races on the Ormond beach, Florida, can be obtained from Mr. W. J. Morgan, 1, Maiden Lane, New York.

REPLYING to the Sinms Manufacturing Company, Limited, the address of the Steel Ball Company is 832, Austin Avenue, Chicago.

STARTING HANDLE FOUND.—Mr. Herbert, 46, Clarendon Street, Harrow Road, W., found the starting handle of a motor-car in the Marylebone Road on Saturday, which he will be pleased to return to the owner.

NUMBERS WANTED.—Correspondents will oblige, when writing letters to the Editor, by adding the registered numbers of their cars for inclusion in our Directory of Numbers.

THE case against E. H. Jones at the Clerkenwell Court has been further adjourned.

MESSRS. WASS AND COCKS have been granted a licence to store petrol by the Ealing Town Council.

MESSRS. H. M. HOBSON, LIMITED, have been appointed sole British agents for the sale of the "Pognon" plug.

WITH reference to the rumoured adoption of a motor-car service at Rosehearty by the Great North of Scotland Railway Company, we are officially informed that the directors have not yet come to any decision in the matter.

WILLING'S "Press Guide for 1904" has been carefully revised, and the new issue continues the useful feature that has popularised this useful work of reference in past years. For all having dealings with newspapers this Guide will be most valuable.

MR. W. L. CREYKE presided over the second annual dinner of the Oxford Automobile and Cycle Agency last week, when about 120 gentlemen met round the festive board. Mr. Claude Rippon proposed the toast of "The Automobile Industries," to which Mr. W. H. Burgess and Mr. J. Newton responded. To the toast of "The Oxford Automobile Agency," Messrs. F. G. Barton and W. R. Morris made effective response.

CLUBS AND ASSOCIATIONS.

NEW SOUTH WALES.

The opening run of the Automobile Club of New South Wales was held recently. Although motoring is yet in its infancy in Australasia, the pastime is becoming popular, particularly in this State. The local Automobile Club, which was only recently formed, already has thirty cars affiliated to it, and of this number seventeen took part in the initial run. The cars as they were lined up in Moore Street, Sydney, prior to the start, and as they wended their way through the principal streets, attracted great attention. The procession was headed by Mr. A. Jones, the president of the club, with his 8-h.p. De Dion car. The following were also present:—Mr. J. Gibbs, who drove a 10-h.p. Darracq; Mr. A. Hunter, on a similar car of 9-h.p.; Mr. J. Nolan, 4½-h.p. De Dion; Mr. J. A. Daley, 6-h.p. Knowles run-about; Mr. W. E. Fisher, on a Darracq car of 18-h.p.; Mr. H. J. Vale, 6-h.p. Benz; Mr. R. Empson, 9-h.p. Darracq; Mr. G. C. Hamilton, 4½-h.p. Locomobile; Mr. Starkey, 6-h.p. De Dion; and Mr. I. Phizackerley in a 6-h.p. car made locally by himself. Mr. Harrie Skinner's De Dion car was at the disposal of the press. On arrival at the Centennial Park, the cars drew up at the Kiosk, where afternoon tea was served. They were there joined by Mr. Mark Foy in his De Dion car. The president of the Club, in a short speech, referred to the progress made by the Club since its formation, which was undoubtedly due to the energy of the officers, and he was of the opinion that the Club would continue to go ahead. After a short spin in the park, the cars went for a run to Coogee.

The officers of the club are:—President, Mr. A. Jones; vice-presidents, Messrs. J. J. Macken, Harrie Skinner, H. J. Vale, Dr. C. W. MacCarthy, and Mr. A. J. Knowles; hon. secretary, Mr. W. E. Fisher; treasurer, Mr. O. Lane.

NOTTINGHAM.

The first Automobile Ball was held under the auspices of the Nottingham and District Automobile Club on the 15th inst., at the Victoria Station Hotel, Nottingham. It is gratifying to the gentlemen responsible for this venture to know that their efforts were crowned with success, and a matter for congratulation to the Club to be able to feel that their hon. secretaries (Messrs. W. D. Wells and R. Harbidge) are untiring in their endeavours to further the interests of the Club, socially as well as officially. The secs. acted as M.C.'s, the stewards being Messrs. H. Belcher, R. Sutton Clifford, jun., B. Winter, H. Bowden, A. Ward, P. Huskinson, J. D. Morrish, and R. Cripps.

WOLVERHAMPTON.

The Wolverhampton Automobile Club held its third annual dinner at the Victoria Hotel, Wolverhampton, on Thursday of last week. Mr. E. Lisle presided over a numerous company, among whom were Mr. J. H. Cooke (Town Clerk of Bridgnorth), and Captain Burnett (Chief Constable of Wolverhampton). After the loyal toasts had been honoured,

Captain Burnett proposed "Success to Automobilmism." The automobile business, he said, was increasing very greatly in Wolverhampton, while motor-cars made in England were not only holding their own in this country, but were making their way on the Continent also. It happened to be part of his duty to give licenses, and he was very much surprised that, while there were a great number of local applications, people had applied to him from Leicestershire, Devonshire, and Yorkshire, to register their cars. He associated with the toast the Wolverhampton Automobile Club.

Mr. S. R. Rhodes, hon. secretary, in replying, remarked that notwithstanding pessimistic prophecies the club had grown far beyond the most sanguine expectations of the most enthusiastic member. In 1902 the club numbered twenty-six members, owning seven cars of an approximate value of £1,300. At the present time they had seventy-six members, owning forty-six cars, of an approximate net value of £14,420. Every one of the committee had been most assiduous in the discharge of his duties. The local police had always taken a very common-sense view of things, and although he was bound to say many of the members of the Club could have contributed to the borough funds had the police thought fit to enforce the regulations, it was gratifying to know that in the past year no member of the Club had contributed in the shape of fines to the borough fund. Motorists ought not to rest content till the anomalies of the new Act were done away with. "Our Visitors" was given by Mr. Osmund Evans. Mr. J. H. Cooke responded, and in the course of his speech said the only reasonable communication between Bridgnorth and Wolverhampton would be by a service of motor-cars. The concluding toast was that of "The President and Vice-Presidents," which was proposed in a witty speech by Mr. W. Owen, and responded to by Mr. E. Lisle.

During the evening Mr. J. H. Cooke presented the prizes, those for cars being Messrs. G. H. Evans, E. B. Bayliss, W. Clarke, T. Cureton, J. Lisle and P. S. Bayliss; and those for cycles going to Messrs. E. Lisle, C. F. G. Boyes, and H. W. Jenks.

SHEFFIELD.

Mr. S. E. Fedden, general manager of the Sheffield Corporation Electric Light Department, has given a lecture at the Wharnccliffe Hotel, Sheffield, to the members of the Sheffield and District Automobile Club,

on "Electrical ignition, as appertaining to the motor-vehicle." Mr. E. F. Coupe was in the chair, and amongst those present were Messrs. H. Parton, A. Clarke, W. James, B. Brown, J. Savage, J. R. Wade, and F. B. Cawood (secretary.)

Mr. Fedden said his desire was to lay before the members the elementary principles of electricity and magnetism and their application to the electric ignition of internal combustion engines as applied to motor-cars, bicycles, and launches. With one exception his car had never been "hung up" in the 5,000 miles he had travelled except by defects in electrical ignition circuits. He illustrated by diagrams the working of electricity, its measurement, and the resistance which was of such vital importance. Going into details, he placed on the board other diagrams illustrating the mechanism of a motor-car and the working of its electrical appliances. The battery, according to its size, would fire a certain current. If that rate of charge or discharge be exceeded it would get hot or break down. In no case should the charging current be exceeded, or injury would follow, and exactly the same result would follow if the discharge was made at a too rapid rate. Again, storage cells should never be run down too far, or sulphating would set in. Short circuits were a source of great annoyance to motorists, and were brought about by a habit which electricity had of taking the shortest or easiest path. The tendency to take a short cut became greater as the electrical pressure or voltage was increased. To deal with the annoyance caused by persons tampering with a standing car during the owner's absence for a few moments, he had devised a simple expedient, which he thought would effectually put a stop to the trouble. It consisted in coupling up to the ordinary battery a small so-called pocket induction coil. One end of the primary coil was in connection with the general ironwork of the car, while the other end was earth-connected by means of a few yards of copper wire, terminating in an ordinary iron meat skewer stuck into the ground. Mr. Fedden concluded by explaining what should be done in case of breakdown or accident, and at the close of his lecture displayed a number of diagrams showing the means that could be adopted by motorists when stranded.

After Mr. Fedden had been heartily thanked for his lecture, Mr. J. R. Wade was presented with a watch, in recognition of his services as secretary of the Club. The following certificates were also given:—For 40 miles non-stop motor-cycle run, Messrs. G. Lee, J. Thompson, J. T. Thompson, W. S. Gilder, W. James, A. T. Dewhurst, and W. B. Davy. For the 50 miles car non-stop run, Messrs. B. Hind, J. E. Evans, J. H. Pickford, and Brook Shaw.

YORKSHIRE.

The fourth annual general meeting of the Yorkshire Automobile Club was held under the chairmanship of Mr. T. E. King, at headquarters on Thursday, the 14th inst. The chief business was the election of officers for the ensuing year, which resulted as follows:—President, Earl Fitzwilliam; vice-presidents, Messrs. A. W. M. Bosville, Bridlington; T. E. King, Harrogate; H. R. Kirk, Leeds; Harry Briggs, Bradford; and W. Penrose Green, Leeds; committee, Messrs. E. Faiers, Herbert A. Jones, R. Winn, Walter Jackson, Thos. Whitaker, Edward Hepper; hon. solicitor, Mr. Alf Masser, Leeds; hon. secretary, Mr. Alf W. Dougill, Leeds; hon. treasurer, Mr. L. Hey, Leeds.

A hearty vote of thanks was proposed, seconded, and unanimously carried to the retiring officers.

It was also resolved that a programme should be drawn up for the coming summer, and that weekly meetings be arranged.

Mr. Faiers then gave a lantern display illustrating automobile progress.

YORK.

The new York and District Motor Club, which has only recently been formed, is now in full working order with a membership of nearly sixty. The second general meeting of the members has just been held, under the chairmanship of Mr. J. E. Gibbs, at the Black Swan Hotel. Alderman Edwin Gray was elected president, and a general badge for the members was decided upon. The arms of York constitute the centrepiece, these being surmounted by a motor-car. The officers are:—Secretary, Dr. Angove; treasurer, Dr. Noel Hood; committee, Messrs. J. Bellerby, J. E. Gibbs, T. Smith, Thos. Horsley, R. P. Garbutt, T. Lumb, W. Rain, W. R. Coates, H. W. Sowden, A. E. Pearson, and A. D. Jackson.

WEST SURREY.

During the absence of the secretary, Mr. R. W. Buttemer, who is about to visit Italy, communications for this club should be addressed to Mr. J. F. Ponsford, Shackleford, Godalming, who will act as secretary, *pro tem.*

PETROL ENGINES.

A MEETING of the Institute of Marine Engineers was held at the London Institution, when a paper on "Marine Petrol Engines and Motor Launches" was read by Mr. O. Sumner, who said that the marine petrol engine was, for all practical purposes, a self-contained gas engine. The petrol used with those engines had a specific gravity ranging from .68 to .72; in other words, the weight of petrol was from 6.8 lb. to 7.2 lb. per gallon. The lower the specific gravity the more rapidly would the petrol volatilise, and the quicker would be prepared the charge of gas. Atmospheric conditions affected the vaporisation of the petrol, and the mixture of petrol and air with an atmospheric temperature of 40 degrees

Fahr. would not be the mixture suitable for a temperature of 80 degrees Fahr. Again, proportionately, more petrol would be required if the engine were to run at, say, 300 revolutions, instead of, say, 500 revolutions, because at the higher piston speed it was not possible for the whole of the volume displaced by the piston to be filled completely, owing to the indraw air being restricted by its passage through the vaporiser. He would like to make it clear that a lead pipe should always be used for the conveyance of petrol from the tank to the vaporiser. There were two types of marine petrol engines, known as the 2-cycle and the 4-cycle. The 4-cycle engine was unquestionably the engine for large craft, whilst the 2-cycle engine was suitable for any class of launch up to about 50 feet. A modern high grade motor launch could live safely in a sea which would swamp or capsize a steam launch of similar size, owing to the latter's heavy boiler and wash of water therein raising its centre of gravity considerably higher than that of the motor launch, with its squat, compact little engine. The motor launch rolled more, but it did it quicker, which was exactly the action wanted in a short, choppy sea.

The Chairman, Mr. W. C. Roberts, who opened the discussion, said that for use both ashore and afloat petrol motors seemed to be coming to the front, and were evidently going to stay. Mr. W. Gardner said that his firm, like the author, were also engaged in experiments with a rotary petrol motor, and although he could not at the moment say anything with regard to those experiments, they were hopeful that in the near future a successful rotary petrol engine would be evolved. Mr. W. H. Flood proposed a hearty vote of thanks to Mr. Sumner for his able paper, and Mr. J. Thom having seconded, the proposition was carried unanimously. A vote of thanks to the chairman, proposed by Mr. J. B. Johnston, seconded by Mr. W. McLaren, concluded the meeting.

REPAIRING A MOTOR-CAR.

At the Marylebone County Court, on the 15th inst., before Mr. Fitzroy Cowper, sitting as Deputy Judge, the Albany Manufacturing Company, Limited, of Willesden Junction, N.W., brought an action against Messrs. W. Arter and Son, Upper Kennington Lane, S.E., claiming £21 ls. in respect of goods supplied and work done.

Mr. Frederick Lamplough, manager to the plaintiff company, Mr. Arthur Herbert, a practical engineer in the employ of the plaintiffs, and Mr. George Smith, travelling representative to the company, gave evidence regarding work done to a motor-car sent to the plaintiffs for repair.

The defendant said that the work had been badly done; for instance, almost immediately after the plaintiffs sent the car back, the boiler-tubes began to leak, and several of the parts rattled when the power was turned on. In cross-examination, he said he had written a letter to the plaintiffs setting out his objections, but it was a fact that he omitted to mention some of the complaints which he now made. Mr. John Price, of J. Price and Company, Kennington, corroborated as to boiler tubes leaking, as described by the defendant, also as to the rattling, and to the ball bearings not being properly adjusted. Daniel McKella, the driver of the car in question, denied having "scorched" the boiler after it came back from the plaintiff's works. His Honour came to the conclusion that the plaintiff's charges were somewhat excessive, took off £3 10s., and gave judgment for £17 11s. 1d. with costs.

A QUESTION OF LIABILITY.

WILLIAM BRENCHEY, a tool gauge-maker, of Charlton Lane, Old Charlton, sued R. F. Carr, who said that he was engineer at the Lee Motoring Works, for £15 odd for work done and materials supplied. He disputed liability on the ground that he was only a servant of the company. He admitted ordering the goods, but not on his own account. They were for the company—for a man named Dennis. In explanation defendant said that Dennis, with others, formed a syndicate for the running of motor-cars between Lewisham and Eltham. It was "a sort of a company" which owned the motors, and he (defendant) was the manager. His Honour gave judgment for the plaintiff, and told the defendant that his remedy was, perhaps, against Dennis.

MOTOR TRAILERS and LICENCES.

At the Bridlington Police Court a cycle and motor agent, Mr. Sidney H. Brown, Bridlington, was summoned for having used two vehicles while licensed for the use of only one. Mr. Stanton, who prosecuted on behalf of the Inland Revenue authorities, said that the case was rather an unusual one. The defendant had taken out a licence for his motor-bicycle, but on September 3rd he had used a trailer attached to it, while having no licence for the trailer, which, he contended, was a separate vehicle. Mr. Holtby, solicitor, Driffield, argued that a motor-cycle and a trailer combined were one four-wheeled vehicle, and that, therefore, only one licence was necessary. The Bench held that two licences were necessary.

In the evidence it was shown that Brown had applied to the local postal authorities and to the Inland Revenue officer (Mr. Hunter) stationed at Bridlington, but that neither parties had known what to charge him for a second licence. He had obtained a licence for the trailer in October. The Bench dismissed the summons, being satisfied that defendant had shown no intention of avoiding the taking out of a licence.

ACTION AGAINST A MOTORING M.P.

AT Glasgow Sheriff Court proof has been led before Sheriff Fyfe in an action at the instance of Thomas Fitzpatrick, 14 years of age, against Mr. Cameron Corbett, M.P., for £500 damages in respect of injuries alleged to have been sustained by him through being run into by defendant's motor-car. Pursuer stated that on 20th April he was wheeling a barrow along Carlton Place when he was stopped at Glasgow Bridge by the constable regulating the traffic. While waiting for the constable's signal to proceed he was run into by Mr. Cameron Corbett, who collided with him in trying to save himself from a plunging horse which had been frightened by the motor-car. As the result of the collision pursuer sustained nervous shock, also injuries to his arms, legs, and hands, and was confined to the house for several weeks.

Mr. Cameron Corbett explained that when he purchased the car he obtained the services of an instructor, who taught defender and his coachman to drive the motor. The accident occurred while he was proceeding to a meeting in the offices of the Victoria Infirmary. When his car collided with the barrow he was not going faster than two miles an hour. He attributed the collision to a pure accident, and he did his best under the circumstances. He paid for the repair of the barrow, and he called on the parents of the lad to make sure that no loss was entailed on them as the result of the accident, but on the following day he received a lawyer's letter demanding £500, which he did not see his way to pay. Medical evidence to the effect that the boy's injuries were of a trifling nature was also given for the defence. His Lordship made *avizandum*.

REMINISCENCES OF THE ROAD

A MEETING of the Scottish Club (Western Section), was held in Glasgow on Monday evening, Mr. John Adam, of Larchgrove, presiding. He was supported by the Marquis of Ailsa, Mr. Edward Brook, younger, of Hoddam, Mr. Jas. Weir, Mr. A. R. Brown, Mr. Hugh Reid, Mr. H. M. Napier, and other prominent automobilists. There was a large attendance, over 100 gentlemen being present.

Mr. Charles Jarrott read a paper on his "Reminiscences of the Road." He observed that seven years ago it was the practice to start getting the car ready on the Monday morning if one wished to go out on the following Friday evening. New bearings had probably to be fitted into the automobile if the motorist had been out on it the previous week. He took away enough spare parts to make another car, and as a rule they were used up before the return. Motoring was a sport in those days. Tyre troubles were then far more exciting than now. Among the good stories told by the author was one to the effect that on one occasion a stop for lunch was made at a country hotel, when one of the leading hunts chanced to come up. On giving the handle two or three vigorous turns to start the car there was a roar and the whole thing was in flames. Apparently the carburettor had flooded, and the vibration from turning the handle had caused the flames to flash back from the burner and to set the carburettor and petrol on fire. The car was a roaring bonfire, the huntsmen rushed out to the rescue of their mounts, the hounds gave tongue, and Mr. Jarrott, in endeavouring to put out the flames with a bucket of water brought by a stableman missed fire and set his enthusiastic friend on the other side of the car dancing like one demented. On another occasion a tradesman supplied him with paraffin instead of petrol. Finding that the engine would not work, the useless liquid was thoughtlessly emptied into the stable yard, and the tank filled up with the genuine article. As a start was about to be made, however, an equestrian entered the yard lighting a cigarette. Without warning his discarded match descended on the stream of paraffin. Instantly the whole car was surrounded by flames. A stableman rushed up with a bass broom to beat them down, but they only sprouted out anew on the broom. At the time the covering bonnet of the motor was off, and as a last resource someone rushed on to the scene with sand, which he cast into, around, and on the top of the motor, which he thought was the real cause of the trouble. It took two days to get the pebbles out of the mechanism of the car.

In reply to a vote of thanks proposed by the chairman, Mr. Jarrott expressed his pleasure in having this opportunity of addressing the members of the Scottish Club, and following up some remarks of the chairman he emphasized his view that the future acknowledgment of the rights of automobilists lay for the next three years with themselves. He counselled careful caution in all towns and villages and consideration in meeting other users of the highway, who, he said, it must be remembered had equal rights with the owners of motor-cars to its use.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JANUARY 30, 1904.

[No 256.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SINCE the announcement last week that the Ninth International Automobile Exhibition had been granted the official patronage of the A.C.G.B.I., Mr. Charles Cordingley has been the recipient of innumerable congratulations from trade and public alike. In fact, so many have been the felicitations on this important event that it has been found impossible to acknowledge them individually. Hence this opportunity is taken of thanking those who have expressed themselves delighted with the action of the Automobile Club in again recognising the exhibition which has so long been identified with the Agricultural Hall.

Motor Buses for the Suburbs.

ALL around the coast services of motor buses are being run in the interests of the public convenience, but London suburbs seem to have become so enamoured of electric trams, or rather have been so conquered by their advocate, that the chances of the motor-bus are small in comparison with the favours bestowed upon the cars that run on tracks. At the western and eastern extremities of the great metropolis, however, early developments may be expected. Motor-buses have lately been seen along the Edgware Road, and the East Ham Council has decided that its Finance Committee shall inquire as to the best way of raising £5,000 with a view to the purchase of five motor-omnibuses. This is a decided step forward, and one in which we wish the East Ham people much success.

Engineering Firms and Motor-Cars.

It is a matter for congratulation that British engineering firms are gradually awakening to the possibilities of the automobile, and that one by one our large concerns are taking up the construction of motor-cars. It has already been mentioned in these columns that the departure has been made by such well-known firms as Messrs. Willans and Robinson and Peter Brotherhood, while now it has to be recorded that Messrs. Crossley Bros., Ltd., known throughout the world for their gas engines, have entered the automobile industry. The "Crossley" car is what may be termed a joint production. In the first place Messrs. Chas. Jarrott and Letts, Limited, have for some time been contemplating the introduction of a car which should combine Continental experience with the excellence of British workmanship and material; a car of the highest grade for use on English roads, and to suit English requirements, and yet with many of the features incorporated in foreign models.

The "Crossley" Car.

THE design of the new vehicle is mainly due to Mr. J. S. Critchley, whose connection with the Daimler and Brush Companies will be remembered, and who, in addition, has had every opportunity of gaining a close acquaintance with the best Continental practice; while, needless to add, full advantage has been taken of Mr. Jarrott's vast experience of touring and racing

cars. The designs once ready, the next problem was to get some engineering firm of repute to construct the same, and, after negotiation, Messrs. Crossley were induced to enter the new field. The result was seen on Friday last week, when, at the invitation of Messrs. Jarrott and Letts, we, in company with a small party of the Press, visited Messrs. Crossley Bros.' extensive works at Openshaw, Manchester, to inspect the first car turned out. As a full description of the new vehicle is given elsewhere in the present issue it is not intended here to enter into details, but rather to briefly record some of the features which impressed themselves on our mind as we passed rapidly through the extensive works, under the guidance of Mr. W. Turner, the manager. Some idea of their immensity may be gauged from the fact that no less than 1,200 to 1,400 men are employed, and that one complete gas engine is turned out every forty-five minutes of the working day. There are always about 800 engines in course of construction, these ranging from the smallest size up to 700-h.p., one of the latter—for America—being seen in operation.

Care in Construction.

IN every department signs were not wanting of the care taken to produce none but the highest grade of work, the amount of money invested in gauges and jigs alone representing no small fortune. The visitors were shown the methods of production on the interchangeable system in all the various departments; here we saw cylinder castings being drilled, there cylinders bored, and here again crank shafts being turned, and so on. As an example of the accuracy with which the different parts are made, it may be mentioned, as one illustration only, that crankshafts and flywheels are produced in totally different departments, and do not come together until they reach the assembling department, when the two parts fit together perfectly. Many other points of interest were jotted down in our notebooks, notably the laboratories in which the raw material is all tested, to which pressure on our space prevents reference, but we have said enough to indicate that now Messrs. Crossley have taken up the building of motor-cars, their vehicles may be expected to quickly run into the front rank of British productions.

"Mean to be on Top."

AFTER the visit the party adjourned to lunch at the new Midland Hotel, in Manchester, where Mr. W. M. Letts, who was in the chair, gave in a humorous speech some particulars of the inception of the new car. Mr. Jarrott, who followed, expressed the opinion that the reason England had been behind in the motor-car industry was not so much due to Continental makers having had a start, but rather to the fact that British engineers had somewhat held aloof from the movement. With such firms as Crossley's and Willans and Robinson taking up the business, he had hopes that an example would be set to other large engineering concerns, and that England would soon begin to recover some of the ground it had lost. Mr. Critchley then explained that his object had been—not to produce an entirely novel car, but to design a vehicle incorporating the best features of Continental practice with good wearing qualities, one that should be capable of running 40,000 miles a year with a minimum of repairs and renewals. Mr. C. Cordingley, in proposing the

health of Mr. W. Turner, the manager, and a director of Messrs. Crossley's works echoed the sentiments expressed by Mr. Jarrott with regard to the British engineering firms having been slow in joining the movement, and congratulated Messrs. Crossley on their departure and on the high grade vehicle they had produced. Mr. Turner, in responding, gave some interesting details with regard to the works, some of which are dealt with above, and, while admitting that Messrs. Crossley were late in taking up motor-cars, added significantly, "We are, however, starting in earnest, and mean to be on the top."

Still Trapping.

THOSE who thought that the advent of the Motor-Car Act would rob the countryside of its police traps need have no fear. The police are still trapping—whether from force of habit or by order of the authorities we cannot say. But Inspector Marks, of the Surrey Constabulary, has acknowledged before the Kingston County Bench that the methods which have done so much to bring the police into disrepute are still being carried on, and that traps are laid on Surrey roads. Not only in Surrey but in the north of England as well, exaggerated views of motor-car speed are being accepted as reliable evidence.

A Reminiscence of the Southport Meeting. Mr. S. F. Edge and his Racer on the Promenade.

Alterations in Quotations.

THE recent publication of the reduction in the price of motor spirit has brought letters from agents in different parts of the country. Apparently some had fairly extensive stocks when the announcement was made, and the way in which clients suggested a lessened retail price rather startled them. Hence the suggestion that in future a longer notice of any contemplated change in price should be given, so that dealers may be prepared.

The Scottish Club.

It was a fully representative assembly that gathered together at Edinburgh on the occasion of the annual dinner of the Eastern section of the Scottish Automobile Club, reported on another page. The Right Hon. Sir J. H. A. Macdonald, K.C.B., presided, being supported by the Right Hon. A. Graham Murray, M.P., Secretary for Scotland, Colonel Duff, Chief Constable Ross, several J.P.'s, and many councillors. The apologists for absence were even more distinguished, including the Premier, two dukes, the Earl of Rosebery, three lords, a M.P., and several sheriffs. The Secretary for Scotland intimated how useful he had been to motorists when the Motor-Car Bill was passing through Parliament. He never spoke—a useful course,

he remarked, because so many who did not know anything about it did speak. Applying the economic theories of Micawber to the new speed limit, he pointed out that if they went at a pace of 19 miles 1,759 yards per hour the result would be happiness, whereas if they went over that, it might end in misery.

Leaving a Car Unattended.

AT the Kingstown (Dublin) Police Court, under the Locomotion and Highways Act, 1896, Mr. James J. Cahill, Donnybrook, has been summoned for allowing his motor-car to stand on the public thoroughfare, thereby causing an unnecessary obstruction. The evidence was to the effect that the vehicle was standing for some time opposite a public-house without anyone being in charge of it. For the defence it was proved that as a necessary precaution against the machine being put in motion, a plug had been removed which would prevent the car being started. Mr. Mahony, the magistrate, said he did not think that there had been any unnecessary obstruction. He did not think that under the circumstances a charge of obstruction could be sustained, as a man was entitled to leave his machine or locomotive outside a particular place for a reasonable time. That was what the defendant had done, and as for taking due precautions against his car being put in motion, the constable had admitted that a certain thing had been done which would prevent it. Without laying down any general rule he would dismiss the case, as he was satisfied that the requisite precautions had been taken. Evidently the Irish legal mind is more tolerant in its attitude towards motorists than are English magistrates.

To Kill 2.

VARIOUS have been the comments made on the numbers placed on automobiles, and not every bystander has clearly understood their significance. At Liverpool, the index letter is K, and the driver of K 2 has been regarded by a local poet writing in a journal of some repute as licensed to "Kill two." No sooner had he realised this fact than he rushed into print with twenty lines of verse. Verily the Motor Car Act is responsible for much more than its authors contemplated.

A Motor-Car Mishap.

A MOTOR-CAR known to fame as L. 15, the property of the Aberdare Valley Motor-car Company, was one day last week leaving the Aberdare terminus for Aberaman, when the petrol pipe broke, causing the front of the car to become enveloped in flames. In view of the celerity with which the fire spread, keen excitement arose among the passengers, all of whom, however, managed to get out of the car without injury. Great credit is due to the driver for the conspicuous presence of mind with which he set about extinguishing the flames, a task which he performed successfully. Just at the moment Inspector David happened to be coming from the direction of the Taft Vale Railway Station, and, having observed the car as it passed down along Cardiff Street, he instantly proceeded to his office, where he gave the alarm to the fire-brigade. Fortunately, the members of the brigade were going through their usual drill, and at once proceeded to the car. In the meantime a great crowd had come together, some of whom ran to the nearest houses to fetch water, by means of which the vehicle had been saved prior to the arrival of the brigade. The motor-car had, however, been considerably damaged, and was taken to the company's works in Gloucester Street by another car.

Wisdom in Winslow.

THE latest addition to the ranks of the Winslow Rural District Council—a locality in the county of Buckinghamshire—is a Mr. Missenden, who has been illuminating the darkness of his colleagues with regard to the intricacies of automobilism. At the last meeting of the distinguished body which now possesses him as a member he declared

that he would like "to see the license of the motor-cars raised to £100 a year, and that the drivers should hold a doctor's certificate as to their mental abilities, as he was afraid that some of them were rather deficient in that respect." Whereupon the other councillors laughed, although the report does not attempt to analyse the reason of their merriment. Possibly some oratorical gesture may have given more meaning to the sentence than appears in cold print. Otherwise the utterance strikes us as conspicuously inane. Rural District Councillor Missenden should understand that the licence applies to the driver and not to the car, and if he meant the registration fee, he should have known that that is not an annual charge, but merely a fee payable once. Probably there are motorists who would like to see a doctor's certificate as to the abilities of councillors, but they have never been so rude as thus to express themselves.

Two Witnesses.

IN the case heard at Kingston the other day, and reported on another page of the present issue, an important point arose. The Act provides that where evidence as to the speed of cars is given two witnesses are required. According to the ruling of the Kingston Bench, one of these can be "looking

the service of use to traders for delivery purposes. There was a possibility of the service being extended to Aveton Gifford and Kingsbridge, but it would be deferred until the Modbury service had been thoroughly established. The company had been registered for a capital of £5,000. Only £2,000 was now required, of which sum between £1,600 and £1,700 had already been promised. The directors had and would continue to work honorarily, and it was evident that they would have the hearty support of Devonshire people.

Technical Instruction.

MUCH interest has been aroused among those concerned with the work of technical instruction in London with regard to the complete plan of instruction now being carried out in Boston, U.S.A. This was outlined in a recent issue by the originator of the scheme, and is a good working basis. It is satisfactory to know that at Battersea, West Ham, Clerkenwell, and elsewhere within the Metropolitan area, those responsible for the engineering classes are not ignoring the automobile. We shall be glad to hear of similar enterprises in the provinces. Tunbridge Wells deserves credit as the first place outside of the

Automobile Racing on the Ormond-Daytona Beach, Florida.—The upper picture shows the Daytona, and the lower one the Ormond end of the Beach.

[Motor Age.]

both ways," and yet be regarded as an exact witness. Such points as these should be carried to a higher court, so that an authoritative pronouncement may be obtained without delay. In the case in question the witness with a stop-watch claimed a speed of twenty-seven miles an hour; the sergeant, who relied merely on his opinion, set the pace at twenty-five miles an hour. If witnesses are to give evidence they should both be similarly provided with watches, and their calculations checked by an independent observer. The issue of the first cases under the Act is certainly disappointing.

A Passenger and Parcels Service.

THE inauguration of the South Hams Motor Carriers, Limited, has taken place in truly British fashion—by a public dinner. This was held at Chubb's Hotel, Plymouth, under the chairmanship of Mr. Gerald Eve, one of the directors, who explained that the company had ordered two 20-h.p. Milnes-Daimler 'buses. It was hoped that these at an early date would run three or four times daily between Plymouth and Modbury, and serve all the villages en route as far as possible. The 'buses would be of such a character as to be used both for passenger and parcel traffic. It was thus hoped to make

Metropolis to recognise the need for technical instruction in automobile matters.

Lights at the Rear.

AT Farnham and elsewhere, motorists have been fined for not carrying red lights on the rear of their motor vehicles, and we would emphasize the danger of carts, vans, etc., being allowed on the roads without lights at the rear. This is a simple matter, and we would urge upon all the great delivery companies, and those who employ large numbers of vans for delivery purposes, to take the hint, in the interests of public safety.

The Prohibition of the Horse.

REPLYING to a question by Sir Joseph Dimsdale, at the London Traffic Commission, mentioned last week, Sir H. E. Knight observed that he would not prohibit the use of horses in the streets altogether, but where they occupied 25 per cent. of the space he would save that by making motor traction compulsory. Pressed as to whether Parliament would ever pass such a law as that he thought there would be no

difficulty if the public convenience would be greatly facilitated. He would not make omnibuses use motor traction immediately, but a law might very well be enacted that all new omnibuses should be constructed for motor traction.

A Hint to Horse Owners.

NOT often do we hear such advocacy of the automobile from one of the City Fathers, and it is significant of the change that is coming, or has come, over public opinion. Sir H. E. Knight's opinions are the most clearly expressed view of the subject we have heard from one in authority and should do much to cause leading London firms to give heed to the importance of the motor-van trials. For, after all, the problem of London's traffic is largely made up of two factors, the length of vans with their horses, and the slow-moving traffic that paces along the busy streets with funereal weariness. The substitution of motor traction would undoubtedly reduce the existing obstruction—and for that small mercy everyone in the City would be grateful. It would also be a convenience if arrangements could be made by which all the streets in a district need not be "up" at one time. The tangled maze of traffic converging at the junction of Shaftesbury Avenue with Tottenham Court Road is a fearsome thing—impossible to behold in any other place than London.

Earl Russell's Advice.

EARL RUSSELL'S views on the Motor Car Act are that test cases should be tried without delay on some of the legal conundrums which have been set. In that we agree, for some of the obscurities will probably be used by country magistrates against the interests of the industry. The power of appeal should also be extensively used, thus securing an opportunity for reviewing the decisions of prejudiced local benches by a more responsible body. No efforts should be lost to influence public opinion favourably towards automobilism both by consideration to other users of the road and by giving rides to people of local influence. Finally Earl Russell recommends that some attempt should be made without delay to formulate what amendments to the law are necessary, so that at the expiration of the present Act motorists may show their unity in a universal demand for more consideration from the Legislature.

Dealers' Marks.

LITTLE has been heard of the marks assigned to dealers under the new Act. The matter, however, is of such interest to the trade that we are preparing a Directory of Dealers' Marks on similar lines to the Directory of Numbers now appearing in the *Journal*. With a view of making the information complete, agents and manufacturers are invited to send us the marks assigned to them, together with particulars of the colours of the plates adopted by their respective councils, and the registration fees charged. On this latter point considerable variety is being shown by the authorities in different parts of the country.

Helping the Industry.

THE Committee of the Automobile Club, as mentioned on a previous page, has decided to give its patronage to the Ninth Annual Automobile Exhibition, to be held at the Agricultural Hall, London, in March. A decision has now been taken as to the application of any monies accruing to the Club from that object, and as a result of the consideration of the matter by the Executive Committee last Monday, they will be applied to the promotion of Dust Prevention and Side-slip Trials, the Investigation of Road Resistance, and generally to such purposes as promote and extend the usefulness of the automobile movement as distinct from the social organisation and development of the Club. This fact will give the trade increased interest in the success of the Exhibition.

Absent-minded Motorists.

HALF-A-DOZEN cases have already come before London magistrates under the new Motor Car Act, and it would appear that carelessness has been responsible for the majority. At Lambeth three cases were heard on Monday, in which the absence of identification plates led to fines. At the South-West London Court an owner was fined 20s. for permitting an unlicensed driver to drive his car, and at Marlborough Street a motorist was fined for not producing his licence when required to do so by the police. The period of grace has passed, and motorists must now recognise the power of the law.

The Parish Motor-Car.

In the Towcester Union some of the workhouse inmates enjoy a trip in a motor-car while the owner, a guardian of the poor, is deliberating with his fellow guardians as to their maintenance and welfare. North of the Tweed the idea is likely to be developed, for the Glasgow Parish Council is considering a proposal to provide a £500 motor-vehicle for the conveyance of the parish poor from one district to another. At present this is done by means of a horse and 'bus—a form of locomotion in vogue in the days of the Pharaohs. It appears that the 'bus has become weary of its travelling and a new vehicle of some kind is as necessary as a change in the weather. A new 'bus with equipment would cost £296, but the upkeep of the horses required for its performance of its work is £364, while Mr. Adam, the Convener of the Finance Committee, estimates that the upkeep of a motor-car for the same amount of work would be only £261. Thus by the adoption of the newer methods the cost per head in carrying the poor patients would be but 6d. as compared with the 9d. now expended. Seeing that this is a saving of 3d. per head, or body, the mere Southron would not have been surprised had the proposal been accepted on the spot. It was, however, decided to postpone a decision till the next meeting. Probably some of the Glasgow Parish Councillors were afraid of making the infirmary and the workhouse too popular.

THE Stafford Rural District Council has resolved to apply for the imposition of the ten mile limit.

THE Automobile Club of Avignon has fixed August 28th as the date of the annual hill-climb up Mont Ventoux.

THE Town Council of Blackpool are making application to the Local Government Board for authority to restrict the speed of motor-cars to ten miles an hour in the whole of the borough.

THE Executive Council of the County Councils Association has adopted the report of the Motor Car Committee and of the conference held on the 7th inst., between representatives of the County Councils and Municipal Corporations Associations and of the Local Government Board and Scottish Office, with the slight modification that the hollow triangle to be erected to mark dangerous places should be coloured red instead of green.

THE Duke of Westminster had a mishap with one of his motor-cars on Sunday evening. The vehicle collided with considerable force with a wall adjoining the Buerton entrance gate to Eaton Park. A portion of the wall was knocked down, and the car was badly damaged. Fortunately, the duke and the other occupants escaped with nothing worse than a severe shaking.

JUST as we go to press we learn that on Wednesday Messrs. Harvey Du Croz, Jun., and C. Sangster successfully drove a 15-h.p. Ariel motor-car, via the Mountain Summit Railway, to within a short distance of the summit of Snowdon, a drift of snow six to seven feet deep preventing further progress. The average grade of the cog wheel rack mountain railway is 1 in 7. It is hardly necessary to mention that this is the first occasion on which a motor-car has travelled up Snowdon.

The "Crossley" Petrol Motor-Car.

Fig. 1.—View of Chassis of "Crossley" Car.

As recorded on another page, the well-known engineering firm of Messrs. Crossley Brothers, Limited, Manchester, whose gas engines are known throughout the world, have taken up the construction of motor-cars. For the present they are confining their attention to one type of car only—a vehicle fitted with a four-cylinder vertical engine which, while nominally rated at 22-24-h.p., develops nearly 30-b.h.p. The object the designers and builders have had in view has been not to produce an entirely novel vehicle, but rather one combining the best features of Continental practice with the highest grade of British workmanship and material, the idea being to build a car which shall be second to none in quietness and steadiness of running, durability and reliability. Associated

to point out that whereas in the early days of the automobile movement it was almost impossible to obtain anything but a photograph showing a general view of the motor-car, nowadays drawings and photographs of the various components which go to form a complete *chassis* are much more readily supplied. In the case of the "Crossley" car this facility of clearly illustrating the details has been accorded to a most liberal extent, it being simply pressure on our space which prevents us from publishing several illustrations in addition to those given herewith.

As will be seen from Figs. 1 and 4, which show respectively an elevation and an outline view in plan of the *chassis*, the general arrangement follows what may be termed standard lines, the engine being set under a bonnet in the fore part of

Fig. 2.—View of "Crossley" Motor—Inlet Valve Side.

Fig. 3.—View of "Crossley" Motor—Exhaust Valve Side.

with the enterprise of Messrs. Crossley Brothers, Limited, are Mr. J. S. Critchley, who is responsible for the design, and Messrs. Charles Jarrott and Letts, Limited, who are putting the cars on the market under the name of the "Crossley." Before commencing a description of the new vehicle it may be interesting

the frame. The latter is of pressed steel, narrowed at the front to allow the front steering wheels to take a larger lock than is possible with rectangular frames. The motive power is supplied by a four-cylinder vertical engine, two views of which are given in Figs. 2 and 3. The cylinders with their water-jackets are

cast in pairs from a special quality of iron. The valves are all mechanically operated, and located on opposite sides of the engine, the inlets being on the right—looking from the driver's seat—and the exhausts on the left. The inlet valves are nickel steel, while the exhaust valves are made of a special quality of phosphor bronze, to which it is claimed no carbon will adhere, and which will withstand a high temperature without pitting. The cylinders are $4\frac{1}{2}$ in. diameter by $5\frac{1}{2}$ stroke, the engine running normally at from 900 to 1,000 revolutions per minute. The connecting rods are of mild steel, and the crank shaft is made from a solid nickel steel forging. In turning it up on the lathe it is held in the machine in a special way, so that there is no strain on the cranks during the operation, and consequently preventing any set or spring. The cranks for each pair of cylinders are set at an angle of 180 deg. to each other. Large phosphor bearings are fitted between each crank, the main bearing $4\frac{1}{2}$ in. long. The piston rings, of which there are five to each piston, are made in a special way on a machine of Messrs. Crossley's own invention, the object being to produce a circular ring with the necessary spring; instead of the usual angular split, the two ends are cut concavely thus (), a pin in the piston wall fitting in the opening thus formed in the rings, to prevent the latter from working round when the engine is in operation.

alignment of one hole to the other. The cylinders are bored for the piston on a special machine with a similar object; while, to ensure a perfect balance, the piston and connecting rods are identical in weight.

One of the special features of the car is found in the carburettor, which is of the automatic air-regulating variety, the suction of the engine being utilised to so adjust the supplementary air inlet of the carburettor that the latter furnishes a correct mixture at all engine speeds. The carburettor is seen in Fig. 3, but we hope to illustrate this interesting device in detail in a subsequent issue, when its method of operation will be more clearly understood. In the meantime, we may mention that, in addition to the usual float and spraying chambers, there is a third one, in the bottom of which is a quantity of mercury. The latter is divided into two parts by means of a little cylinder of a smaller diameter than the outer casing. The cylinder does not extend quite to the bottom of the latter, so that normally the mercury is at the same height on the inner and outer sides of the cylinder. On the surface of that on the inner side is a float connected by a spindle with the adjustable air-valve above. The mercury is exceedingly sensitive in responding to the variations of the suction of the motor, the level changing to a degree corresponding to the slightest fluctuation in the suction, and the float, following

Fig. 4.—Plan View of Chassis of "Crossley" Car.

| D. Combined Water Tank and Radiator. | | K. Rear Internal Brakes. | |

Furthermore, to prevent any unequal expansion and contraction of the piston rings, the water jackets extend to the bottom of the cylinders, so that the piston and its rings in their travel do not get below the water line. The water circulation is maintained by a gear-driven pump and a combined honeycomb radiator and water tank; a belt-driven fan running at a speed of 1,500 revolutions per minute induces a powerful current of air through the tubes of the radiator. To prevent any slipping of the belt which drives the fan, unusually large pulleys are employed. The ignition is by means of a magneto, the gear wheels which drive this running on ball bearings. Provision is made whereby the usual high-tension system of ignition can be fitted in addition to the magneto, and the sparking plugs can be located either over the inlet or exhaust valves as desired. Extreme care is taken in drilling the pairs of cylinders, no less than sixty-five holes of different sizes having to be made in each pair for one purpose or another. To this end a casting, consisting of a pair of cylinders and their water-jackets, is rigidly locked up in a box. The latter is perforated with the various holes, and forms a jig, from which the casting is not removed until every hole has been drilled, thus ensuring perfect

the mercury, opens or closes the air inlet proportionately. To ensure ready vaporisation in all temperatures, the carburettor is provided with a water-jacket. In addition to the usual throttle-valve in the admission pipe close to the carburettor, a further means of controlling the engine is provided by a special arrangement by means of which the gas can be cut off at any part of the stroke of the pistons. This is a device which has given excellent results in Messrs. Crossley's gas-engine practice; it is located on the inlet-valve side of the motor (see Fig. 2), and is arranged to be controlled either by the governor or by hand from the steering wheel. The levers controlling the throttle-valve and ignition advance and retard are mounted on the steering wheel, as in the Mercedes and other high-grade cars. By means of the cut-off arrangement and the special carburettor, the engine can be run at any speed from 80 revolutions to the maximum, rendering the car not only very silent and economical in fuel consumption, but enabling the vehicle to be almost entirely driven on the top speed.

The two cam shafts, the governor, and the pump and magneto driving gear are entirely enclosed. Special attention has been devoted to the lubricating arrangements, a notice-

able feature of the lubrication of the engine and main bearings being that the oil is fed from below, instead of from above as usual. The exhaust gases are employed in keeping up a feed of oil under pressure. The oil tank is, however, not combined with the sight-feeds on the dashboard, but is separate from the latter. The sight-feeds, of which there are nine—three for the engine and six for the gear-box—are provided with a compartment through which a part of the engine-cooling water is made to circulate; in this way the oil is kept at a constant degree of consistency, enabling a steady feed to be maintained to the different bearings.

The engine and gear-box are supported directly from the main frame, no under-frame being employed. The gear-box is suspended at four points, but, to allow for any strain, joints, as will be seen from Fig. 4, are introduced between the clutch and the gear-box, and on the differential shaft. The friction clutch, of which a very clear view is given in Fig. 5, is of an entirely new design; it is of the metal-to-metal type, and consists of two shoes, which are brought into contact with the internal face of the fly-wheel by a central boss which forces out the two arms. Only a slight movement of the pedal is necessary to engage and disengage the clutch, while the spring employed is, as will be seen, but a light one, which can be readily adjusted. The gear-box is of large dimensions, to enable pinions of ample size and wearing surface to be employed. Four speeds forward and a reverse are provided, the drive on the top speed being direct. The two shafts are arranged side by side and on the same plane. From Figs. 4 and 6 it will be seen that each shaft in the gear-box terminates in a bevel gear meshing with corresponding pinions on the differential shaft. On the first three speeds the power is transmitted through the larger pair; for the fourth, the third speed wheel is advanced until a stepped clutch on its side meshes with a corresponding clutch connected with the smaller bevel pinion. The four speeds are estimated at respectively 11, 22, 35, and 48 miles per hour, with the engine running at a speed of 1,000 revolutions per minute. From the differential shaft, which runs on ball bearings, the power is conveyed to the

one being curved in its central part and the rear one cranked to allow of a low frame. The clutch and brake pedals are of the push-forward type. The rear brakes, actuated by a hand-lever, are of the internally expanding variety, entirely enclosed. Like the countershaft brake, which is of the metal-to-metal contracting pattern and operated by pedal, they act equally well whether the car be travelling in a forward or backward direction. The road

Fig. 6.—View of Change-Speed Gear Box on "Crossley" Car.

wheels are of strong construction, the front pair being 910 mm. diameter and shod with 90 mm. tyres, and the rear pair 920 mm. by 120 mm. The wheel base of the car is 8 ft. 3 in. and the gauge 4 ft. 9 in. The chassis weighs a little over 17 cwt., and is, of course, adapted to receive any kind of carriage body. Large phosphor bronze adjusting nuts are provided on the radius rods, these being impervious to rust, and so not affected by exposure to bad weather. A little detail, which adds much to the easy running of a car, is that helmet lubricators are fitted to the radius rods and all small bearings, such as those on the levers connecting the pedals and hand levers to the brakes, change gear, etc. Another little point to which attention may be drawn as illustrating the care which has been devoted to the details is that the plain parts of the bolts are square in section, and fit in correspondingly square holes, while all the nuts are of the Castle type and pinned. From the foregoing description it will be seen that the "Crossley" car is on up-to-date lines throughout, and reflects credit on all connected with its production. We are looking forward to a run on one at an early date.

PHANOMEN.

Fig. 5.—View of "Crossley" Clutch.

rear wheels through Renold roller chains. The steering is controlled by an inclined hand-wheel, and is of the worm and sector irreversible type; the steering rods, which have provision for adjustment, are of very large diameter, and have large special joints. The pivots of the front steering-wheels are supported both at the top and bottom, and run on ball bearings.

The frame is carried on long springs, those at the rear measuring 42 in. The axles are of H section solid steel, the front

To meet the demand for a popular-priced car, the Belsize Motor-Car and Engineering Company, Limited, are bringing out a 6-h.p. two-seated vehicle to be known as the "Belsize Junior."

A COMPANY has just been formed in Liege, Belgium, with a capital of £2,400, to be known as La Compagnie de Transports Automobiles.

AN Australian correspondent informs us that Mr. J. P. Wallace, of the Wallace Tyre Company, Melbourne, has lately imported a 12-h.p. Benz Parsifal car.

As many motorists have learned to their sorrow, the cost of repairs is an item of magnitude with some cars, and frequently acute dissatisfaction has been caused by their excessive nature. The Mobile Company, of San Francisco, have adopted a novel policy to lessen this dissatisfaction, a guarantee being given that repairs to cars purchased from them will not exceed an agreed sum per month, accidents excepted. Should the repairs be less than the guarantee the owner gets the benefit.

THE MOTOR CAR ACT.

SOME of the letters lately received with reference to the Act now in operation will be found in our Correspondence columns; the purport of others will be seen in the references which follow, in which an endeavour has been made to answer some of the inquiries addressed to us, and to explain some difficulties that have already occurred to motorists.

Licensing.

M. A. N. asks if a licence has to be taken out during the period of pupillage. Most certainly. While the intending motorist is a passenger only, no licence is, of course, necessary; but the handling of the steering wheel renders a licence essential. A good many relatives of motorists have already taken out licences in anticipation of becoming practical drivers—although at present they do not even own a car.

Dealers' Marks.

"Do you know of any county where dealers' general identification marks are obtainable at less than the maximum amount, viz., £3?" asks A. W. H. Perhaps our readers can enlighten our correspondent, who must remember, however, such marks can only be assigned by "the Council of any county or county borough in which the business premises of any manufacturer of, or dealer in, motor-cars are situated"—a clause which makes it impossible for any dealer to register the cars engaged in the ordinary way of business outside his own county.

E. S. asks: "I have had to pay £2 for registration. Is this right? If I let cars on hire, has each to be licensed?" The maximum fee for registration is £3, each authority being free to charge what it likes below that sum. Each car let on hire has to be registered and numbered in the ordinary way, a general identification mark not being applicable in such cases.

Fore-Carriages and Trailers.

A prospective motorist writes:—"I understood that a motor-bicycle and fore-car or side car, coupled, is regarded as one vehicle, but have been informed that the fore-carriage and motor-bicycle should each pay a separate duty. Which is the correct view, and what is the position with regard to trailers?" While the Act does not define a motor-cycle, it makes such a distinction with regard to the weight of cars and cycles that Councils can hardly be expected to register as motor-cycles any machines weighing more than 3 cwt. or having more than three wheels. A fore or side carriage with a motor-bicycle should be regarded as a motor-cycle—the trailer adds another wheel, so the combination may alter the conditions for revenue purposes. Care should be taken in registering automobiles that in the space for a de-

scription of the vehicle all its features are set forth. Regard must also be had to the provisions of the Customs and Inland Revenue Act, 1888, and from the Bridlington case, reported last week, it is clear that the authorities are inclined to regard a trailer as a separate entity. Thus a duty of fifteen shillings would be required for each. On the other hand, if a motor-bicycle and trailer were classed as one vehicle the duty would be £2 2s., such combination having four wheels. Thus comes the anomaly that, while one registration may suffice, two duties will have to be paid. Regarding the motor-bicycle with its fore-carriage as one vehicle of less than four wheels the Inland Revenue authorities should be satisfied with the fifteen shillings duty on such a combination.

Duties on Cars for Hire.

L. B. asks "If we keep a car for hire purposes only and obtain a hackney carriage licence, shall we require another licence at two guineas?" Provided that the light locomotive does not exceed more than one ton in weight unladen, no additional duty is imposed under the Motor Car Act, 1903. In such a case as mentioned by L. B. it would be liable to duty under section four of the Customs and Inland Revenue Act, 1888, which fixes the duty on hackney carriages with four or more wheels at £2 2s. and on vehicles with less than four wheels at 15s.

Foreign Motorists in England.

An Antwerp correspondent writes:—"I shall be very much obliged to know through your paper how the new Act will affect foreigners, as I intend touring in England for a week or so next spring. Shall I want a number plate or a licence, and if so, how am I to obtain same before or on landing? If I want a number plate my car will be a sight indeed, and it will be 'hard lines' on my car. A plate for Belgium, one for Holland, one for France, and one for England! And what about police traps? Supposing I am caught, fairly or not, and I give my correct address *here*, will I be tried on the spot or will I be summoned later, and have to go to England or to appoint a solicitor to avoid being judged by default? In case all this red-tapeism to which we here are used, or supposed to be, has to be complied with by any foreigner touring in your country for say a fortnight or three weeks, many will no more think of it, certainly not yours truly." In such a case it will be necessary to register the car and secure a licence, the latter only being obtainable in the district where the tourist makes his headquarters while here. Then he must drive carefully, should he wish to avoid the awkward consequences of police activity.

PRACTICALLY every motorist has his own idea as to the best way to illuminate at night the number plates on his motor-car or cycle. It would be exceedingly useful if readers would send, for reproduction in the *Journal*, particulars, together with sketches or photos, as to the various ways the difficulty may be overcome.

"SOME motorists are said to have adopted Roman numerals in place of ordinary figures. This will puzzle some of our friends in blue when they see a car go by with a good long line of letters on it instead of figures, as, for instance, 'F—CLXXV.'" This extract from a letter suggests some ingenuity but also an illegality.

UP to the 22nd inst. there had been registered in the borough of Leicester 58 motor-cars and 91 motor-cycles; 183 licences to drive had been issued. In the county of Norfolk the figures were 186 motor-cars and 48 motor-cycles, with 189 drivers' licences.

At the South-western Court, on Tuesday, Frank Fellows, of Offley Road, Brixton, charged with driving a motor-car after nightfall without the rear identification plate being illuminated, got scant sympathy from the magistrate. The defendant's plea was that he was unaware that the light was out, and explained that he had no means of ascertaining the fact without dismounting. Mr. Garrett said motorists must bear the responsibility, and imposed a penalty of 10s. with costs.

A Reminiscence of the 1903 Paris-Madrid Tour. Excitement of the Natives at Venta di Banos. Puzzle—Find the Motor-Car.

CONTINENTAL NOTES.

A LITTLE flutter of excitement has run through German motoring circles during the past week owing to a speech of Count Schlieben in the Upper House of Parliament, in which he raised the question of the danger to the public by automobile racing, and particularly during the Gordon Bennett race. The Minister of Justice, in reply, pointed out that a most strict enquiry was going on into the provisions being made for the public safety. The Duke of Ratibor, the president of the German Club, went to some trouble to explain the arrangements being made by the Club to this end. The incident closed by Count Schlieben announcing that his object in raising the question was not to raise a tempest against motorists but to draw attention to the speed excesses of a certain class of drivers and the dangers these present to the public. Messrs. Opel, of Russelsheim, the German licencees of Darracq cars, have entered three of these

single cylinder motor and has belt transmission. It is designed to carry a load of 15 cwt. at an average speed of $11\frac{1}{2}$ miles per hour. The electrical van (Fig. 2), which is used in the Parcels Post service, was constructed at the carriage works in Berlin of Herr C. Klemt; the electric motor is connected up to the front wheels of the vehicle. A battery of 42 accumulators furnishes sufficient energy to carry a load of a ton a distance of about 20 miles on one charge.

THE German automobile Club has fallen into line with the French and English Clubs by forming a motor-boat committee, which will at once make the necessary arrangements for the races it is proposed to hold at Kiel during the coming season.

DURING the course of the forthcoming automobile exhibition in Turin, a meeting of delegates of the various automobile clubs in Italy will be held, with the object of forming an Italian Automobile Federation.

Fig. 1.—The Alcohol Motor Van.

Fig. 2.—The Electrical Motor Van.

THE MOTOR-VANS IN USE BY THE POSTAL AUTHORITIES IN BERLIN. [Allgemeine Automobil Zeitung.]

vehicles for the German eliminating trials for the Cup team. It is stated that one of the Benz Parsifal cars will be driven by Madame du Gast.

A RUMOUR is current in Paris this week that M. René de Knyff has definitely decided not to compete in this year's Cup race, and that the Panhard team will consist of Messrs. Henri and Maurice Farman and M. Teste. Messrs. Panhard and Levassor are building six cars for the Gordon Bennett race, three for the eliminator tests and three for reserve in case of accidents. They are of an entirely new pattern, differing altogether from the vehicles that have so far been produced by this company. The three Austrian cars are to be driven by Werner, Braun, and Hieronymus, all drivers of repute.

As mentioned in a recent issue, two motor-vans are at present being used by the postal authorities in Berlin, one being propelled by an alcohol motor and the other by electricity. We are now able to give illustrations of the vehicles in question. The 5-h.p. alcohol van (Fig. 1), which is being employed for the carriage of mails between the G.P.O. in the German capital and the suburbs of Schöneberg, was built by the Berliner Motorwagenfabrik Gesellschaft, Tempelhof; it is fitted with a

A COMPANY has just been formed in Paris to be known as La Société des Transports Automobiles Varengeville-sur-Mer, Dieppe et le Littoral, to run a public motor-car service between the places named.

THE annual consumption trials known as Le Critérium de Consommation, organised by the "Auto," will be held on March 3rd, 4th, and 5th. This year, however, the classification will not be made on the consumption alone, but also on the speed. The trials will be open to the usual classes of cars ranging from under £200 to over £1,600 and for (1) industrial vehicles carrying under a ton and (2) for lorries able to carry over a ton. Times will be specially taken on the Picardie Hill over 500 metres. The marks will be allotted according to the following formula:—(1.) For the consumption per ton of total weight the marks will be the number of litres consumed divided by the total weight in tons and multiplied by the coefficient 10. (2.) For the consumption per ton of useful load the marks will be the number of litres consumed divided by the useful load in tons and multiplied by the coefficient 10. (3.) Regularity of running and mean speed. No competitor who covers the course in less than four hours (an average speed of 25 kilometres per hour) will be penalised, but every car that

D

maintains a lower average speed than 25 kilometres will be penalised as follows: the difference between the average speed of the vehicle and the minimum average speed demanded will be expressed in kilometres and multiplied by the co-efficient 25, and the resulting number deducted from the marks obtained. Already four Chenard-Walcker, three Creanche, and four Gillet-Forest cars have been entered.

A Snapshot on the German Gordon Bennett Course.

THE Belgian Automobile Club has issued a circular to its members urging them to conform to the police regulations with regard to speed, etc., and to insist on a similar observance of the rules on the part of their mechanicians.

THE preliminary programme of the Cannes "automobile week" has now been issued; it is to be held from the 13th to the 19th March next. On Sunday, the 13th, there will be a gymkhana on the new Albert Edward jetty; on the 14th the first part of the touring competition, consisting of a run from Cannes to Grimaud and back, will be held; the 15th will be devoted to hill-climbing trials; the 16th to trials of various accessories; for the 17th is fixed the second portion of the touring competition, the course being Cannes to Vince and back. A *rallye-papier*, or paper hunt, will be held on the 18th, followed by an exhibition and distribution of prizes on the 19th inst.

A NEW departure is being made by Messrs. Gillet, Forest and Company. It will be remembered that this French company has for some time made a feature of the construction of motor delivery vehicles. A separate company has just been formed in connection with the concern, the object of which will be to hire out to tradespeople motor-vans for the delivery of their goods and parcels.

At the last meeting of the French Chambre Syndicale de l'Automobile it was decided to adhere until the end of 1905 to the same basis of classification in motor-races as heretofore, viz., classification by weight.

FOLLOWING the example of England and France, a Belgian Dust Prevention League has just been formed in Brussels. It will receive the support of all the automobile clubs in the country, and will probably act in conjunction with the Ligue Contre la Poussière lately formed in Paris.

THE "HORBICK MINOR" CAR.

IN a recent issue we mentioned that Messrs. Horsfall and Bickham were bringing out a 6-h.p. two-seated car to meet the demand for a light motor-vehicle at a popular price. There are a number of special points about the new car, which, however, we are for the moment precluded from describing, owing to the question of securing patents, but we herewith give an outline view, together with a few general particulars. The motive power is supplied by a 6-h.p. vertical motor, set in the fore part of a tubular steel frame. The usual high-tension system of ignition, with wipe contact maker, is fitted. The water circulation for the cooling of the engine can either be by means of a pump or on the thermo-siphon system. It may also here be mentioned that the inlet and exhaust valves are interchangeable with those of the 6-h.p. De Dion motor; in this way the purchase of "spares" will be greatly facilitated. One of the special features of the car is the combination with the engine of a reducing gear, which transmits power through a secondary shaft at 700 revolutions per minute, or thereabouts, according to the sizes of the wheels used. From the motor clutch to the rear axle the power is transmitted by means of a rigid-shaft with a flexible coupling at the clutch end only. The change speed gear is combined with the transmission to the rear axle, two speeds and reverse being provided. The gear, which is always in mesh, is on the skew bevel principle, and claimed to be more silent than the ordinary bevel wheels. Furthermore, it obviates the necessity for breaking the shaft and rear axle where they cross each other, and where the strength is required. The engine is controlled by the throttle and ignition levers; and by means of these, together with the change gear, any speed from four to twenty-five miles per hour can be obtained. The wheel base of the vehicle is 5ft. 4in. and the overall width 4ft. 2in.; the approximate weight of the car is 7 cwt. Steering is controlled by an inclined wheel, while the foot and hand brakes are of the double-acting metal to metal type. Ball bearings are fitted to both the front and rear axles; the road wheels are 28in. in diam., shod with 2½in. pneumatics. The car is neatly upholstered and painted, and has ample room for the fitting of a

Outline Elevation of "Horbick Minor" Car.

third seat or a touring or a travellers' basket. The "Horbick" cars enjoy a well-merited reputation, which the "Horbick Minor" may be expected to fully maintain.

AN automobile club is to be formed for Huddersfield and district.

MESSRS. J. R. RICHARDSON AND COMPANY, LINCOLN, LIMITED, of Lincoln and Saxilby, have now got their new works at Saxilby in running order. The works cover an area of 10,000 square feet, and are fully equipped with the latest pattern machine tools of all descriptions. In addition to the manufacture of cars Messrs. Richardson are devoting themselves extensively to repairs to all makes of vehicles. There are three testing pits, and above the repairs bay runs an overhead travelling crane, by which a car can be easily stripped, the engine lifted out, or, if required, the car carried bodily to any part of the department.

SOME DRIVING HINTS FOR AMATEURS.

WE will imagine that you have passed through all of that kindergarten part of your novitiate wherein you have learned the mysteries of what the various levers, clutches, gears and such like are. You have attentively sat beside a not-over clean young man and been shown by him how near you can come to running into or being run into by someone else, and yet escape. All this and a lot more has been indiscriminately shovelled into your knowledge box, and mentally ticketed "automobile knowledge" by you. Proceeding now upon your matriculation at the Experience High School, you are alone in the car and are endeavouring to make use of some of the "knowledge" you have. You have duly "turned the crank," wisely examined and tested the sparking, lubrication, fuel supply, etc., and have finally got the car started. You are on the second speed, and as you do not desire to secure your stock of experience in large lumps, wisdom will tell you that for the first few times second speed should be your favoured one. As you go smoothly on your way, each moment gaining confidence and losing nervousness, gently press down the pedal occasionally so that you may grow accustomed to its use, and learn how much throwing out the clutch has to do with checking the speed of the vehicle. Be careful, however, to do this slowly, and do not let the car lose too much headway, since picking the second speed up again is not the best thing in the world for your gears.

Press down the brake pedal from time to time, and learn how much stopping power it endows you with. When you feel thoroughly at home with the second speed, and realize that you have control of the car, change on to your third, but before doing so be sure to select a fairly good length of straight road to experiment on. The change is effected by pressing down on the clutch pedal; when this is done move the lever into the next notch, and when it is there, let your pedal come up gently. In practising changing speed, it is well to select a down grade, not a hill, but just a very slight incline, as then the car will run on, and you may be more deliberate about your pedal and lever movements. Throw out the clutch frequently, as before advised, and use the pedal brake gently to acquire a knowledge of the effect on your third speed. Practice this well, for by judicious use of the clutch and gentle applications of the foot brake it is frequently possible to slow up just enough to enable you to get through traffic without shutting down. "On my car," remarks Mr. T. B. Trenholme in the "Automobile Magazine," "I rarely use the second and first speeds except for starting, running through crowded traffic and hill climbing." There is, however, one instruction that should be given, and that is, when you have changed on to your third or top speed, you should have retarded or throttled down the engine speed, and by moving the accelerator have given the governor full play. It is not wise for the novice to drive at top speed right off the reel. You can accelerate gradually as you gain more confidence and feel more certain of yourself.

The next step in your education is hill climbing; and the foremost thing in doing this successfully is for you to acquire the trick of changing speed in conformity with the gradient attacked. This, indeed, can hardly be called a trick—it is almost an instinct. To begin with, wherever possible, it is well to put the car at a hill at its best gait on its top speed. It will rush up well at first, but gradually you will feel it slackening. You have the throttle wide open or the accelerator down already, and the only thing to be done in case the car will complete the climb on the top speed is to slow down the ignition. Mind and do this, or the motor will knock—indeed, too early explosions with the engine running slow have been known to break crank shafts. So slow down ignition as the car itself slows.

Eventually it becomes apparent that the car is not going to climb the hill on its high speed, and the throb of the engine becomes accentuated. This is the moment, or, indeed, rather before, but you will learn it as you go—the psychological moment to come down to a lower speed. Changing down is not so easy as changing up, and requires more practice. When properly done, grinding or groaning should in no way be in evidence, and there

should be no forward or backward jerk of the car, which should glide on as though nothing had happened, and you alone in the car should be conscious that any change has been made. To do this successfully, however, is an instinct that comes by practice—sooner with some, later with more, and never with not a few. So you have got to practice it until you have proven which of the three classes you are destined for!

Remember, when in your desire for less speed or more power you throw in the gear lower than the one you have been travelling on, that it is not necessary to withdraw the clutch wholly—indeed, some well-known drivers claim that, if the change is effected at the proper moment, there is no need to withdraw the clutch at all. The clutch should be withdrawn sufficiently to admit of it slipping, just how much varies with every car, and the knowledge of the exact amount will only come with practice. Do not delay until the last moment for coming down to a lower gear, but drive on that gear upon which you are running to the best possible advantage. That is to say, keep the engine running at its normal speed as long as possible by the manipulation of the throttle and sparking. When the speed of the engine begins to drop slightly below the normal, and you feel it labouring, then change, but not before. In passing over the top of a hill, do not be in too great a hurry to change to high speed again. The man who bangs in his second or his third before the engine is ready shortens the life of his vehicle, besides laying up a store

A Young Amateur. (Motor, New York.)

of trouble for himself. If you succeed in surmounting the hill on your first, wait until you hear the engine cut out before you change on to the second speed, and then wait again until the cut out comes before you once more slip in the third.

In coming to a stop learn early to avoid using the brakes. The man who rushes up at full speed to his destination and then jams on brakes should have his car taken away from him. There are times, of course, when the brakes must be used for a sudden stop; but for all ordinary slow downs the clutch pedal should be depressed and the car allowed to slow naturally and easily without being brought up with a bang as though it had run into a wall.

THE British Motor Fittings Company of Birmingham have just brought out a new 6-h.p. single-cylinder vertical high-speed motor. The cylinder dimensions are 4-in. bore by 4-in. stroke, the engine developing about 7½-h.p. on the brake.

"HAZELL'S Annual" now ranks among the reference works regarded as authoritative volumes. As is well known, the plan of the work is alphabetical, and current subjects are brought thoroughly up-to-date, e.g. the fiscal questions, to which 29 pages are devoted. Several new articles have been added, while the figures have been obtained from official sources. Altogether "Hazell's Annual" for 1904 well sustains the reputation gained by earlier volumes.

MOTOR-CYCLING NEWS.

A NEW motor-cycle engine has recently been introduced by Messrs. White and Poppe, Limited, of Foleshill, Coventry. Fig. 3 gives a general view of the motor, which comprises several distinct and advanced features in combination with excellence in workmanship. The cylinder is 80 mm. bore by 85 mm. stroke,

Fig. 1.—Front Elevation of Water-cooled Motor.

Fig. 2.—Side Elevation of Air-cooled Motor.

the compression being $4\frac{1}{2}$ atmospheres, or about 64 lbs. to the square inch, and the normal speed 1,800 revolutions per minute. The inlet and exhaust valves are mechanically actuated and are interchangeable. An interesting departure is the detachability of the valve seatings (Figs. 4 and 5), the inlet valve and its seat as also the exhaust valve and seat being so fitted that they can be removed for purposes of grinding or examination, a convenience which will be appreciated by those who have had experience of grinding in exhaust valves. Each seating is held by two bolts and lock nuts, and there

Fig. 3.—General View.

is no asbestos joint to be broken and remade. Provision is made for adjusting the valve lift stem, so that the total length from cam surface to valve seat is maintained, irrespective of wear. This is obtained by forming the valve lifter on rather stouter lines than usual, and into the top of this screwing a

square-headed hardened steel bolt, which may be turned in or out to maintain the desired lift of valve and the correct timing. Large diameter heavy flywheels are used and ample provision is made in the way of bearings, which are of hard phosphor bronze. The engine, which is made both in the air-cooled form and with a water-cooled head (Fig. 1), is fitted with wipe contact for trembler coil, but in this matter some latitude is allowed individual purchasers, whilst the combustion head is so arranged that the sparking plug may be placed centrally over the piston, or directly over the inlet-valve at the side.

A 150 KILOMETRE motor-race was held between Barcelona and Ignatada, Spain, on the 17th inst. Of the fifteen starters only four finished, owing to the bad state of the roads. The event was won by Sr. Abadal, who on a $3\frac{1}{2}$ -h.p. Werner covered the distance in 3 h. 21 min.

Fig. 4.—Inlet Valve and Seating Fig. 5.—Exhaust Valve and Seating removed from Cylinder.

OUR French contemporary, "L'Automobile," in its last issue gives several illustrations and a long description of a steam motor-bicycle which has lately been completed by M. d'Espugols. The machine is of 2-h.p., the engine being supported on one of the back stays of the frame and driving on to a spur wheel connected with the hub of the rear wheel. The water and fuel tanks fill the upper half of the opening in the frame, the boiler, which uses paraffin as fuel, being located in the bottom half. The machine complete with fuel and water weighs 105 lbs.

THE German Cyclists' Union has fixed June 5th for the start of its motor-cycle reliability trial from Frankfort-am-Main to Berlin.

THE Auto-cycle Club de France proposes to hold a race for motor-cycles from Paris to Bordeaux during the coming season.

At the annual meeting of the Bristol Bicycle and Tricycle Club it was decided to alter the title, so that the club will now be known as the "Bristol Bicycle and Motor Club."

THE second annual meeting of the Liverpool Motor Cycle Club was held last week, when it was decided to admit owners of motor-cars to the club, and to change the title to "The Liverpool Motor Club." The secretary's address is 80, Gloucester Road, Bootle.

A GERMAN firm, the Cyclon Maschinenfabrik, of Berlin, has recently introduced the novel motor-carrier tricycle shown below.

As will be seen, the engine—of $2\frac{3}{4}$ -h.p.—is located in the old Werner position and drives the front wheel by means of a belt. The makers state that, in addition to the rider, the machine can easily transport a load of 4 cwt.

[Allgemeine Automobil Zeitung.]

SOME USEFUL NOTES.

A USEFUL little tool to facilitate the removal of exhaust valves has lately been put on the market by Messrs. Bransom, Kent, and Co. It consists of a light metal frame work; in the centre of the top cross-bar a lug is fixed, in which an endless thumb-screw works. At the bottom of the thumb-screw a bucket washer is fitted, and shaped in such a manner as to make it adapt itself to the head of the valve. At the bottom end of each side of the frame the metal is turned over to form a loop,

in which a bar is made to slide. At one end of each sliding bar is cut a notch, which fits in the recess of the under part of the washer or collar which keeps the spring in position. It will be seen from the illustration that the three operations performed by this tool at one time, namely, holding the valve down, lifting the washer or collar, and compressing the spring, enable the operator to have free use of both hands for extracting the cotter. It is adjustable to fit any size of De Dion type engine, and folds into a small space when not in use.

HAVING had a few cases in which the hoop wire has not been occasionally cleaned and greased, thus allowing rust to set in, the Parsons Non-Skid Co. have now adopted a high grade of nickel steel for the stranded wire forming the hoop. Although this is less prone to rust, it is always advisable to examine and grease the hoop occasionally when reversing the Non-Skid upon the tyre, for the purpose of the wear alternating on each side of the chains. Naturally, if, when adjusting the coupling, the screwed ends of the hoop are allowed to turn, some unstranding of the wire might take place, and therefore a handy twin spanner is now supplied, the use of which absolutely avoids any trouble in this direction.

It does not seem generally recognised that by turning the Non-Skids inside out occasionally the reverse side of the chains can be made to take the wear, and if this reversing is done at intervals, the life of one set of chains in the Non-Skid is quite doubled. The Parsons Company have issued a card of instructions and hints with regard to the use of the Non-Skids, from which we take the following:—Don't pump the tyres too hard when the Non-Skids are in use. If, after prolonged use, the Non-Skid is much too loose when the coupling is adjusted right up, take a link off every other chain, that is, all those sloping in one direction. If still large, serve the remaining chains, sloping in the reverse direction, in the same manner. When inserting renewal chains, or refixing shortened ones as above, do so one at a time when the Non-Skid is upon the wheel, and, after attaching one end of the chain, twist it up as much as reasonably necessary to cause it to lie flat upon the tyre, and not on edge, and then fasten the other end.

STARTING cars, especially large ones, in the cold weather, frequently causes trouble. Now, a very good plan is to fill up the water supply with hot water, as this will greatly facilitate the starting. Another method is to place rags round the inlet pipe close to the carburettor and pour hot water on them; if this is done, the engine will probably start about the second turn of the handle.

THE BRUSSELS AUTOMOBILE EXHIBITION.

THE third Salon de l'Automobile organised by La Chambre Syndicale de l'Automobile de Belgique, under the patronage of the A.C.B., is at present being held in the Palais du Cinquantenaire, Brussels. It was opened on Saturday last, when over 50,000 people visited the show, which is by far the largest so far held in the country. With one or two exceptions the bulk of the large cars are similar to those exhibited at the recent exhibition in Paris. La Société "Belgica" is building cars of 12, 16, and 24-h.p.; these are on standard lines, the four-cylinder engines have both the inlet and exhaust valves mechanically operated off one cam shaft. Noticeable among the vehicles on view is a 16-h.p. chain-driven landaulet, the engine being located under the driver's seat. A new car is the "Baudouin," made in two sizes—15-h.p. and 25-h.p.—by the International Motor Company, Limited, Brussels. A feature of the four-cylinder motor with which they are fitted is that both the mechanically-operated inlet and exhaust valves are located in the head of the cylinder. Only one cam shaft is employed, and the cams controlling the inlet valves are of a special form, and free to be moved on the shaft to give a variable lift to the valves. The governor has been discarded, the speed of the motor being controlled by throttling the gas, this being done automatically when the clutch is disengaged.

The Pipe Company, which will represent Belgium in the Gordon Bennett race, have on view cars of 12, 15, 20, and 30-h.p. La Société de Construction des Ateliers Danneels, of Ghent, which has secured a licence to build Rochet cars for Holland, Belgium and England, shows a 12-h.p. vehicle and an 18-h.p. chassis of this type. La Société La Locomotrice, of Liege, have an interesting exhibit of cars built under licence from the Rochet-Schneider Company. The "Excelsior" cars made by the Société des Automobiles Excelsior range from 6-h.p. to 14-h.p., the two-seated popular vehicle with cardan shaft transmission having an attractive appearance. The Germain Company are well to the front, their exhibit comprising the Hardt two-cylinder two-cycle motor introduced at the Paris Show. La Société de la Transmission Lorenc shows a car fitted with a novel system of transmission, in which neither differential nor change-speed gear is employed.

La Société La Metallurgique of Marchienne au Point display four types—7-8 h.p. and 10-12-h.p. double cylinder and 14-h.p. and 20-h.p. four-cylinder,—the three largest sizes having mechanically-operated inlet valves. The vehicles have pressed-steel frames, and are either driven by chains or cardan shaft as desired; a feature of both is the introduction of a spring arrangement to take up any shock between the engine and gear-box. Les Ateliers Vivinus have one of the features of the Show in the shape of a new 10-h.p. car fitted with a four-cylinder engine, the cylinders being 85 mm. diameter by 110 mm. stroke. In addition, 14-h.p., 16-h.p., and 24-h.p. vehicles are also displayed. Among other petrol cars exhibited, particulars of most of which were given in the report of the Paris Salon, are the Berliet, Cudell, De Dion, Henriod, Delahaye, Talbot, Darracq, Panhard, Linon, Fiat, Mercedes, Oldsmobile, Prosper Lambert, Decauville, Renault, and Georges Richard.

Steam cars are shown by M. Chaboche, of Paris, and M. J. Miesse, Brussels, the latter's vehicle being fitted with four-cylinder engines and chain drive. A big display is made of motor-cycles, these including the Minerva, F. N., Sarolea, Red Star, Antoine, N.S.U., all of which are already on the English market. Anti-skidding bands for tyres on view include the Samson-Hutchinson Company and "Perfecta," the latter being made by M. T. Houben, of Verviers. Similar devices are shown by Messrs. C. Durand and Co., Paris, and M. G. Desclée, Jemeppe-sur-Meuse; the latter's arrangement consists of a chrome leather band, on the tread of which are fixed thin steel plates of such a shape that they form a continuous strip; the band is held in position by straps at intervals round the rim. The Exhibition closes on February 4th.

HERE AND THERE.

THERE are now 1,973 licensed motor-car drivers in Chicago.

THE Watford Engineering Works have started a garage and repair depot for motor-cars.

MR. BULLER, of Bridge Street, Denbigh, is preparing his premises for the repair of motor cars.

THE Automobile Club's Exhibition at the Agricultural Hall, London, in March, will be most brilliantly lighted, sixty arc lamps supplementing the usual means of illumination.

CALLING in at the depot of the Farman Automobile Company the other day we had an opportunity of inspecting a 10-h.p. Argyll car which has been built for Mr. Justice Romer. The body is on novel lines, and is so different from the usual type that it is difficult to give it a name; it is of the covered variety, and, rising flush with the dash board, encloses all the seats, as well as the steering and control levers and

MRS. ROWLEY, of Sylvan Park, Kells, was the first lady in Ireland to obtain a motor-car driver's licence.

AT a meeting of the Western Section of the Scottish Automobile Club on Monday, the 1st prox., Mr. R. Drummond will read a paper on "The Evolution of Roadmaking in Scotland."

THE Humber Company have brought out for the 1904 season a Royal Humberette fitted with a 6½-h.p. governed engine, three speeds and reverse. We understand that the London agents, the Victoria Carriage Works, Limited, have one of the new vehicles available for trial.

A DIFFICULT tour has been undertaken by Colonel W. C. Greene, of Phoenix, Arizona, who recently purchased a French touring car, and has undertaken to drive it from La Cananea, Mexico, where he owns extensive copper mines, to San Francisco. The distance is about 1,000 miles, much of it over arid desert country, which will test the capabilities of the vehicle to the utmost.

The 10-h.p. Argyll Car built for Mr. Justice Romer.

pedals. In fact, it is a kind of enlarged brougham, with a large glass-panelled front. Access to the car is by means of a door located close to the dashboard; within is a single bucket seat for the driver, this leaving ample room to get to the rear seats, which will accommodate three persons. We understand that Mr. Justice Romer intends to drive the car himself, hence the novel arrangement of the seats.

BOATS at sixpence per hour, said Mr. J. Piggott, L.C.C., in the course of a lecture at the City of London College, Moorfields, E.C., have been placed on the lakes in Finsbury, Battersea and Victoria Parks, and at the latter two places motor-launches ply at a penny a trip.

THE Tideswell Parish Council have put forth a scheme for making a new road at Miller's Dale (Derby). The proposal is to make a new road beginning at the foot of Miller's Dale bank, and proceeding behind the church to the station. The gradient of the proposed new road would be one foot in twenty-three, whereas the gradient of a portion of the existing road is one in eight—a dangerous point for motorists.

THE Parish Council of Langtoft—six miles from a station, and the same distance from Driffeld—at its last meeting resolved to petition the North-Eastern Railway Company for a service of motor 'buses from that village to Bridlington, via Kilham.

MESSRS. PETO AND RADFORD, LIMITED, have been registered with a capital of £40,000 to adopt two agreements (1) with Messrs. Peto and Radford, Limited, and (2) with the P. and R. Storage Battery Company, Limited, and to carry on the business of manufacturers and dealers in electric meters and any other electrical instruments.

MESSRS. G. DAVENPORT AND COMPANY, of Hatton Garden, E.C., send us a circular description of a new combined stop-watch, speed indicator, and minute recorder they are introducing into this country. It is known as "Le Chauffeur," and while of the size of an ordinary watch, it performs three different functions, showing at a glance—1, the ordinary time; 2, the time occupied from any given point to another; 3, the time occupied per mile, and the speed per hour from mile post to mile post—from 12 to 150 miles per hour.

It is suggested by the General Purposes Committee of the Oxford City Council that the ten-mile limit should be applied to the whole of the streets of the city.

Up to the 10th inst., no less than £443 had been taken by the Birmingham Watch Committee for registering automobiles and licensing drivers.

Quite a number of ancient steam cars have lately been brought to light. The accompanying illustration shows a steam tricycle built in 1881 by M. Rene Thury, the chief engineer of La Compagnie de l'Industrie Electrique et Mecanique, of Geneva. With it he was able to attain a speed of 25 miles per hour—a record for the period.

A NIGHT shift has been organised at the works of the Hozier Engineering Company, Limited, and facilities thus obtained for the production of fifteen Argyll cars per week.

MESSRS. ALFRED RUSSELL AND COMPANY, of Walsall, have brought out a patent shutter for motor lamps. The reflector of the lamp is made to shoot in front of the light, destroying the dazzling effect when desired, and in its normal position remains in the same way as the ordinary fast reflector. The firm have also patented a ventilating tube for paraffin side-lamps, which is being subjected to a severe test on fast cars.

MR. DONALD MENZIES left Cape Town for Matjesfontein recently on a 7-h.p. Panhard and Levassor car, belonging to the Hon. J. D. Logan, M.L.C. He arrived at Matjesfontein after an absolute non-stop run from Cape Town to Worcester of 7½ hours, and from there to Matjesfontein in 6½ hours, making a total running time of 14 hours from Cape Town. This car is the one which did such admirable work for Mr. Logan during his electioneering campaign, covering over 6,000 miles in less than three months.

WE learn from the Sirdar Rubber Company, Limited, that twin tyres are not only being adopted on the driving wheels but also on the steering wheels of public service cars; for instance, at Hastings, where the double-deck omnibuses had single tyres, they now have twin 2½ inch tyres on the steering wheels, and twin 3 inch tyres on the driving wheels. We may also mention that the Sirdar Company are now prepared, under certain conditions, to contract to keep public service motor-cars and omnibuses in tyres per 10,000 miles. The rate charged depends upon the route over which the 'buses travel, the speed, the weight of the vehicles, and the number of passengers they carry.

THE first automobile registered in Paisley was a motor-lorry belonging to Messrs. A. Bell and Sons, Limited, of the Gleniffer Laundry, Paisley.

"WHO'S WHO" for the current year is again published by Messrs. A. and C. Black. This has become an indispensable work of reference and can be relied on for the accuracy of its biographies of leading men and women in every department of life. Within its 1,700 pages are notes on all the names that appear with any frequency in the newspapers, while in the companion volume, "Who's Who Year Book," is presented the tables which have formerly appeared in the larger volume.

BEFORE Mr. Justice Wills and Mr. Justice Kennedy, in the King's Bench Division of the High Court, the case of "Gilmore v. Slack" has been heard. The plaintiff appealed from a decision of the County Court Judge of Cheshire. He was the owner of a motor-car, and brought his action against the proprietor of a dogcart to recover damages for injury to his vehicle caused by a collision. The defendant counterclaimed for damage which he had suffered by the occurrence. After hearing arguments, Mr. Justice Wills did not see that the Court could overrule the conclusion at which the County Court Judge had arrived, and the appeal was dismissed with costs accordingly.

THE illustration given herewith shows a new petrol motor, which has been specially designed for use on motor-cycle fore-carriages and small two-seated cars, and the propulsion of motor-boats, by the Forman Motor Company, Limited, Coventry. The engine, which develops 5-h.p. at a speed of 1,200 revolutions per minute, is extremely light, its weight being only 90 lbs. The cylinder is 90 mm. bore by 90 mm. stroke, while both the inlet

and exhaust valves are mechanically operated. The motor is made so that it can be fitted in any position on a cycle frame, either vertically or obliquely. It will be noticed that the top of the cylinder is fitted with a special fixing, by means of which the engine can be slung diagonally, while if the motor is required to stand vertical in the frame the four bolts of the crank chamber are easily adapted.

CORRESPONDENCE.

DRY BATTERIES AND ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am interested in the letter on dry batteries in the last issue. May I point out a fact which is not generally known, and that is that every user of dry batteries should have an ammeter to test his cells? It is not a voltmeter that is needed, although this is thought to be the instrument one should have. It is a fact that there may be to all appearances a spark strong enough to do good work, while there is not amperage enough to jump the current through the mixture when under compression. I have seen a battery on a motor-cycle that would show a good spark when testing by making and breaking the circuit, but when testing with the ammeter the battery would not have any effect on the meter. If you have an amperage of from 6 amperes and upwards, you may be sure that you will have the proper voltage to do good work. The amperage is the volume of force, and the voltage is the pressure under which the current flows.—Yours truly,

F. L. EDMUNDSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letters on this subject in the *Journal*, I have had considerable experience with dry batteries and am strongly in favour of them. I have used them almost daily for nearly five years, in fact ever since my machine caught fire in the days of tube ignition. (See *Motor-Car Journal*, March, 1899). The battery I now use consists of four "Ideal" cells. Each is enclosed in a cardboard case, and the whole in an india-rubber envelope. After packing them carefully in the battery case, you need not trouble about them for the next six or eight months. The batteries should be tested when new. I don't know the exact number of amperes they should give, as my ampere-meter only registers to ten, but it should be well above this, and they should continue to work well until they are down to two or three amperes. Care should be taken, in testing, to only momentarily close the circuit as using an ampere-meter is practically short-circuiting the cells and would waste considerable current if continued for any time. I think it is a great comfort to know that you are sure of having a good store of electricity with you for some months, and that you need not trouble about testing each time you start out.

If the batteries are giving out after five or six months, you will have warning by occasional misfiring, and you may have to lessen the distance between the points on the plug, but you will always be able to get home. When these symptoms appear, and you find on testing that there are only about three amperes of current it is time to order a new set, and in the meantime the old ones can be considerably revived by boring a hole through the pitch at the top and putting in a solution of sal-ammoniac or even common salt.—Yours truly,

GEORGE A. E. ROBERTS.

THE MOTOR-CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I, for one, wish to protest against the regulations in connection with the new Motor Car Act, on the ground that it is not only unfair but a very serious matter to compel a reversing gear to be adopted on cars already running. It might safely be left to the makers for the future. It will put many cars on the scrap heap, and the worst is they are mostly owned by persons not able to replace them.—Yours truly,

B.N. 9.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst learning the art of driving a car is it the law to take out a licence during the time you are a pupil? therefore giving freedom to, perhaps, a reckless youth to drive about the streets at any pace covered by this legal document, which he can produce at any time and profess to be an expert driver; perhaps an expert driver to the common danger of the public. Therefore is it fair to grant a licence to a person who is only learning to drive and cannot take charge of a car? It is this kind of driver who chiefly creates all the trouble by having accidents owing to ill-judgment and reckless driving. The careful, considerate driver is tarred with the same brush at once.

Should like to be enlightened upon this point. Do you have to take out a licence before or after you can drive?—Yours truly,

M. A. N.

PICRIC ACID AND PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "A. J. H.'s" letter in the last issue, there is no doubt that picric acid does under certain circumstances, more particularly with small and high-speed motors, increase the power obtainable. I have known, however, of objectionable corrosion in the cylinder following its use, and, to all appearances, due to it. It is fairly soluble in petrol, and therefore it would seem undesirable to use any method of pication in which the proportion dissolved was not definitely fixed, such as passing the petrol over a receptacle containing solid acid. It does not undergo complete oxidation readily unless mixed with an

oxidising agent (as is usual when employed as an explosive), and hence the evolution of secondary products which may be injurious to the cylinder is possible, more especially if the amount passing with the petrol is not under definite control. It may be advisable to point out that picric acid is made highly explosive by mixture with any nitrates, chlorates, or even some metallic oxides, and even a trace of lime may have this effect. Part of its effect in a motor, and probably an important part, is almost certainly due to its increasing the rapidity with which the explosion is propagated through the mixture, an effect which might also be obtained by the preferable method of a more energetic ignition, or more than one pair of sparking points for the same.—Yours truly,

R. W. B.

THE "SPYKER" CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to D. H., I have driven my 20-24-h.p. Spyker 8,000 miles during the last six months. I had one of the first of the cars that came into England. Personally, I think it equal to any car in the market, and cheaper than most. It is well built, very simple to drive, reliable in every way, silent, and equal to a maximum speed of thirty-eight miles on the level. I have gone up long, steep hills, one in 5 and 6, with five up.—Yours truly,

J. W. BROADHEAD.

BENZ v. LIGHT CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having owned and had a deal of experience with a 3½-h.p. Benz car, I have found one very effective way of increasing the power is to fit a crank with a longer stroke; this not only increases the compression, but, of course, draws in more gas.—Yours truly,

A. ALBRIGHT.

THE FATAL 13.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you have published the names of the proud possessors of No. 1 under the new Act, it would be interesting to have a list of those who registered under No. 13, and also a list of troubles which have accrued owing to their having accepted such an unlucky number.

Personally I accepted it without any feeling of superstition, and all would have been well had it not been for an unfortunate note in your issue of the 9th inst. in which you drew attention to the fact that in Salop no one would have number 13. Since then the female portion of my community refuse to go in the car till the number is changed; the facts that we have all had influenza, that the clutch seized one day last week, the rubber ball of the horn was lost on a trip, that our donkey will not pull its cart any longer, are all attributed to this number.—Yours truly,

A. K. 13.

EXPERIENCES WITH THE PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Two of your correspondents ask for information re the "Trusty" paraffin carburettor. I will give mine in short:—I bought one about five months ago and spent three weeks over it trying to make it work. Twice I was successful and it worked all right, only with clouds of smoke. I tried altering the lift of the valve and everything but could not do anything with it. I had a sleeve fitted round the exhaust pipe and the carburettor attached quite near the pipe and engine (2 ins. off), but could get no satisfaction from it. The carburettor was finished off in a very poor manner. Aluminium joints! What good are these? The carburettor was full of sand, which was most difficult to get out. The joints leaked and the threads had small blow holes which were most difficult to find. I believe the carburettor has since been somewhat improved on. I consider it very expensive even if it had worked well. I add my name out of fairness to the makers and to justify my opinion.—Yours truly,

W. WINDHAM, LIEUTENANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Mabey, and "A Man in Blue" re the "Trusty" carburettor, I purchased one of these some little time ago and am using it on an old 7-b.h.p. stationary engine I have had in use about seventeen years. Formerly it worked with slide and lamp ignition, using benzoline; this I have done away with and employ electric ignition. I bought the carburettor really for a 16-b.h.p. Crossley oil engine, but I had not the time, nor the engine at liberty to thoroughly test it, so I tried it on the one mentioned. At first I could not get any good results, but I found it was owing to the needle valve having too much lift; this I altered, and since then I have had no trouble. I believe the makers are altering or doing away with the trouble I had with the valve. When starting up I use benzoline or petrol. I do not run more than a couple of minutes on this, when I change over to a mixture of benzoline and paraffin; sometimes it is half and half, and sometimes it is more paraffin.

But when I want more oil in the tank I put paraffin, and up to now the engine runs well, and with no disagreeable smell. I have run six hours to-day without a jolt. My opinion, however, is that the consumption on paraffin is a little more than on benzoline, but that is nothing compared to the saving in the end. I have not tried a "Trusty" carburettor on a car, but should like to know results if any of your readers have had any experience with one, because, if the carburettor will not work satisfactorily on a car engine, I think I am in a position to make it. I may say that under certain conditions the carburettor will not work on my engine on paraffin alone, but this may be owing to the carburettor being too large for the size of engine, or a fault of the engine valve. I cannot say at present whether it is either of these; perhaps in a week or two I may be able to tell you more about it. I trust the foregoing remarks will help your correspondents. I may add that I have no interest in the carburettor other than its services to me.—Yours truly,

TALBOT C. CLIFTON.

THE REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In connection with the letter in your issue of the 16th inst. regarding motor repairs I would be glad to have the opinion of some of your readers as to a few items in an account just sent in to me. My car is an 8-h.p. tonneau. Some of the items in account are shown below.

	£	s.	d.
New piston head, cast, turned and bored ...	3	0	0
New gudgeon pin ...	7	6	
Making and turning back spring studs ...	1	2	0
Casting and turning and boring bushes in crank case, with use of engine and lathe ...	18	6	
3 bronze bushes casting ...	12	6	
1 new commutator ...	1	2	6
Time 18½ hours to back axle ...	18	6	
To cutting 4 new gear wheels ...	3	7	6
To fitting back axle together ...	19	0	
To fitting engine and axle to car, time 18½ hours ...	18	9	
To making a wheel (19 hours) ...	19	0	
New hub, cups and bolts ...	1	5	0
Spokes and fellows ...	15	0	
Hoop wheel ...	3	6	
2 Continental covers, rims and bolts ...	21	1	4
Putting new rim in hind wheel, repairing tube and cover, 18½ hours (rim paid for) ...	18	6	

Is it customary to charge for the use of the repairer's gas engine and lathe, this item amounting in all to several pounds? I may say that these are what seem to me rather glaring instances of overcharging. The total amount is close on £100 for less than six months' work. The opinion of some experts on these items will oblige.—Yours truly,

CHIRURGEON.

NAME WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would kindly help me in finding the name and address of the driver of motor-car No. A. or B. 179, a 10-h.p. M.C.C., who was driving through Tottenham on the 19th inst. at 3.10 p.m. He has probably ere this received the usual "blue slip." I shall be pleased to appear as witness in defence, as I happened to witness the occurrence, and also noted the two police officers and actually heard their remark when the car passed.—Yours truly,

E. C. PRESTWICH.

[We shall be glad to place the owner of the car in question in communication with Mr. Prestwich if he will send his name and address.]

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Roller Bearing," if plenty of grease is used with the back wheels of the Wolseley, I do not think he will find solids affect the ball bearings. I have once found a ball split in the back axle, but I had that day driven eighteen miles over the worst and roughest road I have ever been fated to travel on. Since then I have never had any trouble with balls. I fill up the wheel cap with white grease (full up), and then take out the screw and give it half a squirt full of lubricating oil. This I find answers far better than putting in gear oil, etc.—Yours truly,

P.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to set the minds of your correspondents at ease on this question, as I have tried both pneumatics and solids, and there is no doubt whatever that the former afford considerably more comfort in driving.

I have noticed that one of your correspondents states that the pneumatic is unreliable and not worth a straw to business men. Allow me to advocate the process of the Glasgow Motor Tyre Company; by their

method, in conjunction with the Cassell's unpuncturable band, they guarantee pneumatics as reliable as solids.

I may say that after trying their process for at least six months I have never known a puncture or tyre trouble.—Yours truly,

R. M. R.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to the letter of your correspondent "Roller Bearings," I may say that my cars which are fitted with solids have ball bearings, but I have never broken a ball yet. I have known cars fitted with pneumatic tyres to break the balls, and the reason is easily understood; the ball races get worn, and, instead of being seen to, a channel is allowed to wear in them in which the balls get jammed and break, but it is an easy matter to examine the axles and put new collars on immediately there is any sign that the ball races become worn; the cost, I believe, is only a few shillings for a set for the Wolseley car.

In reply to your correspondent "Tonneau," I may say that one of my cars has a tubular frame, and that several of my friends have cars made with tubular frames, on which solids are running satisfactorily; of course, one must be careful to choose the right solid rubber tyre, and I may mention that I have the same solids that did so well in the 1,000-miles trials of last year.—Yours truly,

EXPERIENCED USER.

LIGHT CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "L.'s" enquiry appearing in the *Journal* of the 16th inst., I have pleasure in giving my experience of an Argyll car, which I hope may be of service. Two and a half years ago, after examining carefully the construction of all the cars in the market, I fixed upon an 8-h.p. Argyll, and after the machine had been in my possession a month I was so satisfied that I disposed of my horse and trap, and used the car for business as well as pleasure. At the end of a year I decided to go in for an increased power of machine, and ordered a 10-h.p. of the same make, which has also given me entire satisfaction. I may state that I now have occasion to be on the roads almost daily; my journeys average from 3 to 100 miles, and I invariably manage my calls well up to time, and from the beginning I have never lost time on the road through any breakdown. I feel certain that the Argyll will give "L." pleasure and satisfaction all through, and he may consider himself fortunate in fixing on this make out of the many cars now offered in the market.—Yours truly,

W. M. WALLACE.

FRIGHTENING HORSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Concorde" rather favours the idea that horses are less frightened by a car rushing by than one driven slowly.

The motorist that "rushes by" neither sees nor cares for the fright that may be given the animal, nor the after effects of same, and apparently knows nothing of the difficulty of getting that horse past a motor when next they meet.

As I use both horses and motor daily, I must state emphatically that the man who "rushes by" is wrong, and ought to be heavily fined.

I was riding a horse that passed motors—driven carefully—without any trouble, but a month ago a motorist "rushed by"; the frightened animal jumped right off the road, and since that event she stops dead the moment she sights a motor, and is coaxed by with difficulty. Last summer a friend had a horse that was frightened by a car appearing suddenly, noiselessly, and without warning round the bend of a hill. She shied and fell the next time she saw a motor, then bolted and smashed up the trap; before this her manners were perfect and she passed motors with out trouble.—Yours truly,

M.R.C.S.

P.S.—I have used solid tyres for the past thirteen months; they give trouble by broken balls destroying ones—six new cones in the year. This might be remedied by plain phosphor bronze or gun-metal bearings.

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing that you invite correspondence on the above subject, I have thought it well to give you my opinion on the matter in question. Mr. Edge is undoubtedly right when he says "There is a dearth of good drivers." But is it not necessary to first know what constitutes a good driver, and it is with a desire to arrive at some conclusion that I write this letter. Let me tabulate the qualities which are absolutely essential. First, courage. Second, ability. Third, charity. Let us deal with these essentials in their order.

By courage I mean that the driver knows that the car he has under hand is liable to go wrong, that it is as yet a new science, and that he must face bravely every difficulty which is likely to arise; he must learn, and that truly, that there is a cause for everything, and that it is his duty to find that cause, and to patiently remedy any defect arising.

When anything goes wrong on the road, he must not lose his temper, and inwardly curse the thing, but, truly courageous, he must ever keep a good heart in his body, set to work quietly, and go about his work in a methodical manner. Courage also means that he must act coolly under all circumstances, remembering that the man who can keep cool always wins in the end. Who does not know the driver whose conception of courage is that it consists of rushing along at a speed calculated to knock the car to pieces in a very short time. He imagines that to drive at top speed is calculated to impress people with his daring, that it conveys to his master an idea that he is skilful, and that he has perfect control of his car. Poor mistaken, rash men. The careful, steady, courageous driver is he who knows that speed is not everything, and that true courage consists in an all-round watchfulness, ready to act instantly, should occasion arise.

Now as to ability. Driving does not consist in guiding; any child can steer a wheel, the thing is easy, and counts for nothing. A driver must have a perfect knowledge (or at least endeavour to reach that end) of the car he has under hand; he must make it his whole study; not only must he be a theorist, but he must have a practical grasp of the why and the wherefore. He must know the cause, and must never cease until he "knows how the wheels go round." Let him practice, practice, practice, until he can be trusted to remedy all faults while on the road. He must endeavour to show to his master that he is competent in every sense of the word, that he knows the thing, and that when commanded he is always ready. His master will then rest content in the knowledge that there is a man at the wheel who is to be trusted, and that when going on a journey he is trusting himself to one who has his interest at heart, and that "they will arrive."

With regard to charity the driver must always bear in mind that the car he is driving is not his, that it belongs to another who employs him to do all the work in connection with same. He must treat the car as if it were his own, and show in all things true economy. The foregoing virtues are capable of much expansion, but I am confident that the driver who embodied these into his work could command his own price. I am well aware that there is also the question, "What constitutes a master?" but this I leave to a master, and subscribe myself.—Yours truly,

A. K. 33.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a constant reader of your *Journal* and also a motor mechanic and driver, I have read with interest the letters re drivers. I have found it very difficult to obtain a respectable situation, and am still on the look-out for one. There are such a great many so-called driver-mechanics who obtain situations at say from 25s. to 30s. per week, that it does not give the practical man, who has served his time to the trade, a chance. I quite agree with Mr. S. F. Edge that the majority of men who represent themselves as driver-mechanics can only just manage to drive a car. Let them, however, get stuck miles from anywhere and then the owner will find out the inconvenience and expense incurred. A good driver must be capable of driving at the speed his employer wishes; if any breakdown occurs on the road, he must be able to rectify it quickly; he must be willing and obliging, and at all times he must have his car ready and in first-class order. Then I think any reasonable employer would appreciate his services. If a driver is a capable mechanic, it should not be necessary to take a car to a repairer's to be overhauled. The driver ought to be able to replace any part that may have become worn or damaged.

I find it difficult to get replies to advertisements if one does not live in or near London. The provincial man does not seem to have a chance of getting a berth in the south of England.—Yours truly,

H. HART.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the point raised on the above subject, I should like to give my views as a driver. I have had six years' experience

driving commercial cars and trade vans. Eighteen months ago I thought I would like to try private service. The position I then had meant travelling throughout the kingdom from town to town, and, being a married man, I found it very expensive paying lodgings and keeping a home as well. I gave a month's notice to my employer and answered advertisements to try and get a position, but I could not do so, though I had first-class references and did my best to get work for two months. In the end I went back to the firm I left, where I am at present. I built the car I am now driving, and of course thoroughly understand repairing as well as driving. I know several first-class men in Liverpool alone who cannot get work, and yet there are boys that have a week's tuition (paid for) who get employment as soon as they can steer a car.—Yours truly,

DRIVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to state my experiences as a motor-driver and mechanic. I am a thoroughly trained mechanic, and can do erecting as well as fitting, and also hold a public service driver's licence. Now, as a mechanic I can get £2 per week (54 hours), but as a driver I am offered the same or even less (never more) per week, Sundays included, and also never know when I am on duty or off. Now, as there are any amount of car owners who engage driver-mechanics at about 30s. or 35s. per week, the question arises, "are they really mechanics?" I contend that they are not, and not only do they keep good men out of work, but get them a bad name as well. Another point is this. Some employers think there is little work to do on a car, and consequently expect their drivers to do odd jobs. My experience teaches me that if one is conscientious, he can always find plenty of work to do on the car or in the car-house, providing the car is used pretty frequently, without wanting any other jobs found for him.

With reference to drivers taking their friends for rides on the car, I think if owners would let their driver, when they engage him, thoroughly understand they won't have it, it would stop what is undoubtedly a gross liberty for a driver to take. As for myself, I am thoroughly disgusted with a driver's lot, and intend in future to keep in the shops.—Yours truly,

CHAMELEON.

IRON CASTINGS.—Mr. H. R. Allan writes: "Can any reader let me know of a firm which makes iron castings for steam motor-car engines?"

AN AMATEUR-BUILT CAR.—Mr. W. Bashford writes:—"I shall be glad if you will kindly note that the photo of the car which you so kindly published last week was taken while the car was on its trial runs, and the body was only a rough-built seat; since then the car has been fitted with its proper body and will compare with most cars on the market."

ALCOHOL FOR MOTOR-CAR USE.—A correspondent writes:—"I shall be glad to know whether alcohol, such as is produced in France for running motor-cars, etc., can be obtained in England." We do not know of any firm supplying alcohol in England. Should any of our readers have information on the point, perhaps they will communicate with us.

WINTER COMFORT writes:—Is there any firm making a set of connections to enable me to make use of the exhaust gases or cylinder-cooling water for heating the vehicle in winter?

CELLULOID.—"Storage" writes:—"Will some of your readers kindly give me the address of celluloid merchants who make a speciality of celluloid sheeting about $\frac{1}{4}$ in. thick, perforated, corrugated celluloid, celluloid tubing, and vent plugs, for small accumulators?"

MICHELIN TYRES.—In answer to "Simon" who asks "Will an 820 by 90 Michelin inner tube fit a 760 by 90 tyre?" there is no such size as 820 by 90, the size being 810 by 90, or 820 by 120. The tube in this size of tyre, if it is to be used with a 760 by 90 cover, should be cut down a matter of six inches, as, if it is put in at its present length, it might be liable to buckle up and burst.

Curiosity.

Bonneted!

OUR DIRECTORY OF "NUMBERS."

[ALL RIGHTS RESERVED.]

Below is a further instalment of Motor Car Numbers. This List will be continued weekly, and Motorists who have not yet communicated with us are invited to forward their Names, Addresses and Numbers, with any observations they can offer as to the working of the new Act.

Ashworth, Edmund, Shavington Avenue, Hoole, Cheshire...	F.M.	15
Altham, J. L., Burnley	C.W.	6
Atkinson, C., Burnley	B.	10
Arnot, James, M.D., Brampton, Cumberland	A.O.	56
Ambrose, A. R., Piddington, Northampton	B.D.	157
Asquith, J. H. S., Halifax	C.P.	22
Aberdare Valley Motor Car Co., Aberdare	L.	15
Baldwin, Mr., Halifax	C.P.	2
Burnell, G. W., Lower Brook Street, Rugeley	E.	9
Brown, G. H., Rugeley	E.	11
Burnell, H. E., Rugeley	E.	14
Boden, H. S., The Beeches, Sherborne, Dorset	B.F.	4
Brydges, J. K., Electricity Works, Eastbourne	A.P.	225
Beavers, F., Cuzgarth, Adel, Leeds	U.	19
Burnyill, J. R. J., Crowle	B.E.	38
Bush, H. E., Fore Street, Chard	Y.	111
Browne, Mrs. James, 98, Sandgate Road, Folkestone	D.	309
Brown, G. T., East View, Chorley, Lancashire	B.	205
Bishop, F. C., Wolverhampton	B.	253
Bashford, W. T., Ivanhoe, Walm Lane, Cricklewood	D.A.	17
Bentley, Walter, Wyke House, Ashleigh Road, Leicester	A.	23
Bellingham, H., Burnley	B.C.	28
Bolton, Frank, Uttoxeter	C.W.	18
Barnard, E. B., Grove Lodge, Sawbridgeworth	E.	50
Bamford, C., Beaconside, Lichfield	E.	51
Brady, Herbert, 8, Ashton New Road, Manchester	A.R.	233
Bridgman, G. S., "Courtland," Torquay	A.R.	234
Blewett, W. T., Hayle	E.	74
Baldwin, J. H. L., Halifax	N.	257
Baldwin, W., Northiam, Sussex	T.	30
Clarke, William, Wolverhampton	A.F.	40
Clark, Alfred, "Holton," Motcombe Road, Bournemouth West	C.P.	2
Clark, A. C., Ryde, Isle of Wight	A.P.	196
Glover, G. A., The Mill House, Kempston, Bedford	D.A.	19
Clements, G. H. H., Burnley	B.F.	33
Coop, J., 7, Mornington Road, Southport	D.L.	31
Cochrane, Wm., 304, Regent Road, Salford, Manchester	D.L.	32
Cox, Rennie, Colne, Lancashire	B.M.	36
Caldwell, T., Hampden Street, Bolton	C.W.	7
Clay, Mr., Halifax	B.K.	14
Clay, Mr., Halifax	N.	275
Crossley, C. W., Halifax	B.	120
Crossley, Edw., Halifax	B.N.	8
Clark, Douglas, 15, Landport Terrace, Southsea	C.P.	3
Cousins, G. S., Bury St. Edmunds	C.P.	4
Crossman, Mr., Uttoxeter	C.P.	5
Cammond, J. N., Ormsdale, Fortwilliam Park, Belfast	C.P.	7
Cornell, A., 3, High Street, Tonbridge	B.K.	39
Carver, A. D., Woodlands, Gorton, near Manchester	B.K.	31
Cheeld, Sydney, Chesham, Bucks	C.F.	74
Dixon, J. S., Wolverhampton	F.	53
De Gruchy, Thos. H., 781a and 787, High Road, Leytonstone	O.I.	6
Darke, F. G., Waterloo House, London Road, Sutton	D.G.	17
Dupuis, F. J., Rugeley	D.G.	18
Dee, F. Shapland, On Tour "Lady of Ostend" Co.	B.	698
Davey, F. E. R., Cranbrook Road, Redland, Bristol	B.H.	31
Davey, F. E. R., Cranbrook Road, Redland, Bristol	D.A.	15
Drake, W., Halifax	F.E.	15
Denton, F., Halifax	A.	718
Evans, William, Wolverhampton	E.	84
Eastbourne, Borough of	A.	2473
Evans, Osmond, Wolverhampton	A.E.	117
Evans, George, Wolverhampton	C.P.	11
Evans, W. H., Wolverhampton	C.P.	15

(To be continued.)

IMPROVEMENTS IN MOTOR-BICYCLES.

By M. O'GORMAN.

MR. MERVYN O'GORMAN was to have read a paper on "Desirable Improvements in Motor-Bicycles" at the first annual dinner of the Auto-Cycle Club, but, owing to the protracted character of the proceedings, the subject was deferred to the 29th inst. Dividing his proposals under various headings, Mr. O'Gorman writes:—

Weight.—If we had an explosion turbine, and if the gain of weight and space were proportionate to the reduction obtained in turbine steamships, we would have a 2-h.p. engine and gear weighing, not 30 lb., but 5 lb., occupying not half a cubic foot, but only a quarter. Such a machine, to give the necessary effort, would need to revolve, not at 1,200, but at 5,000 revolutions per minute, and not to give 600 useful impulses, but about 5,000 useful impulses in the same period of time. This development is remote because of the imperative necessity for compression, with its attendant reciprocating parts. Still, whether for good or evil, we are about to make a step in the direction of higher engine speeds, for it will not take us long to realise that under the newly fixed limitation of cylinder capacity alone we can obtain more power if we use that cylinder more often in a given time. I look upon a limit to cylinder capacity alone as a temporary measure of a somewhat dangerous character. The alterations which are desirable for race winning under that standard are somewhat numerous:—

(1) Increased engine speed. (2) Multiple cylinders, possibly. (3) Water cooling, certainly. (4) Fly-wheels larger, certainly; heavier, probably; external, possibly, in spite of the fact that for touring purposes an external fly-wheel is notorious for thinning mud. (5) Larger valves, both inlet and exhaust, and larger exhaust tubes. (6) Mechanical inlet valves, for the valves will have to work fast, and as they will be relatively larger, their inertia is liable to be increased, and therefore to require strong springs and a positive opening. (7) Pressure fuel feed, for, if we wish to get gas rapidly through a given size of tube, we must push it in instead of merely sucking at it, and if we supply the gas under pressure, we shall be working the engine at a less ratio of expansion, so that we shall be driven to every sort of ruse to keep the cylinder cold. (8) Insulated exhaust; by keeping our red-hot exhaust tube well insulated with asbestos from the exhaust port, we may secure that none of its heat shall be conducted back to the engine.

I do not suggest that all this is either entirely undesirable or entirely inevitable, but those very few who do not believe in the permanency of the new limit will have been interested to see that the Technical Committee of the French Automobile Club reported against it on November 11th, 1903—that is, after the holding of the "Quart de Litre" cycle trials.

Fuel Efficiency.—In fact, it would be a desirable improvement if an ingenious person would formulate to-night a standard based on both fuel consumption and weight limit (if not for short races at least) for all competitions over 100 miles. What we want is an efficient transmission and engine, and a light vehicle. The best way to encourage the development of an efficient engine and transmission rather than a large engine and bad transmission is to call for a high fuel efficiency under a weight limit.

Silence.—On a long run it is an intense relief felt when a steep down hill makes it necessary to cut off the ignition and the motor ceases to flutter. For silence we must aim at:—(1) A noiseless transmission such as a belt without its drawbacks. (2) An efficient transmission, because this helps to keep the engine small, and therefore the explosion small. (3) A noiseless valve and ignition gear. (4) A real exhaust silencer.

Silence by preventing the oscillation of the air.—The German army is said to be testing a silent gun, and it has been surmised that this silence was secured by a flap valve, which closed over the mouth of the cannon within 1/100th of a second after the shot had been fired, thus preventing the inrush of air to fill the void, and therefore preventing air oscillation, and resulting in silence. This is, I think, theoretically sound; also a similar theory is the basis of the Oldsmobile and other silencers, which exhaust freely into a pot with small exit tubes. The pressure in the pot is raised quickly, but the small tubes let the air fizzle out slowly. The larger the pot the less the back pressure, and the more continuous is the stream from the small holes—i.e., the less air vibration or sound.

Silencing by diminishing air velocity.—In the above methods it will be seen that the air velocity need not be diminished; in fact, it may even be increased—i.e., where small tubes are used. There is, however, a totally different plan. It is well known that if the air channel has an ever-increasing diameter, the gas pushed through it will travel at an ever-decreasing velocity. If the sides of the conical opening so formed be free to vibrate, we get a trumpet which might give the musical note required for silencing by interference. Perfect exhaust silencers have been devised for motor-cars.

Vibration.—Just as dust is the greatest enemy of the motor-car, so is vibration to the motor-cycle. Resilient frames are amongst the most alluring and yet discouraging problems. The existing spring frame, as now used, provided with a compressible top bar, though excellent for push bicycles, has a drawback in that when the wheel base spreads, the handlebars close up towards the saddle and give an objectionable lateral joggle, which might be found undesirable with the speedy succession of shocks to which a motor-cyclist is subjected on the road.

Balanced engine.—Somehow very few bicycle makers are attending to the question of the balanced engine. I would commend them, one and all, to study the fly wheels of the Lanchester air-cooled engine.

Pedals.—The pedal machine suffers under one serious disability, and that is the stiff-legged appearance of the rider who keeps one pedal up and one down as is usual. One remedy for this which ought to be tried, despite

the old-time prejudice of our pedal-propelled days, is the up-and-down treadle gear.

Ignition.—Electric ignition has not yet been displaced, but if we are to use an induction coil, we should at least derive from it the essential advantage which it is calculated to afford, namely, excessively accurate timing. A variation of the time of sparking unknown to the rider of a minute fraction of a second will easily make a difference of 5 or 10 per cent. in the output of an engine, i.e., quite as much in the difference between chain and belt drive, and a very large number of machines lose in this way by the absurd minuteness and cheapness of the rocker gear. The system which can yield the utmost accuracy, namely, mechanical make-and-break, is the one which with skill should give the best results. The superiority of the single spark is that the instant of break can be determined with mechanical precision, so as to be practically independent of the backlash of gear-wheels, of vibration and jolting of the engine, of the voltage of the accumulator, and independent of the previous actuation of the spring. With the trembler coil, however, the moment of making contact is by no means so clearly determined. It is a secondary effect after a brush has rubbed upon a surface which it approaches along a more or less conducting slope. If the accumulator is not full, the attractive force of the iron core of the coil rapidly diminishes (with the 25 per cent. fall of voltage), and the response of the attracted armature is correspondingly less rapid. If the first spark fails to ignite the charge under compression, a later spark will do so when the piston has moved forward, so that the driver is not warned by a misfire that his ignition timing is wrong and his gear faulty.

Numbering.—I have been told of a device which I must warn you strongly against, but I mention it because it is ingenious (though reprehensible). We all agree that a man who drives furiously should be punished, but we all know that speed (20 m.p.h.) as such does not fairly constitute furiously driving. Mr. Baillie's suggestion is that the new number plates shall be fixed, not on a rigid support, but on a support to which the moment the vehicle exceeds a speed of 20 m.p.h. is given a rapid oscillatory motion, with an amplitude of half an inch (the distance between the figures). The object of this is, of course, to shake the dust off the number plate, so that it may be the more clean and legible. All that is required is a fairly stiff spring support of some length, and mounted on a rotating part of a fly-bob, which will joggle the spring when the desired speed has been reached.

A simple method of obtaining a very similar unlawful result is to support the number plate centrally on a quick threaded screw, which, by giving a pull to a Bowden lever, will turn the plate upside down.

COUNTY COURT CASE.

MR. WATERFIELD, of Farnborough, sued Mr. Saunders in the Aldershot Court for the balance of an account for supply of a motor-bicycle, valued £54 19s., all of which had been paid, except £14. His Honour gave a verdict for the plaintiff.

ALLEGED NEGLIGENT DRIVING.

At the Bloomsbury County Court, before Judge Bacon and a jury, Mr. Charles Pinoli, managing director of the Pinoli Restaurant (Limited), Wardour Street, Soho, W.C., sued the Great Central Railway Company for damages caused to his motor-car by the negligent driving of a carman named Falconer. On August 24th Mr. Pinoli was driving along Regent Street when a goods' van, belonging to the defendant company, came down Mortimer Street, and the pole smashed into the rear of the motor-car. The repairs necessitated had cost £29 3s. 6d. The plaintiff said the car cost £900. The jury returned a verdict for the plaintiff for the full amount claimed, with costs.

A White Steam Car in the Snow at

U.S.A.

CLUBS AND ASSOCIATIONS.

HEREFORDSHIRE.

THE annual meeting of the Herefordshire Automobile Club was held at the headquarters, Hereford, last week. Mr. J. T. Hereford (president) occupied the chair, supported by Mr. Wilfred Groom (hon. secretary), and members of the committee. Mr. Groom said since the commencement of the club to the end of the year they had fifty-five members. Three had since joined, making fifty-eight—twenty-eight car owners and thirty motor-cyclists. The fifty-five members had paid their subscriptions, and there was a balance in hand of £44 14s. 2d. After discussion, it was decided that the amount of the affiliation fee to the Automobile Club of Great Britain and Ireland should be 5s. per member instead of 10s. 6d., which gave the members all the advantages of the club with the exception of the supply of the Club journal. The Chairman suggested that competitions should take place between the middle of March and the end of September, and said winter months should be strictly barred in the future. It was pointed out that arrangements might be made to meet other clubs, such as Cheltenham, South Wales, the Midland, and so on, the advantage of gaining other people's ideas being favourably commented upon.

MIDLAND.

THE following meetings for the winter season, at the club room, at the Grand Hotel, Birmingham, have been arranged:—January 30th, road reminiscences and cinematograph; February 6th, annual dinner; February 27th, "Wire Wheels Tyred": paper to be read by Mr. F. W. Lanchester; March 12th, general meeting and report. Dinner and discussion on next season's events.

SHEFFIELD.

THE annual report of the Sheffield Club is a record of good work done since its formation in 1902. Reference is made to the hill climbing competition held in May, the motor-cycle non-stop trial, and a similar event for cars on Boxing Day. Service was also rendered in connection with the new Motor-Car Act. The committee took up the question with the local authorities, and interviewed the Hackney carriage committee, the town clerk, the chief constable, and other gentlemen in authority respecting the regulations likely to be made. Valuable services were rendered by the Hon. Treasurer, whose car was placed unreservedly at the disposal of the various authorities; also Mr. A. E. Thompson, who kindly proffered one of his cars for similar work on behalf of the Club; and Mr. J. T. Thompson, whose motor-bicycle was of considerable service to the powers that be, in enabling them to deal with the placing and lighting of the numbers on motor-cycles.

MANCHESTER.

At the annual meeting of the Manchester Automobile Club, held at the Albion Hotel, Manchester, Mr. F. Smith was in the chair. The annual report was read by Mr. Hoyle Smith. This showed that the membership of the club was 166 as against 140 at the same time last year, and briefly reviewed the variety of work done during the time. Mr. Headridge moved the adoption of the report which was adopted. The treasurer, Mr. S. Okell, read the treasurer's report, showing a balance of £156 in hand. Considerable discussion, which was taken part in by Messrs. Higginson, Houghton, Hollingdrake, Saville, W. E. Rowcliffe, and Eckersley, then took place on the question of increasing the subscription to the club. It was suggested that in future the subscription be two guineas instead of one guinea. At the suggestion of Mr. Arrowsmith, seconded by Mr. Higginson, a vote was taken, when a majority of those present voted in favour of the increase of subscription, subject to confirmation at an extraordinary general meeting to be called for this purpose. The hon. treasurer and hon. secretary were re-elected, Mr. Morris remarking that Mr. Hoyle Smith was a true friend to motoring, and had done all in his power to promote the comfort and enjoyment of all members of the club. Votes of thanks to the chairman and members of the committee for their past services terminated the meeting.

HALIFAX.

THE second annual dinner of the Halifax Automobile Club was held at the White Swan Hotel, on Thursday last week, when about twenty members were present. Amongst the guests were his worship the Mayor, the Chief Constable, Mr. Edgar Booth, Solicitor to the Club, and others. After the dinner an enjoyable smoking concert followed, presided over by Mr. James Lord, the president of the past year. For the current year Mr. A. F. Firth, J.P., was elected president, and Mr. James Lord vice-president. During the last season the Club arranged several pleasant runs, including two to Southport, also one to Scarborough for the Whitsuntide holidays. During the coming summer a further number of day and week-end runs are being arranged.

SCOTTISH (EASTERN SECTION).

On the 21st inst. the annual dinner of the Eastern Section of the Scottish Automobile Club was held at the North British Station Hotel, Edinburgh. The Rt. Hon. Sir J. H. A. Macdonald, K.C.B., presided, and after the usual loyal toasts proposed the toast of the evening, the health of Mr. Graham Murray, M.P., the Secretary for Scotland. It was no secret, he said, that the new Secretary was an automobilist, and he (the Chairman) thought that was a good thing in the interests both of the public and of those who used

motor-cars. Because, having the knowledge as a good citizen of what the rights of the public were, and having the knowledge as a good automobilist of what were the reasonable ambitions and feelings of automobilists, he would be able to deal, as they all knew that he would deal, with perfect impartiality in regard to what was undoubtedly to be not only one of the great industries of the future but what was to benefit the country in the matter of road transport. They welcomed him there that night with perfect confidence that in him they should have a Secretary for Scotland who would attend to the interests of Scotland and to all the interests of the realm with a single eye to what was best for all of them.

The toast having been pledged with cordiality, the Secretary for Scotland said that he had been told that he was there not in the quality of an automobilist, but on account of the kindly feelings which many of them there had to him, and the pleasure it had given them that one brought up among them should hold the high office he held at the present moment. He believed he had been as great a road-user as any of them, because he had been a bicyclist for a great many years. He took up the motor-bicycle at its very inception, and since then he had been the possessor of a car. He thought the possession of a motor-bicycle was a fine experience. It did them a deal of good for the car, which was not thrown away, because when he said that he managed during the summer to run a light car for 3,000 miles without a chauffeur or a breakdown, he did not think he could have done that if he had not previously had a motor-bicycle. There was possibly no education so good for the motor-phobist as being taken out on a motor-car, and the more these people got familiar with what a motor-car was and could do there would be less likelihood of the prejudice they had seen in the past being developed in the future. He was quite aware, from the point of view of a motorist, that the speed limit was considered absurdly low. He was quite aware, from the point of view of a member of the House of Commons, that if the speed limit of twenty miles had not been accepted the Bill would have been wrecked, and if the state of prejudice and feeling which existed then had gone on motoring would have practically been stopped altogether. But as a motorist he knew that that was almost absolutely slow. The truth was that the ordinary person did not know much about pace at all.

The Chairman next gave the toast of "Automobilism." Dr. Dawson Turner replied. The other toasts were "Other Automobile Clubs," by Mr. Norman D. Macdonald, Chairman of the Scottish Automobile Club, and replied to by the Comte L. de Clercq, member of the Technical Committee of the Automobile Club of France; and "The Chairman," proposed by Councillor W. W. Macfarlane.

THE MOTOR-CAR ACT.

THE first cases under the Motor-Car Act have been heard at the Kingston-on-Thames County Bench. Herbert Coombes, of 102, Pavilion Road, London, S.W., was summoned for unlawfully driving a motor-car at a greater speed than 20 miles an hour on the Portsmouth Road, at Cobham, on January 17th. Superintendent Marks, of the Surrey Constabulary, stationed at Horsham, said at 11.30 a.m. on January 17th he timed the defendant with a stop-watch over a measured quarter of a mile at the Tartar Hill, Cobham, which he covered in 23 seconds, or at the rate of 27½ miles an hour. In answer to the defendant the witness said he was standing at the foot of the hill, and a quarter of a mile away from where the measured distance began, but he could easily tell when the defendant entered the measured distance. Police-sergeant W. R. Lucas, Surrey Constabulary, gave corroborative evidence.

The Defendant: How fast do you say I was going?—The Witness: I should say about 25 miles an hour.

Had you a stop-watch?—No.

Then how do you know?—It is simply my opinion.

The defendant said it was impossible for the sergeant to say how fast he was going, as he was running in front of the car with his back towards it when it was stopped.

Police-sergeant Lucas: But I had my head turned so that I could see you and the signal of the superintendent at the same time.

The Chairman: That is an important point, for under the new Act it requires two witnesses to give evidence as to speed.

The Magistrate's Clerk: There are two witnesses.

The Chairman: But the question is, was the last witness looking in front or behind?

The sergeant said he was looking both ways.

The magistrates having conferred together, the Chairman said a majority of the Bench were in favour of a conviction, and the defendant would have to pay a fine of 20s.

MR. H. LIDDELL, of Lynwood, Addison Crescent, London, was also summoned at Kingston for driving a motor-car at a greater speed than 20 miles an hour at Cobham, on January 17th.

The Chairman said the Bench had received a letter from the solicitors for the defendant, in which they complained that the alleged offence having occurred on Sunday, January 17th, the summons, taken out on the following day, was made returnable for the 21st, which left the defendant only two clear days in which to instruct counsel and prepare his defence. The summons against Mr. Liddell was adjourned for a week, the Chairman of the Bench intimating that seven clear days should be given defendants to answer their cases.

DEALERS' MARKS.

Next week we shall publish an instalment of the Marks assigned to dealers by the local authorities in various parts of the country. We shall be glad to have from those firms which have not yet sent their Marks particulars of the same without delay.

COMMENTS.

The Gordon Bennett Cup.

ELSEWHERE we publish a report of a special interview with the chairman and secretary of the Automobile Club. Motorists generally are much indebted to Mr. Roger Wallace and Mr. Julian Orde, not only for the trouble they have taken with regard to this year's Gordon Bennett race, but also the keen interest with which they have regarded the convenience of English motorists likely to witness the contest. It is confidently to be hoped that the actual number of types of vehicles to participate in the contest will be somewhat numerous, a contingency fortunate, and indeed inevitable in all the circumstances. Five Mercedes, two for Germany and three for Austria, are already announced, and it would seem that we shall depend very largely upon the entries from France and England to make the event thoroughly representative of all types. Whilst recognising the merits of the vehicles that have hitherto done good service by competing, it would add considerably to the interest should one or two other British cars succeed in getting through the eliminating test and so win a place in the official team to do battle for the Cup.

Refreshment at Inns.

AN application for the renewal of the license of the Black Swan Inn, near Crawley, was adjourned on Tuesday by the Haywards Heath magistrates, opposition being offered by Mr. Philip Bright, of Regent's Park, N.W., who complained that when motoring on the Brighton road he was refused a cup of tea at the house. He asked for the tea for his driver, who was a teetotaler, and the landlady told him that he ought to know better than to order tea at a public-house. The landlord's excuse was that the request was made at an inconvenient time, and his application for the renewal of a license was adjourned for a month. In refusing to cater for the various tastes of those who travel by road, publicans and innkeepers are adopting a very short-sighted policy. So, too, are those who charge exorbitant rates for tea, coffee, and similar refreshments.

The Motor Volunteers.

NOT satisfied with having wheels that go round faster than any others in the service of the Army, the Motor Volunteer Corps is now making application to the War Office for arms. At present the members are without any means of self-defence. Should the enemy get too near all they can do is to

get away—and that, thanks to the automobile, could be done pretty quickly. But, fired with military ardour, these volunteers are now asking for rifles, another step towards their complete equipment as an effective fighting force. Proposals are also being made for the training of the corps in the present year. It is unlikely that any scheme will be decided on for bringing the corps together for simultaneous training, the members being so widely scattered over the Kingdom; but it is proposed that portions of the corps shall be employed in the various military districts with regular or other troops, acting both as orderlies and fighting soldiers. For the motor-cyclists of the corps training in scouting and general reconnaissance work are especially proposed, though the ordinary motorists would also have training of the same kind.

The Confusion of Numbers.

AN early example of the difficulty which police as well as motorists are likely to find in attempting to discern the numbers on motor-cars has just arisen. Last week a letter in our correspondence columns asked for the name of the owner of "A or H 179, a 10-h.p. M.M.C., who was driving through Tottenham on the 19th inst." Now comes a letter from Dr. J. J. Ridge, the well-known doctor of Enfield, to the effect that he is the possessor of H 179, "which is an 8-h.p. Argyll with hood, and was not at Tottenham on the day in question." Not only is there a difficulty of ascertaining correct numbers on cars, but automobiles are becoming so similar in appearance that it is not so easy to distinguish the different makes of cars as was the case two or three years ago.

A Suggestion adopted by the Board of Trade.

MANY months ago we published a letter from Sir Alfred Bateman on behalf of the Board of Trade, in which he promised that our suggestion with regard to the separation of the imports and exports of motor-cars from those of motor-cycles should have consideration by the Departmental Committee for the revision of the Trade Accounts. On this subject we have just received a further communication from the Board of Trade, Mr. H. Llewellyn Smith intimating that the suggestion has been before the committee and that "it has been decided to alter the former headings, both in the import and export section of the monthly accounts." This is satisfactory, and we would congratulate the Board of Trade on the thought which it bestows on suggestions made with a view to the improvement and greater usefulness of its statistics.

The Reliability of the Car.

THURSDAY next will be the third anniversary of the inauguration of a motor-bus service running regularly to a time table in connection with the L. and N.W. Railway train at Boxmoor station. The same two vehicles have been running all the time and have demonstrated the reliability of such cars when properly attended to. They are owned by the Hemel Hempstead Motor-Car Company, which also lets vehicles on hire, and recently supplied a 9-h.p. car on hire for a month in Harrogate

and two months in Scotland. It went all the way to Deeside by road. The only thing that happened was a delay of a day in Harrogate in order to re-metal a crank shaft bearing. In both cases the performance of the car and driver gave such satisfaction that it led to a purchase of a motor vehicle. The same carriage, though fitted with solid tyres, was recently hired to convey an invalid, for whom a couch had to be made up, forty miles by road with equally gratifying results.

Nearing the Summit of Snowdon.

The Ascent of Snowdon.

REFERENCE has already been made to the ascent of Snowdon on a British car. We are now able to reproduce two photographs by Mr. Wickens, of Bangor, showing Mr. H. du Cros, jun., making the attempt on his "Ariel" car. Our photographs illustrate the last slope from the finish and also the car tacking about in the endeavour to find the snow sufficiently hard to continue the ascent. The car was driven to within a short distance of the summit, a drift of snow from six to seven feet deep preventing further progress. This is the first time the ascent of Snowdon has been attempted, and naturally the Ariel Company are elated at the success of their vehicle.

A Strange Case.

A CASE has been heard at the Norwich Assizes in which a baker brought an action against Mons. H. Rollet for personal injuries. It appeared that the defendant was shooting in Norfolk, and left his motor-car unattended partly on the roadway and partly on the bank while he was shooting with some friends in an adjoining field. The baker was coming along in his cart when his horse shied and turned the vehicle over so that it fell upon the stationary motor-car. Seeing that the roadway was thirteen feet wide, that there was ample room for the plaintiff to get by, and that he himself thought the horse would pass the car without trouble, we do not see that the motorist should have been held responsible. In fact, Justice Channell said he could not see how the fact that the defendant left the motor-car unattended contributed to the accident. The plaintiff acknowledged that he usually left his horse and cart unattended.

The accident was caused by the horse becoming frightened at the motor-car. There was no evidence at all of an improper use of the highway. If, instead of this car having been stopped, it had been properly in motion, and on the right side of the road, and an accident happened, no action at all could have been brought. There was no doubt about that.

Judge v. Jury.

THE jury returned a verdict for the baker, assessing his damages at £34. M. Rollet, who had made a counter claim, was given the point, and then the Judge remarked that he did not think he could do anything in any way to differ from the jury, but he quite thought that the Court of Appeal might say that he ought not to have left the case to the jury at all. Under such circumstances the defendant must feel that English justice is a strange and complicated thing. On the face of it it would appear that the matter should be carried to appeal, in which case the Motor Union might see its way to render assistance.

Theft of a Motor-Car.

THE police in North Staffordshire are engaged in endeavouring to discover the perpetrators of an extraordinary theft which has been committed at Hanford, a village near Stoke-on-Trent. It seems that a motor car was left during the afternoon in the grounds attached to the residence of Mr. W. D. Spanton, consulting surgeon, at Hanford, from whence it was subsequently stolen by some unknown person. By whom the car was removed, and how it could be taken away without attracting attention, is a mystery, and at present no clue has been obtained which is likely to lead to its unravelling or the recovery of the missing vehicle.

Motor-Boat Race.

THREE challenges have now been received from France for the British International Cup for motor-boats. Two of these entries are for boats driven by petrol motors, one from M. Clement and the other from Messrs. G. Pitre and Company. The third is a Gardner-Serpollet steam launch entered by Messrs. Legru and Gardner. No less than seven boats have been entered to defend the cup on behalf of Great Britain, two being from Mr. S. F. Edge, the present holder, three from Messrs. J.

The "Ariel" descending Snowdon by the Cog Railway.

E. Hutton, Limited, one from Messrs. Thornycroft, and one from Lord Howard de Walden. This will necessitate an eliminating race being held to decide upon the three boats which are to represent England in the race itself. Further entries, it is hoped, will yet be received from France, which will also necessitate an eliminating test; and if, as is confidently expected,

entries are received from Germany and the United States, the race will be the most representative and important international contest for motor-boats that has ever taken place. The actual date of the race, which will be held probably in the Solent, is to be July 30th.

The Affiliation Question.

JUST now the provincial clubs are exercised over the affiliation question, and the Eastern Counties organization, at its annual meeting at Ipswich, has decided that the committee may affiliate with the A.C.G.B.I. on condition that the capitation grant should not exceed five shillings. This is the line that is being taken by several organisations. There is apparently no real desire for a federation apart from the Automobile Club, and we expect the forthcoming conference will result in a very general adherence to the parent association.

Sensible Decisions.

THE Enfield District Council have determined on the places in their area to be indicated as dangerous, under the Motor Car Act, 1903, but the question of the speed limit caused a warm discussion at the last meeting, and was referred back to Committee for reconsideration by a majority of one. In Hertfordshire the County Council has resolved that it is undesirable at the present time to make application to the Local Government Board to limit the speed of motor-cars below the maximum of twenty miles an hour, as further restriction would possibly have the contrary effect to what was intended. Evidently the personal influence that individual motorists have been able to exert throughout the country has been of service in the education of councillors.

Wisdom at Deal.

THE report that the authorities at Deal proposed to suggest a restriction of the speed of motor-cars passing through the town to ten miles an hour has aroused so much opposition that the Town Council has rescinded its resolution on the subject and withdrawn its notice to the Local Government Board. Spirited letters of protest had been sent to the Town Clerk by Judge Emden, the Motor Union, the manager of the South-Eastern Hotel, and a score of other motorists—a fact which doubtless did much to influence the final decision of the Council. Several councillors mentioned that they had been approached by local motorists on the subject, and it was evident that considerable education had been carried on since the previous meeting of the Council. As a local journal remarks, the very stringent provisions of the Motor Car Act afford adequate protection to the public, independently of this optional clause, and we are glad the approaches to the town are not to be disfigured by notice-boards which would have been little short of a gratuitous advertisement of an indisposition to move with the times.

Dover Persistent.

WHILE the Deal Council has proved amenable to local wishes and sensible of the interests of the town, Dover is in a recalcitrant mood and in reply to the objections of the Motor Union and the Kentish Automobile Club has sent a reply to the Local Government Board re-affirming the previous decision. Space prevents us giving more than a conspectus of the letter sent by the Town Clerk to the L.G.B., but he has pointed out that the petitions were received after the proper date, and the objection of the Automobile Club to the roads of the borough being scheduled as a whole was not in accordance with the intention of the Act. The objection that the borough, being one of the chief Channel ports in connection with the progress of automobiles to and from the Continent was not of importance, as the borough was only three miles in extent, and if the cars proceeded at twenty miles an hour it would be passed in nine minutes, and if at ten miles an hour it would be traversed in eighteen minutes.

The King's Highway.

At a meeting of the Western Section of the Scottish Automobile Club, held in the Windsor Hotel, Glasgow, on Monday, Mr. John Adam presiding, Mr. Robert Drummond, C.E., F.S.A. (Scotland) read a paper on the evolution of road making in Scotland. "King's Highway," he explained in introduction, is not, as popularly supposed, every highway. The name was appropriately confined to the four King's Great Highways stretching throughout the kingdoms of England and Scotland; the Fosse—from Cornwall to Caithness—Watling Street, Erminge Street and Ryknield Street traversing other portions of the kingdoms. By decree of Moluncius, the 23rd King of the Britons and the first who gave them law, these highways shared with the ploughs of tillers and the temples of the Gods, freedom of succour, so that fugitives to any of these for succour from trespass were safe from pursuit. Hence the name "King's Highways." The present road system was instituted in 1617, when Justices of Peace were constituted the road authority. In 1669 statute labour was introduced (the origin of another present-day term) when on roads known by that name each person was compelled to work a certain number of days in each year. The first Turnpike Act was in 1713, and between 1750 and 1884, 350 Roads and Bridges Acts passed the legislature. The era of roadmaking ended with the advent of railways, about 1840.

Mr. C. W. Gooch on his Messie Steam Car.

Mr. Gooch has driven his car about 6,000 miles over some of the most trying roads in England, and reports that he has found it satisfactory in every way.

Road-Making in Scotland.

AFTER referring to the Roads and Bridges (Scotland) Act of 1878, and to the Local Government (Scotland) Act, 1889, which gave the public control of the roads, the lecturer submitted a diagram map of Scotland showing the various local ratings for road maintenance. These vary from 3½d. to 1s. 5d. in the £. He pointed out that the standard of efficiency had much to do with the differences in assessments, but other considerations also were present, as:—1. Geographical position and proximity to good repairing material. 2. Vicinity of large town and consequent heavy traffic. 3. High or low rateable value. He suggested that to remove or diminish the anomaly the Government grant should be largely increased and should be allocated with regard to the scale of rating as well as to the amount spent on maintenance; or that no grant be made unless the rate be, say, 7d. to 8d. in the £, which is the average rate over Scotland. He pointed out the tendency of some road boards to neglect the main lines, and urged, in view of the increasing use of the road and of the new forms of locomotion, that these should be treated as of first importance. He took the view

that small area authorities were to be discouraged and that great advantages accrue from the whole roads in a county being under one control. Mr. Drummond blamed to a slight extent the steam roller for aggravating the dust nuisance, the fault, however, being largely due to a proper binding material not being used. The material giving off least dust and also the best results in binding new metal is the half-worn material taken from the old surface before the metal is applied. To obtain this the road should be regularly scarified and the loose material laid aside. He advocated greater attention to the sweeping and cleaning of roads in dry weather, both as a dust preventive and in the interests of economy, as dust is much more readily removed than mud. The experiments with oil were explained and discussed, and the Club, it was suggested, should bear the expense of local experiments. In conclusion, Mr. Drummond pointed out the salient features of the Departmental Committee on Roads in England and Wales, and contrasted the conditions of English and Scottish roads, and drew attention to various directions in which improvements in the width and contour of roads and other such matters might be made. A discussion followed.

Lucky Thirteens.

SINCE the lady of Salop declined to be labelled A.W. 13, there have been no cases of the refusal of motorists to accept the unlucky number. Some have even revelled in the distinction. Dr. E. H. O'Brien, of Rock Ferry, Birkenhead, writes us that he is "quite pleased at getting the unlucky number," and adorns his car with C. M. 13 to show his contempt for all such superstitions. Mr. E. Estcourt, of Wroxham, Norfolk, has secured A. H. 13. As yet it has not brought him bad luck, but the fact that his car was used in the Norwich bye-election on behalf of a candidate who failed to secure election is significant.

Lights on Vehicles.

THIS is a subject about which much has been written of late. A few practical lessons such as that just administered by Mr. W. T. Lord at Uxbridge will prove the value of the warnings that have appeared in the press, and also relieve the roads of one of these great dangers. Whilst driving a motor-car between Uxbridge and Hillingdon some days ago at about 8 o'clock at night, Mr. Lord came suddenly up to the back of a timber cart which was carrying no light either behind or in front. A balk of timber about seven feet long was projecting behind, and had he not had good lamps and good brakes, he would most probably have impaled the front of his car. He drove on towards the next police-station for a constable, but, meeting one on the road, requested him to go back and take the man's name and address, which he did, with the result that the driver was fined at the Uxbridge Police Court. Having regard to the restrictions placed upon motorists in the shape of lights and numbers, it is the duty of every car owner to protect himself and his fellows by insisting, so far as is possible, that other road users shall carry out their obligations. It is a very serious thing that a man driving a car, as in this case, worth about £600, should have to run the risk of smashing it up (and possibly himself incidentally) because drivers of slow vehicles insist on crawling along in the middle or on the wrong side of the road without a light. Mr. Lord intends to give in charge every driver of any horse vehicle he comes across on a dark night without a light, and doubtless other motorists will do likewise.

Motor-Cycle Licences.

THE hon. secretary of one of the provincial automobile clubs has had private intimation from an Inland Revenue officer that comparatively few motor-cycle licences have been taken out, and that it is probable that some action will be taken shortly. It must be remembered that the register of motor-cars and cycles kept by Corporation and County Council officials is

likely to be utilised by the revenue authorities, and that no excuse as to ignorance of the law will avail should prosecutions be instituted. Hence the warning that is now given to those who have not yet taken out their licences—15s. in the case of motor-cycles.

Stop Watches.

JUST as Surrey was unpleasantly prominent in its attitude towards motorists it has become equally notorious under the new Act. A more reasonable policy is being carried out by the magistrates, however, and we would congratulate those who sit on the Kingston bench on their recognition of facts in the first case brought before them under the Motor Car Act of last year. Superintendent Marks had timed a motorist over a measured course, starting a stop-watch as his victim entered the trap and stopping it as he emerged therefrom. The watch had the appearance of cheapness in the eyes of the defendant's solicitor, who plainly intimated his view to the Court. The superintendent did not appreciate such a suggestion of economy, and retorted, "Well, it is supplied to the police by the ratepayers." On being tested in court it was shown that no reliable timing could be done with the watch, and the Bench decided to dismiss the case. Probably this will have the useful effect of stopping further traps in Surrey until the ratepayers can supply the police with reliable watches, or until the police can use their common sense in dealing with motorists.

Railways and Automobiles.

MR. GEORGE MONTAGU'S paper, summarised on another page, led to an interesting discussion. Mr. Norman Macdonald, who was in the chair, said that the railway motor-car had been kept back by the fact that the railway companies had acted on the advice of mechanical engineers who were mostly steam men and confined themselves too much to steam. In connection with motor-car services, success depended mainly on having one man in charge. This had been done by the G.W.R., with the result that the manager of that section of the work was able to carry out his own ideas and to manage his men in his own way. Mr. Henry Fowler, of the Midland Railway, mentioned that the Belfast and Northern Counties Railway had in some respects been the pioneers in regard to the adoption of motor-cars on the roads, and he regretted that there were no reliable figures available as to the cost of such services when developed by railway companies. Mr. Burrows, of the Great Northern Railway, Mr. Coventry, of the Great Western Railway, Mr. Monckton, of the Great Central Railway, Mr. H. Austin, Mr. Lennon, Capt. Campbell, and others took part in the discussion.

THE Cardiff Cabs Committee will shortly have before them an application from the South Wales Transport Company, Limited, for a licence to run a service of motor omnibuses, which will ply for hire and carry passengers and parcels between Cardiff and Llandaff Yard on the one hand, and Cardiff and Llanishen on the other.

LAST week King Edward VII., accompanied by the Queen, paid a visit of inspection to the Gordon Boys' Home, situated on the Surrey Hills, midway between Woking and Bagshot. Though cold, the weather was fine, and their Majesties, who were attended by General Sir Dighton Probyn, the Hon. J. H. Ward, and the Hon. Dorothy Vivian, had a splendid motor-car journey through Windsor Great Forest and Bagshot, and then over the hills, from which some of the finest scenery in this part of the country is to be viewed, to the home. At the institution the Royal motor-car was driven to the parade ground, where the boys, about 240 strong, were formed up in review order, and received their Majesties with a general salute, which the King acknowledged.

THE GORDON BENNETT COURSE.

INTERVIEW WITH MR. ROGER WALLACE AND MR. JULIAN ORDE.

COMPARED with the keen interest which was manifested in the Gordon Bennett race at this time last year, the present excitement in the 1904 event appears somewhat languid. But, while publicity is lessened by the change of venue to a greater distance, conversation in automobile circles is largely concerned with the prospects of the Cup being retained by the present holders or regained by one or other of the two nations that have previously won distinction in the contest. But the Eliminating Test has yet to be encountered; hence the anticipations with which motorists in this country are regarding that event. In view of the uncertainty as to the route on which it will take place, so far as the selection of the British team is concerned, I called last Friday at the headquarters of the A.C.G.B.I. to ascertain the position of affairs from those mainly responsible for the arrangements.

Mr. Roger Wallace, K.C., was in consultation with Mr. Julian Orde, the secretary, who had returned that morning from Brussels, where he had been wrestling with Belgian burgomasters

cautiously pointed out. "The course passes through two communes, and their approval has to be obtained. The burgomasters have realised the importance of the race, and are under the belief that all motorists are millionaires—or, at least, have wealth beyond the range of ordinary mortals—and the terms upon which the roads can be obtained for the day of the proposed race are somewhat beyond what we had expected."

Mr. Wallace regarded the exalted ideas of these burgomasters with regard to finance as unwise. "In fact," he observed, "they may be inimical to the interests of the country; for, while the Eliminating Test will have to be held, it is by no means certain that Belgium is the only possible country in which it can be run. Should the Belgian authorities prove really unreasonable, our plans will, of course, have to be altered somewhat."

From the preliminary canter of the British contestants we passed to the course itself. Both Mr. Wallace and Mr. Orde have been over the route as outlined in the *Journal* on December 5th last and they are familiar with the country round about. Naturally I asked for some comparison with the angular route in Ireland as well as the dreariness of the prospect for a good many miles along its course.

"Those who go to Homburg," said Mr. Wallace, "will be

On the Gordon Bennett Course. The Road between Wellburg and Altendorf.

whose ideas have swollen with the development of automobile racing.

"It has been suggested," remarked Mr. Orde, "that it would be more satisfactory to hold the Eliminating contest over a course closely approximating to the conditions of the actual race than do the short tracks available here. Hence the desire of the committee to arrange for the event taking place abroad."

"And would the competitors assent to such an arrangement?"

"Oh, there will be no difficulty on that account," was the reply, spoken in a tone of conviction. "Those who will drive recognise the advantage of a race instead of a mere speed trial, while every British motorist would welcome the contest as duplicating the interest felt in the Cup."

"And is the idea welcomed on the Continent?"

"We have tried to have the contest over the Circuit des Ardennes, and the authorities evidently recognise the material gain such an event would be to Belgium. To a large extent the sanction of the road race depends on the goodwill of the Belgian Government, and in securing that, the motoring enthusiasm of the King of the Belgians should be an important factor. But there are other considerations not to be ignored," Mr. Orde

struck with the picturesque country. The whole district is a delightful one, beautiful landscapes alternating with scenes as rich in historic interest as they are profligate in natural beauty. Homburg is, of course, familiar to every traveller on the Continent. From there to the Castle of Saalburg, where the start will be made, the road rises gently through a well-wooded country, in strong contrast to the approach to the Ballyshannon cross-roads of last year."

A moment's reflection brought to mind the run from Dublin through poor old Rathcoole and the dejected villages that showed their ruins all the way to Kilcullen. And then the uninteresting scamper of five miles to the starting point between uneven hedges bordering equally uninviting fields. Visitors to Germany will have a more welcoming prospect. Mr. Orde shares Mr. Wallace's enthusiasm for the 1904 course.

"It should prove a capital run," said the secretary, "but unfortunately there will be sixteen controls to slacken the speed and give advantage to the cars that can most quickly get away after being stopped. The road is 139½ kilometres in length, so that the four circuits which will have to be made will necessitate 64 halts, with an accompaniment of language that will fortunately be foreign to many of the Observers."

"The Irish course was bare of level crossings; what of the German?"

"Well, there is one just beyond Wehrheim, but I learned that the trains will be stopped on the day of the race and the bed of the road will be made level, thus avoiding the bumps that proved so frequent on the Irish course until it was levelled for the event. While last year's route was fairly level, the course for this year is uphill to a great extent. In fact, quite 90 per cent. of the first half of the road is uphill, the switchback being the predominant note."

In Mr. Wallace's recollections of the course the two right-angled turns beyond Altendorf are most vivid.

"Beyond the river Lahn the scenery develops a grandeur all its own, commencing with the Castle of Weilburg, rising from the rock that juts from the river in picturesque solitude. Then a good straight road stretches to Altendorf, where, within a hundred yards of each other, are two right-angled turns that will test the nerves of the drivers even more than did the curly road by the Mageny Bridge last year."

Mr. Orde has acquainted himself with the details of the organisation now being developed, and it is evident that the sharp corners will be trimmed, the uneven surface made straight, and everything that is possible will be done to secure safety on the day of the race, June 17th, which will be graced by the presence of the Kaiser. So much has been written about the prospective hotel charges outdistancing the Irish rates of hospitality that his authoritative statement on the subject is of interest.

"The hotel charges are very high, but it must not be forgotten that Homburg is a good centre for all countries, and that it attracts, every year, visitors from all parts of Europe, whether there is to be a motor car race or not," said Mr. Orde.

"There is another factor," added Mr. Wallace. "In addition to the usual contingents from Italy, from Servia, and from the southern kingdoms of Europe and from Russia, it must not be forgotten that the Germans have not yet seen a race of this calibre. The country is much more thickly populated than is Ireland, and the crowds that will pour, not only into Homburg, but also into Frankfort and Wiesbaden, as well as Konigstein, Limburg, Ober-Ursel, and other places directly on the route, will be immense. But we were fortunate enough to secure to the A.C.G.B.I. the use of 100 of the best rooms in the Homburg hotels at a reduction of 20 per cent. on the charges fixed by the syndicate of hotel proprietors. That is something for which we must be grateful."

Then the conversation became general, and we reverted to Brussels, it being made clear to me that the resources of the Club will not allow any hitch in the Eliminating Test, even if the Belgian Burgomasters prove intractable. Mr. Orde being fresh from Brussels it was natural that talk should drift to the exhibition now in progress there.

"I cannot understand why English makers should ignore the exhibition at Brussels. The Dunlop Company was the sole British representative. And yet the Brussels show is no mere aftermath of Paris. Buyers were present from England, France, Germany, Northern Europe, Italy, Russia, and even the United States, and I feel confident," added Mr. Orde, "that those English firms seeking international business are not wholly wise in ignoring the splendid show in the little Belgian capital."

"And to what is the success of the exhibition mainly due?"

"Well, organisation is something, but the fact that the display is under the auspices of the Automobile Club de Belgique is a great factor," said the secretary, and Mr. Wallace, speaking from his full knowledge of Continental automobilism, assented.

"You see that such patronage secures the attendance of Society people, and also the international notice that means much for the exhibitors at such a show. And from the personal inquiries I made from the exhibitors, I should say," said Mr. Orde, "that everyone is satisfied with the business done. M. Oscar Gregoire, one of the founder members of the A.C.G.B.I., sold a 32-h.p. car eighteen times; and Belgian manufacturers, whose productions are really creditable, must have done exceptionally well, and secured important introductions to buyers from abroad."

LOLLIUS.

THE MOTOR CAR ACT.

English Licences in France.

"Normandy" writes:—"I am thinking of making a tour with my car in France during the coming summer. Will you kindly inform me whether the driving licence I have just secured here in England will be recognised by the French authorities, or whether it will be necessary for me to also secure a permit from them? A friend of mine tells me that in France driving licences are only granted to motorists after they have shown themselves qualified to drive. Is this so?" The licence issued by the English authorities will not be available in France, where a permission to drive has to be obtained from the Service of Mines. If "Normandy" is a member of the A.C.G.B.I. and a capable driver, that organisation will send a certificate to the French Department, which will be exchanged for a driver's permit.

The Weight of a Car.

The duty on a car which weighs under one ton is two guineas. "For the purpose of arriving at this weight," writes F. W., "am I allowed to remove the cover from my car? It is a detachable one and is not always used with the car. I suppose the carrying of a number on every occasion the car is out is necessary under the new Act." The removal of the cover would not avail F. W. anything with the Revenue authorities should he be using the car with the cover and an officer run the complete vehicle on to a weighbridge. The better way will be not to remove the cover for weighing purposes. With regard to the latter part of the question the number will have to be carried whenever the car is out.

Rear Lights.

Mr. G. C. Bedwell, who was the first resident motorist in Cambridge, writes:—"I notice in your issue of the 30th ult. that a person was fined because his back lamp was out. Now, if everybody had their illuminating back lamp on the left hand side of the car, the driver could easily see, by casting a side glance, whether his lamp was alight, and without the trouble of getting down. I find this a great advantage, and am using a lamp which acts as an illuminator and red lamp. I have tried many ways of fixing the lamp to get the best results, and find that if it is put at a right angle to the plate and $\frac{1}{2}$ inch in front I get the best result." Perhaps some of our readers will require further explanation.

Dealers' Marks.

As a general rule the authorities are charging £3—the maximum fee—for the dealers' marks. The Cornwall County Council, however, is charging £2 only, the reduction having been obtained by reason of an application by the Cornwall Centre of the National Association of Cycle Traders, of which Mr. W. E. Hicks, of Truro, is the local secretary. The mark in that county consists of white figures on a chocolate red ground.

Variety in Plates.

MR. GILBERT MARSHALL (Chesham) asks if it is only the rear plate that need be illuminated, and also as to whether he can have the letters above the figures on the back of the car and all in one line on the front? The regulations of the Local Government require only "the identification plate on the back of the motor-car" to be illuminated. There is no reason why dissimilar plates should not be adopted on the front and rear of the car provided they are in accordance with the regulations as to size, etc. A good instance of our correspondent's suggestion occurs in the vehicle with which the ascent was made up Snowdon. From the photographs on page 938 it will be seen that Mr. Du Cros has adopted both the plates allowed by the L.G.B.

SINCE the new Act relating to motor-cars came into force, the speed has been much faster through the streets of Horsham, according to a local journal.

THE "HOWARD" STEAM WAGON.

STILL another old-established engineering firm to take up the construction of heavy steam wagons is Messrs. J. and F. Howard, of the Britannia Ironworks, Bedford. The accompanying illustration gives a general view of the vehicle they have produced; it is designed to carry a load of five tons, and to haul a trailer with an additional two to three tons. The frame is built of channel steel, with strong channel steel braces, the whole being riveted up by hydraulic machinery. The boiler, which is located in the fore-part of the frame, is of the vertical type, of special design, with solid-drawn coiled water-circulating tubes, giving great heating surface and large grate area; it is designed to work at a pressure of 200 lbs. per square inch, and is lagged with sheet steel. All the necessary fittings are provided with seating blocks riveted to the boiler. It is adapted to be fired with either gas coke or Welsh coal. The engine is of the compound type with high-pressure cylinder 4 inches diameter and low pressure cylinder 7 inches diameter, the stroke in both cases being 5 inches. The reversing gear is of the link motion type. The engine, which can run up to a speed of 600 revolutions per minute, is entirely enclosed and runs in an oil bath. A by-pass valve, worked by the driver from the seat, is fitted to allow high-pressure steam to be admitted to the low-pressure cylinder when desired. A special regulating valve is attached to the steam pipe, so that the driver has the engine under complete control by the foot lever, for starting, stopping, and going slow, without removing his hands from the inclined steering wheel. An independent steam feed pump as well as one driven by the engine are provided. Two speeds are available, the power being conveyed from the crank shaft by steel spur gearing to the intermediate differential shaft, the

The "Howard", Steam Wagon.

after being connected to the rear road wheels by side roller chains. The differential gear is provided with a locking arrangement of a simple and effective form, to enable the vehicle to extricate itself from any soft places in the roads traversed. The approximate over-all dimensions are, length 17 feet 3 inches, and width 6 feet 10 inches, the flat platform measuring 11 feet 6 inches by 6 feet. The road wheels are of the traction engine type, 3 feet 6 inches diameter by 9 inches in width at the rear; the front wheels are 3 feet diameter by 5 inches wide. The rear axle is 3½ inches square, and the front one 2½ inches. Ample brake power is provided, and on hard macadam roads an average speed of five miles an hour can be maintained. As to hill-climbing capacity, the makers inform us that hills of a gradient of 1 in 10 can be mounted without difficulty. The consumption of gas coke or Welsh coal under ordinary circumstances is about one ton per week, and the water tank carries sufficient water for a run of about fifteen miles. It will be readily understood that any type of wagon body can be fitted to the vehicle.

CONTINENTAL NOTES.

THE Gordon Bennett Committee of the German Automobile Club, actuated by the express desire of the governing authorities, has decided that the cars of all motorists attending the Cup race, German and foreign, are to carry a plate, to be provided by the German Club at cost price, and bearing the symbols G.B. and a number. By these means the authorities hope to render the task of controlling the race much easier. The Club will erect a stand accommodating 10,000 spectators, to view the race. The structure will be built entirely of steel, and will span the course, near the starting point, like a bridge. The colours of the competing cars will remain the same as last year, the new challenging countries mutually deciding as to what colours each shall adopt. The Mercedes 1904 racers are reported to have been already out on the road.

THE announcement is now definitely made that M. Rene de Knyff will not drive in this year's Cup Race, and that the drivers of the three Panhard cars in the French eliminating trials

will be Henri Farman, Teste, and H. Tart. Messrs. Storero Nazari, and Lancia have also been chosen as the drivers of the three Italian cars.

THE Automobile Club of Marseilles is organising a hill-climbing competition for the 21st inst. It will be held on a private road over a distance of a kilometre, with a standing start and a stopping finish. There will be three classes: (1) open touring cars up to 12-h.p.; (2) open touring cars over 12-h.p.; and (3) covered touring vehicles. The total weight of the car, the number of passengers carried, the horse-power, and the time occupied in covering the kilometre, are all to be taken into account in making the awards.

IN the course of a recent interview as to the effect of the spread of automobilism on railways, the vice-president of the Paris, Lyons and Mediterranean Railway Company stated that "In view of our very large system, with its multiplicity of branches and the variety of causes which influence travel, it is

not possible to say exactly what the effect of automobilism has been upon our passenger business up to the present moment, but our impression is that the railways should see in the great progress of this new industry something to welcome. Not only has it brought us business in the transportation of the automobiles themselves, but it has increased rather than diminished the number of passengers over the lines of our company. In short, we regard the automobile rather as an auxiliary than a competitor, for, as a matter of fact, every new invention in the way of locomotion only serves to develop a taste for travel."

THE Belgian Automobile Club is organising a competition of anti-skidding devices which is to extend over a period of six months from March 1st next. The maximum number of points that can be gained is 110, divided as follows:—Efficacy against skidding, 60; wear of device, 30; weight of ditto, 10; and cost of renewal, 10. The anti-skids entered will be fitted to

THE latest madness in connection with the looping-the-loop craze is shortly to be seen in Paris, either at Olympia or at the Casino de Paris. Instead of travelling round a loop, a motor-car is to run along a switchback path, the first part of which is a very steep fall. At about midway there is a gap in the path, across which the car is not only to leap by the impetus gained in the descent, but at the same time to turn a complete somersault. The most remarkable part of the scheme is that it is reported to be due to a well-known French motor engineer.

THE Hungarian Post and Telegraph authorities in Budapest are inviting tenders until the 15th inst. for the supply of eight motor-vans for the postal service in that city. They are to be fitted with 10-h.p. two-cylinder petrol motors, running at not more than 1,000 revolutions per minute; they are to carry a load

The Archduke Leopold Salvator of Austria recently visited the works of the Austrian Daimler Motor Company at Neustadt, Vienna, and afterwards went for a drive in an Austrian Daimler Car. The Archduke is seen in the accompanying illustration seated at the side of Herr Fischer, one of the directors, who is at the wheel. [Allgemeine Automobil Zeitung.]

cars which, during the period named, will cover approximately the same distance.

THE Swiss Automobile Club has decided to organise a hill-climbing competition on the Port-Noir-Cologny road for the 24th April. There will be two classes, one for racing cars and one for touring vehicles.

THE City Council of Frankfurt-am-Main has decided to impose a tax of £10 each on all automobiles, except those used for purposes of business.

TWENTY-TWO cars and fifteen motor-cycles have so far been entered for the anti-skidding competition which the Automobile Club de Seine-et-Oise will hold from the 24th to the 28th inst. A number of prizes are being offered in connection with the competition, including an *objet d'art* presented by the municipal authorities of Versailles.

of 500 kilog. in addition to the driver and attendant. A maximum speed of nineteen miles an hour is called for.

FOUR entries have already been received by the Belgian Automobile Club for the Circuit des Ardennes—viz., Hautvast (Pipe car), Baron de Caters (Mercedes), Coppée (Panhard), and Madoux (Excelsior).

THE Elektrischer Kraftwagenbetrieb mit Oberleitung für die Verscheidethal Gesellschaft is the name of a company which has been formed at Bilstein to establish and work a service of electric motor-vehicles taking their current from overhead conductors, between Kirchveischede and Grevenbrück, Germany.

THE Nice Automobile Club has decided to organise an international automobile exhibition. It will be held in the Casino from the 2nd to the 10th April next.

THE "RYKNIELD" CAR.

IN our issue of April 18th last we recorded the opening of the large works which have been erected by the Ryknield Engine Company, Limited, at Burton-on-Trent, for the manufacture of the "Ryknield" cars. It may be remembered that the company was launched and financed by some of the most prominent members of the great brewing firms, and that the

Fig. 1. -Sectional Elevation of "Ryknield" Clutch.

works are of the most modern description and are adapted for turning out in quantities cars of the highest grade. For the present the company is devoting its manufacturing energy to a 10-h.p. double-cylinder car, but the designs are in hand for a 20-h.p. four-cylinder vehicle having magneto and high tension ignition, four-speeds and reverse and side chain transmission.

The 10-h.p. Ryknield car follows in its general outline the best modern practice. On a pressed sheet steel frame is placed, under a front bonnet, a two-cylinder petrol engine, with mechanical inlet valves and magneto ignition. The new Longuemare carburettor with automatic air regulation is at present fitted, but we understand the company have in preparation an automatic carburettor of their own design. The drive is taken through the Ryknield duplex clutch to a three-speed gear-box, and thence by cardan shaft to the rear live axle. The latter is designed so that the driving shafts bear no part of the weight of the car, but pass through the hubs and drive back into them by jaw clutches. We do not intend at present to describe the car in detail, but think that a description of some of the special features will be of interest.

The clutch, unlike the majority, is independent of the main flywheel of the engine, but has a light clutch drum, having two sheaves, engaging one on either side, drawn together by springs common to both on the circumference, thus eliminating all thrust on the engine or gear box when in or out of gear. These sheaves at the same time so balance each other when put in gear as to be silent and perfect in action. The action of the mechanism will be readily followed by reference to Figs. 1 and 2. The clutch drum A is keyed to a floating shaft C, one end of which is let into a recess bored in the engine flywheel F, and deriving its motion by means of a transverse key K. The other end is butted against a cotter Q, which acts also as a dis-

tance piece between it and the change-speed gear-box shaft Z. It is prevented from falling out of place by sliding joints N and P. The part P which is keyed to the shaft Z has two channels cut at right angles, the horizontal one to take the tongue of the shank N, and the vertical one for the cotter Q, this preventing N from sliding out, so securing the clutch and at the same time leaving it flexible.

The two sheaves B¹ B² are drawn together on a clutch cone by means of twelve springs Y, which are kept in position by pockets and adjusted by means of nuts and bolts X. To unclutch, these two sheaves B¹ B² are drawn apart by pressing down the pedal which actuates cross shafts T¹ T² by means of levers R¹ R² R³, causing other levers L¹ L² to move outwards, thus drawing B¹ B² away from A by means of stirrups S¹ S² working in grooves M and N. The sheaves B¹ B² are prevented from twisting relatively to each other by means of lugs H¹ H² H³ on B, sliding in slots cut in B¹.

To remove the clutch the cotter Q is withdrawn, this allowing the shaft C to slide back and disengage with K and flywheel F; the clutch is then turned round until the tongue N is in a vertical position, so as to allow it to drop bodily downward out of the stirrups. Lubrication is provided by means of oil pipes from the dashboard attached to the top of the stirrups so as to let the oil down between the faces of the shanks and stirrups through holes in M and N to the bearing.

Passing now to the steering gear, the ordinary form of steering adopted in motor-cars is by worm and pinion, in which there is usually no means of taking up the slack due to any wear that takes place. Consequently, when the car is running, the front wheels, instead of being rigidly connected with the steering wheel, have an amount of play depending upon the wear. This has been entirely eliminated in the Ryknield arrangement, in which two nuts fitted upon a triple thread screw are employed. The two nuts work on radial surfaces, on a combined double crank lever. In Fig. 3 these are indicated by letters N¹ N², L being the crank lever, with the part R hinged at H. Should any wear take place in either the screw or nuts it can be taken up by removing a small cap D¹ in the side of the case,

Fig. 2. -Front Elevation of "Ryknield" Clutch.

and screwing up one small wedge bolt C, which forces the two ends of the lever L and R apart from a fixed centre, thus pressing one nut against the top of the thread and the other against the bottom. Any play between the screw S and the case can be taken up by the adjustment screw A, which presses the stop D upwards, causing the collar E to press against the top of the case. Another great advantage is that whereas in the worm and pinion type the steering lever, which has to take all the shock

of obstacles on the road, is much overhung, in the Ryknield it is central, and thus takes a thrust direct to the screw. The case is made in halves and bolted together, being made oil-tight.

The steering wheel (see Figs. 4 and 5) is also of novel design. In place of the ordinary aluminium wheel, the "Ryknield"

Fig. 3. -Details of "Ryknield" Steering Gear.

wheel is built up of dished steel spokes. These are built up upon a central steel boss and combine extreme lightness with strength, and obviate any danger of cracking across the boss. The two controlling levers for the ignition and carburettor are placed on the wheel, and may be operated without moving the hands. The levers L^1 L^2 turn about the steering shaft N , working against the quadrants Q^1 Q^2 (which are solid with the upper part of the wheel,) being held tightly in any position by springs T^1 T^2 . To retard or accelerate the engine the lever L^1 is pushed backward or forward. This is fixed to a sleeve A^1 which is cut with a spiral face, as is its counterpart B^1 . When A^1 moves forward relative to B^1 the latter is moved downward, being prevented from turning by the pin P . The lower sleeve B^1 has a groove turned in it to take a stirrup M^1 , which is fixed on the end of the rod R . Thus the wheel is left free to turn without interfering with the positions of the levers and rods. The rods R^1 R^2 work in a guide G which is fixed to the steering column C , so keeping the rods in position. The springs S^1 S^2 hold the bottom sleeve against the top one. The other lever is similar except that the sleeves A^2 B^2 are inside A^1 B^1 .

At the forthcoming Show the Ryknield Company will have a 10-h.p. chassis, a standard tonneau, a Victoria, and a light delivery van, in all of which the features referred to above will be found.

THE Massachusetts Highway Commission licensed 3,872 motorists and registered 3,206 automobiles in the first three months that the automobile registration and licensing law was in force. Professional drivers to the number of 678 were also licensed.

MOTOR-CYCLING NEWS.

THE annual meeting of the Motor Cycling Club was held last week. From the report of the work of the club presented by Mr. G. E. Roberts, the secretary, it appears that the number of members elected in 1903 was 109 as against 30 for 1902. The successful series of trials organised during last summer was referred to, and it was announced that Mr. S. F. Edge had offered two trophies for competition during the coming season. It is probable that a long-distance club run will be organised some time during the present year. A discussion ensued as to the desirability of having the executive committee composed solely of non-trade members, Mr. Tuchmann moving that the trade members, instead of being on the executive, should form an advisory committee and help the club in other ways. Eventually the proposal was negated by a large majority.

THE following runs for motor-cyclists have been arranged by the Sheffield Automobile Club:—Thursdays, 11th inst., Victoria Station Arches, for Blythe; 18th, Millhouses, for Baslow; 25th, Victoria Station Arches, for Bawtry. Saturdays, 13th, Hunters' Bar, for Grindleford; 20th, Victoria Station Arches, for Worksop; 27th, Hunters' Bar, for Castleton. The meet, on each occasion, will be at 2.30 p.m.

THE case of O'Donoghue v. Mcon, which will probably be heard in the High Courts in a few weeks, will secure a judicial declaration as to the position of the trailer in view of the Inland Revenue tax. This vexed question is certainly ripe for settlement.

Figs. 4 and 5. -Sectional Elevation and Plan of "Ryknield" Steering Wheel.

ONE of the alterations in the Minerva motor-cycles for the 1904 season as compared with last year is that instead of one accumulator of 30 ampère-hour capacity, two separate accumulators are provided to occupy exactly the same space, each having

a capacity of 15 ampères, and a two-way or rather a three-way switch is provided that enables the rider to switch on or off either accumulator. As this change necessitates a different method of connecting up the wires, the accompanying diagram showing the correct method of wiring may prove useful. The positive (red) terminals of the accumulators are connected by a short wire with the + terminal marked P of the coil, and the negative (black) terminals of the accumulators are connected respectively with the right and left hand terminals of the switch, whence the wiring passes along the left half of the handle-bar and is "earthed" when the left handle is screwed home. The terminal T on the coil is connected with the platinum screw of the contact breaker. The terminal M is connected by a short wire to the metal of the frame. The terminal on the other side of the coil is the one by which the high-tension current passes, and is connected by a thickly insulated wire to the sparking plug placed on top of the combustion chamber of the engine. In order to derive the utmost benefit from the provision of accumulators in duplicate, the rider should always make a practice of using one accumulator only at first, and not switching on the other until the first signs of running down and consequently requiring recharging. If the rider gets into

Diagram of Wiring for Minerva Motor Cycles.

the habit of using either accumulator indifferently, he runs the risk of exhausting both his accumulators simultaneously, whereas by using one first and then the other he has greater latitude to get one recharged before the other requires it. When detaching either accumulator for re-charging care must be taken lest the ends of the loose wires should come in contact with each other, resulting in immediate and injurious discharge of the other accumulator. The extremities of the M and P wires should be marked so that they can readily be identified and connected up to the correct terminals of the accumulator when replacing it.

A MEETING has just been held in Turin, when the formation of the Motor-Cycle Club of Italy was decided upon. A committee has been appointed to draw up the necessary rules.

THE "Abingdon" is the name of a new fastener for the driving belts of motor-cycles which has lately been introduced by Messrs. Coxeter and Sons, Limited, of Abingdon, and of which illustrations are given herewith. As will be seen, the fastener consists of four parts—a curved wire with threaded ends,

a small plate, and two nipples. It is claimed to be unusually strong, while the fact that there are no projecting pieces is referred to as one of its advantages. The device can be used with every size of belt, flat or V-section. It is easily detached by

unscrewing one nipple and attached by screwing down the nipple.

THERE seems to be a growing tendency among motor-cyclists to adopt handle-bar control on their machines. The means it offers of being able to control the engine without removing the hands from the handle-bar of the bicycle are undoubtedly a great advantage; more especially is this the case in starting, when a firm grip of both handles is necessary to properly pedal, while in heavy traffic, or at night, the exact position of the various valves can be told by the feel alone, without in any way having to trust to one hand to steer the machine. In connection with his system of control Mr. George Roberts, of Twyford, near Winchester, has recently introduced the novel arrangement of thumb slides illustrated herewith. They consist of a piece of slotted tubing about 2½ inches long, with a clip for attaching to the handle bar, as shown at 1 and 3. The slide, 2, fits easily in the tube, and is moved backwards or forwards by means of the button. One end of a Bowden brake wire is attached to the slide, and the other end to the gas or air lever of the carburettor, as shown at 4. The latter can thus be instantly opened or closed without removing the hands from the handles of the machine, the natural position of the thumbs being always over the buttons of the slides. The amount of gas or air can be regulated with the greatest nicety, and, although the slides move easily under the thumb, they will not move from any shaking of the machine. They can also be used for advancing the spark and holding the exhaust valve open. Where two are required on one handle bar, twin thumb slides can be supplied,

two being fixed on one clip, or two of the single thumb slides may be used for the same purpose. In fitting the arrangement, it is essential that the outer portion of the Bowden wire should be firmly fixed close to the slide and also to some portion of the frame of the machine near the gas or air lever.

MESSRS. A. D. BARNETT, LIMITED, has been registered with a capital of £8,000 to carry on the business of manufacturers of and dealers in motor-cars, etc.

THE Middlesbrough Corporation Hackney Carriage Committee have decided to postpone for six months the drafting of regulations under the Motor Car Act.

THE "NAPIER" CARBURETTOR.

THE accompanying illustration gives the details of the carburettor which is now being fitted to the Napier cars.

A is the air admission pipe, B a throttle valve in the same controlled by a diaphragm C, subject to water pressure on its upper side, D is the jet, the petrol being maintained at a constant level by the ordinary float feed arrangement. E is a hollow cylindrical valve surrounding the jet and having two ports, one, F, controlling the air admission to the jet chamber, the other, G, throttling the mixture to the motor. This valve is controlled by the driver, an actuating lever being arranged on the steering wheel for this purpose. H is the ordinary valve controlled by the governor, independently of the hand throttle. J is the pipe leading to the motor. A perfect carburettor to allow the driver of a car to vary the speed or the turning effort of the motor and to give the best possible mixture under all conditions, without waste, must fulfil the following two conditions, or any combination of them: first, to allow the turning effort of the motor to be varied, the speed remaining the same; second, the speed to be varied, the turning effort to remain the same. In the new carburettor shown herewith this has been accomplished as follows:—The

first condition is fulfilled by the hand-controlled throttle E, for as the driver rotates this valve to reduce the supply of gas to the motor by the port G, the valve is also cutting off the air admission by the port F. By varying the shape and size of these two ports a permanent ratio can be established between the flow of gas to the motor and the air admission, and any desired suction obtained at the jet, the motor running at constant speed. The second condition is complied with by using the automatically-controlled throttle B in the air admission. To control this valve advantage has been taken of the fact that the water pressure in a pump-driven water circulation varies with the speed of the motor. Thus, suppose the driver wishes to slow the speed of his motor, he actuates the central throttle E, reducing the supply of gas to the motor and getting the correct proportions of air and petrol, then as the motor slows down the automatic valve still further reduces the air admission, in order to maintain the correct mixture.

The advantage claimed for the Napier carburettor is that no throttling action takes place when the engine is called upon to give its greatest power. When full power is desired the central throttle is wide open; the automatic valve is also wide open and held so by a force independent of the suction of the motor, the water pressure being available whether use is made of it or not.

THE "SUNBEAM" SIX-CYLINDER CAR.

IT was announced in these columns some time ago that Messrs. John Marston, Limited, were at work on a new six-cylinder "Sunbeam" car. We are now able to give a few particulars of the vehicle, which will be exhibited at the forthcoming Show. The engine has six cylinders, cast together in three pairs. The bore and stroke are the same as in the "Sunbeam" 12-h.p. car, and the cranks are set at an angle of 120 degrees. The valves are all mechanically operated, the inlets being on the opposite side to the exhaust, and are interchangeable as far as valve seats, plugs, guides, etc., are concerned. A new feature is embodied in the inlet cam shaft, which is made so that the cams can slide longitudinally, they being sloped off towards the back, thus providing a variable lift to the inlet valves, giving a large range of control of the engine speed, at the same time effecting a notable economy in the quantity of petrol consumed. There is, of course, beyond this the ordinary throttle governing device, and in conjunction with the latter another new feature has been added, this being a pneumatic brake for the engine. A new compensating air valve has been fitted to the carburettor. The clutch is of the metal-to-metal internal type, running in oil, giving, it is claimed, no thrust either on the engine or the gear box. Two forward speeds and one reverse are provided, the top speed being so arranged that when in gear the drive is direct from the engine to the countershaft. From the latter the power is transmitted by side chains to the rear road wheels. The lay shaft for the second speed lies idly in the box when the top speed is running. Both engine and gear box are automatically oiled. The brakes are three in number, two internal metal-to-metal on the rear wheels running in oil and in the chain cases and the third, also metal-to-metal, on the differential gear. Carried on the steering wheel are the two levers for the accelerator and variable lift to the inlet valves, whereas the advance spark lever is underneath the wheel in the position it occupies on the 12-h.p. cars. The steering is non-reversible, with the cross bar located behind the axle so as to reduce to a minimum the risks of accidents. An effort has been made in the new car to abate the dust fiend by putting a new type of steel shield under the vehicle from end to end. There is nothing whatever below this shield excepting the steering arm and the pipe to carry away the exhaust.

THE Select Cycle and Motor Manufacturing Company has been registered with a capital of £6,000 and offices at Greenock.

FURTHER experiments have been made on the Selby and Cawood Light Railway with the new motor rail coach which has been constructed for the North-Eastern Railway Company, and its working has proved very satisfactory.

THE A. G. Mulliner Motor Body Company, Limited, has been registered with a capital of £2,000, to adopt an agreement with Messrs. A. G. Mulliner and T. C. Usher for the acquisition of the business carried on at Church as the Mulliner Motor Body Company. The first directors are Messrs. King and J. W. Wall.

At the last meeting of the East Riding (York) County Council, the minutes of the Highways and Bridges Committee were agreed to. These included the report of the sub-committee appointed to take any steps necessary to give effect to the provisions of the Motor Car Act. The sub-committee recommended that notice posts should be as simple as possible, and that white posts be used to indicate that the speed should be reduced to ten miles an hour until the next white post was reached, and that red posts be used to indicate dangerous corners, cross roads, and precipitous places.

HERE AND THERE.

THE Bury Town Council is considering the purchase of an automobile for its surveyor.

COLONEL CROMPTON has been explaining the dust problem to the members of the Camera Club.

WE understand that Messrs. H. B. Nelson and Company have opened a free motor garage at 7, Harrington Road, South Kensington.

The Beaufort Motor Company's new 10-h.p. Tonneau.

MR. F. F. WELLINGTON, who is well known in the automobile trade, has resigned from the firm of F. F. Wellington, Limited. He hopes to make early arrangements for the representation of some good motor-car firm in London.

It has been decided to file notices of objection on behalf of the Motor Union to the applications by the Borough Councils of Blackpool and Newbury for a ten-mile limit of speed within their districts.

15 CHANCERY SHAFESBURY AVENUE, London, is clear for through traffic south to north, but something should be done to prevent the fearful maze of traffic at the junction of Tottenham Court Road with Charing Cross Road.

A FIRE at Mr. Crisswell's motor-car stores, Newmarket, the other day, placed in danger a large number of valuable race-horses in a stable in the vicinity. The outbreak was, however, confined to the works, which were unfortunately destroyed.

At the first ordinary meeting of the Society of Engineers for the present year, held this week, Mr. Douglas Mackenzie was awarded the president's gold medal for his paper on "Motor Transport for Goods"; and Mr. R. J. Thomas the Bessemer premium for a paper on Road Maintenance.

THE racing committee of the American Automobile Association has officially accepted the record of 39 2-5 seconds for a mile on the ice at Lake St. Clair, made by Henry Ford, on the 12th inst. The affidavits of the timers and the statements of witnesses were noted, and the record accepted as the world's best for one mile straight away.

MOTOR 'buses were responsible for much discussion at the last meeting of the Eastbourne Town Council. The Town Clerk read a letter from Messrs. Clarkson, Limited, stating that their price for a double deck motor omnibus was £807 and for a single deck 'bus £735, and that they were prepared to deliver the latter in July and the former not later than August next, though they hoped it might be earlier.

The Society of Automobile Engineers is the title of an association which has just been formed in New York. It is the purpose of the society to hold frequent meetings for the interchange of ideas and knowledge on automobile construction, and, at quarterly meetings, to have papers read which will form the subject of discussion. Two classes of members are provided for—active, who must be actual engineers; and associate, who may be persons connected with automobile construction. Mr. A. L. Riker has been elected as first president.

THE Scottish Motor Garage Company, Limited, have storage for 200 cars at their garage in Renfrew Street, Glasgow.

MESSRS. JAMES AND BROWNE, LIMITED, are opening a West-end depot and garage at 395 and 397, Oxford Street, W.

A SERVICE of motor-omnibuses is being inaugurated between Forest Hill Railway Station and Camberwell, via Peckham Rye.

MR. THOMAS SHAW, of Dundee, has been lecturing before the local Society of Experimental Engineers on "Petrol Engines and Motor-Cars."

MESSRS. RAINY AND WATERS have secured a warrant from the Edinburgh Dean of Guild Court for the erection of a motor-car works in Westfield Avenue, Edinburgh.

IN the county of Leitrim three motor-cycles had been registered up to the end of last month. No motor-cars had been authorised nor had any licences to drive been issued.

THE Garrard Manufacturing Company, Limited, are bringing out a three-wheeled, two-seated car fitted with a 4½-h.p. water-cooled engine. The power will be transmitted to the rear wheel through a cardan shaft and worm gearing, three speeds being provided.

WE have received a copy of the first number of a new monthly journal entitled "Motoring in France." While published in Paris, it is printed in English, its object being to form a connecting link between the automobile movement and industry in England and France.

SIR EVAN JAMES, K.C.I.E., chairman of the directors of Clarkson, Limited, was present at a social gathering of the employees of the firm at Chelmsford at which Mr. T. Clarkson thanked the men for their share in winning the distinction lately accorded the firm's steam cars.

MESSRS. SELBACH, LIMITED, is the title of a company registered with a capital of £80,000 to carry on the business of automobile builders and proprietors, etc. The number of directors is to be not less than two nor more than five. Mr. O. C. Selbach is the first, and has power to nominate two others.

MESSRS. WILLIAM GUEST AND SON, of the Neptune Works, Sheffield, have sent us samples of their repair outfits, ranging in price from 6d. to 2s. The latter size is specially adapted for motor-cyclists' use, and in view of its contents and handy size can be well recommended as a necessary adjunct to the tool-bag.

The "Soames" Motor Van, built by the Langdon Davies Motor Company, Ltd., for the Imperial Tobacco Company, Ltd.

MESSRS. JOSEPH LUCAS, LIMITED, send one of their court plaster and stamp cases and perpetual time-to-light-up tables, with which they seek to give familiarity to their name among motorists. They have also issued a wholesale catalogue of motoralities for 1904, in which their well-known specialities are fully described and clearly illustrated.

AN International Union of Motor-car Drivers has just been formed in Milan.

THE ELECTRIC IGNITION COMPANY, of Birmingham, have just brought out a secret and combination switch and a new contact breaker, which they have provisionally patented, and of which illustrations are given herewith. Fig. 1 shows the switch, the handle of which is made detachable and can be entirely removed when the car or motor-bicycle is left unattended. A couple of turns or so breaks the contact, and this locks up the electricity effectively,

FIG. 1.

FIG. 2.

as it is unlikely that anyone who wishes to tamper would think of screwing down the handle before using. When the handle is in either of the outside positions a slight pressure outwards breaks the circuit, which remains interrupted as long as the pressure is maintained, but on this being withdrawn the handle flies back and makes contact again, a feature which will be appreciated by motor-cyclists in traffic-riding, and also by drivers of cars in passing restive horses, as under the new regulations it is necessary to stop the engines firing, if required. The new contact breaker, shown in Fig. 2, is made on the company's wipe principle. The metal composing the blades is of the hardest material obtainable, and is, it is claimed, not likely to wear away. The return current is earthed by a separate wire, the makers not believing in earthing through moving parts, oil being an insulator and consequently setting up a certain amount of resistance. The cam is made on a new principle, allowing adjustment for timing purposes, at the same time being held absolutely rigid on the half speed shaft. The arrangement is stated to also reduce the wearing away of the fibre to a minimum.

AT a meeting of the Glasgow University Engineering Society, on the 11th inst., Mr. L. Rottenburg, M. Inst. C.E., will read a paper on "Recent Developments in Internal Combustion Engines."

CHARLES JAMES, driver to Lord Charles Fitzmaurice, has been summoned at Chippenham for driving a motor-car across the town bridge at a speed between fifteen and twenty miles an hour. He was fined £5 and costs.

MESSRS. S. HOLMES AND COMPANY, of Albion Works, Bradford, have just brought out a handy little jack for lifting the wheels of motor-cars off the ground. When extended the jack is 17 in. high, while when closed it is only 7½ in. long; its weight is 5 lbs.

THE farmers on some of the local councils in the Fen districts were engaged in very congenial work in suggesting notice boards for motorists with alarming frequency along their roads. But the fact that the county funds will have to bear the cost is restraining their ardour.

WESTRUMITE has been used upon the concrete floors of the warehouses of Messrs. Friawell, Limited, with satisfactory results. Hitherto they had difficulty in keeping new carriages free from dust, which seemed to rise out of the cement, but since using Westrumite they have been saved much inconvenience from that cause.

Two London motorists have registered their vehicles in Monmouthshire, so as to secure low numbers.

THE latest "Goodrich" tyre showcard depicts "Babette," and will doubtless be much appreciated by agents.

NEW works for the repair of motor-cars and the storage of petrol have been erected by Mr. W. Scott, at Dunstable.

MESSRS. POWELL AND HANMER have registered their business of motor-lamp makers, etc., as a limited liability company.

THE Lancashire Steam Motor Company, Limited, has lately completed a heavy steam wagon for the Wigan Coal and Iron Company, Limited.

THE Automobile Club de France has just issued, in book form, the regulations under which motor launch and yacht races are to be run in France.

A SOUVENIR of the Gordon Bennett race of last year comes from the Continental Caoutchouc and Gutta Percha Company, whose tyres were fitted to the winning car.

THE French Post and Telegraph authorities are arranging for the conveyance of the mails between Arras and Albert and between Calais and Colembert by motor-car.

FROM the office of the "Local Government Journal" comes the Local Government Annual and Directory for 1904. This is now in its thirteenth year—a sufficient tribute to its utility.

FROM M. J. Barreau, publisher, Paris, comes a handsomely got up booklet the bulk of which is devoted to a description of Messrs. De Dion Bouton's large works at Puteaux. This is followed by an account of the excursion to the Meuse by a party of motorists all owning De Dion cars, in August last year, while the concluding four pages are devoted to some useful hints with regard to De Dion cars.

POLAND STREET, Oxford Street, W., is now associated with automobilism, the Lacre Motor-Car Company, Ltd., having established itself in the conveniently located West-end thoroughfare. Hitherto this concern has been known as the Long Acre Motor-Car Company, Limited, and the alteration in name is consequent upon the change of address. The company is the sole London agent and official repairer for the Wolseley Company, and in their extensive showrooms they have the latest models of the Wolseley cars, both for inspection and for trial runs. In company with Mr. F. Goodchild, the courteous secretary, we recently made a tour of the four floors of the premises, which are numbered 1, 2, 3, 4, and 5, Poland Street. There is ample garage accommodation for forty cars, lockers being provided for each owner, and also facilities for the washing of cars. There will also be a special bench at the service of his driver or mechanic in making repairs, thus giving some of the advantages hitherto only possible in a private motor house. A lift with a platform 16 ft. by 9 ft. ascends from basement to top floor, where are the stores of spare parts and accessories. The various compartments ranged along the walls in shelves number 2,000, each being carefully indexed so that any piece can be found without confusion. In the basement is the cement-floored washing compartment and benches for workers in metal; on the ground floor are the showrooms, with double folding doors opening into Poland Street and giving a carriage way of 15 ft. or 16 ft. There, too, is the series of lockers for users of the garage. On succeeding floors are wood working shops, varnish rooms, aluminium stores, and everything requisite for the making of motor-car bodies—a speciality with the company. The repair shops are equipped with everything making up a modern plant. Motors can also be tested; in fact, the establishment is complete in every respect. A licence has been obtained for the storage of 250 gallons of petrol, and not only is the place electrically illuminated but there is every facility for the charging of electric cars as well as of accumulators. The roof is utilised as a timber store. Telephonic communication with every section of the vast premises adds to the ease of management. During our visit we saw several good types of bodies in course of manufacture and the Lacre Motor Car Company should be prominent during the coming season with the Wolseley landaulettes fitted with side doors of excellent design.

OUR DIRECTORY OF "NUMBERS."

[ALL RIGHTS RESERVED.]

Below is a further instalment of Motor Car Numbers. Motorists who have not yet communicated with us are invited to forward their Name, Addresses and Numbers.

McCammond, J. N., Ormisdale, Fortwilliam Park, Relfast	O.I.	6
M'Lean, Wm., 343, St. Vincent Street, Glasgow	G.	84
Morris, E. T., 137a, Finchley Road, Swiss Cottage	G.	85
Milne, G., Turland Cottage, New Pitligo, Aberdeen	A.	2728
Mortimer, J. E., 19, Maxilla Gardens, W.	S.A.	5
Murray, E. Irving, Ellesmere, Weybridge	A.	2457
Moffat, Alex. G., Southville, Swansea	A.	447
Mott, C. M., Townend Road, Wisbech	C.Y.	3
Morris, T. A., Bourne	C.Y.	68
Mowlem and Co., Limited, J., Westminster	E.B.	32
Macintosh, Dr., Bird Side, Clapham Common, S.W.	C.T.	42
	A.	692
	A.	1626
Nairn, W., 20, Airdale Avenue, Chiswick, W.	E.J.	3
Nestle, H., 48, Cannon Street, E.C.	A.	3056
Oxley, W., Selwood Lodge, Shirecliffe Lane, Sheffield	W.	163
Oswin, J., Norwich Road, Walsoken	E.B.	25
Power, Owen, 43, Park Street, Bridgend	L.	70
Philbrick, E., 28, Marloes Road, Kensington	A.	632
Payne, A. C., 89, Clapham Common, North Side, S.W.	A.	720
Pryke, Palmer, 28, Broad Street, King's Lynn	A.H.	121
Peake, C. H., Whitkirk, near Leeds	V.	33
Portal, M., High Sandhoe, Hexham	X.	8
Pouzo-Maurice, Rev. F. L., Kimbolton Vicarage, S. Neots	E.W.	13
Phillips, H. Russell, Lannoweth Terrace, Penzance	A.F.	8
	A.F.	5
	E.B.	23
	E.B.	28
Pierce, Dr., 137, Park Street, Liverpool	K.	121
Pearce, Wm., "Neilgherry," Dyke Road, Brighton	C.D.	8
Padwick, E. D., Manor House, Horsham	B.P.	91
Prior, Samuel, M.B., Mulgrave House, Huddersfield	C.X.	3
Partington, E., Ormskirk Road, Newtown, Wigan	C.X.	8
Putman, James, Bicester Road, Aylesbury	B.	105
	B.H.	87
	B.H.	88
Ratcliffe, W. H., 17, Osmaston Road, Derby	C.H.	40
Read, H., Osborne Villa, Totton, Hants.	C.R.	83
Roper, Wm., St. Ronan's, Southport	B.	211
	B.	299
Rowley, Miss, Sylvan Park, Kells, Ireland	A.I.	15
Ribbons, S. W., 12, Raleigh Road, Hornsey, N.	A.X.	37
Ribbons, H. G., 12, Raleigh Road, Hornsey, N.	A.X.	36
Ridge, J. J., Dr., Enfield	H.	179
Ridley, L. T. R., Fulwell Sea Lane, near Sunderland	X.	149
Roberts, Dr. C. Hubert, 21, Welcher Street, W.	A.	128
Raine, W., 35, Penley's Grove Street, York	D.N.	12
Ryall, Chas., 51, Queen Anne Street, Cavendish Square, W.	A.	114
Robinson, Peter, Scot Lane, Newtown, Wigan	B.	106
Standeven, J., Halifax	C.P.	17
Soraby, J. H., Halifax	C.P.	19
St. Lawrence, Lady Geraldine, Claddagh, Windsor	S.P.	26
Short, H. W., Sundridge Parade, Bromley, Kent	D.	225
Snowden, C. M., Riseley Hall, South Stanley	D.	779
Smith, H. J., Old Market, Wisbech	C.	100
	E.B.	38
	D.3	D.4
	D.5	D.6
	D.7	D.8
	E.	74
	E.	75
	E.	76
Seymour, J. B., 5, Church Street, West Ham	A.N.	3
Sadler, Leonard F. V., Market Place, Burton-on-Trent	A.N.	30
Sadler, Bernard F., Market Place, Burton-on-Trent	F.A.	9
Sollas, Percy T., 36, King Henry's Road, S. Hampstead, N.W.	F.A.	8
Smith, Ernest H., 4, Market Place, Honor Oak Park, S.E.	A.	1407
Shaw, Harold, 10, Gloucester Terrace, Hyde Park, W.	A.	445
Stanton, W. J., 24, Abingdon Street, Northampton	A.	34
Smith, Edgar, Halifax	A.	2718
Stephenson, Dr. F., Mayfield, Blackburn	D.F.	28
	C.P.	10
	C.B.	16

Swain, John, Tufnell House, Tufnell Park Road, Holloway	A.	2034
Street, S. G., Beethoven House, King's Lynn	A.H.	84
Szumper, E. F., 39, Rusthall Avenue, Bedford Park, W.	E.J.	1
Smith, J. Wales, 10 and 12, Rampart Road, Woodhouse, Leeds	U.M.	4
Sims, F., Suffolk Parade, Cheltenham	A.D.	64
Simms Manufacturing Company, Limited, Welbeck Works, Willesden Lane, N.W.	H.	340
	H.	341
Townshend, R. H., Elcot Park, Hungerford, Berks	B.L.	212
Tait, Thomas A., Ovenden House, Tenterden, Kent	D.	214
Torquay Motor 'Bus Service	T.	46
	T.	106
Taylor, G. E., 5, Oakhurst Terrace, Benton	X.	121
Tapp, Mrs., The Hill, Bromley	D.	200
Tyler, Dr., The Crescent, Wisbech	E.B.	20
Theed, Capt. W. H. A., Homestall, Amhurst Wood, E. Grinstead	A.P.	241
Tytherleigh, E. J., 141, Christchurch Road, Boscombe, Bournemouth	E.L.	143
Tebbutt, S., "Bigenholt," Northlands Road, Southampton	C.R.	2
	C.R.	4
Thomas, T. E., 46, Airdale Avenue, Chiswick, W.	E.J.	2
Underhill, G., Okehampton	T.	162
Veale, Dr., Drighlington, near Bradford	U.	96
Vaughan-Jenkins, W., Combe Grange, Monkton Combe, Bath	Y.	79
Warker, H., 14, Brookfield Avenue, Roundhay Road, Leeds	U.	4
Winter-Wood, E. J., "Kenwick," Paignton	T.	10
White, J. Holmes, Clarendon, Newcastle-on-Tyne	X.	28
Wavell, Miss, Halifax	C.P.	12
Wellington, S. H., Tuffley Avenue, Gloucester	A.D.	19
	A.D.	20
Walpole, J., Tydd Goat, Wisbech	E.B.	33
Walford, Eric W., 18, Hertford Street, Coventry	D.U.	77
Wigley, Mr. Lynton, Brunswick Road, Kingston Hill	P.	472
Watts, Hall, Bishop's Burton, Beverley	B.T.	20
Waddington, A., Poppleton, Yorks	C.	418
Wood, A. W., Glenholm, Buttershaw, Bradford	A.K.	63
Wolstenholm, Dr., M.B., Egerton Terrace, Newtown, Wigan	B.	60
Wood, J. M. S., M.B., West Leigh, Rotherham	E.T.	4

DEALERS' MARKS.

M'Farlane, T., 22, South Methven Street, Perth	E.S.	A.
Rennie and Prosser, Limited, 93 and 95, Mitchell Street, Glasgow	G.	A.
Jennings and Company, 86, Mitchell Street, Glasgow	G.	J.
Hozier Engineering Company, Bridgeton, Glasgow	G.	D.
M'Lean, Wm., 313, St. Vincent Street, Glasgow	G.	G.
Albion Motor-Car Company, Limited, South Street, Scotland, N.B.	H.S.	A.
Mo-Car Syndicate, Limited, Underwood, Paisley	X.S.	P.
Love, John, Bennoch Road, Kirkcaldy	S.P.	A.
Ariel Motor Co., Ltd., 132, Long Acre, W.C.	A.	B.Y.
Brush Electrical Engineering Co., Belvedere Road, S.E.	A.	B.O.
Friswell, Ltd., Albany Street, S.W.	A.	B.F.
Lacre Motor Co., Ltd., Poland Street, W.	A.	D.M.
James and Browne, Ltd., 342, King Street, Hammersmith	A.	J.
Donald and Co., 61, Goldhawk Road, Shepherd's Bush	A.	D.V.
Putney Motor Co., Upper Richmond Road, Putney	A.	E.Y.
Great Central Garage, 300, Marylebone Road, W.	A.	C.S.
Begbie Manufacturing Co., 407, Oxford Street, W.	A.	G.O.
Carlton Garage, 5, New Burlington Place, W.	A.	C.T.
Roots Oil Motor and Motor-Car, Ltd., Chicheley Street, York Road, S.E.	A.	R.
Lancaster Motor Garage, Lancaster Gate, W.	A.	F.L.
Beaufort Motor Co., 14, Baker Street, W.	A.	B.
Weston Motor Syndicate, 14, Mortimer Street, Regent Street, W.	A.	W.
Century Engineering Co., Cumberland Park, Willesden Junction	A.	H.
British Automobile Commercial Syndicate, Ltd., 1, Endell Street, W.C.	A.	B.C.
Langdon-Davies Motor Co., Ltd., 101, Southwark Street, S.E.	A.	D.L.
Simms Mfg. Co., Ltd., Welbeck Works, Willesden Lane, N.W.	A.	H.K.
Imre Engineering Co., Ltd., 48, Tottenham Street, W.	A.	D.D.
Donne, Morgan, St. John's Square, Clerkenwell	A.	F.D.
Gobron Motor Company, Knightsbridge	A.	B.P.
"Spark" Motor Company, 186, Pentonville Road, King's Cross	A.	G.Z.

To be continued.

CORRESPONDENCE.

THE REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just read "Chirurgeon's" letter on this subject in the last issue of the *Journal*. By the items mentioned in the account given these appear to be nothing but gross overcharges. If the engine is of standard type the piston ought not to have cost more than half the price mentioned; the studs for back axle could undoubtedly have been replaced by standard bolts costing only a few shillings; the charge for new bushes for the crank case is not out of the way, but the castings appear to be charged for twice. A new timing gear complete could have been fitted for the charge of the commutator. With reference to the back axle, as far as I can judge the same thing has been charged for three times. It is not customary to charge separately for taking down an axle and re-erecting it; this is generally included in the repair. I should imagine a man to be a very slow workman to take eighteen hours to remove an axle from a car and take the same to pieces. Fitting this together seems to have taken the same length of time, and then there is still a further charge for fitting this to the car. The price of gear wheels is rather a difficult matter to estimate without knowing exactly their size and form. If the wheel is entirely new, the charge is reasonable, but if it was only fitted with a new hub is decidedly an overcharge. I should imagine the tyres were charged for twice by the price mentioned, but this is very difficult to say without knowing the size. There also appears to be a great overcharge with reference to fitting the new rim.

It is not the usual practice in the repair shop to charge for doing repairs and then on the top of that to charge up men's time and use of engine and lathes—these items are generally included in the repair, so much being charged for the man's time, with a certain amount per hour for the use of machinery, making the whole up to a certain price inclusive.—Yours truly,

H. J. T.

TO THE EDITOR OF *The Motor-Car Journal*.

In reply to "Chirurgeon's" letter, his account seems to have been made out in a very extraordinary way, as in some cases "turning and boring" is charged for, in others "use of engine and lathe," and in others only the number of hours worked. The account would have been much more comprehensive if it had all been charged out in the same way. Of course it is customary in the engineering trade to charge for the use of machinery, but that is usually added to the number of hours worked and so much per hour extra. Some of the items in the account seem exorbitant.—Yours truly,

THE WATFORD ENGINEERING WORKS.

SILENCERS AND HEATING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As many suffer from cold feet when motoring, I often wonder that the cooling water is not carried from the cylinder under one's feet before going to the radiator. I fitted my small car up like that three years ago, and have always been kept quite comfortable all weathers. It warms the whole body through the feet.

The silencers. Why cannot these be dispensed with, and a simple outlet valve be fixed to exhaust pipe? This, one would think, would pass the exhaust freely and close to prevent the back rush of air into the tube which is the cause of the noise. As the mixture expands suddenly on ignition and then almost immediately contracts to less than its original bulk before firing, it looks as if a valve silencer should increase the power, by sucking the piston back.—Yours truly,

C. H. 40.

LIABILITY OF REPAIRERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers write their views as to the liability of repairers in the case of fire? Is it necessary to insure motor-cars sent for repair against possible loss or damage by fire? Are we liable in the event of their being burnt by a fire occurring on the premises?—Yours truly,

W. E. W.

PARAFFIN v. PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very pleased if any reader could give me the following information:—What is the relative efficiency as to amount of work that can be done with one gallon of Royal Daylight paraffin oil as against petrol of 700 gravity? To make my question quite clear, suppose one gallon of paraffin (used through an efficient vaporiser) can keep an engine going at a given speed for one hour, how long would one gallon of 700 spirit keep the same engine going at the same speed? I want to arrive at the difference of cost, if any.—Yours truly,

CYCLE MECHANIC.

[The question put by "Cycle Mechanic" is somewhat an unusual one, and cannot be readily answered without experimenting. Perhaps some

of the makers of the various carburettors suitable for paraffin could give some information on the point.]

PUMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers kindly tell me of any good circulating pump (other than a cog pump) to take the place of the cog pump on the earlier type of De Dion voiturette? I find it impossible to fit the ordinary type of centrifugal pump on account of want of clearance for the central water inlet. The water inlet and exit should both be on the same side.—Yours truly,

T.

[There are many different types, other than the centrifugal, which would, no doubt, suit T.'s purpose. A great number of them will be found illustrated in the price lists of any of the large motor accessory firms, such as those of Messrs. Brown Bros., Mr. Oscar Selbach, etc., among which a suitable pump ought to be found.]

AN ACCUMULATOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Not the least valuable part of your admirable *Journal* is the correspondence columns. One has only to read this each week to obtain a valuable store of useful information, and I wish to ascertain from someone who knows better than myself (of whom there are many) whether I am doing right in using two accumulators coupled together of 4 and 6 volts on a 6-h.p. car (De Dion). When I first got the car it had a battery of three dry cells, which after running out I replaced as above.—Yours truly,

A CONSTANT READER.

[In answer to "A Constant Reader's" enquiries re coupling accumulators, one of these, giving off four volts, is quite sufficient to drive his car. By using a higher voltage there is a possibility of shorting the coil and rendering same useless. It is very seldom that a higher voltage than four is used on any car.]

RECKLESS DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I trust that you will find space for a protest against the disgraceful manner in which some motorists drive along the Kew road, Richmond. This road runs from Kew Bridge to Richmond, and is one of the favoured routes from London into Surrey. In many parts it is less than thirty feet wide, and has fourteen side roads running into it in about a mile, with the addition of a tram line usually in a more or less greasy state. The majority of motorists drive along it with reasonable care, but there are many who drive at a speed that is disgraceful, thirty, thirty-five, and forty miles per hour being not uncommon.

On Saturday, January 30th, about 1 p.m., a green Mercedes was driven along this road at fully the latter speed, dashing from side to side to get round a bus and then a tramcar, throwing sheets of mud and slush on to the foot passengers. At this high speed it cleared the tram by a few inches; had there been the slightest swerve a bad accident would have resulted. As it was, it thoroughly scared the driver of the tram, also many of the passengers.

Although in Surrey, the police in this district are perfectly fair and friendly to motorists. I have not heard of a single prosecution for furious driving along this road, even with the ample provocation given. I know for a fact that a number of the residents intend to petition the police to stop the abuse if it is continued during the coming season, and then we shall have the usual police trap, and most likely the innocent law-abiding motorists will suffer for the reckless cad. Trusting that this warning will have a beneficial effect.—Yours truly,

A RICHMOND MOTORIST.

UNIVERSAL NUMBERING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your current issue you quote some remarks of Judge Emden, who clearly favours the numbering of horse-drawn vehicles. Let us agitate, not for the abolition of numbering, but for its universal application. I believe we should either secure this, which would remove the special motorist grievance, or we should arouse the spirit of English fair-mindedness to say, if horse-drawn vehicles are not to be numbered neither shall automobiles. If anyone has a better policy for removing motorists' grievances and benefiting the industry without injury to others, I shall be interested to hear it. To me the plan seems to offer the solution of a difficulty otherwise insuperable.

I am myself an owner of horse-drawn vehicles, and shall remain such, although I would gladly be a motorist. I should not object to have number-plates on my automobile when I bought it provided that my horse-drawn vehicles had to carry numbers also. But if the choice be, as it now is, either to ride in a vehicle officially branded as subject to special police vigilance or to ride in a horsed carriage with no such taint upon it, I choose the latter.—Yours truly,

SWITCHED OFF.

BURNT GASES AS MOTIVE POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should esteem it a favour if any of your readers would inform me whether my idea of utilising the burnt gases of a petrol motor as a motive power to drive a car is practicable. The apparatus would consist mainly of three parts, viz., a petrol motor, which may be termed the "explosion generator"; a pressure tank, and an ordinary double acting pneumatic motor; a valve fitting is screwed into the walls of the cylinder in the explosion generator. Attached to this is the pressure tank with pressure gauge, into which the products of combustion from the explosions in the cylinder are forced and then carried to the pneumatic motor. This motor would be coupled, through a clutch at one end of the countershaft, to the explosion generator, and at the other end coupled direct to the back axle of car by means of chain-drive or bevel gearing.

To obtain the necessary starting pressure in tank a number of explosions would first have to be made in generator, which would be operated by a hand starting device.

The operation of working would be as follows:—The clutch disengaged, and the starting handle turned, drawing down the piston in generator to let in the mixture of petrol vapour and air. The compression of this mixture would follow on the upward stroke of the piston, then the firing of same by electric spark at the commencement of the next downward stroke, the explosion forcing the gases through the valve into the pressure tank and also exerting some of its force on the piston, causing it to descend. Still turning the handle, the piston again travels upwards, and further forces the gases into tank. The exhaust valve is then made to quickly open and close in order to let out the remaining gases in the small combustion chamber above the piston. The hand starting-device is thus continued until the pressure gauge shows sufficient power to start the pneumatic motor, which would transmit power direct to the back axle. The clutch is then made to engage in flywheel of generator and the throttle of pressure tank opened. As the car moves forward the piston in generator is thus made to travel up and down, causing the explosions and supplying an even working pressure in the tank.

The advantages of this system are:—Superiority over the steam engine, there being no boiler, condensing of steam, or trouble with burners, and superiority over the ordinary petrol motor, in the absence of all noisy change speed gearing, etc., and also a considerable saving in the consumption of petrol, as, on descending hills, disengaging the clutch would throw the explosion generator out of gear.—Yours truly,

H. M. J.

BENZ v. LIGHT CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am greatly disappointed with the discussion on this subject. The most that any correspondent has accomplished is to—and that is doubtful—restore the car to its original state of efficiency, and a poor thing it is at that. I will venture to say that there are potentialities in the old Benz car that none of the writers have yet dreamt of and which are capable of being turned to useful account, granted the required skill. In the cars referred to the Benz cylinder is 110 mm. diameter. It was first called a 1½-h.p., afterwards it was called 2.9-10-h.p., next it was called 3½-h.p. Interested and observing persons will have noticed that cylinders of that diameter by other makers are called 8, 9 and even 10-h.p. Does not this point to undeveloped possibilities in the Benz? I know a gentleman who has a "Benz Ideal" (2.9-10-h.p.) which has been skilfully altered and improved in the direction indicated above. What power it is now I cannot say, but I should think it is 6 or 7-h.p. He says the original power is sufficient for running on the level road, but now, when he comes to a gradient, it makes no difference to him. He has such a reserve of power that on coming to a hill the car, like a spirited horse, will make a dash, and actually go quicker. But this he does, I think, to create a little surprise for those who accompany him. He has a "Star" carburettor, altered to admit of a M.O. inlet. I believe he has only one belt. He has, I think, three band brakes, which somehow come into operation one after another by the pressing of one pedal. Such is the power of these brakes, that if all were put on at once you would be thrown off your seat. He can travel for two days without calling for petrol or water. What I have here said is subject to correction, as I am too far away to verify, but it is substantially correct. If you could get this gentleman to give a description of the transformation he has made in a Benz, we should have something worth reading.—Yours truly,

W. H. W.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noted with interest the remarks in the recent numbers of the *Journal* re solid tyres. I fully agree with several of your correspondents that many motors are useless to medical men and that no car which runs on pneumatic tyres is (to medical men) worth having. Personally I have always used solid tyres and found them to wear well. I have had two cars, both Benz make, which did good service. I ordered some three weeks ago a Brown car, completely English, from Messrs. Brown Brothers, the specification of which is as follows:—Two cylinders,

8-h.p., chain driven, artillery wheels fitted with 2½ inch solid buffer tyres, tonneau body with front glass and canopy with side curtains, affording complete protection in bad weather, and extra water-cooled brake. Its power, build and simplicity influenced my decision, and especially its performances on a trial trip up a winding hill of 1 in 4. I trust in six months to be able to report well as to its behaviour.—Yours truly,

CHARLES T. W. HIRSCH.

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the question of drivers I quite agree with the latter part of Mr. Edge's letter when he says that good men are difficult to get. But the real reason is because good men cannot get a wage which their experience merits. The majority of owners expect to get a good mechanic and driver at about 30s. or 40s. I know several men who would be pleased to enter private service if it was of any benefit to them. I myself have been brought up in the engineering trade all my life, the last four years being in the motor trade, building and repairing motor-cars, and driving, and also electric light work. I have during the last three months answered two advertisements every week, giving my experience, etc., but not stating any wages, and yet, strange to say, I have not received a single answer. I take it that advertisers could not pay what they consider a high wage. It is quite evident that such men getting driver-mechanics' wages in a works would not enter private service for the same remuneration, considering that they would have to put in much longer hours and have less comforts than formerly. Owners seem to prefer to keep a man who can simply drive and clean a car, and send out for every little repair that needs doing, instead of keeping a good man who can do every repair. In the end the owner has by the other plan to pay double for his repairs, as a good many drivers do not know when a car is going wrong until it breaks down altogether. "Sub Judice" is right when he says ex-coachmen are not always so handy at washing a car as a mechanic. I must admit that coachmen make very good drivers, but let the slightest mechanical defect present itself and a man has to be sent from the works to put it right, or the car sent to the works, and perhaps in most cases the car is running right again inside ten minutes and probably costs several pounds.—Yours truly,

ONE WHO KNOWS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a driver of some little experience, I avail myself of the happily-worded invitation in your recent issue to express my views on this subject. It seems to me that the class of man Mr. Edge finds it so difficult to obtain must be a good practical engineer, and he must also be a good gentleman's servant. Now I believe that, in getting his training as a practical engineer, a man naturally acquires that which unfits him for the duties of a servant.

First.—He acquires an independent spirit, born of the knowledge of his own craftsmanship. He is not dependent on his "character," as the servant is. Provided he is a good workman he can always obtain work where there is work to do. The manufacturer does not enquire how long a man held his last situation, or whether he is honest. The manufacturer takes care that the man is honest. Can the man do his work? that is the question. So he is naturally an independent individual, this good mechanic.

Second.—The works he has gained all his experience in (and paid a good price for it too), shuts its doors at 5.30 or 6 p.m. as the case may be. He goes home to wash, to feed in peace, to feel he has done his day's work, and also that he is free. He may have a hobby, or he may work to improve his position. Anyway, he has four hours of every day to live his life in. On Saturday at noon he is "done" again—a clear spell till Monday morning. If his hobby has been to make a motor-bike, he is off to Brighton or Scarborough—out "on his own," an automobilist himself, free.

Third: If he is ambitious, as many are, he has ample scope to make a career of his own.

Set against these:—A servant must be the very reverse of independent. The servant who "lives in" is never "done," never "free." Driver once, driver always, and I think we have a fair statement of the case. I believe the foregoing to be facts, and contend that they show that an engineer, who is also a driver, in private service, has to perform duties which the nature of his training makes very difficult for him to perform. Also, that unless he has more consideration from his employer than is very often the case, he is far better off as an engineer at the "works." I think the tendency, in the future, will be for the engineer to leave private service severely alone—to leave it, in fact, in the hands of the coachman, and apply himself to the perfection of machines for the said coachman's use.—Yours truly,

AD SUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I, as a driver-mechanic, express my humble opinion on the point raised re owners and drivers in the *Journal*? Drivers should, when making an application for a situation, tell the truth about their abilities and ask for a reasonable wage. This would be better than professing to thoroughly understand seven or eight different makes of cars, and

demanding an exorbitant wage. They would undoubtedly be thought better of by the owner. For it is a fact one bad man spoils six good ones. Of course there are exceptions, and, as "Sub Judice" states, there are cases where one owner has eight or ten drivers in as many months; and perhaps, if the truth was known, the whole lot would not know as much as one good man.—Yours truly,

F. RALPH HARDING.

SIR,—I should like to give my views on the above subject. As a mechanic able to give sound driving references, at the beginning of 1903 I applied for a berth and found nearly forty other applicants, many of them with a "certificate." Among others were a carpenter and a chemist's assistant, calling themselves driver-mechanics, with no other recommendation than their "certificates." Several were tried and found wanting. They were willing to take the berth at about 25s. per week. I obtained the berth without a trial and at double that salary, and gave satisfaction as long as I could put up with it, which was a very short time. The point is that it is impossible for a man, unless brought up to the trade, to become a mechanic in two or three weeks. He could not use a file in the time, let alone be capable of doing repairs to a valuable car. Many do become fair drivers in that time, but such should not expect the salary of a mechanic, who can save his employer much more than the extra salary he is paid. In some cases the owners fail to understand the nature of the repairs, etc., and begrudge time, consequently, when the next occasion arises the mechanic lets the car go to the repair shop. The car is then in dock for a week or more for a job he could have got over in a day or two. The owner has to pay a bill which allows the repairer a big profit and perhaps 5 or 10 per cent. for the mechanic. This is more often the case with the certificated driver, as a good mechanic knows the price of parts, etc., and will not see his master overcharged. Many of the genuine mechanics are fairly educated men, whose parents paid £50 to £100 to apprentice them to the trade, and when they go out do not take kindly to different details of private service, especially at establishments where the car is kept on the move almost night and day, including Sundays, or at others where they are constantly reminded that they are only servants. Again, a chauffeur often has to live with the stable helpers, while the coachman will have a cottage to himself. This being the case he ought to have the equivalent added to his salary. The same class of man can be made a very good servant with fair treatment if the owner places confidence in him, without getting familiar one day and very much the reverse the next. I would advise gentlemen taking up a car for the first time to endeavour to obtain a man who is a genuine mechanic with, say twelve months' private service reference, driving and character. These men are not cheap, as a rule, but reliable and in the long run cheapest. It is better to pay for knowing how than to save to let another man find out.—Yours truly,

MECHANICIAN.

FREEZING POINT OF PETROL.—"Freezer" writes:—"Can you give us the freezing point of petroleum spirit? I have been unable to find this in any technical books." [We have no information on this subject. If any of our readers have any data on the freezing point of petrol we should be pleased to hear from them.]

PETROLEUM SPIRIT.—In addition to the Anglo-American Company, Carless Capel, the Gas Lighting Company, and Whitaker, petrol is being supplied by Messrs. S. Bowley and Son, of the Wellington Works, Battersea, S.W., and the British Refined Motor Spirit Company, of Silverthorne Lane, St. Phillip's, Bristol.

MOTOR-CABS.—Replying to Messrs. Gee and Son, the address of the maker of the Collin motor fore carriage described in a recent issue is M. A. Collin, 41, Boulevard de Courbevoie, Courbevoie, Paris.

IRON CASTINGS.—In reply to Mr. H. R. Allan, the Motor Castings Company, 101, Gray's Inn Road, W.C., and the Watford Engineering Works, Watford, write that they are in a position to supply castings and fittings for steam motor-car engines.

WATER CIRCULATING PUMPS.—Replying to Mr. H. J. Croft, Messrs. Lawrence and Company, Limited, 132, Latimer Road, London, W., are the English agents for the Grouvelle and Arquembourg pump described in a recent issue.

CLUBS AND ASSOCIATIONS.

EASTERN COUNTIES.

THE annual general meeting of the Eastern Counties Automobile Club was held at the Great White Horse Hotel, Ipswich, last week. Mr. F. L. Bland (chairman of the committee) presided, and there were also present—Dr. C. K. Moseley (hon. secretary), Mr. A. Hackblock, Dr. E. L. Rowe, Mr. J. R. Egerton, Mr. C. C. Ching, Mr. Edwin Sayer, and Mr. W. G. Fisk. After the hon. secretary's report had been read, the chairman, who is also treasurer of the club, presented the accounts, which showed that the total receipts were £39 18s., and that the balance in hand was £18 8s. 3d. In moving the adoption of the report, he said that the bad state of the roads last year, in this particular part of the district, was not entirely due to the weather. Owing to a difficulty, he understood, in getting the carting done, the mending of the roads was not taken in hand early enough, and for some months, with a lot of loose stuff lying about, the roads were in about as bad a state as they could possibly be—enough to damp the ardour of any automobilist. Dr. Rowe seconded, and the report was adopted.

The Earl of Stradbroke was re-elected president. The hon. secretary (Dr. Moseley) and the hon. solicitor (Mr. E. P. Ridley) were re-appointed, and, following upon an alteration in the rules, the new Administrative Committee was constituted as follows:—Mr. F. L. Bland (ex-officio, as chairman), Major Carthew, Mr. A. Hackblock, Mr. Godolphin Milbank, Captain Duff (Bury St. Edmunds), Mr. Robert Page (Great Clacton, Essex), Mr. W. P. Burton, Mr. A. C. Churchman, Dr. Rowe, and Mr. E. C. Sayer. On the motion of Mr. Hackblock, seconded by Dr. Moseley, Mr. F. L. Bland was re-elected chairman, with hearty thanks for his admirable services.

SHEFFIELD.

THE first annual general meeting of the Sheffield Club, whose report was summarised last week, has been held at the headquarters. Mr. Herbert Barber took the chair, and moved the adoption of the report and statement of accounts, which was carried unanimously. Mr. J. R. Wade read the report of the proceedings at the meeting of the representatives of Provincial Clubs and the Committee of the A.C.G.B.I., in London, on January 18th, which showed that the London Association was arranging to meet them on the question of affiliation, and on the motion of the chairman it was decided to leave this matter in the hands of the committee. The following officers were elected for the ensuing year:—Vice-presidents, Messrs. Harvey Foster, Herbert Barber, Duncan Gilmour, and James Barber; treasurer, Mr. E. F. Coupe; hon. secretary, Mr. F. B. Cawood; committee, Messrs. A. J. Blyde, W. Coldwell, C. A. Clarke, S. E. Fedden, E. H. Hill, Benj. Hind, W. James, J. W. Needham, J. T. Thompson, and J. R. Wade. A letter was read from the organisers of the Theatrical Professions Carnival in aid of the Lord Mayor's Distress Fund. This was arranged for the 4th inst., and it was decided that the club should do all in its power to assist. The following gentlemen at once promised to take part, or send their cars to take part in the procession, viz.:—Messrs. H. Barber, S. E. Fedden, P. R. Thompson, W. James, J. Ellia, J. T. Thompson, Jas. Hind, A. T. Dewhurst, and J. Walker. On the 27th inst. the club will have a run to Castleton.

RAILWAY COMPANIES AND THE MOTOR PROBLEM.*

By MR. GEORGE MONTAGU, M.P.

My object is to point out what has been done by the railway companies, and what is contemplated by some of them in the near future, in relation to the motor question, and also to form some kind of picture of how far this development is likely to lead. I shall have to confine myself in the main to the passenger aspect of this question. So far little has been done in the direction of the carriage of goods by motor by the railway companies, either in the substitution of motors for horses in the distribution of light goods in large towns or by the distribution of heavy goods from big railway centres by motors instead of local goods trains, which would deliver goods at the door, thus superseding the expensive methods of distribution from wagons on branch lines, which involves so much expense in shunting operations. Few people realise how enormous is the loss in this respect which takes place on our great railways. It was stated once before the House of Commons by the officials of the Midland Railway that every year 14,000,000 miles of shunting took place. I believe I am right in saying that this figure included the loss sustained from the distribution of goods, as well as shunting for the purpose of avoiding fast trains.

Although the introduction of motor-coaches at present is more directed towards economy to supersede trains on local branch lines, it is likely that they will be utilised just as much in the near future to relieve congested traffic on the main lines. One of the principal causes of congestion of main line traffic is the running of trains at different speeds on the same line of metals, and this is often not so much due to purely suburban stopping trains, which have separate lines for their accommodation, but to the intermediate stopping trains, such as those that stop at intervals of ten or fifteen miles, and also to those other stopping trains which are fitted in at different sections of the railway in order to feed and to distribute passengers from the express and intermediate trains. It is, I believe, by the motor-coach that enormous saving will be effected in this way. For two reasons—first, because one coach capable of holding some sixty or seventy passengers, with one or two trailers added if necessary, would be amply sufficient to hold the number of passengers wishing to be carried; and secondly, because by the use of a fairly powerful engine so great an acceleration can be obtained as to prevent in any way the blocking of fast trains.

The first motor-coach to appear was designed by Mr. Drummond, of the London and South-Western, last year, for the working of a short branch line between Fratton and Southsea. Great economy has been effected since its introduction. The car is owned jointly by the London and South-Western and the London, Brighton, and South Coast Railways. He tells me that the cost of running is 2.3d. per mile, as against probably something like 8d. to 1s., which would be the case of the ordinary engine and coaches, while the coal consumption is 6.5 lb. per mile, as against probably 20 lb. or more under the ordinary system. The first coach was originally designed with a vertical boiler, which was adopted on account of the cheapness of this kind of boiler as against the horizontal one, and on account of the short distance of the journey; but as under their new scheme it is proposed to run motor-coaches on the light railway from

* From a paper read at the Automobile Club on Thursday, the 28th ult.

Basingstoke to Alton, and no doubt on other lines later on, where they will be required to run longer distances, Mr. Drummond has now adopted a horizontal boiler which will become the standard pattern. The new cars will be able to travel for a distance of sixty miles without a fresh supply of water, and to carry sufficient coal for the day's work. They will be able to attain a speed of thirty miles an hour. In this case, as with the motor-coaches which have been tried on the Great Western, the engine is placed on the leading bogie, horizontal cylinders being used as in a locomotive, the bogie wheels being coupled so as to provide greater adhesion, the second trailing axles being driven. In a new scheme, as this is, figures must be taken with some reservation, and they must obviously vary very much according to the district; but, at any rate, the figures I have already given show extraordinary improvement as against the train.

On the Great Western motor-coaches have been designed for special work, since in the Stroud Valley they have to contend with gradients of 1 in 75 to 1 in 100, and where, owing to the stoppages which are made at level crossings, for which purpose power had to be obtained from the Board of Trade, who, it is interesting to note, raised no opposition, have to have as high an acceleration as?

In addition to the stops made at the regular stations in the Stroud Valley, of Chalford, Brimscombe, Stroud, and Stonehouse, four others are made at level crossings. This innovation has proved most beneficial to the large population of cloth-workers in that valley. The fares from Chalford to Stonehouse are 6d. for the seven miles. The car runs every hour, and takes about forty-six minutes to do the double journey, the second car being held in reserve, and used when necessary.

The Taff Vale Railway has also been experimenting in the same direction, and has been running a coach between Cardiff, Penarth, and Cadoxton, a distance of 9½ miles.

Since the decision of the North-Eastern Railway to employ the combination of petrol and electricity some experiments recently were made by Messrs. Stirling, of Granton Harbour, Edinburgh, who seem to have solved this difficulty. Mr. Drake, the manager of the works, has invented a special type of gearing, which enables the car to be started, and ten or twelve miles an hour to be obtained, after which the top speed can at once be introduced, giving an acceleration up to thirty or more miles an hour. The arrangement can be applied to tramway cars, and so well it is governed that one lever for starting all the speeds, stopping, and braking is alone required.

The London and South-Western Railway are inquiring into the question of the motor-car as a feeder to the railway. The Midland, I understand, are contemplating experiments with motors, but what precise form they are taking I am unable to say. The Great Eastern Railway are seeking powers this session for the running of motor-cars, but I have been unable to obtain information in this connection, as divulsion might create prejudice before their Bill is obtained.

On the Caledonian Railway they have for some two years been running one or two Milnes-Daimler wagons and light lorries, but these have, I am sorry to say, not been altogether successful. Recently, however, I hear they have been impressed by the Stirling petrol motor coach, which I mentioned before, and they very likely will put some of them into service. It is noteworthy that the Caledonian were the first railway to adopt motors for parcels and light goods delivery. It is probable that, in addition to their contemplated Stirling motor-coach, they will also make a trial of the same company's cars, which are much the same as the North-Eastern motors, which have been running since last summer in Holderness, and which Lord Leitrim has been trying in the north of Ireland. These cars are of 24-b.h.p. The North-Eastern cars—which have special clerestory roofs, similar to those of railway carriages, which give a feeling of airiness inside—have been running between Beverley and Driffield Stations. The service was inaugurated last summer, and ran as far as Beeford, a distance of fourteen miles, but has now been extended to Driffield.

Lord Leitrim has done great service by attempting to assist the development of the beautiful country in Donegal, in the north of Ireland, by regularly running motors in connection with the train services. He has called it "The Coast Line Motor Way." The cars have been running between Strabane railway station and Rosapenna—a distance of thirty-eight miles. Lord Leitrim has had no trouble at all with them, and they ran continuously from July to the end of October in connection with the trains, with the exception of one day, when one omnibus was running out of three. It is interesting to note that he was the first to carry his Majesty's mails, though the North-Eastern Railway were before him in advertisements. The Great Northern of Ireland have given him excellent assistance, and have done all they can to further the interest which he has shown.

I now turn to what will prove to be a great advancement, and that is the work which the Great Western are doing to open up Cornwall and Devonshire by means of motors. Mr. Inglis, now the general manager of the Great Western Railway, having been previously their engineer, is a Cornishman, and interested in developing his county. The Great Western Railway have, for some time now, been running cars between Helston and the Lizard, and from Marazion to Newlyn, a suburb of Penzance. Two cars are used for the latter service and one for Helston. It is proposed to run services as well from Penzance to St. Just, Mullion (the Marconi station) to Helston, Saltash to Carrington, and Modbury to Yealmpton. The two latter services are in the neighbourhood of Plymouth. Between Modbury and Yealmpton the Great Western will meet with competition with a private company which is just commencing to run cars, and it will be interesting to see what will be the result. Of the thirty cars that have

been ordered, eighteen are of 20 horse-power, and twelve of 16 horse-power. There is one other service in contemplation, and that is in Wiltshire, between Calne and Marlborough, where there is considerable traffic in farm produce and light goods.

In conclusion, I think that automobilists may congratulate themselves and the railway companies, that within the last year a very great stride has been made in the application of the motor to the uses of the railways. Every day it is being shown, even in the experimental stage, that economy results from the adoption of the motor. It will, I believe, go far to cure, not only great social evils, such as the overcrowding in the great towns, but also those which are of no less importance, the difficulties of railway transit, which are so intimately bound up in them.

SETTING ASIDE AN AWARD.

IN the King's Bench Division, before Mr. Justice Wills and Mr. Justice Kennedy, sitting as a Divisional Court, the case of the Lanchester Engine Company v. Bourke has been heard.

Mr. Loehnis, for the appellants, said this was a motion on behalf of Mr. W. L. Bourke, who lived in Manchester, to set aside an award made by Professor Hele-Shaw, of University College, Liverpool, directing Mr. Bourke to pay £114 odd for the repair of a motor-car to the Lanchester Engine Company, of Birmingham. The ground for the motion was that Mr. Hele-Shaw had taken evidence on the matter unknown to Mr. Bourke. In September, 1902, Mr. Bourke purchased from the Lanchester Company a motor-car which cost between £600 and £700. The next month it was returned for repair, Mr. Bourke contending that at the time of the sale it was not in the condition it ought to have been. The Lanchester Company said it was, and they submitted an estimate for repairs to put it in a proper condition, alleging that the defects were due to the bad treatment of the purchaser, the estimate being £64, of which £20 was for new tyres. It appeared that Professor Hele-Shaw got estimates from the company by letter of the cost of the repairs. These came to £204, and the arbitrator directed Mr. Bourke to pay £114 of that sum. Mr. Bourke was never aware of any other sum than that of £64, and he paid the £114 without prejudice in order to get possession of his car. He now sought to get the award set aside.

Mr. Justice Wills said he much regretted that some arrangement had not been made between the parties, especially as, in his opinion, Mr. Bourke had got uncommonly good value for his money. It was admitted that the award could not stand in view of the course taken by the arbitrator unless Mr. Bourke had disintitiled himself from making the present motion. He (the Judge) did not think he had so disintitiled himself, and therefore the award must be set aside with costs. Judgment accordingly.

ALLEGED FURIOUS DRIVING.

THE case of Mr. H. Liddell, reported in last week's *Journal*, has been again before the Kingston magistrates. Superintendent Marks, of the Surrey county police, asserted that he timed him over a measured quarter of a mile on the Portsmouth road at Cobham on Sunday, January 17th, and found that his car covered the distance in 36.25 sec., or at the rate of twenty-four miles an hour, four miles in excess of the limit. When he saw Mr. Liddell's car pass a post at the beginning of a measured distance he started a stop-watch, which he stopped when the car passed the "winning post." The defendant told the Bench that he was not going at more than fourteen miles an hour. Mr. H. J. Swindley said that the watch used by Superintendent Marks was quite worthless for purposes of timing. Holding the watch up in his hand, he added:—"I have just done something with it that will show you it is a worthless watch. I have tested it in the same way as the Automobile Club would. You start the watch, and if you hold it in your hand and put a slight pressure on it, it will stop, and if you take the pressure off it will go again. If a man holding such a watch is a little bit eager, and presses the watch, he could make a motorist do five miles in five seconds. I know this watch well. I have known it as a cyclist for the past twenty

Force of Habit.

years." The Chairman: That evidence is of great assistance to us. The summons is dismissed.

At the Loughborough Petty Sessions, before Mr. S. Wells, Col. the Hon. Montagu Curzon, Ald. W. Tidd, Messrs. C. B. Shakspeare, J. Harriman, and S. Wells, Richard Sutton Clifford, solicitor, Loughborough, was summoned for dangerously driving a motor-car at Loughborough, on the 17th ult. Mr. George Rowlatt prosecuted, and defendant was represented by his father, Mr. Sutton Clifford, who, at the outset, objected to the summons on the ground that it alleged four offences, whereas only one offence could be shown and charged on one information. The summons alleged driving at a speed, and driving in a manner dangerous to the public, having regard to the amount of traffic which already at the time was on the highway, and with driving at a speed and in a manner dangerous to the public, having regard to the amount of traffic which might be reasonably expected to be on the highway. He submitted that these were four offences, and that Mr. Rowlatt must elect which one he would proceed upon. He further pointed out the hardship on defendant in these charges, owing to the time and place of the alleged offence not being specifically stated. The summons only stated that it was on the 17th and on the highway in Loughborough. There were 24 hours in the day, and about twenty-six miles of streets in Loughborough. This car was out three times that day, and it was rather hard that defendant should not know till he got into court what he had to meet. Mr. Rowlatt said there was only one offence, but he was perfectly willing to strike out some of the wording of the summons. The Court were of opinion that there was only one charge, and that the summons complied with the Act of Parliament. After hearing the evidence, the Chairman said the Bench had unanimously decided to convict, but, taking into consideration the fact that this was the first case under the new Act in the county, they would only inflict a fine of 20s. and costs. Mr. Clifford intimated that he should probably appeal against the conviction.

At the Southport Police Court, last week, Mr. T. T. L. Scarisbrick, the late mayor of the borough, was charged with driving a motor-car at a dangerous speed. The police alleged that on the 8th ult. Mr. Scarisbrick drove his car at a speed dangerous to the public, there being considerable traffic about at the time. A police-constable estimated the speed at over 20 miles an hour, and added that the car had no number on it. A lady stated that it was going at the rate of an ordinary train, and nearly as fast as a racing car at the motor trials. One cabman stated that it was going at about 40 miles an hour, while another stated that it was going at double the rate of the express train by which he had travelled to Liverpool. For the defence it was contended that the car was not travelling at excessive speed. Mr. Scarisbrick gave evidence, and stated that the car had a number both at the front and back, but the latter might have been covered with mud. He was using a gear which would not enable him to attain a greater speed than 12 miles an hour. A fine of £5 and costs was imposed.

JOHN FOLLETT (a motor-car driver from Tonbridge) was summoned at the Tunbridge Wells Court for driving on the public highway at London Road at a speed and in a manner dangerous to the public, on January 19th. Frederick Grainger deposed to the excessive speed of the motor down Major York's Road, and incline across Tunbridge Wells Common towards the town, and said the car nearly ran into him. Mr. Elers, who retired from the Bench during the hearing of the case, corroborated as to the dangerous speed of the car along the hilly road. Defendant denied that he was exceeding the legal limit, but the Justices decided to inflict a fine of 10s. and 12s. 6d. costs.

THE SALE OF A CAR.

BEFORE Mr. Justice Ridley and a common jury, in the High Court, an action has been brought by Mrs. Fitzgerald, of Fairfax Road, Bedford Park, Chiswick, against the Motor-Car Company (Limited) and Mr. Robert Moffat Ford, managing director of the company, to recover damages for an alleged breach of warranty on the sale of a motor-car. Defendant denied the warranty. The plaintiff's case was that in November, 1902, her son, Mr. J. H. Fitzgerald, acting as her agent, entered into a contract to purchase of the defendants a Decauville motor-car for £150, which was warranted by the defendant, Mr. Ford, to be new. The car, plaintiff said, was not new, and had often to be repaired, as it was not made of good material. Mr. Fitzgerald, son of the plaintiff, gave evidence of the defective condition of the motor-car. In cross-examination he admitted that he had been told by experts that the car had never been driven before. Mr. Ford gave evidence to the effect that the motor-car was perfectly new when supplied to the plaintiff, and that the defects subsequently discovered in the car were due to its being driven by an inexperienced person, and not to bad materials or bad workmanship. In cross-examination, witness said he called the car a new one in 1902, though it was built in 1900; it had not been used before it was sold to the plaintiff. The jury found a verdict for the defendants. Mr. Justice Ridley entered judgment accordingly, with costs.

MOTOR-BUS IN A COLLISION.

THE Central Bottling Company, of Birmingham, brought an action against the Birmingham Express Motor Company, Limited, to recover damages for an injury to a horse which they alleged to have been caused by the negligence of a motor-bus driver. After hearing the evidence his Honour remarked that this was the first case he had had to deal with in which a motor-bus or motor-car was alleged to have caused a collision. The jury had to decide a mixed question of law and fact.

They should bear in mind the fundamental principle that the King's highway was free to all to use, to pass along, or to stay upon reasonably. Whatever the private opinion of motors might be, they should remember that they were recognised by law as entitled to go along the road and to make a certain amount of noise. The jury awarded the plaintiff £34 13s. 6d. damages.

AUTOMOBILE RACING IN FLORIDA.

PRIOR to the opening of the automobile race meeting on the Ormond-Daytona Beach, Florida, it is announced by telegraph that on the 27th ult. W. K. Vanderbilt, jun., on a 90-h.p. Mercedes, succeeded in covering a mile in 39 seconds, or equal to a speed of over ninety-two miles per hour. The new record is reported to have been accepted by the Automobile Club of America. The meeting proper commenced on the 28th ult., when the final in the mile handicap for the championship of the American Automobile Association was won by Barney Oldfield (Winton), his time being 46.5 seconds. On the 29th ult. Vanderbilt won the final in a five-mile handicap in 3 minutes 38.1.5 seconds, and also the mile race for amateur drivers in 48 seconds. The final day of the races, on the 30th ult., saw a further addition to Vanderbilt's list of wins, he carrying off the first place in the ten mile invitation race in 6 minutes 50 seconds, and a fifty-mile race in 40 minutes 49.4.5 seconds, Bowden, on a 60-h.p. Mercedes, being second in 42 minutes 44.1.5 seconds, and La Roche, on a Darracq, third, in 45 minutes 7.4.5 seconds. Oldfield did not start in this event, while Blair (Panhard), and Brokaw (Renault) gave up at the fortieth mile. On the 1st inst. a series of trials against the watch were held. Ross on a Stanley steam car covered a kilometre in 34.4.5 seconds, and the mile in 55 seconds. Stevens' times on a Mercedes were respectively 27 seconds and 43.1.5 seconds.

THE LIVERPOOL CYCLE AND MOTOR SHOW.

THE eighth Liverpool Cycle and Motor Show was opened in St. George's Hall on Tuesday last, and will close to-day (Saturday). One of the largest stands is that of the Road Carrying Company, Limited, on which are shown examples of the latest Georges Richard, Daimler, Bollee, Oldsmobile, Argyl, Minerva, White, Lanchester, Peugeot, and Siddeley cars. The Alldays and Unions Company are present with their Traveller voiturette and motor-cycles. Messrs. J. A. Lawton and Co. display Panhard, Gladiators and Napiers. Mr. Francis Weighill shows the Ader cars, while Darracq cars are shown by Mr. Wm. Lea. The Belsize Motor-Car Company, Limited, have on view specimens of their new 15.20-h.p. and 7-h.p. cars; the 5-h.p. Humberette is to be seen on the stand of Messrs. Slade and Company; the Protector Lamp and Lighting Company, Limited, introduce for the first time their "Bijou" car, which is fitted with a 5-h.p. motor and two speeds; while De Dion cars are displayed by Messrs. Kelly, Bournemouth and Co. Automobiles are also shown by Mr. Chas. Lucas, Messrs. Hutchings, Limited, Messrs. Robinson and Price, Limited, and the Provincial Electric Construction Company, Limited; while practically all the leading makes of motor-cycles are to be found in the exhibition. The heavy steam-wagon section is represented by the 5½ ton vehicle of the Hercules Motor-Wagon Company. Messrs. Alfred Dunhill, Limited, and Messrs. Lewis have a large exhibit of motor clothing, as have also Messrs. J. A. Turner and Co. and Messrs. Nicoll and Co. Altogether the organisers of the show are to be congratulated on the result of their labours.

UNREGISTERED CAR.

AT Forfar the first prosecution under the new Motor Car Act has been brought up at the Forfar Sheriff Court, when Dr. M'Alister, Forfar, was convicted for a contravention of the Act in so far that on January 7th he drove a car on the Forfar and Brechin road without having a registered number. Sheriff Lee said this was the first case, and as it was always difficult to get the public to understand, he would be lenient; but in order that the case might serve as a warning he imposed a fine of 5s.

THE RISKS OF TRIAL RUNS.

ON Nov. 27, 1902, Mr. Edmund Howe went to the cycle show at the Crystal Palace with a friend who was thinking of purchasing a car. They spoke to the representative of the Alldays and Unions Engineering Company (Limited) about trying one. The machine was running in the grounds, and about six o'clock they started from the North Tower Gardens. They ran down the slope at a considerable pace, and suddenly shooting off the road on to the grass, ran into an iron seat. Mr. Howe's leg was badly broken, and he was carried to the Norwood Cottage Hospital on an ambulance. It was nineteen weeks before the patient could return to business, the leg having become permanently shortened by an inch. He considered that the accident was owing to the negligence of the driver of the car, and he sued the firm to recover damages for the injuries he had sustained. The defendants denied that he was on their car at their invitation, or that their driver was negligent. The case has just come before the High Court, when without leaving the box the jury found for the plaintiff, damages £200.

ON THE WRONG SIDE.

AT Holbeach Petty Sessions, before Mr. R. Merry, J.P., and other magistrates, Mr. George Schwind, of Dimbleby, Falkingham, Lincolnshire, was summoned for driving a motor-car on the wrong side of the road whilst passing three horses and a waggon, and also with failing to give audible notice of his approach, at Sutton Bridge, on the 10th December. Mr. Nelson, of Sleaford, defended, and pleaded not guilty. The Bench convicted, and imposed fines amounting to £3 and costs.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, FEBRUARY 13, 1904.

[No. 258.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LINCOLNSHIRE boasts several medical men as motorists, and one of them, Dr. Gilpin, of Bourne, has been discoursing to the members of his club on the upkeep of a motor-car—a subject which affords endless opportunity for discussion from so many points of view. Dr. Gilpin does not anticipate any early reduction in the cost of running automobiles; but, with regard to the cost of cars, he rightly emphasises the better mechanism that is now supplied with such vehicles. On the vexed question of solid v. pneumatic tyres, his experience is decidedly in favour of the latter, despite their liability to puncture. During the discussion, Mr. C. W. Pennell, J.P., said he always kept his tyres running until they were worn through, and then he had them re-rubbered, a plan which he considered made them as strong and serviceable as when in their original condition.

At the Agricultural Hall.

In view of the novelties that will be found at the Automobile Club's Exhibition at the Agricultural Hall, London, in a few weeks' time, many prospective motorists are wisely postponing decision as to purchases till they have had an opportunity of fully realising the prospects of the trade for the year. The unsettled weather lately endured has also delayed many customers in their choice of cars, so that everything points to the fact that good business may reasonably be expected for next month's show, which will be the ninth of the series held at Islington. Agents in the provinces, too, will avail themselves of that opportunity to visit London and thus see for themselves the great advance that has been made in the trade during the past twelve months.

The A.C.G.B.I. and the Exhibition Question.

WHILE referring to the Exhibition, the following extract from the "Automobile Club Journal" of last week will be of interest as setting forth the history of the official sanction given by the Automobile Club to the Agricultural Hall Exhibition:—
"On October 17th the Committee was approached by the Society of Motor Manufacturers and Traders asking on what terms the Club would grant its patronage to their second Exhibition, to be held at the Crystal Palace from February 12th to the 24th inclusive. The Committee took the matter into consideration, and after two interviews between the Club Secretary and the Secretary of the Society, which were reported to the Club Committee, certain terms were put forward to the Society and at the same time to Mr. Cordingley, the Committee wishing to grant its patronage to both Exhibitions on precisely equal terms. The terms as put forward were accepted *in toto* by Mr. Cordingley, and were rejected *in toto* by the Society, without leaving any loophole for any further negotiations in the matter. In order, however, that the Society should receive every opportunity

of reconsidering its position, it having first approached the Club in the matter of the Club granting its patronage, it was further discussed on several occasions in Committee, and eventually the Society, recognising that by the delay the Club desired to give them another opportunity of resuming negotiations, addressed a letter, dated January 15th, suggesting that a Sub-committee of the Society and a Sub-committee of the Club should meet to discuss the matter, not for this year, but for the year 1905. The above-mentioned letter was discussed in Committee on Monday, January 18th, and, having come to the conclusion that the Society was not serious in its first request nor in its subsequent action, the Committee decided to grant its patronage to Mr. Cordingley, after having kept him waiting three months."

A Grotesque Misrepresentation.

"In the light of these facts," continues our contemporary, "the statement in a newspaper—to which Lord Russell draws attention in a letter in the current issue—that the Club have given their patronage to the Islington Show for the sake of £500 is seen to be a grotesque misrepresentation. The Club throughout these negotiations has been actuated by the sole idea of benefiting the British automobile industry by securing to these annual exhibitions the support which would have further increased their usefulness. That it should be now asserted by the parties who are responsible for the failure of these intentions that the Club has sold its patronage, and that that statement should be credited in certain quarters, are matters that all those who are anxious for the future of the automobile movement will view with mixed feelings of indignation and regret."

Fancy Schemes for Traffic.

NOVELISTS as well as motorists should attend the meetings of the London Traffic Commission, for much fiction and many fancies are being retailed in that heavy atmosphere. One of the latest plans suggested are roadways across London with an upper storey for fast motor-cars, and a lower floor on which slow-moving vehicles and obstacles—the terms are often synonymous—could lumber along at their own leisured slowness. Airships, tunnels, moving platforms, and other devices have also been suggested, and doubtless before they report to the House the Commissioners will hear of a proposal to project people through pneumatic tubes to their destination, thus saving them the trouble of walking, and obviating the need of automobiles.

Cars from Coils.

THE origin and circulation of newspaper rumours would be an interesting study in connection with automobilism, but for the fact that the recording of actualities provides sufficient for the energies of ordinary mortals. Last week the story went the rounds of the press that the motor-car belonging to a doctor in Staffordshire had been stolen, and that its recovery was somewhat doubtful—an improbable sort of story that could only serve as a warning to other motorists to take care how they left their vehicles when visiting. The sensational report turns out to have been wholly wrong. But

probably the local reporter who originated the story would claim that it was founded on fact, for Dr. Spanton informs us that the coil was stolen, and on that slender basis a whole car was constructed—and lost. This week another similarly exaggerated version of a motor-car incident has been in the press. The master of the Northwich Workhouse informed the guardians that a kindly disposed gentleman had presented a motor-car to that establishment. Immediately imaginative journalists pictured the delight of the inmates at going beyond the boundary on a modern automobile. But alas! the motor-car was a toy, and has not yet been beyond the children's ward, where it is proving a delightful addition to the nursery equipment.

The Motor Union.

WE would call the attention of members of the Motor Union to the fact that the annual meeting of the Organisation will be held at the Agricultural Hall, London, on Tuesday, March 22nd. So many motorists from the provinces will be coming to town during the week that it will be to the general convenience of the majority to have the meeting during the third week in March, while the fact that facilities will be provided at the Exhibition will be appreciated by both town and country members.

A Motoring Party at the White House, Washington.

[Motor Age.]

Indian Interests.

INDIA will, as the roads improve and local industries develop, become an important factor in the automobile market. This fact is being rightly appreciated by leading houses in our great dependency, and at least two of these are anxious to hear from British makers as to the possibilities of business. Mr. Rolfe, of 3, Council House Street, Calcutta, and Messrs. Vatcha Brothers, of Girgaum Road, Bombay, are interested in the matter, and we give their names in the interests of the commercial relations of this country with the distant parts of the Empire. At a recent meeting of local motorists at Calcutta an "Automobile Association of Bengal" was formed, which will watch the interests of motorists in that part of the world. The fact that the movement has developed sufficiently far to warrant the formation of such an organisation is significant of the advance that has been made.

Advance in the Country.

THE education of the county of Huntingdon to its present sympathetic attitude to motorists has been a specimen of the growth of knowledge which should ultimately produce a very friendly feeling throughout the country. In 1902 there were sixty-eight convictions against motorists, and so keen were the police that last April they added the telephone to their equipment and devised motor traps on thoroughly scientific lines.

Now the County Council, recognising that the position of affairs has been fully met in the first section of the Motor Car Act, has decided not to specify any roads or specified areas as dangerous, and through which motor-cars must be driven at a reduced speed.

Trial Trips.

THE return of something like settled weather will bring with it the "Trial Tripper," i.e., the man who makes a round of the various dealers and agents professing to be on the look-out for a motor-car, but really anxious to enjoy a few good afternoon rides. The mode of dealing with this particular class of person has not yet been settled by the trade, for, unfortunately, he is too often not discovered until after he has had his ride. If the trade was thoroughly combined it might be possible, although we do not consider it likely, to eliminate the free tripper from the worries of business. When, however, every agent is anxious to felicitate any possible customer, he must necessarily conform to the wishes of such nuisances, whether the result be a purchase or not. We heard the other day of a firm which, having satisfied itself that the client was really having a pleasure trip without any prospect of business, ultimately deposited him some five or six miles from a railway station, and then let him enjoy the pleasure of a run on "Shanks' pony" by way of a change. A few such experiences as that would probably cure some individuals from the habit they seem to have contracted.

Brilliant Illumination.

WHILE the absence of lights is a danger, the presence of lights of too startling brilliancy is regarded as something of a terror by many public bodies. The County Roads and Bridges Committee for Warwickshire recommend to the County Council that the Local Government Board be urged to amend their regulations as to the lighting of motor-cars, that the lighting powers of lamps borne on a motor-car be more nearly similar to those on a carriage, the luminant powers of a motor-lamp being at present greatly in excess of the latter, and of such dazzling intensity that it defeats the object for which it was intended, and is calculated to cause serious accidents to those who use horse vehicles at night.

Professor Boys on Motor-Cycles.

PROFESSOR VERNON BOYS, who presided over the meeting of the Auto Cycle Club, at which Mr. Mervyn O'Gorman's paper, published in the *Journal* of the 29th ult., was read, made some pointed criticisms. From experiments he had made, he was afraid that the turbine explosion engine was hopeless for the motor-cycle. He did not mind a little noise, as it saved the need of sounding the horn at times. While on the question of power he would seriously urge the desirability of motor-cyclists not having heavy engines; they were limited by law to twenty miles per hour, and he would urge upon all motorists to respect this speed limit for the next three years. The only advantage of a high-powered engine would be that it would enable the rider to go up hill at full speed. He thought that a machine which would appeal to a man who was desirous of becoming a motor-cyclist would be one that was light, and of a moderate power, which would take him up any hill at a speed of, say, seven miles an hour; and he was sure that makers did not know what harm they were doing by insisting upon high-powered engines.

Side Slip Competition.

A CONSIDERABLE amount of interest has been shown in connection with the forthcoming Side Slip Trials to be held by the A.C.G.B.I., and a private track has been lent for the purpose of the competition. Competitors should, however, be reminded that the last day of entry is February 29th, and that drawings of the devices to be submitted must be sent

in by that date. The first prize will be £100, or possibly up to £200, if the device is considered worthy, and other prizes will be considered according to the merits of the devices in the opinion of the judges. The actual trials will take place about March 25th.

"Motor-car Fatality."

HERE is a paragraph from the "Evening Standard" under the heading reproduced herewith:—"The recently introduced system of motor-cars on the Great Western Railway between Chalford, Stroud, and Stonehouse was the scene of a shocking accident this morning. While a motor-car was waiting in the newly-erected Bromscombe Station, a carpenter named Tyson, of Gloucester, who was standing on the up line, failed to notice the approach of the Gloucester express. He was instantly killed, his body being shockingly mutilated." Really this is too bad. The motor-car may have been somewhat uncertain in its action in the early days, but to describe the incident thus recorded as a "Motor-car Fatality" is about as striking an instance of editorial carelessness or journalistic prejudice as we have ever known. The "Evening Standard" owes an apology to the automobile industry as well as to the newspaper world for such stupidity.

Steam Vehicles.

LAST week at the Society of Arts a discussion took place on steam cars for public service, this being inaugurated by Mr. T. Clarkson, of Chelmsford, whose practical endeavours on behalf of the steam car have already been mentioned in these columns. Lieut.-Col. Holden presided, and in the course of the discussion Col. Crompton gave praise to the reader of the paper, Mr. House, and others who have maintained their advocacy of the steam car despite the almost universal popularity of the petrol vehicle. He pointed out that petrol in public service involved considerably more danger than when used by private persons only, and declared that Mr. Clarkson in running 1,019 miles during the reliability trial on paraffin without a hitch had really performed wonders. Other speakers, including Sir Evan James, followed, and Mr. Nash, of Torquay, described how a Clarkson steam car had recently weathered a violent storm at that place, where the waves dashed high over the top of it. Evidently the steam car is likely to be much before the public during the coming season.

Electrical Carriages.

THAT the petrol car is not likely to have all its own way is also evident from the speech of Mr. Schenk at the luncheon given on Monday by the Electromobile Company in connection with the development of their business in Mayfair, a reference to which is made on another page of the present issue. The fact is that automobilism is making such rapid headway at the present time, that we are likely to hear far more than has recently been the case, both of electric and steam driven vehicles, as well as the now familiar petrol car. It is gratifying to have Mr. Schenk's assurance that the chassis of the electrical vehicle this company are now placing upon the market is of British make, the production of a leading firm of Yorkshire engineers, while the best carriage-builders of London are giving their attention to the carriage work, so that the combination of engineering and coach-building experts may result in this English branch of automobile industry being elevated to a position worthy to rank with the productions of French makers.

Horse Riding.

ONE jobmaster, in view of the changing condition of things, has made a suggestion to his fellow horse-owners that they should not lightly pass out of memory. The value of horse-riding as a healthy exercise has not been generally regarded beyond hunting circles in this country; although in Continental capitals it is more generally recognised—as the sales of English

riding horses to Paris, Berlin, and Vienna, amply testify. Why not encourage the hire of horses for spins out into the country or round the parks? Part of the pleasure of the motor-car is associated with the sensation of rushing through the air at a rapid rate. Add to this the healthy exercise associated with horse-riding, and it will be seen that the horse need not yet be relegated to zoological gardens or preserved in natural history museums.

The Woes of the Jobmaster.

STABLES are being transmogrified into garages and haylofts into repair shops with sufficient frequency to indicate the trend of the times. In the Bloomsbury County Court a farrier has just been lamenting the growing favour of the automobile. "I have been ruined by motor-cars," he plaintively observed, "and eighteen of my best customers have given up horses." So far as the West End of London is concerned, the change will be welcomed by sanitary authorities. No longer will the courtyards behind the mansions of the nobility reek with the perfume of the stable, while the cleansing of the streets will become easier as the number of motor-carriages in use becomes greater. We were in a garage one day this week where three score cars were accommodated—all owned by Society people who appreciate the greater convenience of the ever-ready automobile.

Lunch en Route

Traps.

ALTHOUGH the cases of alleged furious driving lately reported under the Motor Car Act have not been numerous, the minor offences chronicled against motorists have already resulted in a fair increase to the police court exchequers. A suggestion made by Mr. Denman, the London magistrate, should, however, be considered by the police, and we should also like to see the point raised before the local authorities in various parts of the country. He thinks it would be more satisfactory if the police tests with regard to the speed of automobiles were made over a distance longer than a furlong, in order to minimise the risk of error, a suggestion that has the merit of common sense. It should be acted upon without delay.

Dealers' Marks.

WHILE continuing the Directory of Numbers we began last week a list of Dealers' Marks, which we hope to continue until it comprises a trade directory of considerable value. In our last issue a beginning was made with Scotch and London firms; in our present issue we continue the list of dealers' marks so far as the Metropolis is concerned, and also some in use in the North. In our next number the list will be extended to the Midlands and Western Counties, and firms located in those districts are asked to send us their marks without delay.

Irish Progress.

SINCE the Gordon Bennett race of last year, little has been heard with regard to the automobile movement in Ireland, although figures lately published in the *Journal* showed that there were between 600 and 700 automobiles in the Emerald Isle. At one time it was thought somewhat likely that an Irish automobile week would be organised for 1904, but it is becoming apparent that the suggestion will most probably be held over for at least another year. Meanwhile the number of motorists grows almost daily, and the country gentry are recognising that the use of the motor-car will extend their social circle far beyond the limits of the present slow railway travelling with which they have to be satisfied. The Irish Automobile Club, too, is becoming an active body, its latest venture being the proposed provision of a reading-room for members, and the establishment of a motor-car garage in a central position of the city of Dublin.

The Popularity of the 'Bus.

THE faith of the chairmen of the Omnibus Companies in the popularity of the 'bus is really touching. They affect not to feel the competition of tubes, cabs, motors, or anything else that runs on wheels. And yet they always confess to having a watchful eye on developments in the way of motor traction. At the meeting of the Associated Omnibus Company, Limited, held this week in London, Mr. S. Crews, the chairman, said with regard to motor-omnibuses no progress was made last year owing to the fact that the special omnibus built for London street service failed to pass the licensing authorities, on account of the width exceeding the limit. He believed a concession would shortly be made, increasing the width limit, when doubtless some motor-omnibuses would be seen on the London streets. His fellow directors, as well as himself, were of the opinion, however, that omnibuses, whether propelled by motors or drawn by horses, are likely to remain for many years to come the popular carriage, especially in the crowded and congested thoroughfares of this great city.

Agriculture and Automobiles.

IN discussions on agricultural depression the labour difficulty is often overlooked. Labourers are too apt to compare their low wages in the country with the higher amounts offered in the towns—never heeding the greater cost of living, which invariably destroys the margin. This labour problem is not likely to be solved until wages in the country are brought nearer those of the towns—a contingency not to be thought about just yet. It is just here where the motor will be useful to the farmer in enabling him to cope with his work with less labour than has hitherto been the case. And in view of the steady flow of men from fields to towns the value of the motor as a substitute needs little urging. Agricultural societies are interesting themselves in the matter, and at the next Highland Show trials of agricultural motors will be a feature of that representative Scottish display.

The Improvement of Roads.

IN connection with the municipal elections in Belfast, the Irish Roads Improvement Association took a very intelligent line in bringing before the candidates for vacant seats four important points which would otherwise have been overlooked. One was concerned with the appointment of properly trained men to the responsible staff in the construction and upkeep of the streets and roads of the city, whilst another dealt with the stricter enforcement of the bye-laws relating to the lighting of vehicles and traffic regulations generally. We would suggest that the work done by the Irish Roads Improvement Association in this matter might well be imitated in this country by the various local automobile associations which are springing up. Motorists feel most acutely the bad condition of the roads in many of our provincial towns, and hence they may

reasonably take the initiative in an agitation which will ultimately prove to the benefit of all users of the roads. The lighting of vehicles and the quickening of the pace of some slow-moving and cumbersome vans that now lumber the highways is also a matter in which motorists should take some concern, and, whilst not forgetting the importance of the wider question in Parliamentary elections, should recognise the necessity of impressing these minor points upon candidates in local elections.

Silence.

MOTORISTS are often puzzled as to how motor-cars have been quietened recently, and it is rather interesting to look at the matter carefully to see where the noise has been deadened. We have now on most cars the carburettor with the automatic air regulator, a device which is certainly a great step to producing a quiet engine, seeing that, before it was introduced, there was some difficulty in getting the engine to run slowly, owing to the fact that the carburettor did not allow the engine to have less air when running slowly, and if it was run at too slow a speed it would easily stop. Another point to look to is the valve-gearing. At one time there was not very much attention paid in this direction and the half-time wheels were made very small, with the result that they rang and chattered in the most objectionable way. Now, however, we find very broad gear wheels; fibre wheels are also largely used, and consequently the valve gearing of the modern car runs as quietly as a clock. Outside road wheel brakes are a frequent source of noise, as, after they have worn a little, they rattle in a most annoying manner. Now, however, we find the internal expanding brake almost universally used, and of course, if properly constructed, there can be no rattle about them. In the latest models of most manufacturers long pistons are used, as it is found that they do away to a large extent with that objectionable knocking noise found in a fast-running engine.

The Berkshire Club.

THE inaugural dinner of the Berkshire Automobile Club took place at the Great Western Hotel, Reading, on Friday, the 5th inst., and about forty members and friends sat down, under the chairmanship of Sir Gilbert A. Clayton East. Amongst those present and who responded to the various toasts were Mr. E. Gardner, M.P., Major A. F. Poulton, Chief Constable of Berks, Messrs. Roger Wallace, Staplee Firth, Rees Jeffreys, Julian Orde, E. R. Portal, J. F. Ochs, C. Cordingley, and Dr. Hopkins Walters. In the course of his speech Major Poulton observed that Berkshire was one of the great highways into London, by road, rail, or water, and a great many motor-cars passed through the county. He was opposed to the setting of police traps on lonely roads, but placed policemen in villages and dangerous places to stop the few motorists—and he acknowledged they were only a few—who drove recklessly.

A MAY DAY procession of motor vehicles is to be organised this year.

THE Earl of Sandwich has just been elected a member of the A.C.G.B.I.

THE membership of the Motor Van and Wagon Users' Association now exceeds one hundred.

THE Kaiser has officially notified the German Automobile Club of his intention to witness the Gordon Bennett race.

THE Car and General Insurance Corporation, Limited, has arranged to give special terms to members of the Motor Union.

ON another page we publish an article on the interesting question of the use of picric acid in connection with petrol motors. As a good deal of attention has latterly been devoted to this "energiser," we shall be glad to have the experiences of those who have investigated its action.

THE NAPIER SIX-CYLINDER CAR.

IT was announced some time ago that for the 1904 season Messrs. S. F. Edge, Limited, were bringing out a six-cylinder Napier car, and this week we are able to give some particulars and illustrations of the new vehicle, the advent of which has been awaited with interest. The claim made for the new car by its makers is that, while of British construction, it is the best car in the world at the moment. In putting this

type, by which over a given diameter of valve a much larger circumferential opening is obtained than with the ordinary single-port valve. The engine has circular hollow connecting-rods and is fired by single-coil synchronised ignition. Only one coil is used and one brush, so that every cylinder fires exactly at equal intervals after the one before it and before the one to

Fig. 1. — View of Napier Six-Cylinder Engine— Exhaust Side.

forward, it is not suggested that on every point it is necessarily better than every other car in the world, but it is claimed that on no one single point has any automobile ever been in advance of the one under notice, and that in many points it is ahead of anything that has gone before. These are somewhat important claims to make, and we, as probably also many of our readers, will closely watch the behaviour of the new type on the road, to see how far it fulfils them in practice.

Fig. 2. — The Clutch on the Napier Six-Cylinder Car.

follow on, with the result that the engine shaft is never quite free from impulse, there being no interval of rotative effect. Fig. 1 represents a view of the exhaust side of the motor, and shows the chains driving the commutator and lubricating pump, both of which are located on the dashboard. The water circulating pump is positively driven, and runs on ball-bearings; it has a cut-out arrangement whereby, should by any chance any foreign matter get into the pump and stop it,

Fig. 3. — The Chassis of the Napier Six-Cylinder Car.

Passing to a description of the vehicle, a good idea of the chassis can be obtained from Fig. 3. The frame is constructed of steel, and is narrowed at the front to allow of a very sharp lock being taken. The motor, which, nominally rated at 18-h.p., develops 30-b.h.p., is located in the usual position under the bonnet. The six cylinders are cast in three pairs, there being no water joints in the cylinder heads. The valves are all mechanically actuated, the inlet valves being located above the exhaust. The inlet valves are of what is known as the "annular"

instead of the pump being broken, as is usually the case, there are two small prongs which would break without damaging the pump. These prongs are easily and instantly renewable when the pump is in working order. Even should the pump at any time stop, the water will still be above the tops of the cylinders, so that no harm to the engine could result, the only inconvenience being that the water would be more rapidly used up. From Fig. 1 it will be seen that the radiator is of the honey-comb type, of an exceedingly thin nature. This reduction in

size is obtained by the use of thin tubes, which are claimed to have extraordinary cooling properties, as well as great strength. Each tube is fluted in four places, with the result that larger water spaces between the tubes are created, and the same advantage of big tubing is obtained by keeping a large amount of metal in contact with the air and with the water. The aluminium fan, which induces a current of air through the radiator, is driven by a belt. The mixture is supplied by the carburettor with the hydraulic air regulator, which has already been described and illustrated in the *Journal*. The engine is stated to be perfectly silent, the exhaust, with the engine throttled down, being inaudible at three yards' distance.

Coming now to the clutch which connects the engine with the gear-box, a view of this is given in Fig. 2. It is of the metal to metal variety with no end thrust, being self-contained and kept in gripping position by three springs, which are independently and instantaneously adjustable. It is capable of transmitting 40-h.p., and yet, as is shown in Fig. 2, a two pound weight will depress the clutch sufficiently to allow it to slip. Between the clutch and gear-box a special universal joint is provided to prevent any strain on either. The joint is a solid square fitting into a similar shaped hollow receptacle, each piece being perfectly ground and hardened. It is so arranged that by undoing a few small nuts either the engine or gear-box can be removed without interfering with the other. The gear-box is exceedingly small and light. Three speeds forward and reverse are provided; on the top speed the drive is direct to the differential shaft, without any gear wheels moving, the gear-box merely acting as a long bearing. The gear-box is provided with an instantly removable lid. The differential gear is of the spur wheel type. From the differential shaft the power is conveyed to the rear wheels by the usual side chains. The engine and gearing are entirely encased in, the engine being covered on the upper portion by the bonnet, and the lower portion underneath by an aluminium shield, which extends to the gear-box, so preventing mud or dirt getting to the engine. The latter is of so flexible a character that on a standard-gear car the top speed will, the makers state, be practically always used, speeds of four to fifty miles an hour being obtainable by the use of the accelerator without the clutch ever being taken out. In fact, we are informed that one of these cars has been driven up Reigate Hill on the top speed, with three up, and in muddy weather.

On the extreme right of the dashboard is fixed the mechanically-driven lubricator, which only works when the engine runs, in the centre is the whole of the ignition apparatus. To the left is a small lubricator for the ignition, and to the left of this again is the indicator for the water circulation. Close to the latter is a small auxiliary air inlet, while underneath these are four grease lubricators for the gear-box and the water tube which runs to the water-cooled band brake on the differential shaft. The pipes are all carried inside the frame, and only project out when necessary to get to their respective bearings. The axles are of H section nickel steel; the rear one is quite straight, the chassis being kept low owing to the springs being slung underneath the axle. The rear wheel brakes are of the self-contained internal expanding type—metal to metal. A noticeable feature of the steering is the deeply-dished hand wheel with throttle lever in the centre. Roller bearings and ball-bearings thrust blocks are used where an advantage is gained by so doing, so that the minimum amount of power is lost in overcoming the friction in the transmission. The chassis, which is mounted on long springs, weighs 17 cwt., with 120 mm. tyres on the back wheels, and 100 mm. on the front. The standard sized wheels are 36 in. diameter. The wheel base is 9 ft., so that carriage bodies with side entrance can be fitted.

WE have received from the General Accident Assurance Corporation, Limited, a list of the principal claims paid by them during the past twelve months on account of motor-car assurances. It reveals far more eloquently than any long article could do the advisability of owners taking out such policies.

THE MOTOR CAR ACT.

Decision Deferred.

A MAJORITY of the town council of Worthing thought it would be a good thing if the speed of motor-cars and motor-cycles could be limited to ten miles an hour in all the streets of the town. The Local Government Board, however, sent intimation that it would be necessary for the council to specifically define the particular limits or places to which it was desired the restrictive regulation should apply. For the present the council will defer the matter—a sensible decision.

Cases in the Courts.

FOR driving a car without a lamp burning near the rear identification plate a motorist has been fined £3 at Mortlake, and another £1 at Horsham. Ten shillings has been extracted at Marlborough Street from a driver who did not produce his licence to the police when required. At Northampton, St. Neots, and Newcastle, fines of £5, £7 and £2 have been inflicted on motorists for driving to the public danger.

In the Isle of Man.

"TYNWALD" writes:—"Encouraged by the fact that you are devoting special attention to answering queries from your readers anent the Motor Car Act, I venture to ask for some information regarding motor-cars in the Isle of Man. What is the authority in this bright little spot that application has to be made to register one's car and obtain a driving licence? Also, what is the identification mark for Manxland? I should also be glad if you could inform me if there are any special regulations as to the speed, &c., of motor-cars and cycles in the island, as I am told that the regulations with regard to cycling are not the same as in England."

Dealers' Marks.

A NORTHERN dealer wants to know, "as a user of a general identification mark, if he is compelled to have a different coloured plate to private users. It was suggested by the L.G.B. 'white letters on a red ground,' but it does not seem quite clear that it is compulsory, and, as a matter of fact, I know some users of general marks who adopt white letters on a black ground. The abstract furnished by the County Council says nothing about it, neither does the registration." The regulations of the L.G.B. are very precise on this point, Clause b of Article XII. being as follows:—"The colouring of the plates shall be different from that used for the plates forming the ordinary identification mark." As a rule white letters on a red ground seem to be favoured by the local authorities.

Reversing Gear.

"J.M. 163" writes:—"I think the letter of 'BN. 9' appears none too soon; I have been looking for letters on this subject for some time. It must not be overlooked that this regulation is only a bye one, it was not contemplated when the rules were issued, and was sprung upon small car owners as a great surprise. What is the object of this rule that limits the weight to 5 cwt. (I am told a 3½-h.p. Benz car weighs 7½ cwt.)? I purchased a 3½-h.p. second-hand Benz car last year for between £60 and £70; it has no reverse, and does not require one; it can travel at from ten to fourteen miles an hour and stop in two yards, and lifted round by hand quite easily. I am told that it will cost about £20 to put a reverse to it, and then it will not be improved by a sixpence. I think two courses are open to small car owners; first, to get the 5 cwt. altered to 8 cwt. or 10 cwt.; secondly, that small cars built before January 1st, 1904, be not required to have a reverse; otherwise it looks as if our small cars will have to remain in their sheds till November 5th next." Several correspondents have overlooked the fact that the regulation as to reverse gears is not a new one. It occurred in the Local Government Board regulations under the 1896 Act, Article 11 including the following clause:—"Every light locomotive, if it exceeds in weight unladen five hundredweight, shall be capable of being so worked that it may travel either forwards or backwards." We are afraid the clause is retrospective.

Picric Acid and Petrol Motors.

By H. A. THIERSCH, F.C.S.

THERE has lately been much discussion on the subject of the use of picric acid to increase the explosive force of petrol, and the most extraordinary and contradictory opinions have been expressed. It will, therefore, not be amiss to look at the matter from the point of view of the chemist who has studied picric acid, and who knows fairly well what it will and will not do.

Picric acid is prepared from carbolic acid (phenol) by treating it with nitric acid, a process known as "nitration." It forms small yellow crystals with an intensely bitter taste, but is not, unless in very large quantities, actually poisonous. Though it can be handled with practically absolute safety, it can also be made to behave as a very powerful explosive. It is slightly soluble in petrol. These last two facts show us at once that it might conceivably be used to "enrich" petrol, and, by assisting in the explosion of the "mixture," materially increase the power.

Now, supposing we have two explosives, both normally generating the same volume of gases, the one which produces the greater heat will be the more powerful. As we can calculate both the volume of gases and their temperature from the known composition of any explosive, we can see at once how they compare as to energy. Examined in this way, picric acid is, weight for weight, more powerful than a petrol-air mixture, and should apparently have advantages over this. But as picric acid is a solid and cannot be vaporised under the conditions obtaining in an explosion motor, it must plainly be mixed or dissolved in a medium, such as petrol or alcohol, which will carry it into the cylinder.

Further, as picric acid cannot be readily exploded either by a flame or by any electrical firing system, it is necessary that the carrying medium should itself be of an explosive nature. For it has been proved that picric acid can usually only be fired by an "initial detonation"; that is, by the explosion of some substance either in contact with it or in close proximity. This result is obtained by dissolving the picric acid in a solvent such as petrol, and carrying this, vapourised and mixed with air, into the combustion chamber. The petrol-air mixture is fired by the spark in the usual way, in turn exploding the picric acid; and, as the two explosions take place with almost instantaneous rapidity, they may be considered as simultaneous. The practical result is, therefore, that the spark fires the picric-petrol-air mixture, giving greater power than with one consisting of petrol gas and air only.

The quantity of picric acid used should not be large, as experiments have shown that, if it materially exceeds 5 per cent. of the petrol, firing is not certain. That is, the initial explosion is insufficiently strong to explode a greater proportion of picric acid. Even this very dilute mixture seems to materially increase the power—exactly by how much has not yet been determined, but it probably varies from 5 per cent. to 15 per cent.

But picric acid has two very great disadvantages. It acts very strongly on metals, corroding them, and the products of explosion invariably contain corrosive gases. Not only the petrol tank, but every part of the motor (carburettor, inlet-valve) which could come in contact with the acid would very speedily become corroded, and accurate working of the parts would soon become impossible. Further, as we know that picric acid is not volatile, while petrol is, we see that, as soon as this is vaporised, the picric acid must separate out, the result being that it is present in the "mixture" as a very fine powder or dust. It is, therefore, reasonable to expect that much of the acid will be deposited on every part of the

motor between the carburettor and the combustion chamber. This is actually the case, and a small portion of the picric acid never gets so far as to assist in the explosion. The inlet-valve gradually becomes choked, and ceases to work satisfactorily, and after some time would become seriously pitted and corroded. As the carburettor is constantly in contact with the acid, it would be acted on in a similar way.

The other point, that of the corrosive products of combustion, is not so serious. With efficient lubrication of the cylinder, which is, of course, in any case essential, corrosion need not be feared, as metal which is thoroughly oily or greasy is not attacked by such gases.

To sum up, if we could obviate the tendency of the picric acid to separate out from the petrol, by adding it, for instance, in some way directly to the petrol-air mixture in the cylinder, without passing it through the carburettor and ordinary inlet-valve (thus avoiding its corrosive action) picric acid might be of very great value for enriching or "energising" petrol. Some metal, such as silver, which is practically unacted on by picric acid, might be found useful for protecting exposed parts of the motor, and I am sure that a suitable method of attaining satisfactory results could be suggested by some of our motor-engineers.

MESSRS. W. F. FRENCH AND SONS, LIMITED, has been registered with a capital of £2,500 to acquire as a going concern and carry on the business of a cycle and motor trader, Mr. W. F. French, at 314, High Road, Balham.

THE motor-car agents and dealers in New York have just formed the Automobile Trade Club. The chief object of the club is to have a common rendezvous for luncheon, where the members can meet and discuss current topics.

THE Grande Maison D'Automobiles, Limited, has been registered with a capital of £10,000 to carry on in the United Kingdom or elsewhere the business of manufacturers of and dealers in motor-cars, etc. The registered office is at 366, Euston Road, N.W.

At length Lancashire has awakened to the possibilities of the motor-car, and in scores of places impossible to tramway track, motor-bus services will ere long be in running order. The Bolton Corporation is about to establish a service between that town and Darcy Lever—a low-lying village in the locality.

MR. T. S. PHIPPS, who left Bombay with two motor-cars for a tour in India, has arrived safely at Mhow. He found the roads in good condition, and travelled by way of Igatpuri, Nasik, and Dhulia. The only delays *en route* were due to the difficulties of placing the cars on the ferries which cross the rivers.

THE Anglo-American Motor-car Company, Limited, have sent us a copy of a very complete catalogue they have issued, giving full particulars and detail illustrations of the Cadillac car, for which they are agents. They have also sent a booklet describing the improvements which have been effected in the Winton cars for the 1904 season.

THE Physicians' Automobile Club, of New Jersey, held a discussion on sparking-plugs at their last meeting. A proposition was made to amend the club's constitution so that physicians who are prospective purchasers of motor-cars may become associate members until such time as they shall become owners of vehicles, when they will be eligible for admission to full membership.

CONTINENTAL NOTES.

THE main topic of conversation in Continental motoring circles anent the Gordon Bennett race is the excessive charges which the hotel proprietors are making for accommodation during the Cup week. As regards the German eliminating contest, it is reported that this will be held over a 60-kilometre course in the Luneberg districts, passing through Soltau, Bisingen, Evendorf, Egerstorf, Salzhausen, and Oldendorf. A rumour is also current that only the cars of the Opel-Darracq and Benz Companies will take part in the eliminating race. The four Opel-Darracq cars, which are being built at Russelsheim, will, it is said, have four-cylinder engines of the same dimensions as those of the 90-h.p. Mercedes. The frame, shafts, and axles are being supplied by Messrs. Krupp, of Essen.

NOTHING definite has yet been settled with regard to the course for the French eliminating contest. The Panhard cars for the Gordon Bennett race will not be driven by chains, but by cardan shaft and live-axle. It is not intended, however, to make this change in the standard Panhard touring cars. It is reported that M. Alexander Burton, of Cannes, who owns a 60-h.p. Mercedes, will drive one of the 100-h.p. Gobron-Brillié

for tourists' cars, one kilometre with flying start, each car to have four persons on board, and with the necessary petrol, oil, etc. This will perhaps be the most interesting of the two races, for which a few nominal prizes will be given. Our correspondent adds that Algeria is a grand country for motoring. "The roads are very good and the country in the interior is worth seeing, especially Kabylie, and I can recommend those having cars to pay us a visit, say in the month of April. They will find no difficulty with the Customs people when landing. There are a large number of automobiles in Algiers, over 200. I may add that there is no restriction to speed once outside of the towns."

FRENCH motor-car builders are preparing to make an extensive display at the forthcoming international exhibition at St. Louis. It is expected that over 100 cars will be sent to the show, the exhibitors including Darracq, De Dietrich, Panhard, Mors, A. Clement, Fouillaron, Jeantaud, Aster, Griffon, Renault, Mutel, Turgan-Foy, and Georges Richard. In addition to the foregoing, most of the leading accessory firms are preparing to take part in the show.

THE Automobile Club de Namur and Luxembourg is offering a cup in connection with the Circuit des Ardennes race, to be awarded to the driver of the car which makes the fastest time

The King and Queen of Italy on their Krieger Electric Car.

cars in the French eliminating contest. The colours of the cars in the Cup race, so far as arranged, will be:—Germany, white; England, green; France, blue; America, red; Belgium, yellow; Italy, black. The Austrian and Swiss colours have not yet been decided.

TO-DAY, Saturday, the Automobile Club of Algeria will hold a race for the silver cup presented by an American gentleman named Sneden, a winter resident in Algiers. The cup has to be won two years in succession, the distance being one kilometre with a flying start. An Algerian correspondent writes that the race is not likely to be very interesting as there are only a few large cars in Algiers. The following are the entries for the event:—

- 45-h.p. De Dietrich, owner and driver, M. Malglave.
- 70-h.p. Panhard, owner and driver, Baron de Crawhez.
- 35-h.p. De Dietrich, owner and driver, M. Gerin.
- 22-h.p. De Dietrich, owner and driver, Baron de Viviers.
- 14-h.p. Renault, owner and driver, M. Samselius.
- 14-h.p. Renault, owner, M. de Bellemare, to be driven by mechanician.

On the same day and over the same course there is to be a race

once round the course. There are already fifteen entries for the race.

THE annual hill-climbing competition from Neuwaldegg to Exelberg, promoted by the Austrian Automobile Club, is to be held on May 8th. There will be classes for (1) light cars weighing up to 400 kilog.; (2) cars from 400 to 650 kilog.; (3) cars up to 1,000 kilog.; (4) motor-bicycles up to 50 kilog.; and (5) ditto up to 65 kilog.

AN important international automobile exhibition was opened on Saturday last in Turin by the Duke of Genoa. Altogether there are about seventy exhibitors, and all the leading types of French, German, Austrian, Italian, Swiss and Belgian cars are on view. There is also a large display of motor-cycles. It is to be regretted that British productions, either as regards petrol cars, or motor-cycles, are not represented.

No less than thirteen entries have so far been received for the anti-skidding device competition, which is to be held by the Automobile Club of Seine-et-Oise, from the 24th to the 28th inst. These include two cars fitted with the Samson-Hutchinson non-skidding band, and two with the Sainsbury anti-skidder.

Mr. W. R. M'Taggart, of Dublin, will, it is reported, drive one of the cars fitted with the latter.

SCHEVINGEN, the Dutch fashionable seaside resort, is to have an "automobile week" from the 5th to 10th July next. The programme will include mile and kilometre speed trials, driving competition for touring cars, and a floral fete.

At the annual meeting of the Russian Automobile Club, lately held in St. Petersburg, it was decided, in conjunction with the Moscow Automobile Club, to organise a reliability trial between St. Petersburg and Moscow during the coming summer. Arrangements are also being made for a tour to Homburg in connection with the Gordon Bennett race. At the meeting Mr. P. P. Boekel read an interesting paper on the novel features of the Paris Salon.

A PROJECT to construct a motor racing track near Spa is just now being freely discussed in motoring circles in Belgium. The proposed track is between Malchamps and Bronromme; it would be five kilometres long and comprise both level and hilly stretches. It is reported that the municipal authorities of Spa have agreed, under certain conditions, to give the necessary land for the proposed track.

A PUBLIC service of motor-cars is shortly to be established between Noumea and Bourail, New Caledonia, a distance of about 100 miles. The service, which is to receive a Government grant, will be maintained by three Turgan-Foy 24-h.p. petrol omnibuses.

It is stated that Signor Vittorio Sambolino, a well-known sportsman of Turin, has applied to the Italian Minister of Public Works for authority to establish a public service of automobiles in Italy and on the French and Swiss frontiers. It is proposed to create not less than 250 lines in localities not served by the railways.

THE Belgian Automobile Club has issued another circular to its members pointing out that excessive speed is still being indulged in by many *mecaniciens* and urging them to take steps to prevent this so far as their own cars are concerned.

THERE is a prospect of some record breaking trials at an early date. M. Gobron, of the Gobron-Brillié Company, as a result of the recent wonderful performances of Mr. W. K. Vanderbilt, jun., in Florida, has issued a challenge to the latter for a kilometre or mile race, to be timed by officials of the A.C.F. Baron de Caters has replied to M. Gobron that he will be glad to take up the challenge in the course of a week or so, when he will receive delivery of his new 90-h.p. Mercedes racer.

THE French postal authorities are about to inaugurate a somewhat extensive scheme of mail transport by automobiles. The work will be put out to contract, and tenders are about to be invited for the carriage of the mails over no less than twenty routes—three in the department of Pas de Calais, four in Puy de Dome, five in Dordogne, seven in the Pyrenees and one in Gers.

THE carburettor of a small motor requires thoroughly knowing to be able to get good and uniform results from it. Its function is to vaporise the petroleum spirit. This is done by a small quantity of the liquid petrol being forced under the action of the suction stroke of the motor through a small aperture and broken up into a spray by impinging on to a metal cone. There are, of course, many modifications of the method in which this is carried out. Before it can be used in the motor-cylinder the petrol vapour must be mixed with air in the right proportion. This requires some experience in the management of the mixture. The greatest power can only be got by having the proper mixture, so as to insure complete combustion of the charge. If the proportions are not correct, overheating will probably take place, and the exhaust gases will smell strongly. With a perfect mixture it is remarkable how little of it is required to develop the full power of the motor. Incomplete combustion is also very often responsible for sparking plug troubles, owing to fouling or charring of the points.

SOME USEFUL NOTES.

—X—

USERS of cars which have the Panhard starting device should remember that the little starting box on the crankshaft requires lubrication from time to time; if this is neglected, the box is liable to "seize," with the result that the handle will fly round and may do considerable damage.

WHEN in a multiple cylinder engine one or more cylinders produce little or no power, the usual way to determine which are the faulty cylinders is by short circuiting the sparking plugs in succession and noting the effect on the speed of the engine. A handy little device for accomplishing this has lately been introduced by the Auto Accessories Company, of Cleveland, U.S.A., under the name "Tell-Tale Cylinder Detector." The device can be used for both high tension and make and break igniters. In using the detector with a multiple cylinder engine, the device is first placed on one plug so that one ball touches the bushing and the other the insulated portion of the nut. When a short circuit is produced in a cylinder which is in proper working order there will be a diminution of speed that recuperates the moment the detector is removed. If the cylinder is inoperative its application will have no effect on the motor speed or exhaust. If trouble is shown to exist in a particular cylinder it may be due to a defect in the ignition or some other cause. In order to

determine whether it is due to the ignition, one ball of the detector is separated slightly from the sparking plug. If a spark jumps across the gap thus formed the fault is not likely to be with the ignition.

FOR the benefit of users of their motors, Messrs. De Dion Bouton and Company have just issued a list giving the dimensions of the various sizes of their engines. As we are frequently receiving enquiries from readers as to the bore and stroke of De Dion motors, the following table will not be without interest:—

Date of Introduction.	H.P.	Number of Cylinders.	Bore. mm.	Stroke. mm.	Cooling.
December, 1895	1	1	52	70	air
April, 1896	1	1	58	70	"
September, 1896	1	1	60	70	"
January, 1897	1	1	62	70	"
January, 1898	1	1	66	70	"
June, 1899	2	1	70	70	"
November, 1899	3	1	80	80	water
February, 1900	2	1	74	76	air
May, 1900	2	1	74	76	water cooled head
October, 1900	4	1	84	90	water
May, 1901	6	1	90	110	"
November, 1901	8	1	100	110	"
April, 1902	8-9	1	100	120	"
September, 1902	1	1	62	70	air
December, 1902	10	2	90	110	water
April, 1903	12	2	100	110	"

THE "XENIA" AUTOMATIC CARBURETTOR.

IN describing the "Crossley" car in our issue of the 3rd ult. we briefly referred to the automatic carburettor fitted to this vehicle, and promised to deal with it fully when the necessary drawings were available. These we are now able to publish, Figs. 1 and 2 showing sectional drawings of the device, and Fig. 3 a general view. For the following description of the carburettor we are indebted to Mr. J. S. Critchley:—

The novelty of this carburettor consists in the method of and apparatus for regulating the air supply and keeping the quality of the mixture constant at all speeds. Before going fully into the details of construction, it may perhaps be as well to consider the functions a carburettor for a petrol motor is called upon to perform. The great variation required in the speed of modern petrol engines, and also the constant variation of load, make the construction of a carburettor a much more difficult matter than if the motor were required, as in stationary practice, to run at constant speed and load. With the last-named con-

Having in view these conditions, it is clear that the carburettor has ever-varying and peculiar work to perform which can only be controlled by the suction of the motor, and must not be regulated by any results brought about by the engine's own increase or decrease of speed. In other words, the carburettor must act instantly.

There are two methods by which the air and petrol may be kept in their proper proportion. Firstly, means may be provided for cutting off both the air and petrol together, and, secondly, by cutting off or reducing the air supply only and leaving the reduced suction to regulate the petrol supply. The first-named method is difficult to carry out owing to the small size of the petrol jet, and has to be delicately done to be effectual for great variations of speed. The second method is the most feasible and effectual, as the quantity of air being so much greater in volume than the petrol very accurate adjustments can be provided. When the motor is pulling hard and running, say, at 100 revolutions below its maximum speed, it will be found that the amount or degree of vacuum in the suction pipe is just as great as when the motor is running at full speed, and the motor under these conditions requires its full volume per stroke, and its air ports wide open.

G. Throttle valve.

ditions it is only necessary to once adjust the air and petrol inlets. When, however, speed and load are ever varying, the carburettor must still maintain the correct proportions of air and petrol. Air velocity plays a very important part in the carburation, and thorough mixing cannot be obtained without a certain air velocity. The fallacy exists that a richer mixture is required at slow speeds. This is not so; at all speeds the proportions of air and petrol must be the same; that is, the quality must be always constant at every speed, the only variation being that at slow speeds with the throttle valve partially closed the quantity must be less, but the quality and air velocity maintained.

A motor runs at less than the cut-off speed for two reasons. Firstly, by the act of the driver in closing the throttle valve, and, secondly, when the motor, by reason of the load put upon it, cannot work up to its maximum speed. Most modern engines are worked under these conditions. It is seldom that a motor-car driver allows the engine to "cut out." On inclines especially the motor is "pulling hard" and not running up to its cut-off speed. At other times the throttle is more or less employed.

Now any carburettor, the air supply of which is regulated by extraneous power, such as an increase or decrease of pressure due or created by the speed of the motor, cannot in this case give the motor its full supply, and just at a time when it is most required. A carburettor of this description does not anticipate the requirements—the motor continues to labour using an excess of petrol for the power developed, and cannot have the power given to it for picking up its speed. Take another form of regulation by means of a spring valve; this arrangement certainly gives full supply as the suction demands it, but when the throttle is partially closed, there comes a point when the vacuum or depression in the suction pipe fails to cause the valve to open, or, at least, to the required extent, and an incorrect mixture is the result. Moreover, spring arrangements require careful and accurate adjustment, rendering a perfect gradation of speeds almost impossible. The Xenia carburettor used on the "Crossley" car, has the defects of neither, is designed to give the exact quantity of air required at every speed, and under all conditions, and anticipates the requirements of the motor to an absolute exact degree. The petrol supply is of the usual float-

feed type, and is connected up in the usual way to the jet A; A¹ is a passage giving a fixed air supply, and A² the mixing chamber. B is the uptake to which the suction pipe of the motor is fitted. The mixing chamber A² and uptake B are water jacketed, a portion of the circulating water being conducted through it. The automatic regulator, which is attached to the body of the jacketed part by means of studs, forms the novelty of the apparatus. D are chambers, four in number, which contain mercury, and which surround a central tube D². In the base of the latter are four openings or slots D³, whereby the mercury in any of the outer chambers can flow into D². The bottom of the tube D² is plugged with wood, D⁵ having a central tube, for the purpose of reducing the quantity of mercury. The outer chambers D have an opening to the atmosphere. In the inner tube D² a wooden float D⁶ is placed, and connected by a light spindle E to a piston valve E¹. Ports F are formed in the cap F¹, through which air can pass to the mixing chamber A². Above the level of the mercury in the tube D² a passage D¹ is made, so that by a small coupling pipe the chamber D² is connected to an opening D⁷ in the passage A¹ of the fixed air supply at a point exactly opposite the jet. G is a hollow cut-off valve or throttle operated either by hand, by the motor governor, or by both, by means of the spindle G¹, whereby the quantity of the mixture is varied. It will be noticed that this throttle valve is hollow and so arranged that the two currents meet in the mixing chamber A². When the throttle valve G is pushed right through the mixing chamber the supply is entirely cut off.

Fig. 3.—General View of "Xenia" Carburettor.

The regulator works in the following manner. When the motor is running dead slow, say at 100 revolutions per minute, the throttle valve is open about one-sixteenth of an inch, and the valve E¹ just covers the ports F, the fixed air supply giving, at the slowest speed, the requisite amount of air to run the motor. As the valve G is opened a greater vacuum or depression is created in the passage A¹ and the mercury chamber D². The mercury therein at once rises by reason of the increased vacuum, and falls in the outer chambers D. The rising mercury carries with it the float D⁶ and valve E¹, thereby admitting the exact quantity of air required, the petrol and air supplies being thus actuated by the same source of motion, namely, the increased vacuum in the suction pipe. With full load and the throttle wide open, the amount of vacuum or depression is such that the ports F are full open. It will be obvious that when the throttle valve is wide open the full quantity of air must be admitted,

whatever may be the actual speed of the pistons, and that as the throttle valve is closed and the speed decreased, the vacuum also decreases, and the air valve closes with absolute precision, thus giving the same quality of mixture at any speed. The slightest alteration in the opening of the throttle valve is instantly responded to by the opening or closing of the air valve; in action the air regulator is just as sensitive as the ordinary barometer. In order to prevent any agitation of the mercury a slight quantity of glycerine is put into the float chamber D², and steel balls are placed in each of the chambers D for the same purpose. The carburettor adjusts its air supply very accurately, with the result that a great economy in the consumption of petrol is effected.

A PETROL MOTOR TENDER FOR MAURITIUS.

IN 1899 the City of Port Louis, Mauritius, had the first modern English-built motor steam fire engine, specially constructed for the Fire Brigade by Messrs. Merryweather and Sons. This engine has completed four years' service, and has proved a most serviceable machine, able to reach fires more quickly than horse-drawn engines, and always arriving with full steam; it can get to work promptly; and it has saved a large amount of property, which would otherwise have been destroyed by fire. Port Louis has also a hydrant service, and a "first aid" machine being required for dealing with small fires, the makers of the motor steamer were requested to build a suitable apparatus, and they have designed the self-propelling hose-carriage shown in the illustration on page 973.

The motor is of the double-cylinder petrol type running at moderate speed, with electric ignition, and is placed between the frame in front of the machine under a bonnet. Power is transmitted through a gear-box, with sliding gears to the countershaft, and thence by roller chains to the rear wheels. Two brakes are fitted, one a band on the countershaft, worked by pedal, which also throws the clutch out of gear, and the other of the band type, acting on the hubs of both the rear wheels. The frame is of steel, strongly stayed and mounted on laminated springs, wrought axles, and steel wheels with solid rubber tyres. Under the driver's seat is a large box for gear, while behind is another receptacle for carrying stand-pipes, branch-pipes, etc., and below is a tray which will carry over 1,000 feet of hose for use with street hydrants or the motor fire engine. There is room for eight men, and the engine is of 12 to 15 h.p., giving a speed of twenty to thirty miles per hour on the level. The machine has been tested on hills, and easily ascended a gradient of 1 in 8 fully loaded.

MESSRS. DAVID MOSELEY AND SONS have entered into a contract with the British Motor Tyre Syndicate, Limited, for the manufacture of the Seddon tyre.

RUMOURS have been rife recently as to Mr. C. Jarrott driving an English car in the eliminating trials for the British Gordon Bennett team. They are false, Mr. Jarrott will drive a De Dietrich car only.

THE Bridgwater Motor Company, Limited, has been registered with a capital of £20,000 to adopt an agreement with Mr. H. Carver for the acquisition of the business of agents for and dealers in motor-cars and cycles carried on by him at Bridgwater.

MOTORISTS who went to Ireland last year were not so much concerned with the ancient buildings of the country as with its rooms and hotels. Hence the new history and description of the cathedral church of St. Patrick, Dublin, written by the Dean, and published by Messrs. G. Bell and Sons, Limited, will enable them to make partial atonement for the omission. This book is one of the Cathedral series, and deals pleasantly with a subject of interest not only to Irishmen but to all who take delight in buildings of architectural interest and historic importance.

TOURING IN ENGLAND AND ON THE CONTINENT.

A TOUR of some three thousand miles through England, France, and Germany has recently been completed by two American motorists—Messrs. Leon C. and R. H. Spaulding, of Rochester, N.H. The tour was made on a Winton car, and was free throughout from any trouble with their vehicle other than punctured tyres. Accompanied by a mechanic, the Messrs. Spaulding left the United States on September 3rd last, their car coming over on the same steamer, and on the day of their arrival they toured from Liverpool to Manchester. A couple of days were spent in Cottonopolis, and the following Sunday morning the trip to Leicester was made through Derbyshire. Mr. Leon Spaulding, who drove the car throughout the trip, considers these roads the best he found in Europe. The grades were gradual, and the surface was superior to anything on the Continent and immeasurably better than those of New Hampshire, where he resides. Kenilworth and the remains of the abbey founded in 1122 were visited, as was also Warwick and its famous castle, and then through Northampton to London. Several days were spent in the Metropolis, side trips being made to Kettering and other points. Then the Channel was crossed, the tourists going to Boulogne. Something like six hundred miles were ridden in England, and on that and the trip through the Continent the American tourists had ample opportunity of comparing the roadways of the three countries. While those on the Continent were long and straight and of excellent quality, Mr. Spaulding is of the opinion that the surface of the English roads is better, the only drawback being their turns and twists, which prevent speed.

The trip from Boulogne to Paris was made in due season, and at the latter point the necessary licence was secured, and after a four days' stay there the party toured through Lyons to Nice. Next, a run to Monte Carlo was enjoyed, and then a week was spent in the Maritime Alps, the objective point being Grenoble. It was a beautiful ride over perfect roads and a gradual grade for miles, as shown by the fact that an average of fifteen miles an hour was maintained. The roads in the district are built around the mountain side, with sharp, dangerous curves. In many instances the road could be seen three or four miles away as it wound round the mountains. From Grenoble, Geneva was next visited. While on the road from Geneva to Lucerne the car was going along fairly fast, when suddenly a pair of oxen was driven on the road. Mr. Spaulding immediately applied the brakes, and the vehicle skidded and ran up the side of a bank. His brother jumped over a hedge, the interpreter dived into the same, and Mr. Spaulding hung on to his steering-wheel. No injury, fortunately, resulted, and the trip was continued from Berne to Lucerne. The next day the party climbed Mount Rigi, and then went through Basle to Mulhausen, Germany. Then came the trip down the Rhine to Strasburg, Metz and Cologne, and then to Brussels, where the party returned by train and steamer to England—leaving the mechanic to take the car to Liverpool, from which point a steamer was taken for Boston.

Mr. Spaulding takes particular pride in the fact that he took back with him all the extra parts that he carried. He was not as fortunate, however, in the way of tyre troubles, as he experienced five punctures on two separate days, and finally had to purchase a new pair of tyres for the rear wheels.

THE "RECTORY" STEAM WAGON.

HEREWITH we give an illustration of still another new steam wagon. It is known as the "Rectory," and is built by the Rectory Engineering Company, Limited, of Fullwell Road, Sunderland, to the design of their manager, Mr. J. K. Walton, and is the result of several years' experience in this special branch of engineering work. The fire-tube boiler is of special design and gives ample steam at 220 lbs. per square inch. The heating surface is about 105 square feet, and the grate area 3.5 square feet. The boiler is made in two parts, having an upper and lower shell, the former being easily removed when necessary for cleaning purposes. The engine is of the compound reversing type, having cylinders 4 in. and 6½ in. diameter, the stroke being 6 in.; it has constant lead valve gear worked by a single eccentric. All the working parts of the engine are entirely enclosed in a dust-proof case and run in oil. The machine-cut two-speed gearing and the roller driving chains are also completely enclosed in an oil-containing case. A specially strong type of steel leading and driving wheels is used, the front wheels having 6 in. tyres, and the rear wheels 9 in. The Ackerman system of steering gear is adopted, and a powerful screw band brake is fitted. The water tank will carry sufficient water for a run of from fifteen to twenty miles, according to the nature of the roads; the bunkers are large enough to carry 15 cwt. of coal. The front axle is pivoted at the centre, so as to allow

either wheel to drop one foot when going over rough ground without throwing any strain upon the frame, and consequently the engine and gearing are also free from undue strain when negotiating rough roads. In a recent trial of the first "Rectory" wagon turned out, a gradient of one in nine was, we are informed, easily negotiated with a useful load of four tons.

The "Rectory" Steam Wagon.

THE Normal Powder and Ammunition Company have been appointed sole representatives of the Usines Prunel for the United Kingdom.

A GARAGE for a dozen cars has been opened by Mr. A. Downie, in the Haymarket Terrace, Edinburgh.

THE Birmingham Motor Express Company, Limited, have several motor-buses of the Milnes-Daimler type on order.

FOR not having a light showing the direction in which he was going on his motor-bus W. Billington has been fined six shillings at Eastbourne.

M. A. CLEMENT has sent in a challenge to the A.C.G.B.I. for the "Harmsworth Cup." He has built a boat fitted with a powerful Talbot motor for the purpose of the race.

APPLICATION has been made to the authorities of the Canton of Ticino for a concession to establish and work a public service of electric motor vehicles between Locarno and Gravello, Switzerland.

THE Dublin and Swords Motor-car Company, Limited, has been registered with a capital of £2,500 in 500 shares of £5 each, for the purpose of establishing a line of motor-cars between Dublin and Swords, near Dublin.

A COMPANY, to be known as the Montreal and South Shore Auto Car Company, has been incorporated in Montreal to establish an automobile service between Victoria Square and St. Lambert. The cars to be used will each carry twenty-two passengers, and will be of 20 horse-power.

HERE AND THERE.

A SUGGESTION has been made for a motor-car service between Bridgnorth and Newport (Salop).

MR. C. R. BASE has removed his tailoring establishment to 306, Regent Street, W., near the Oxford Circus station on the Tube.

THE Pollard Garage, Limited, has showrooms at 47, Queen's Road, Bayswater, and is devoting considerable attention to motor-cycles.

MESSRS. ALFRED DUNHILL, LIMITED, will be in control of the garage at the Crystal Palace Show. A large staff of assistants will be in attendance.

PLANT for making copper and asbestos washers has been laid down by Messrs. John Child Meredith, Limited, of Birmingham. It is their intention to carry a stock of every size.

THE Windsor Rural District Council have had before them the subject of closing the gates of Windsor Great Park against vehicular traffic. The matter was adjourned for further information.

COUNCILLOR T. T. L. SCARISBRICK, who was recently fined £5 and costs for motoring in Lord Street, Southport, "to the danger of the public," is appealing against the verdict of the Southport Bench.

APPLICATION has been made for a concession to establish and work a public service of electric motor vehicles between Pamplona and Villara, Spain, the cars taking their current from an overhead conductor.

A DISCUSSION on "The cost, upkeep and care of a motor-car" is to take place at a meeting of the Western Section of the Scottish Automobile Club on Monday next. It should bring out some interesting information.

THE Pioneer Motor Car Company of India, Limited, has been registered with a capital of £5,000, to carry on the business of manufacturers, hirers, and repairers of and dealers in motors, motor-cars, motor yachts, etc.

TURNER'S MOTOR MANUFACTURING COMPANY, LIMITED (the makers of the Miesse steam cars), have now removed to the new works which they have recently purchased. Trial runs can be arranged with customers from the new place in Lever Street, Wolverhampton.

MESSRS. VAN RADEN AND COMPANY, LIMITED, have brought out an exceedingly neat and simple switch for one or two sets of accumulators. It is circular in shape and measures $1\frac{1}{2}$ in. over-all diameter by 5-8 in. in thickness, the base and cover being made of polished ebonite. The switch, which is practically watertight, is self-locking, and owing to its rigid construction there is little possibility of it getting out of order.

OWING to the increasing difficulties experienced in getting stock delivered quickly enough, the Edison and Swan United Electric Light Company has decided to adopt motor-traction for this purpose, and the first of their motor-vans recently commenced its duties. This van, a Milnes-Daimler of two ton capacity, makes a daily trip from the works at Ponder's End with a stock of lamps for the head office in London; thence supplies are taken to the various contractors in other parts of London. On its return in the evening, the van carries a load of empties and raw material.

THE first of the North-Eastern Railway motor-coaches, after preliminary tests, went through a satisfactory official test run of 60 miles on their main line last week. This coach was fitted with the first of the new "Wolseley" 80-b.h.p. petrol motors. The petrol consumption was approximately one pint per b.h.p. per hour. A speed of nearly forty miles per hour was frequently attained, and the sixty miles test run was accomplished at about thirty miles per hour average speed, including four stops and starts. The coach climbed a bank 1 in 95 on each journey without any difficulty whatever.

THE Brouhot Motor Company of Great Britain, Limited have opened a new depot at 25, Mortimer Street, Regent Street, W.

IN the "Agricultural Economist" for February, Mr. E. O. Greening continues his series of articles on the motor and its probable influence in agriculture.

WE are informed that Sir W. G. Armstrong, Whitworth and Company, Limited, have taken over the entire patents and rights in connection with the Wilson and Pilcher petrol cars.

A COMPANY has been formed at Cleveland, O., U.S.A., to place on the market an odourless fuel for petrol motors which is said to possess 80 per cent. more energy per gallon than petrol.

AT a meeting of the Newcastle Emllyn Urban District Council it has been decided to co-operate with Cardigan in a petition to the Great Western Railway to arrange a motor service between the two towns.

SIR ALBERT DE RUTZEN, the magistrate at Bow Street, London, is considering the information laid before him by Mr. Staplee Firth as to the alleged perjury by a policeman in a motor-car case heard at that court.

AUTOCARS AND ACCESSORIES, LIMITED, is the title of a company, registered with a capital of £200. The first directors are Messrs. J. Portwine, J. Weller and H. E. Weller, and the registered office is at 114, Long Acre, W.C.

A 10-h.p. Argyll Car with Detachable Coupe Top.

MESSRS. A. DONALDSON AND COMPANY, LIMITED, has been registered with a capital of £3,000 to establish and carry on the business of manufacturers, etc., of motors, motor-cars, launches, etc. The signatories are all resident at Edinburgh.

AT a meeting of representatives of the District Committees of the Inverness County Council—under the presidency of Lord Lovat—it was agreed to recommend the Committees to appoint a joint Road Surveyor at a salary of £400, and that he be supplied with a motor-bicycle, with an allowance of £30 for repairs.

ALDERMAN W. B. HULTON has assured the Lancashire County Council that while the Main Roads and Bridges Committee, of which he is chairman, had no desire whatever to harass the makers of motor wagons, or to obstruct the users, the wagons must be so constructed and used as to prevent the destruction of roads and undue expense to the ratepayers.

MESSRS. HOLDING AND SON, of 7, Maddox Street, W., and 4, King Street, E.C., have just issued an extensive and highly illustrated catalogue which appears to cover the whole field of motor garments and of stylish garments that may be worn to motor in as well as for ordinary purposes. There is a striking illustration of their latest patent garment, viz., a waterproof coat called the "Car-Poncho."

MESSRS. CHARLES JARROTT AND LETTS, LIMITED, have secured the British rights in the automatic tyre inflator illustrated and described in our issue of the 16th ult. The device, which was awarded the gold medal at the Paris Salon, is now being made in this country and will be known as the "Pompeesi."

"ENGLISH CLUBS," a list of nearly 3,000 clubs frequented by English people in all parts of the world, for 1904, has just been published by Messrs. Spottiswoode and Company, Limited, and is edited by Mr. E. C. Austen Leigh, M.A. The book gives much information about each club, and this year, for the first time, automobile clubs find a place in the work; although we look in vain for information as to the Yorkshire, Nottingham, Reading, Manchester, Lincoln, and other well-known automobile clubs.

SINCE the advent of the new Motor Car Act an increasing amount of interest is being taken in instruments which will indicate the speed at which one is travelling on a motor-car. Among the many devices of the kind is the Jones speedometer, an American instrument which has been put on the English market by Messrs. Markt. The device is attached to the dashboard of the car, and is driven by means of a flexible shaft, at the end of which, in the old type, is a friction pulley, which rests against a ring or drum attached to one of the front wheels. In the latest pattern the friction drive has been abolished, and a positive gear drive substituted, greatly increasing the accuracy of the instrument. It can be had to fit on either the right or

left side of the car, and for wheels from 24 in. to 36 in., advancing two inches each time. In addition to the pattern designed especially for the dashboard, the speedometer can be had in a form specially for attachment to the steering arm, in which case the flexible shaft is dispensed with, and a certain amount of complication avoided, but in this position it is not so easy to read the dial, especially if the car be running at all fast. The dashboard pattern is made in two varieties, one registering up to fifty miles an hour, and the other recording speeds up to one hundred miles an hour.

ONCE a livery stable, now a garage for electric carriages, the premises in Curzon Street, facing Half Moon Street, Piccadilly, W., presented a busy scene on Monday, when a number of pressmen became acquainted with the work of the Electromobile Company, Limited. An inspection was made of the facilities possessed by the company for storing cars, more than seventy of which are now being garaged for private owners. A motorist having purchased an electric vehicle can have it kept charged and in good order in Curzon Street, the services of expert drivers being also available on a system which should be appreciated by West End people. Minor repairs can also be effected there. After an inspection of the garage and of the cars, Mr. E. Schenk drew attention to the progress that the electric vehicle is making. Although London had been somewhat laggard as compared with Paris and New York, the carriages now upon the streets of the metropolis would compare well with those of other cities. In the Electromobile, carriages English workmanship had been employed, the "straight chassis" being the work of Messrs. Greenwood and Batley, of Leeds, while London carriage builders were responsible for the coach work.

A COURSE of lectures on internal combustion engines is being given at the Hartley University College, Southampton.

THE London agents for the petrol made by Messrs. Whitaker, of Manchester, are Messrs. Miller and Company, 19, Hanover Square, W.

It is announced that the India-Rubber, Gutta-Percha and Telegraph Works Company, Limited, of Silvertown, is about to take up the construction of electrical cars.

A USEFUL handbook has just been issued by Messrs. Bradbury and Co., Limited, of Oldham, giving a number of hints with regard to the running of the "Peerless" motor-cycles.

POLICE CONSTABLE KERKHAM, of North Brixton, was once a motor-car driver. In his new capacity he secured the conviction of a motorist at the Lambeth Police Court, on Tuesday, for driving to the common danger.

THE East Sussex County Council is about to purchase a motor-car for the use of their chief constable, Major Lang. Probably the fines inflicted during the last few months in that locality on motorists will be more than sufficient to pay the cost.

WE have received two interesting snapshots showing a 10-h.p. M.M.C. car in Western Australia. The vehicle is the property of Mr. F. Wittenoom, who reports that it has run several hundred miles without giving the slightest trouble.

OWING to the growth of his business, Mr. A. A. Godin has taken new premises at 1, Red Lion Square, W.C., which are now being fitted up. He hopes to be in these premises within the next fortnight. Space will be reserved for a plant for charging accumulators.

THE Chief Constable of Folkestone has advised against any restriction of motor-car speed to the ten mile limit in the borough, and suggests that caution notices be placed on the borough boundary on Dover road, at the top of Sandgate Hill, and near the top of the Waterworks Hill.

EXAMINATION of the tracks left in the sand on the Ormonde-Daytona beach, Florida, after the passage of the Packard Company's racer, the Grey Wolf, showed that frequently the car was entirely clear of the ground, the rear road wheels sometimes being out of contact with the sand for a distance of eight feet, by actual measurement.

ON page 974 we illustrate one of the standard types of commercial motor-vehicles which Messrs. A. Darracq and Company are introducing into this country. It is fitted with a 12-h.p. engine, and in general arrangement follows the well-known lines of Darracq cars. The wagon, which is capable of carrying a load of 30 cwt., is provided with three speeds and a reverse, all controlled by one lever on the steering column.

PUBLISHED by Messrs. Sweet and Maxwell, Limited, and also by Messrs. Stevens and Sons, Limited, is "The Statutes of Practical Utility passed in 1896." These are arranged in alphabetical order in continuation of "Chitty's Statutes," and have useful notes by Mr. J. M. Lely, M.A. Of the forty-seven Acts adopted last year, twenty-four are dealt with, including, of course, the Motor Car Act. The text of the latter is given, with the Local Government Board's Regulations, and the book will be of value as well as of interest to the legal profession.

AT the official Exhibition of the Automobile Club to be held at the Agricultural Hall, London, next month, under the direction of Messrs. Cordingley and Company, a special section will be devoted to a display of heavy vehicles for municipal and public services. All the leading British makers of such automobiles for heavy traffic will be represented, including the Yorkshire Steam Wagon Company, the Lancashire Steam Motor Company, Messrs. Foden, Limited, Messrs. Mann, Messrs. Stirling, and the makers of the Hagen and Hercules types of vehicles. In the light car section several vehicles which will not be exhibited at any other exhibition in this country will be on view, and the interest of the public will also be aroused in leading types like the Peugeot, Talbot, Star, De Dietrich, Dechamps, Spyker, Richardson, Mors, Duryea, Mercedes, Serpolle, etc.

MOTOR-CYCLING NEWS.

—■—

MR. H. A. DIPPLE, of Brockley, was summoned at Greenwich by the Inland Revenue authorities for keeping a carriage, viz., a motor-cycle, without a licence. Mr. Purnell, an Inland Revenue officer, said that on September 23rd he saw the defendant on a motor-cycle. He afterwards sent defendant a form, which he filled up, to the effect that the cycle was the property of Mr. J. J. Leonard. Mr. Leonard said the defendant was a partner in his business at the Brockley garage, adjoining the defendant's premises. On the occasion in question he was testing a motor-cycle before it was sold. The defendant said that at the time there was a verbal agreement of partnership from March last, but he did not state it in the form he filled up, as he had no agreement to show. This year he had taken out a two-guinea and a fifteen shillings licence, which he had since found were not necessary. He held a County Council licence which cost £3. Mr. Baggallay said the defendant made an untrue answer on the form, and must take the consequences. He would have to pay a fine of £3 and 9s. costs.

MR. G. C. GNAPP, manager of the cycle department of Messrs. Walker, Sons and Company, Limited, has returned to Colombo after an interesting ride by motor-cycle to Kandy, Ceylon. Starting on his Quadrant from Grand Pass bridge in the early morning on New Year's Day, he passed through Veyangoda an hour and five minutes later, and did not dismount until the thirty-ninth mile-post had been reached. Later, while going along at a rattling pace round a curve, and loudly sounding his cycle horn, Mr. Gnapp found himself all but landed between the ponderous legs of an elephant, which was being driven Colombo-wards. An accident was averted in the nick of time; but the elephant and its keeper seemed to be the most alarmed, and they regarded the strange contrivance, which they apparently saw for the first time, with amazement. The journey was continued over the Kadugannava Pass. The climb was a stiff one, and care had to be exercised in negotiating the sharp elbow-curves, for which the road is so noted. Mr. Gnapp rode on to within six miles of Kandy, when a heavy shower of rain compelled him to dismount and take shelter. With the completion of the ride to Kandy, Mr. Gnapp has ridden 1,000 miles on his motor-cycle, and he says that the Quadrants seem to have caught on, as, in the two months following his return from England, he had sold, or had received orders for, eight machines.

MESSRS. JOHN CHILD MEREDITH, LIMITED, have sent us a sample of a number-plate they have introduced for attachment to the lamps of motor-cycles. It is made to fit any lamp. There are three sizes, for lenses from $3\frac{1}{2}$ in. to $4\frac{1}{2}$ in., for ditto from $4\frac{1}{2}$ in. to $5\frac{1}{2}$ in., and ditto from $5\frac{1}{2}$ in. to $6\frac{1}{2}$ in. When fixed in position, the plate throws no shadow upon the road; its weight is under three ounces.

THE Motor-Cycling Club will hold its first run of the season on the 12th March. Brighton will be the destination, starting from Purley at 3.30 p.m. It is proposed to hold a run from London to Edinburgh on the Saturday before Whit-Sunday, the start to take place at midnight.

THE Austrian Touring Club and the motor-cycle section of the Automobile Club of Austria are organising a motor-cycle race from Vienna to Brunn for the 8th May. There will be separate sections for racers and tourists.

AT the invitation of the captain, Mr. E. H. Humphries, the members of the Birmingham Motor-cycle Club attended an "At Home" at the headquarters a few days ago, when a most enjoyable evening was spent. In the course of a short address Mr. Humphries mentioned that prizes to the value of upwards of £30 were already offered for the coming season in competitions. The honorary secretary stated that it was proposed to hold two or three runs each month during the coming season, as well as occasional smoking concerts and week-end runs.

A NEW friction clutch for use on motor-cycles has lately been brought out by the 20th Century Cycle Company, of Erith. It consists of a metal driving pulley, recessed so as to also form the female portion of the clutch. The pulley runs free on the engine shaft. The male portion of the clutch is leather covered and is kept in contact by means of an internal spiral spring in the outer end of the engine shaft, which is bored out to receive it.

Fig. 1.—General View of Clutch.

This male part is held to the shaft by a feather, so that while it must rotate with the shaft, it is free to slide laterally on it. The clutch is operated by lever and wire from the handle-bar, and a suitable arm on the clutch is connected therewith, the clutch being drawn out by pressing a lever on the handle-bar. A ball race takes the thrust when the arm is out, and the thrust on the clutch and pulley, caused by the internal spring, is overcome by means of a groove turned on the spindle, in which run three set

Fig. 2.—Section of Clutch.

screws which are screwed through the boss of the pulley. The device can be fitted to existing motors for either chain or belt drive, and seems to be well adapted for the high-power engines of two-seated motor-cycles.

MESSRS. JOSEPH LUCAS, LIMITED, have removed their London office to 224, Shaftesbury Avenue, W.C.

THERE was a noticeable increase in the exports of motor-cars and parts from the United States during December last, a total of £14,709 being recorded as against £8,739 in the last month of 1902. The total for the year was £328,605 as compared with £213,956 in 1902.

OUR DIRECTORY OF "NUMBERS."

[ALL RIGHTS RESERVED.]

Below is a further instalment of Automobile Numbers. Motorists who have not yet communicated with us are invited to forward their Names, Addresses and Numbers.

Dealers are also requested to send their general identification marks for inclusion in the second column.

Ajello, L. R., 10, Albert Road, Gloucester Gate, N.W.	A.	652
Arnott, Geo., Market Place, Pickering, Yorks	U.	87
Allen, Wm., Tone Engineering Works, Taunton	Y.	82
Aldons, D., Mannamead, Plymouth	C.O.	18
Bartram, W. J., 97, St. Nicholas Road, Norwich	E.X.	6
Bocock, Geo., 16, New Station Street, Leeds	U.	54
Bacon, Hatley, Commercial Street, Leeds	U.	18
Burbridge, E. B., Easton, Newbury	B.L.	309
Burnham, Walter M., Carlingford House, Merton	P.	19
Butler, J. G. W., "Anaverna," Murrayfield, Edinburgh	S.	32
Bradley, David, Denshaw House, Morley, Leeds	C.	59
Bannister, Miss Edith, 9, Cannon Street, Accrington	B.	133
Bolton, L. A., 10, Bowden Street, Oldham	B.U.	7
Bedwell, G. C., East View, Tenison Road, Cambridge	C.E.	104
Berry, A. W., Artillery Street (South), Colchester	F.	431
Baker, T. and Sons, 35 and 37, Friar Street, Reading	D.P.	27
Birmingham and Coventry Cycle Company, 165, Above Bar, Southampton	C.R.	46
Benbough, G. L., 22, Tivoli Place, Ilkley, Yorks	C.	379
Bowden, S., Sutherland Terrace, Plymouth	C.O.	7
Burrongs, Wellcome and Company, Snow Hill Buildings London, E.C.	A.	1469
Carter Paterson, and Co., 128, Goswell Road, E.C.	A.	2174
Clark, W. E. and Co., Station Road, Doncaster	C.	304
Coade, James W., 61, Brixton Hill, S.W.	C.	306
Corbet, Captain, 61, Gt. Cumberland Place, W.	A.	12
Clarke, Stewart, Dundas Castle, S. Queensferry, N.B.	S.X.	5
Campbell, A., 14, Baker Street, W.	A.	2222
Citroen, D., Shooters' Hill, S.E.	H.	251
Cooper, Montague, Taunton	Y.	94
Caunt, J., Portland Square, Sutton-in-Ashfield	A.L.	38
Chadwick, W., Reid's Road, Blackpool	B.	203
Collett, O., Bampton, Oxon	B.W.	12
Cary, Mrs. R., Elliott Terrace, Plymouth	C.O.	9
Cross, Mr., Darnford Street, Stonehouse, Devon	T.	2
Crosley, James, 12, Tower Bridge Road, S.E.	A.	410
Delafield, R. B., 33, Frankfort Street, Plymouth	C.O.	12
Dean, Major, The Towers, Yarmouth, I.W.	C.O.	124
Day, W. J., Mount House, Harwich Road, Colchester	D.L.	25
Egerton, Mr., Ipswich	F.	457
Estcourt, E., Thatcholme, The Avenue, Wroxham	D.X.	11
Edge, S.F., 14, New Burlington Street, W.	A.H.	12
Edison and Swan, United Electric Light Company, Limited, 36, Queen Street, E.C.	A.H.	13
East Pier Engineering Works, Scarborough	A.	3332
Edwards, W. P., Corporation Street, Taunton	H.	372
Firefly Motor Company, Croydon	A.J.	62

CORRESPONDENCE.

BENZ v. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much amused with the letter of W. H. W., in last week's issue, and hardly knew whether to take it seriously or not. In the first place it would be interesting to know how the different speeds are worked with only one belt, or is it a geared Benz? also how these three marvellously powerful band brakes are put into operation "one after the other" by pressing one pedal. In my experience the brake power of a 3½-h.p. Benz is utterly inadequate for the weight of the car, and I should be glad to hear of a more powerful foot brake. The fact that "he can travel for two days without calling for petrol or water" either means that he has had some enormous tanks fitted or that he does not travel far. Your correspondent makes a mistake when he says the cars have only been restored to their original efficiency, and even that is doubtful; if he reads the letter of Mr. Hay Taylor he will find that his car was improved shortly after it was bought new. The fact is the cam

that I venture to write you on the subject. Can W. H. W. prevail upon the gentleman who has made such improvements on his Benz to give the readers of the *Journal*, who are interested in Benz cars, the benefit of his experiences? I am the owner, fortunate or unfortunate, as the case may be, of a Star Benz, and I have often thought, considering the size of the cylinder and the excellent get up of the car, that much more power should be got out of it.—Yours truly,

STAR BENZ.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been very much interested in the discussion on the above subject, which has been instrumental in bringing out a number of "tips" for users of the 3½-h.p. Benz car. I cannot, however, agree with those correspondents who condemn the mechanically-operated inlet valve. In my opinion, this is of great importance on these low-powered cars. I was one of the first to fit the Ratcliffe device, and must say it has been a great improvement. Not only can I now mount fairly stiff gradients, but I can run much slower in traffic on top speed, which is a great advantage.

The New Motor Fire Tender for Mauritius. (See page 967).

operating the exhaust was not originally made the correct shape to give the best results, but slightly widening it at the sides makes a wonderful improvement in the power. If there are potentialities in the old Benz cars not yet dreamt of, I am sure we shall be only too pleased if we can find them out or have them pointed out to us; but I think it is useless to compare the size of the Benz cylinder with those in use on the latest make of engine; for one thing, the Benz is a slow-running engine, making about 750 revolutions a minute against the others at 1,500 or 2,000, which would, I should think, make the latter about two or three times as powerful looked at from a non-practical point of view. Personally I think if a 3½-h.p. Benz is improved so as to do twenty miles per hour on the level and take small inclines on top speed, making an average of fifteen or sixteen miles per hour, it is quite as much as we can expect from it.—Yours truly,

A SATISFIED BENZITE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest the letters in the *Journal* respecting the Benz car. I have got a few hints which have benefited me; but the letter in last issue signed W. H. W. whets my curiosity so much

When adopting the M.O.I. valve care should be taken in fitting the cam in the right position, so that the valve is full open on the commencement of the stroke, and closed at the end of the stroke. The air valve spring at the back of the cylinder may require readjustment to suit the new conditions.—Yours truly,

GRATIFIED BENZITE.

THE REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is difficult to see where "Chirurgien" has been "glaringly overcharged" in the items mentioned by him last week. Time is charged out at 1s. per hour. Does he think that any repairer can supply skilled labour cheaper than that? It is customary for a repairer to charge for use of gas engine and lathe, though it is not always entered as a separate item. Gas engine and lathes have to be paid for, both in first cost and upkeep.

I have had considerable experience in costing and pricing up motor repair work, and, after looking carefully through the items printed, I

really cannot see that your correspondent has much to complain of. But does not an 8-h.p. car, which costs £100 for repairs in less than six months, suggest a change of make unless "Chirurgien" has been unfortunate enough to meet with bad accidents?—Yours truly,

FRANCOIS.

MISFIRING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have frequently found when driving in wet weather that the engine of my car either stops altogether or misses very badly when the sparking lever is in an intermediate position, but will go perfectly well when the spark is either fully advanced or fully retarded. Directly I put it back, however, to an intermediate position the trouble begins. The curious thing, however, is that in fine weather the motor—a 6-h.p. De Dion—gives no trouble; it is only in wet weather that it starts its tricks. If you or any of your readers can assist me in locating the cause I shall be extremely obliged.—Yours truly,

PLUVIUS.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am one of those who are tired of pneumatics. It is all right talking about "puncture proof bands," etc. I have had only three punctures and two bursts in a year, but every time I have gone out with the car I have had from three to six tubes to replace. Fancy six tubes going down in one afternoon, and they talk of the pleasures of motoring! I never did so much work in my life in a year. What is to prevent the loosening of patches caused by the heat—patches which

the ball races are in good order, the trouble of broken balls will disappear.—Yours truly,

WOLSELEY CAR.

WHAT IT COSTS TO KEEP A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an interested reader of the *Journal*, but one who is not yet the proud possessor of a motor-car, I venture to ask those who have had experience to let you have for publication in these columns particulars as to the expense of running and upkeep of a small automobile. I believe there are many motorists who keep a record of their motoring expenses, and if only they will allow the same to appear in print it might assist many who are at present waiting to make the plunge. In order to prevent any invidious comparisons between different makes of cars, the name of the type need not be given. Nowadays all high-grade cars, I believe, can be relied upon to give good service, and if the cost of the car, horse-power, number of cylinders, speeds, chain or cardan drive, size of tyres (pneumatics or solids) were mentioned, these would form sufficient guidance to would-be motorists.—Yours truly,

J. W. MOORHOUSE.

THE STORAGE OF PETROLEUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In looking through the regulations with reference to the storage of petrol, "Petroleum (Motor Cars) Regulations, 1903," which came into force on the 18th March, 1903, it seems to me that it is necessary, under Regulation 7, to give notice to the local authority if one

The Darracq 12-h.p. Motor Lorry. (See page 970.)

have been properly done with the best of material, not amateur patches. Owing to friction I have had the pleasure of putting four or more patches on a tube which had been partly melted off on many occasions. No more pneumatics for me! I am having solids put on the wheels, and if they damage the car much, then I shall think it time to give up motoring. What about the "Rossel" spring wheel? Is any British firm going to take it up? In my opinion pneumatics are doomed; they are good for bicycles, as I have found, but for cars they are really absurd.—Yours truly,

PNEUMATIC SICK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Roller Bearings," in your issue of January 23rd, I feel sure that the broken balls in his Wolseley car are not caused by the use of solid tyres, or, at any rate, with a scientifically designed section, but more likely caused by the ball race being allowed to become worn. The condition of the ball race can generally be judged by jacking up and spinning the wheels, and if the same do not revolve sweetly—that is to say, if there is a peculiar rumbling noise—it is a sure sign that the bottom of the ball race has become scored, which soon causes the balls to get out of shape; if, therefore, car owners would more often look to their wheels instead of running until something happens, there would be no trouble on this score. I have had three cars running with Sirdar buffer solid tyres for something like two years past, and have 3-inch high speed buffer tyres fitted to the driving wheels of a 24-h.p. Wolseley with pneumatics on the front wheels; with this combination the speed up to thirty miles an hour is quite comfortable. With all the three cars I have not had a single case of a broken ball, although the cars are in constant use, and I feel sure, if "Roller Bearings" would try these, and occasionally see that

stores petrol in a building within twenty feet of a house. This regulation is as follows:—

"Any person who keeps petroleum spirit in a storehouse, which is situated within twenty feet of any other building, whether or not in his occupation, or of any timber stack or other inflammable goods not owned by him, shall give notice to the local authority under the Petroleum Acts for the district in which he is so keeping such petroleum spirit and shall renew such notice in the month of January in each year during the continuance of such keeping, and shall permit any duly authorised officer of the local authority to inspect such petroleum spirit at any reasonable time. This regulation shall not apply to petroleum spirit kept in a tank forming part of a light locomotive." A "storehouse" is defined to mean any room, building, coachhouse, lean-to, or other places in which petroleum spirit is stored. As this is a point which I do not remember having seen referred to in any of the motor papers, I mention it so that owners of cars and cycles, many of whom must store their petrol in buildings within twenty feet of their houses, may give the necessary notice to their local authority.—Yours truly,

A.O. 33.

TELEPHONE WIRES AND THE CHARGING OF ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having twin lead covered wires connecting two telephones, using dry batteries, would it be possible to pass a current of 100 volts over these wires, for charging motor ignition accumulators? If I connected on to the lead covering with the negative from the two telephones, and used the wire so freed for the negative return to source of 100 volt supply, would the positive 100 volt lead which I propose to connect to the lead

still in connection with the telephones interfere with their working? If this is not practical, how could I get over the matter without using separate wires, and not put an earth on the 100 volt supply? The telephones are of the private installation type with a small generation for ringing up, made, I think, by the General Electric Company.—Yours truly,

S. C. C. VINE.

[The telephone wires could be used for passing a current of 100 volts pressure to charge motor ignition accumulators with the following disadvantages:—First, if the insulation of the wire is not very good the 100 volts between the lead outer and the copper inner wires might break down the insulation and produce a partial short circuit. Second, the lead wire being connected to the 100 volt supply would certainly put an earth on the circuit; if the supply is a private one, these points would not signify, provided fuses were placed in the circuit and a double switch to cut off when not in use. If the supply is a public one, it would be contrary to the regulations to do it.]

BURNT GASES AS A MOTIVE POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the query of your correspondent, H. M. J., in the last issue of the *Journal*, I may inform him that for over a year I have been working on exactly similar lines to his suggestion, and that some months ago I took out a patent for this method, along with some very important additions which have become obvious in the course of experiments.—Yours truly,

HAROLD C. READING.

HOTEL CHARGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Respecting your reference to hotel charges in the last issue of your valuable paper, may I give, for the benefit of motorists (more especially motor-cyclists, for I am one of them) who pay a visit to Windsor, the details of my bill after putting up at a leading hotel for a snack for two persons:

	s.	d.
2 Steaks...	5	0
2 Coffees ...	1	0
1 Ginger beer ...	0	6
Attendance ...	1	0
Garage (tri-car) ..	1	0
Tips (optional, of course) ...	1	0
	9	6

Although this was at a good hotel, they have yet to learn modesty in their charges.—Yours truly,

OWEN JOSEPH.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My view of the Act is that something stringent was required for the "cads" on the road. I also think that as yachts go scot free from taxation, not only as regards the vessel but also as regards the men (servants) employed on same, and the registration, motor-cars are somewhat hardly dealt with.—Yours truly,

R. L. CURTIS, JUN.

THE MATERIAL FOR PETROL PIPES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note on page 913 of your issue of January 23rd, a report of a meeting held by the Institute of Marine Engineers, at which a paper on "Marine Petrol Engines and Motor Launches" was read by Mr. O. Sumner. In this it is stated:—"He would like to make it clear that a lead pipe should always be used for the conveyance of petrol from the tank to the vaporiser." Would any of your correspondents kindly inform me the reason that this is so, as I am greatly interested in this kind of thing?—Yours truly,

GREENWOOD.

THE POLICE AND TRAFFIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the collision near Patcham, as a resident on the road itself, will you kindly allow me to say a few words? The police, especially one sergeant who left some eighteen months ago, have been very strict on motorists, unnecessarily so at times, and not strict enough on the horse traffic. The village itself demands care in passing through, the road being narrow and curved, and frequently quite a line of cabs, etc., will be found drawn up outside the "Black Lion," leaving practically only room for one vehicle to pass. It is quite a common thing to meet after dark furniture vans and other lumbering vehicles without the slightest vestige of a rear light, or a front one, and on three afternoons per week, Brighton market days, between Patcham and the "Plough" at Pyecombe, it is usual to have to try and pass some two or three dozen of market carts, ambling along in the middle of the road in twos and threes, with a goodly proportion of the drivers fast asleep.—Yours truly,

C. D.

TWO AND FOUR CYCLE ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any of your readers could give any information on the following points:—Has a two-cycle engine the same power as a four-cycle engine of the same bore and stroke? Can a two-cycle engine be run as fast as a four-cycle engine of the same size?—Yours truly,

W. J. FIELDING.

[It is not possible to obtain the same power from a two-cycle engine as from a four-cycle, both of the same bore and stroke, and running at the same speed, but the two-cycle engine can be run at a higher speed and thereby develop the same power. The deficiency of power is due to the impossibility of such a high compression as in the four-cycle, thereby giving a much weaker explosion. In running the engine at a higher speed its wear is very great, and against the principles advocated by almost all makers.]

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with H. Hart, with "Chameleon" and with "Driver" as to boys with a week's tuition as drivers. But let me state a fact. When employed in the repair shop of one of our leading manufacturers I had occasion to witness a driver employed by the firm's agent taking a car from the works, which had been overhauled.

He accelerated, and when the engine was racing as merrily as ever it could, he clutched without taking his foot off the accelerator and starting on the third speed. The result was, that he started off like a shot and narrowly missed upsetting the car, having to take a V-shaped corner, when he applied both brakes with a vehemence that left me wondering how it was he had a differential gear left to go home with. I went to the agent and applied for a driver's berth. Although I had been in the firm's repair shop during four months and have served my time as a mechanic, I was told that my driving capabilities were not good enough to be entrusted with a car. I had not been tried and no references were taken up.

Well, by what I saw of not only that one, but of others of that agent's drivers, I am still wondering how they managed to find employment there.—Yours truly,

NONPLUSED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I agree with Mr. Edge. If good men were easy to get one would not find that the car driven and cared for by the owner runs at a great deal less per mile than the chauffeur-driven one; and also I notice that the owner-driven-and-cared-for one is ever ready to come out! Is it a recognised custom for private motor-car drivers to receive and ask for commission on all purchases paid for by them, such as petrol, spare parts, oil, plugs, &c.? I hear it is common, and I think it must be, as a friend of mine, after driving many miles in the mud and wet, entered a motor place and asked for four gallons of petrol and two spare plugs and a receipt—he kept motor-running accounts. He got it all including the receipt, and the man said, "Here is your lot," and handed him 1s. 6d. Receipt was in full.—Yours truly,

OWNER.

DRY BATTERIES.—Replying to "Novice," the Ideal dry battery is made by the Ideal Electric Company, 78, York Road, King's Cross, N.

DE DION MOTORS.—Replying to Mr. M. Brown, the cylinder dimensions of the 3½-h.p. De Dion motors are 80 mm. bore by 80 mm. stroke.

THE DE DION-BOUTON WORKS.—Replying to "L. W. B." and "A. W. S.," the booklet on the De Dion Works, referred to in our last issue, is printed in French, and is published by M. J. Barreau, 16, Rue Littré, Paris. The price is not stated.

THE MONARQUE MOTOR.—We have an enquiry for the name and address of the makers of the Monarque motor-cycle engine. Should any of our readers have the information, perhaps they will communicate with us.

ALCOHOL FOR MOTOR-CAR USE.—In answer to the enquiry as to obtaining alcohol for running motor-cars, the Jones Haulage Syndicate, of Whitacre Heath, Warwickshire, inform us that they have been experimenting with the same for use in their agricultural motors, and that they will shortly be in a position to supply same on a commercial scale.

CLUBS AND ASSOCIATIONS.

LEICESTERSHIRE.

THE first annual dinner of the Leicestershire Automobile Club was held on Monday at the Bell Hotel, Leicester. Mr. E. George Mawbey, M.Inst.C.E., took the chair, and amongst the company, numbering nearly fifty, were Colonel L. L. Powell, Mr. T. W. Lumley (chief constable of Leicester), Mr. H. A. Hamshaw, Dr. Hewlings, Dr. Mason, and Dr. West. After the loyal toast had been honoured, Colonel Powell proposed, "The Club and the President." The chairman responded. That was the first year of its existence, and it had been attended by a considerable degree of success. Having referred to the great strides automobilism is making in the country, the chairman went on to speak in eulogistic terms of the Leicestershire roads. Mr. H. A. Hamshaw gave "Kindred clubs and the visitors." Mr. T. C. Aveling, of the Birmingham Club, whose name was associated with the toast, replied, and pointed out that it would be necessary, in a year or two, for the affiliated clubs to employ a paid secretary instead of a honorary secretary, if the work was to be carried out in a satisfactory manner. The Chief Constable of Leicester also responded, and wished the club success. It rested with the members themselves, he said, whether automobiles became popular or not. Automobilism had undoubtedly come to stay, and he assured them that both he and the members of the force were anxious to help motor-car drivers.

The Chairman heartily thanked Mr. Hubbard and Mr. McAlpin for their efficient work as secretaries during the year. Mr. Hubbard had been advised by his doctor to discontinue car driving, but for all that he had decided not to sever his connection with the club.

A Snapshot in Fairmount Park, Philadelphia.

MIDLAND.

THE second annual dinner of the Midland Automobile Club took place on Saturday at the Grand Hotel, Birmingham. In the unavoidable absence of the President, Mr. J. Broughton Dugdale, J.P., the chair was taken by Mr. Ballin Hinde, and amongst those present were Messrs. Tangye, J. Holder, H. Holder, O. Harmer, H. Austin, Fred. Lanchester, E. Instone, P. V. Vernon, J. Milburn, and A. J. W. Millership.

The toast of the visitors was proposed by Mr. C. V. Pugh, and suitably responded to by Mr. J. C. Percy. The Midland Automobile Club was proposed by Mr. Hamilton, Barnsley, and responded to by the hon. sec., Mr. Thos. C. Aveling. A presentation was made to Mr. F. Lanchester in connection with his recent marriage. Mr. Rees Jeffreys responded to the toast of the A.C.G.B.I.

NEWCASTLE.

A MEETING of automobilists was held at the Station Hotel at Newcastle-on-Tyne last Saturday, when Captain H. S. Streatfield, of Ryhope, who presided, gave a lucid resumé of the new Act, and of the means already adopted by the Motor Union and other authorities to safeguard the interests of motorists. It was unanimously decided to form a district branch of the County of Durham Automobile Association in the north-western portion of the county. Mr. A. Wood, of The Hermitage, Chester-le-Street,

was elected president; Captain W. C. Blackett, of Sacriston, vice-president, and Mr. F. Herbert, Birtley, R.S.O., hon. secretary; these three gentlemen, together with Mr. P. T. Smith, of Coldpike Hall, Lanchester, and Dr. Cox, of Bensham, were appointed to act as a general committee. An influential body of members were enrolled, and the chairman impressed upon those present the necessity for careful driving, especially in congested areas such as Sunderland, where the authority had declined to sanction any irksome restrictions, but relied upon the discretion and judgment of motorists, and the opinion was very generally expressed that this confidence should be respected. A hearty welcome was extended to motor-cyclists and others interested in mechanically-propelled vehicles, and the subscription fixed at a merely nominal amount in the hope that all local automobilists will at once communicate with the hon. secretary.

CLAIM FOR DAMAGES DISMISSED.

At the Manchester Assizes Mrs. Bagot claimed £500 for injury and loss suffered through the negligent driving of a motor-car by a servant of Mr. Riley of Blackpool. Negligence was denied, and the defendant pleaded contributory negligence on the part of the plaintiff. Her case was that she was driving a trap, in which two other ladies were seated, from Blackpool to Poulton on the night of the 23rd October last, and that near a bend of the road she was met by the defendant's motor-car, driven by his servant, when it dashed into her trap, and the wheels of the two vehicles got locked together. After the collision efforts were made to get the vehicles apart; this was successfully accomplished, and immediately the separation took place the wheel of the plaintiff's trap fell to pieces, the plaintiff fell out, and the trap rolled over upon her as she lay on the ground and injured her severely. Mr. Taylor, K.C., said the defendant's case was a direct contradiction of that presented by the other side. The defendant gave evidence to the effect that the car was a light one, only $4\frac{1}{2}$ horse power, and incapable of travelling more than twelve miles an hour. Several witnesses, including residents in the neighbourhood, who came upon the scene after the collision, and had opportunities of seeing the position of things, bore out the view put forward on behalf of Mr. Riley. The jury, without leaving the box, found a verdict for the defendant.

ALLEGED FURIOUS DRIVING.

PROFESSOR HUNTINGDON, of King's College, London, was summoned before the magistrates at the Hove Petty Sessions for driving a motor-car to the danger of the public on the London road, Patcham, on January 23rd. E. Penfold, brake driver, said that about 5.15 p.m. on the day in question he was driving a brake and pair. When near Patcham he saw a motor-car driven by the defendant approaching on the wrong side of the road. Witness thought he was going straight for the horses and pulled up close into the gutter. The car then turned off towards its proper side, but immediately came back and ran into the off-side horse and the side of the brake, the pole being snapped, the under carriage damaged, and the horse injured. Dr. Gilkes said he did not remember seeing any other lighted vehicles, except the car, on the road. The defendant declared that it was so dark at the time that he did not see the brake until close to it, there being no lights on it. Considering the conditions then prevailing, he thought no vehicle ought to have been on the road without a light. If there had been a light on the char-a-banc he would have seen it a considerable distance away. The Bench imposed a fine of £10 and £1 14s. costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, FEBRUARY 20, 1904.

[No. 259.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

JAPAN, full of the modern spirit of advance, is reported to be about to adopt the automobile in the army, and we can scarcely credit the report. Probably, like many other eastern rumours, it has little foundation in fact. On more substantial ground, however, it may be declared that the wealthier classes of the Japanese community are taking an interest in motoring. The fact that an American who has been a resident for the last half-dozen years has returned to New York on the look-out for agencies is significant evidence of the demand that is likely to arise when the present trouble subsides. Every country of the world is recognising the automobile.

The Darracq Racers for the British Gordon Bennett Team.

SOME surprise was caused when among the entries for the eliminating contest for the British team for the 1904 Gordon Bennett the name of Messrs. A. Darracq and Company appeared. As is now fairly well known, this is an English company with works at Suresnes, near Paris. One of the conditions of the International Cup Race is that the competing cars must be entirely constructed in the country they represent in the event, and much discussion has taken place as to where the British Darracq racers were to be built. From a reliable source we learn that the work has been entrusted to an old-established firm of engineers in the North, Messrs. G. and J. Weir, Limited, of Cathcart, Glasgow. The vehicles will of course be built in accordance with plans furnished from the French works, and we may further add that their construction is to be supervised by Mr. Pullinger, of Messrs. J. Marston and Company, Limited, the designer of the "Sunbeam" car.

Automobiles and the Post Office.

WHILST the postal authorities of the Mother Country are still making a few local experiments with regard to the utilisation of the automobile in the postal service, some of the colonial postmasters are showing considerably more enterprise in the matter. We hear that the Federal Postmaster-General of Australia is endeavouring to establish a motor mail service in Tasmania, and that the Melbourne authorities will shortly seek quotations for suitable motor vehicles both in Europe and America. It is to be hoped that in this connection the names of British makers will not be overlooked.

Presidency of the A.C.G.B.I.

SPECULATION is rife with regard to the presidency of the A.C.G.B.I., and names are being freely bandied about irrespective of the real claims of their owners to such a distinction. The occupant of such an office will not only require tact, influence and experience, but he must be a man aloof from the controversies that have lately raged in Piccadilly.

Clear of trade associations, he must, nevertheless, be one who is acquainted with the industry from a broad point of view. Recognising the essential character of these qualifications one name occurs to us, as it will to many others, as likely to command respect and add dignity to the Club government. In the days before automobiles were legalised on the public highway, Sir David Salomons was a friend and advocate of the light locomotive. He assisted the passage of the Emancipation Act through both Houses of Parliament, and he organised the motor-car meet at Tunbridge Wells, which first drew general attention to the automobile in this country. Since then, as chairman of the Foreign Relations Committee of the A.C.G.B.I., he has won international renown, and, altogether, Sir David is a man whose election to the Club presidency would give that organisation a higher prestige abroad and an added credit at home.

Covered Van Regulations.

SIR THOMAS DEWAR, M.P., has been congratulated by many members of Parliament on the promising success of his advocacy of some legislation to abate the dangers of covered vans in London traffic. With the class of vehicles now in use the dangers exist during the operations of turning corners and crossing streets at spots where several roads meet. The necessity for reform in the present regulations can be realised when it is noted that during the past two years no fewer than 3,500 accidents caused by this kind of vehicle occurred in the streets of London, and out of this number seventy-six were attended with fatal consequences. The bye-law which comes into force on May 1st next requires that all vehicles shall be reconstructed in a way which will permit the driver to have a full and uninterrupted view of the traffic in front and abreast of him, and that no person shall drive any vehicle upon a public highway who is not in a position where his view is unobstructed.

Reviving an old Agitation.

AT the luncheon held in connection with the opening of the Motor-Car Show at the Crystal Palace on Saturday last, Lord Stanley, in proposing the toast of the automobile industry, declared himself a motorist with something akin to enthusiasm for the sport. Then he proceeded to a defence of the Parliamentary party which was hastily formed in connection with the agitation for motor legislation last year. It was rather a pity he should have revived this matter, for all who took part in that premature attempt at solving a great problem would doubtless prefer to "let sleeping dogs lie." The Parliamentary party have very little to congratulate themselves upon, and no after-luncheon speech from Lord Stanley or anybody else will ever induce motorists to believe that they have so very much to be grateful for from the legislation of 1903.

Needless Vexation.

ALREADY in many parts of the country motorists are finding that the legislation which was to place them on an equality with all users of the road is somewhat of a delusion. Not only are the police keenly criticising the speed of vehicles and maintaining the traps, which were such a bad feature of their policy last year, but the way in which many are exercising

their right to call upon drivers for the production of licenses is becoming something of a nuisance. We hear of several cases where fully licensed drivers have been constantly stopped and asked for the production of their licenses, apparently without any reason whatsoever. Then, too, the enthusiasm with which the police are hauling before the magistrates those who, according to their calculation, are going slightly over the twenty miles limit, is certainly not carrying out the spirit of the first section of the Act. We would ask those in authority not to fancy that everyone is satisfied with the present position, and not to imagine that none would desire to go back to the old condition of things. The truth is that motorists are not confident as to the impartiality of the administration of the law, and cannot help feeling that the police and magistrates are often too closely associated to secure fair play.

Toleration, not Satisfaction.

IN fact the position of the motorist is not a happy one just now. Firstly, the weather has been against him and has turned the dry land into a series of running streams or continuous mud banks; secondly, the police are as watchful as ever; and thirdly, the severity of the magistrates has been in no way relaxed. Such a triple combination is enough to

Mr. W. K. Vanderbilt, jun., in the Centre of a Group of Officials at the Florida Race Meeting. (Motor Age.)

harden our hearts against all forms of motor legislation; but, like the Israelites when urged to flee from Pharaoh, we feel inclined to suffer present ills rather than encounter further possible ills we wot not of. Hitherto, legislation—save the happy stroke of 1896—has been unkind. It is now tolerated because of the fear that any change may be for the worse.

A Motor in a Novel.

WHY do people utilise the motor-car as an excuse for novel writing? We can forgive Mrs. Kennard and be equally sympathetic to Mrs. C. N. Williamson, because both have already won their spurs—a metaphor perhaps out of place in the *Journal*, but it will serve—but when every other writer introduces an automobile merely to run it down, or rather to allow it to run somebody down, we become somewhat hard of heart. Now here is Mr. R. W. Bradshaw Needham writing a short novel with the long title of "A Man and a Motor and subsequently a Wife." Doubtless his intentions were entirely amiable, but why talk of a girl being "architectonised on the right lines?" Still, with all its faults of this kind, the book is not without interest, and in the latter chapters are some well-told incidents of motoring in Surrey. And thus the critic's promised wrath is assuaged, for a pleasant hour may be spent with such a

genial author as Mr. Bradshaw-Needham. The book is published by the Clements Publishing Company.

Level Crossings.

SHOULD the weather ever again become dry and reasonable—and it can hardly continue its unseasonable dampness much longer—motorists will be upon the road in greatly-increased numbers. Attention may therefore be called, not for the first time, to the dangers that lurk in the level crossings that are found wherever the railway has been established. The point occurs to us with all the more emphasis in view of what has recently happened on the Cleveland and Portishead Light Railway. On the level crossing at Weston, a collision occurred between a train and a wagonette. It was ascertained at the inquest on the bodies of the two people killed, that the railway company had fulfilled all their obligations as required by Act of Parliament. But more is wanted, and motorists would like to see all level crossings indicated by some general mark of identification, so that they could be made aware of the proximity of such a crossing, even before reaching it.

Motor-Car Fees.

No less than £283 has been received by the county authorities of Stafford in fees for the registration of cars and the licensing of drivers. Other counties have been even more fortunate, and there is no doubt that the Motor Car Act has opened up a new avenue of revenue for local authorities. It is to be hoped that the money thus obtained will be usefully expended in improving the roadways, especially in districts which have been long neglected in this respect.

Thorns on the Wayside.

TROUBLES are frequent enough on English roads without their number being increased by thorns bestrewn in the path of motorists and those who travel. At the West Malling (Kent) Petty Sessions a man named Little has been summoned for laying hedge clippings on the highway. The defendant said they were clipping the hedge three days, and cleared up every night. If he was convicted every farmer in Kent ought to be prosecuted. The Bench convicted, and imposed a fine of 5s. and costs, which should prove a salutary warning "to every farmer in Kent." Publicity should be given such cases wherever farmers are negligent of their duties. Thorns in tyres are no joke.

Universal Lighting of Vehicles.

AT the present time Mr. Rees Jeffreys is preparing a report for the Motor Union as to the advisability of initiating legislation for the universal lighting of all vehicles upon the public roads. It is being forced upon motorists very keenly that the time for such an advance in legislation is coming, and that any proposals in that direction would have a large measure of practical sympathy in the House of Commons. Frequently have we heard of cases where vans and carts lumbering along the highway unprovided with lights constitute a menace to the public safety. Some motorists are serving the public interest by prosecuting such offenders, but more definite and stringent legislation is essential.

Drivers.

THE correspondence that has been running in our columns for the past month on drivers shows no slackening of interest, and it is evident the subject is one upon which there is much to be said on both sides. It is clear that there is a great deal of prejudice against the employment of young drivers, while others would urge that as mechanics they are unequalled. But the private owner wants something more than mere driving. He wants his motor to run as smoothly and

economically as is consistent with comfort and the enjoyment of the pastime. To secure that end, the man he employs should have some mechanical knowledge and a good deal of common sense. The possession of the latter quality is a decided advantage, even to the driver of a motor-car.

Alcohol v. Petrol.

RECENT experiments made in this country by a firm interested in the development of agricultural motors lead to the hope that ere long alcohol may be obtainable on a commercial scale, and cars propelled by alcohol-spirit may be seen on English roads. Ireland has been looking forward to such an event with considerable interest, and the Department of Agriculture there has promised its hearty co-operation in any scheme for obtaining alcohol for motor-cars in that country. Makers of motor-cars can assist the agricultural industry in more ways than one.

sible, that unless small presents are made no purchase is likely to result. Two or three exposures of such methods would do considerable good and help to place the trade upon a more satisfactory basis.

Military Motor Trials.

DURING the last few days some important trials of the capabilities of motor lorries have been carried on in the vicinity of Edinburgh, by officers of the Royal Engineers. By means of barrels of water and heavy pieces of iron, with loaded sacks on the top, the total weight of the lorries was made up to seven tons; which, as the bodies of the vehicles are 10 feet 6 inches long and only 4 feet 3 inches wide, had to be piled up to a considerable height, thus constituting a good test for the springs, owing to the swaying of the load when passing over irregular ground. Thus loaded, with some half-dozen officers and engineers from Messrs. Stirling's works, perched upon the top, the vehicles, with their ponderous wheels, presented a

The Rev. A. C. Hervey and Family, of Alton, Hants, on their 10-h.p. Beaufort Car.

Commission.

THE private gentleman who suggests to a friend the name of a motor-car, and then, should a purchase take place within anything like a twelvemonth, goes to the maker and demands commission, is one of the creatures who ought to be fired out without delay. A dealer who had disposed of a car to a total stranger a few weeks ago has just received requests for commission from two private persons, and also from a couple of agents, every one of the quartette being equally emphatic as to the part he had played in influencing the purchaser with regard to that particular car. The only way by which this can be effectually stamped out will be for the makers and their agents to emphasize very clearly to the purchasers their position in the matter, and then be equally firm in resisting any attempts at what is really a subordinate form of blackmail. It would appear also that there is need for a note of warning against the so-called "expert," who, requested by the budding motorist to advise him as to the merits or demerits of a particular car, goes to the showroom gently intimating in as quiet a manner as pos-

striking appearance. A large board on the rear of each vehicle displayed in bold white letters the words "War Department," and the machines were painted khaki colour. One day a distance of forty-two miles was covered at a rate of nine miles an hour, and on other occasions satisfactory tests were made up various steep hills, while the crossing of a football field, made slippery by recent rains, was successfully performed by the vehicles.

Motor-Car Imports and Exports.

As compared with a year ago, there is a falling off in the importation of foreign motor-cars and cycles into this country. In January 335 cars valued at £120,772 were imported, together with 51 motor-cycles, estimated at £3,746, the combined total of £124,518 contrasting with £167,112 in the first month of last year. As regards the exports of British automobiles, these last month amounted to 55 cars, valued at £28,636, and 78 motor cycles estimated at £3,619, giving a combined total of £32,255, as compared with only £16,876 in January, 1903.

Free Men or —!

"AND who would be bondsmen in the land of the free," sang a poet of old, little anticipating that in the Twentieth Century an attempt would be made to hold a new industry in an adamantine grip of bondage. Automobilmism, having freed itself from the shackles of the law—so far as total prohibition on the roads was concerned, is not likely now to be handcuffed in such a way that no movement can be made without risk of breaches of agreements or fears of forfeits. Members of the trade are free to exhibit what they like, and where they choose; not many are inclined to place themselves in a noose leading them whithersoever their fellow-bondsmen may wander.

Coercion Must Fail.

ANY such attempt to restrict the actions of those engaged in a growing and expanding industry must fail, although it might have succeeded in the Middle Ages. This year's experience amply proves that no two halls in the United Kingdom are capable of accommodating all the firms anxious to exhibit automobiles and the various accessories connected therewith. At the Agricultural Hall, although it covers a ground floor area of nearly five and a-half acres, it will be difficult to find space for all applicants, in spite of the added area gained by the extensive galleries with their three rows of stands, King Edward's Hall, the Minor Hall, North Annexe, Berners Hall, etc. With this fact in mind enterprising firms are likely to maintain their position of freedom and their right to do what they consider best in their own interests.

British Automobilmism.

DURING the discussion on the paper by Mr. Aveling, summarised on another page, the Hon. C. S. Rolls said he hoped that British manufacturers would be able to prevent importations from increasing in the same ratio as had been the case in the past. Several firms were now turning out from three to five hundred cars per annum, and he knew of one that was arranging to turn out 1,500 cars this year. Mr. Napier said it was unfortunate that the petrol car was taking up so much attention, to the neglect of the heavy oil car. He himself had made some experiments with oil, and had found he could run his car just as well on naphtha as with petrol. The petrol he got was about .72 sp. g., and he first of all tried a mixture about half and half, from which he obtained perfect results. Then he tried the pure naphtha with equal success, and had run about 250 miles on nothing but naphtha. He never had a dirty sparking plug, and the fuel only cost him 6½ a gallon. Sir John Macdonald, who presided, concluded the discussion by moving a hearty vote of thanks to Mr. Aveling, which was unanimously adopted.

Affiliation.

ON Monday an important conference of automobile clubs was held at the A.C.G.B.I. to consider the affiliation question. Dr. Walters (Reading), Captain Streatfield (Durham), Captain Cole (Lincolnshire), Mr. F. B. Cawood (Sheffield), Mr. S. R. Rhodes (Wolverhampton), and other representatives of important provincial clubs took part in the discussion, and ultimately it was agreed to accept the three schemes submitted by the A.C.G.B.I. with some minor amendments. These are best understood from a speech made by Mr. Roger Wallace during the conference to the effect that some bodies preferred to have the "Club Journal," as well as become members of the Motor Union—they paid 10s. 6d.; others did not want the "Journal," but desired membership of the Union—they paid 5s.; the funds of other bodies, such as motor cycling clubs, would not allow them to affiliate, or they did not want to affiliate, but they desired membership of the Union—they paid 2s. 6d. The schemes had been arranged with the idea of meeting all classes, and so to get everybody together.

No More Lists of Police Persecution.

AFTER publishing for more than a year a weekly list of cases of motorists charged with furious driving, *The Motor-Car Journal* has decided to abandon that special feature of its pages. Prejudice against motorists still exists on the magisterial bench, as is apparent from the heavy fines which have been inflicted in the cases heard this year, and the way in which magistrates have threatened to inflict severer penalties on a repetition—or alleged repetition—of offences. In taking this step the *Journal* does not in any way lessen the warning already given to motorists to recognise existing regulations, but does not, at the same time, intend to assist the system of persecution which is unhappily feared in many quarters.

The Motor Trade of London.

COMPARED with the automobile establishments that did service in the early days of the movement, present-day premises devoted to the purpose show an improvement that would have seemed impossible five years ago. The great garage of Messrs. Friswell, the well-ordered premises of Messrs. Milnes-Daimler, the showrooms of the Lacre Company, and the facilities offered by the Locomobile Company at their Sussex Place garage, are evidences of the changes that are taking place. Firms are rightly recognising the necessity for organisation and systematic superintendence in garage and repair work, and recent developments in the Metropolis prove that the automobile trade of London is well capable of sustaining the reputation of the capital city of the Empire.

Automobile for Official Uses.

AT Hartford, in the United States, the local authorities have long utilised the motor-car in official work. Three years ago a new police van, propelled by electricity, was purchased, and a twelve-month later an automobile ambulance was also placed at the city's service. Recently we hear that a motor vehicle has been obtained with two bodies, available for police and ambulance work respectively, so that now the one car is able to do the work which originally required two separate vehicles, each with different teams of horses. It is said that the actual cost of the vehicle, exclusive of course of driver, etc., is only twelve dollars a week, and as it has the advantage of being available at all hours of the day, the development of the automobile in Hartford has been a distinct economy for the people of that place.

THE Cannstatt Automobile Supply Association claim to have received the first 1904 model 18-28-h.p. Mercedes car. The speed of the vehicle is said to be 20 per cent. greater than that of the 1903 model.

Up to the 11th inst., 960 automobiles had been registered by the County Council of Surrey, of which 522 were motor-cars and 438 were motor-cycles. 1,350 licences to drive have been issued in the same county.

PRINCE and Princess Alexander of Teck, who left England for Cannes on Monday, paid a visit to the Duke of Cambridge on Sunday, using the motor-car which the Earl of Shrewsbury presented to Prince Alexander on the wedding day.

RUMOUR has it that the eliminating trial to select the British team for the Gordon Bennett Cup race may be held in the Isle of Man. On another page we give some information with regard to the automobile regulations in the island.

THE Automobile Club of America has decided to hold the first of the eliminating tests for the American team for the Gordon Bennett race in New York on April 15. These will be of a technical nature, and will be followed within a week or ten days by speed trials on the beach at Ormonde, Fla.

THE CORONET FOUR-CYLINDER PETROL MOTOR.

THE accompanying illustration shows a new four-cylinder petrol motor which has just been brought out by the Coronet Motor Company, Limited, of Coventry. As will be seen, the cylinders are separate castings with their water jackets and have a bore of $3\frac{3}{4}$ in., stroke $4\frac{3}{4}$ in. The normal speed is 1,000 revolutions per minute, at which the average power developed on test is 20-22-h.p., increasing to 25-27-h.p. at a speed of 1,400 revolutions. The inlet valves, as well as the exhaust, are operated by one cam shaft which runs with its gear wheels continuously in oil in a dust-proof case. The cam shaft is so arranged that it can be withdrawn, if necessary, without removing either inlet or exhaust valves. The mixture is supplied by a specially designed float-feed carburettor, the jet of which can be inspected or removed without uncoupling any parts. The engine is governed on the admission by a novel form of throttle box, for which patents are being applied for. The governor is located in the same oil bath and dust-proof case as the cam shaft gear wheels. The crank bearings are of good diameter and length and a bearing is fitted between each throw of the crank. Two large inspection plates are

fitted to the lower half of the crank case. The end of the cam shaft is left so that magneto ignition can be fitted if desired. The ignition plugs are placed in the induction valve caps, and the makers inform us that in practice they can run with as much as half a gallon of oil in the crank case without interfering with the sparking. Complete, the motor, as illustrated, weighs 315 pounds.

A MOTOR-BOAT section is being formed in connection with the Belgian Automobile Club.

THE Los Angeles Automobile Club has offered to supply temporary mile posts, to be erected between Los Angeles and Fernando and between Los Angeles and the city of Pomona, California, if the county authorities will bear the expense of erecting them. The club has also offered to provide permanent posts, to be made of concrete. Each of these artificial stones will be five feet high, one foot wide and six inches thick. The Automobile Club is particularly anxious to have these two "runs" marked off so as to permit of the use of the roads during the present season, in which case automobilism is expected to receive a great impetus. The Highway Commission regards the matter with favour, and it is considered certain that the Board of Supervisors will accept the Club's propositions.

THE MOTOR CAR ACT.

Charge for Dealers' Marks.

A firm in Sussex who as dealers only registered one car write pointing out that a large firm in London or Coventry, with several vehicles used in the course of their business, would have to pay only the same registration fee as the smaller dealer. This seems somewhat unfair to the latter, and it is a pity that a scheme of graduated fees was not adopted. At Wolverhampton the small dealer has been considered, and a charge of £1 only is made for the registration. Firms at Old Hill, which is only six miles from Wolverhampton, have to be registered with the county authorities, eighteen miles away, who charge £3—the maximum for the dealer's mark. Several other apparent anomalies have also been brought to our notice.

Dealers' Marks.

In our last issue the marks of some dealers at Kendal were given, and a correspondent writes from Westmorland asking for an explanation. In the case of dealers general identification marks are given for a maximum fee of £3, securing to the trader a series of numbers at the one charge. Apparently there is no uniformity in the methods adopted by various authorities. At Liverpool, for instance, A is regarded as the distinguishing mark for a trader's vehicle, various numbers being assigned for the individual firms. At other places a different letter or combination of letters is given the various firms. In the county of Westmorland, where the index letters are E.C., the letter W is assigned to the trade, each member of which is given five numbers and can have the selection of three colours—red, green, or blue. At Nottingham the mark is in black letters on a yellow ground.

The Isle of Man.

With reference to the point raised last week by a correspondent as to the operation of the Motor Car Act in the Isle of Man, we would point out that the measure, as adopted at Westminster, is inoperative in the Isle of Man and also the Channel Islands. Motor-cars in the Isle of Man come under the Highways Act, 1899, of the local Legislature and also the Light Locomotives on Highways Order, of the same year. Under these regulations motor-cars are not allowed to travel at a greater pace than fourteen miles an hour; they must exhibit lamps at the usual hours as in England, and also give audible warning of their approach, at corners, etc. For breach of the Act fines not exceeding £10 are inflicted. In addition to the ordinary carriage duty or license fee for a hackney carriage, motor-cars are subject to an annual duty of 10s. if weighing less than half a ton, and of £1 if between that weight and one ton, unladen.

Other People's Numbers.

"What," writes a Wandsworth motor-cyclist, "is to prevent an exchange of numbers among motorists after the registration of their cars? Is it not possible to so make the 3 as to appear like an 8; or what is to stop a man placing an altogether bogus number on his vehicle? The other day I saw identically the same number on two vehicles, both being on the road. They were not dealers' marks, and evidently one was inaccurate." Where the honesty of a man is not enough to prevent him playing such shabby tricks on fellow-motorists, only a wholesome fear of the law will stop a course of procedure that is absolutely reprehensible. Not one extenuating circumstance can be found for such conduct, and, in common with every self-respecting motorist, we would denounce any attempts thus to bring confusion and annoyance on innocent men. It must be taken for granted that no one would substitute a number belonging to another person unless he intended to break the law. Fortunately the Act provides for such cases—if found out—and Section V. declares that "if any person forges or fraudulently alters or uses, or fraudulently lends or allows to be used by any other person, any mark for identifying a car or any licence under this Act, he shall be guilty of an offence under this Act."

SOME HINTS TO INTENDING PURCHASERS OF A MOTOR-CAR.

THE first main considerations the prospective purchaser of a new car has to decide are (a) how much he will pay for it; (b) what seating capacity he requires; (c) to what use the car is to be put: touring or "runabout" work, or both.

(a) As regards price, cars may be roughly classified as follows:—

- (i.) below £200.
- (ii.) between £200 and £400.
- (iii.) above £400.

(i.) Cars below £200 are mostly of the single-cylinder variety, of about six horse-power, and, with few exceptions, driven through a live axle. Average speed about 17 miles per hour.

(ii.) Cars between £200 and £400, usually double-cylindrical, from six to ten horse-power. These comprise the large class of medium-powered touring machines. Average speed about 22 miles per hour.

(iii.) Cars above £400 comprise the higher-powered touring machines of four or six cylinders.

(b.) In group i. the cars are mostly designed to carry two persons, but a third (spider) seat or even a tonneau is in some cases added. For touring purposes the addition of a tonneau makes the car too heavy for its engine-power, whilst a spider seat is draughty and uncomfortable.

In groups ii. and iii. the higher engine-power enables four persons, at least, to be carried easily.

(c.) As regards the choice of propulsive power, and the work for which the car is intended, it may be briefly said that

Petrol cars and heavy steamers are suitable for "all round" work.

Electric cars and light steamers are suitable only for local work.

Having now, for argument's sake, found several cars which seem to suit your requirements as regards price and seating capacity, the next consideration is whether you intend to look after the car yourself or to employ a mechanic. If you are going to look after it yourself, then accessibility of parts is of paramount importance, whilst a live axle is a great advantage, as the complication of countershaft and chains is thereby eliminated. But it should be remembered that there are at present on the market a number of cars with faultily-designed live axles, and, in general, it may be said that the methods of adjustment in a live axle which runs on ball-bearings should be carefully looked into.

GEAR.

Do not omit to inspect this, and, generally speaking, favour the car with the biggest and strongest-looking gear wheels. There are several cars now on show the small size of whose gear wheels is utterly disproportionate to the power which they have to transmit, and in which fair all-round work would mean speedy renewal.

TYRES.

If your choice falls upon a car designed for use with pneumatic tyres, be careful to ascertain that these are of a size consistent with its weight and speed. This information is best obtained from the tyre manufacturers themselves, since retailers of cars (especially of the cheaper kinds) are apt, from financial motives, to fit too small a size. Remember that by fitting your car with large, even excessively large, pneumatic tyres you will reduce the pace and increase the original outlay, but you will gain (with reasonably careful driving) comparative immunity from punctures and bursts, and you will undoubtedly save money in the end. As regards solid tyres, there are several good cars specially built for these. The disadvantages of solids compared with pneumatics are, slower pace and greater vibration, with increased wear and tear of mechanism, but it should be remembered that this latter disadvantage

may be to a large extent compensated by good springs, whilst many drivers advocate the combination of pneumatics on the front and solids on the driving wheels, an arrangement which is frequently recommended.

FUEL CONSUMPTION.

Roughly it may be said, in respect to petrol cars, that this increases in proportion to the horse power. The light "run-about" steam cars are expensive to run, but the makers of the heavier touring types claim that their machines cost less than petrol vehicles of similar weight and pace.

REVERSE MOTION.

The intending purchaser of a small two-seater will do well to remember that in England the law requires every car weighing more than five cwt. to be fitted with a reverse, a fact which some agents either accidentally or intentionally overlook.

TRIAL RUNS.

These should be taken preferably where the roads are in doubtful or even bad condition, for then the side-slipping propensities, very marked in some cars, and especially in such as are fitted with single-cylinder engines of eight or nine horse power, are most easily observed, whilst it is much more useful for the intending purchaser to know what the car can do in bad circumstances, than when conditions are in its favour. The car should then be tested with special reference to its brakes and its hill-climbing capacity.

Every car worthy of the name should be able to climb a gradient of 1 in 6 with a full load. Either brake used separately should be able to hold the car with full load forwards and backwards on a gradient of 1 in 6.

In most cases the application of the foot-brake withdraws the clutch. But, in the case of a touring car especially, preference should be given where this practice is not adhered to, for then a third brake, i.e., the engine, is available in case of necessity. The brakes of heavy cars should be invariably water-cooled.

The above notes, while referring principally to petrol cars, since these at present constitute the majority, also apply with modifications to electric and steam cars.

Finally it may be mentioned that the horse-power of an engine as claimed by the makers is a very unreliable criterion in many cases of the speed and hill-climbing powers of a car, and, when dealing with makers whose reputation has yet to receive the seal of public opinion, the only real test of its capacity is to go for a ride on the car and see what it will do. W. J. E.

MESSRS. SHIPPEY BROTHERS, LIMITED, have been appointed sole London agents for the steam wagons of the "Hercules" Motor Waggon Company, Levenshulme, an illustration of which was given in our issue of August 22nd last. The 1904 type of wagon will be on view at the Show at the Agricultural Hall.

MESSRS. KENEALY are to be congratulated on the quantity of information they have compressed into the "Motoring Annual and Motorist's Year Book" for the current year. The present volume contains more than 400 pages, and is illustrated with photographs of several well-known motorists as well as short biographies of many more, after the manner of "Who's Who." Records, trials, and races are chronicled in concise form, and the fact that the index contains about 1,300 references is ample demonstration of the fulness of the information.

If a motor-car is not to be used for a week or so it is well to cover the whole of the vehicle with a light sheet, the edges of which are provided with tapes to enable it to be tied down into position on the car. Leather hoods should not be allowed to remain for any long period in a folded-up position, for, however good the leather may be, and whatever means are taken to provide for its protection and the retention of its suppleness, it will dry and crack where sharp bends occur in it. For this reason it is well, if possible, to let the hood remain open during such time as the car is standing in the garage.

MOTOR-CYCLING NEWS.

THE Rover Cycle Company, Limited, of Coventry, have recently taken up the construction of motor-cycles, and this week we are able to give an illustration and a brief description of the machines they are turning out. The frame is designed to carry the motor in the popular vertical position with such

cam; as the cam turns round these two projections are rubbed or wiped together, making or breaking contact. The moment the projections part the rocking lever is pushed by a compression spring against the end of a screw, forming a stop which prevents the lever remaining in contact with the cam. The sudden intervention of the stop ensures a quick break, resulting, it is claimed, in a hot and fat spark between the extremities of the sparking plug. The carburettor is of the float-feed spray type; two separate

Fig. 1.—The Rover Motor-Bicycle.

rigidity as to ensure adequate strength to provide for the severe stresses. The motor, which is constructed throughout in the Rover works, is of 3-h.p., having both a bore and stroke of three inches. The main bearings are large in diameter and long, that on the belt side of the engine being extended to an exceptional length by the use of a deeply-dished driving pulley. Both the inlet and exhaust valves are operated by mechanical means; a separate cam is used for each valve, the lower end of each valve tappet being provided with a roller to minimize the friction. An improved and protected method of retaining the valve springs is employed, consisting of a slotted collar which slides on to a reduced diameter near the end of the valve stem, over which a sleeve fits, holding it in its place; the top of the sleeve is cupped out to accommodate the lower end of the valve spring. The sparking plug is situated immediately above the inlet valve, where it is subjected to the scouring influence of the inrushing gas; and in the exact centre of the cylinder head is inserted a paraffin valve closed by a spring of sufficient strength to be proof against the influence of suction, and opened by a cam actuated by a small lever. Handle-bar control is provided by the left inverted lever actuating an exhaust-valve lifter through the medium of a rod or wire, whilst the right inverted lever automatically interrupts the electric current by means of a special switch, and also applies the front brake. The contact breaker (Fig. 2) is quite an original design, having neither a trembler blade nor a platinum tipped screw; it is a "wipe" contact, and yet there is no friction whatever except at the moment of the contact being made. The usual trembler blade is replaced by a rocking lever having a projection near its centre to meet the projection on the revolving

accumulators wired up to a two-way switch the top rail are provided. Thus, one accumulator can be always held in reserve and instantaneously switched into use upon the other evincing signs of exhaustion. The transmission is by means of a V-shaped belt. In addition to the front wheel rim brake worked by the right hand inverted lever, a back-peddalling expansion brake worked by a clutch on the crank shaft is provided. The disadvantage experienced with most back-peddalling brakes is the impossibility of wheeling the machine so fitted backwards; this has been overcome by providing a lever or trigger which on being raised holds the brake out of action; while to guard against the possibility of the trigger being thus left, the pedal crank is arranged with a small catch which on the first forward revolution pushes the trigger down and thereby places the back pedal brake ready for action.

THE motor uni-cycle has made its appearance! It is on view at the motor-car exhibition at present being held in Turin, Italy. The 2-h.p. motor and seat for the rider are mounted on the inside of a wheel 7ft. diameter.

WEST Ham—an eastern suburb of London—now has its motor-cycling club, of which Mr. W. Simmonds, of Plaistow, is chairman, and Mr. A. C. Davis, of Canning Town, is secretary.

THE Auto-Bike Messenger and Delivery Company is the name of a concern which has just been formed in Rochester, N.Y., U.S.A.

THE Motor Cycle Committee of the C.T.C. is promoting a week's tour in France at Easter.

Fig. 2.—The Rover Contact Maker.

CONTINENTAL NOTES.

HERR RASCH, the German Government inspector, accompanied by Freiherr Brandenstein, the secretary of the German Automobile Club, has completed a survey of the course for the Gordon Bennett race. The representatives of the municipal authorities of the various districts included in the route were also of the party. The dangerous turns in the roadway have been carefully noted, and the necessary steps for putting the track in good condition have been arranged for. Some suggestions have been put forward to the effect that the toll-gate at Weilburg should be removed. It has been decided, however, that this is not necessary, the authorities being of opinion that the width of the road at that point is sufficient in its present state. It has also been settled that the cars for the Austrian team are to be painted black and yellow.

A GRENOBLE firm, in conjunction with Messrs. Thomas Cook and Sons, have just started a series of automobile excursions

The wheel-base of the vehicle is nearly 14 ft. The designer intends to make some speed trials with the car after the show, and, according to report, expects to attain a speed of 125 miles per hour.

A MOTOR-CAR exhibition was opened in the Palace of Industry, Amsterdam, on Friday last week, by the president of the Dutch Automobile Club. There are between fifty and sixty exhibitors, the cars on view including all the leading French, Belgian, and German types. An interesting motor-boat section has been organised in connection with the show, which will remain open until the 21st inst.

MR. H. R. KIRK, the well-known Yorkshire motorist, has recently been touring in France on his 24-h.p. De Dietrich car. One of the trips was from Paris to Monte Carlo, which was made in easy stages in four days. On the first day of the outward journey he ran to Dijon, on the following day Lyons was reached, the third day found him at Avignon, and on the fourth day he

M. Cormier's Tour on an 8-h.p. De Dion Car—The Vehicle among the snow in the Airlberg.

[Le Chauffeur.

in the Nice district. One car makes a daily trip from Nice to Mentone via the beautiful Corniche road, and returning by Monte Carlo, Beaulieu, and Villefranche. On Tuesdays, Thursdays and Sundays there are excursions to St. Jean-la-Rivière and the Valley of the Vesubie; and on Wednesdays and Saturdays one to the Gorges du Loup and Grasse.

THE GARDNER-SERPOLLET COMPANY have secured a contract for a number of 20-h.p. steam omnibuses for a public service in Martinique. They are intended for the conveyance of both passengers and mails, and will have accommodation for eighteen persons.

AMONG the novel vehicles on view at the motor-car exhibition at present being held in Turin is a 200-h.p. racing car. It follows the usual arrangement of chain-driven cars, and has been designed by Signor Dobelli, of Rome. The four-cylinder vertical engine has cylinders 9½ in. bore by 6½ in. stroke, the normal speed being 1,300 revolutions per minute.

ran through Cannes to Monte Carlo. Similar long stages were made on the return journey, Valence being reached the first day, and Dijon the second.

It is reported that the Sports Committee of the A.C.B. is endeavouring to change the route of the Circuit des Ardennes in order to avoid the sharp corner at Longlier, and also to slightly increase its length. The new course is Bastogne, Barrière de Champlon, St. Hubert, Decogne, Neufchâteau-l'Eglise, Habay-la-Neuve, Corne du Bois des Pendus, Martelange to Bastogne, a distance of 126 kilometres as against the 85 kilometres of the old course.

THE Solent Yacht and Marine Motor Company, Limited, has been registered with a capital of £5,000, to acquire the business carried on by Messrs. Charles Sibbick and Company, Limited, at Cowes, to adopt an agreement with Mr. F. W. Livesay, and to carry on the business of motor-launch and boat builders.

HERE AND THERE.

THE Haywards Heath Council has decided against the erection of notice boards as to motor-car speed.

BEFORE the Coventry Engineering Society, Mr. C. R. Garrard has been lecturing on Road Locomotion.

MESSRS. J. LACOSTE AND COMPANY have brought out a new induction coil for petrol motors. It is arranged to be attached to the dashboard and is fitted with an ignition controller. As

will be seen from the illustration given herewith, the coil is provided with two sets of buttons, by means of which, in the case of misfiring in any one of the cylinders of a motor, the faulty one can be detected. Take the case of a four-cylinder engine; the cylinder which is misfiring or giving any trouble can at once be detected in the following way. Press the buttons 1, 2, 3 in the bottom row, the high tension current is then put into short circuit with the frame, and no spark is produced at the sparking plugs in the corresponding cylinders, so that, if the motor still continues running, it will be evident that cylinder number 4 is firing as it should. Reverse the process, cutting out cylinders 4, 3 and 2, and then perhaps the motor will stop, showing that cylinder number 1 is at fault. When, having stopped the motor, it is required to verify the sparking at the plugs and adjust the tremblers of the coil, by pressing any button on the top row the corresponding trembler "buzzes" and produces a spark at the plug tips. Usually, to perform this operation with an ordinary coil, it is necessary to turn the engine round until the desired contact in the commutator is reached, and to do this it is necessary to release the compression in some way or another, as otherwise the engine would not stay in the position while the necessary adjustment was made. A great feature about the controller is that while running not a single extra connection is used, and when wiring the coil up, the connections to be made are exactly the same as a coil not fitted with the controller.

MESSRS. JACKSON BROS., of Knutsford, have a motor-car depot at Grove Street, Wilmslow, where they have a large stock of accessories, petrol, etc.

WE learn that the Mo-car Syndicate, Limited, Paisley, are bringing out a new type of "Arrol-Johnston" car with the engine in the front. It is being made in two sizes—16 and 20-h.p.—both having three-cylinder horizontal engines, the cars being chain-driven throughout.

A PROPOSAL is under consideration at the Belgium Automobile Club to organise a backward race; that is to say, instead of the competing cars running forward, they are to be driven backwards on the reverse gear. The suggested course is from Brussels to Grosselies.

THE PIONEER MOTOR COMPANY FOR INDIA, LIMITED, are showing at the Palace a little stereoscopic souvenir with photos of motor-cars with the added effect of relief that comes by stereoscopic vision. This new company have already shipped an automobile to Bombay, together with a driver, and Anglo-Indians are invited to obtain one of the souvenirs from 17, Shaftesbury Avenue, W. There are so many ways in which this novelty can be used that many motor-car firms will probably consider its adoption in connection with their own particular cars.

A PUBLIC service of motor-cars has just been started between Havre and St. Romain, a distance of twenty kilometres.

MESSRS. J. GRANT AND SONS, of Strathmartin, N.B., are now using a motor lorry for the conveyance of grain.

MESSRS. WOOLER AND SHORE, of 162, Aigburth-road, Liverpool, have been appointed district agents for Star cars.

MESSRS. DU BOIS, LIMITED, 4, Princes Street, Hanover Square, W., have been appointed London agents for the Dennis cars.

THE Ryknield Engine Company, Limited, are building a 20-h.p. car fitted with lorry body, for station and shooting work, for Lord Burton.

THE Sheffield Motor Company, Limited, has been registered with a capital of £5,000, to acquire the business of motor-car dealers and repairers now carried on by Messrs. E. H. Hill and H. Hill, at Sheffield, and to carry on the said business.

THE Monmouthshire County Council has decided "That a bye-law be framed to suppress the nuisance and annoyance caused to the public by the unnecessary use of horns and other instruments by parties travelling by vehicles and motor cars throughout the county."

MESSRS. W. J. PECKHAM, LIMITED, has been registered with a capital of £10,000, to acquire the business carried on by Mr. W. J. Peckham, at 84, Osborn Road, Southsea, at 278-280, Commercial Road, Portsmouth, and at 5, Stoke Road, Gosport, and to carry on the business of manufacturers and factors of and dealers in motor-cars, motor-cycles, etc.

ON Friday last week the quarterly 100 miles non-stop trial of the A.C.G.B.I. was held over the customary course to High Wycombe and back to the Club Garage, Down Street, W. A 5-h.p. Coventry Humberette was the only vehicle, entered and successfully made the journey in bad weather, the cost of fuel per mile at 1s. 3d. per gallon working out to 44d., the speed attained on the outward journey averaging 13.82 miles per hour, including the hill-climbing tests.

HEREWITH we illustrate a new unpuncturable and non-skidding band for the pneumatic tyres of motor-cars which has

lately been introduced by Mr. G. H. Hoyle, of Ash Lea, Brighouse. As will be seen, it consists of an endless leather band set with staples and fastened to the rim with straps through brass eyelet holes. It is stated that the treads cannot creep or roll when once the tyres are inflated. They are made in all sizes up to 900 mm., the size for 750 by 85 mm. tyres weighing 6 lbs.

BRITISH AUTOMOBILE INDUSTRY, 1904.

By T. C. AVELING, ASSOC. M. INST. C.E.

UP to the present the leading firms in the industry have confined the greater part of their ability to the production of pleasure vehicles, and have by these means now gained the necessary experience to enable them to be in a position to put on the market a commercial vehicle of value to the public at large. That the future of the industry will eventually and permanently be with the commercial vehicle we cannot doubt, and, further, that the great firms of the future will be those who have produced an efficient commercial vehicle, in a like manner as the great shipbuilding firms are not those who have confined their output to high-speed yachts for pleasure vehicles, but have turned their attention to the production of ocean liners, tramp steamers, and men-of-war. That the industry has made strides in the last four years is undoubtedly true, and the following comparison between the output of the various firms mentioned in 1900-1901 and 1903-1904, may be of interest:—

		Value of cars per week.	
		1900-1.	1903-4.
		£	£
Wolseley, estimated	...	500	2,500
Daimler	...	1,400	4,500
M.M.C.	...	1,000	2,000
Lanchester	...	none	3,000
Ariel	...	150	1,000
Napier	...	600	6,500

showing an increase in three years of something like 400 per cent. on the output of these individual firms alone. Since then there are at present,

wheel be altered, and, in its stead, the diagonal plates be allowed so long as they are of a close formation, and that a minimum width of tyre should become law in proportion to the total weight moved; this in itself would be a boon to the lorry-maker, as it would ensure the wagon not being overloaded. The maximum weight allowed for heavy road locomotive wagons (mounted on springs) is 4 tons 13 cwt. per pair of wheels, and these wheels must be at least 8in. wide. Now it must be borne in mind that these wheels have merely a rolling action on the road; that from practice with these weights this width of wheel has been found sufficient. It should be noted, however, in the Heavy Road Locomotive Act, 1861, Sec. 4, 1898, Sec. 1, that if a wagon is carrying one block or other single article of a greater weight than 16 tons, the tyres of the wheels must be at least 8in. wide. All the above, too, it should be noted, is at a maximum speed of four miles an hour. Whereas in the case of motor-lorries a speed of five miles an hour is allowed, and that the higher periphery speed of the motor lorry necessarily increases the wear on the road. For the petrol electric heavy wagons I believe the Wolseley Company are making trials. For the petrol heavy vehicles there is no doubt that every firm now engaged in the manufacture of the lighter vehicles will ultimately enter into competition in this field. Amongst the builders of petrol omnibuses of Great Britain may be mentioned Messrs. Stirling, who have made a speciality of this work.

The next heading we come to is that of a *Pleasure Car*, subdividing itself into petrol, steam, and electric. The first of these headings, petrol, sub-divides itself into pleasure cars of a ton and upwards, cars of 12 cwt., voiturettes, quads, tricycles, and motor-bicycles. Engaged in the first three of these sub-divisions are such well-known firms as Messrs. Napier, Wolseley, Lanchester, Daimler, Ariel, Ryknield Engine Company, Thornycrofts, Marston, Star, Wolverhampton; Hozier, Dar

THE AUTOMOBILE INDUSTRY.

now formed and carrying on work, *i.e.*, manufacturing, such firms as Messrs. Humber, of Beeston and Coventry; the Mo-Car Syndicate; the Ryknield Engine Company; James and Browne; Marston Limited; Stirling's; together with the firm of Messrs. Darracq, who are building new works in this country, and also the Clement Company. Other firms are:—Sir W. G. Armstrong, Whitworth and Co., Limited, who are making the Wilson and Pilcher and the Roots and Venables cars. Also Messrs. Willans and Robinson, who have taken up the Duryea and Mr. Hutton's car. I believe that Messrs. Crossley, the gas engine makers, are expending a sum of thirty thousand pounds on machinery for motor-car manufacture, and we know that Messrs. Clarkson, of Chelmsford, are producing an efficient steam car. Amongst the steam wagon builders may be mentioned Messrs. Thornycroft, Coulthard, Fodens, Leyland, Straker, Ellis, Yorkshire Steam Wagon Company, Wantage Engineering Company, Savage, Hindley, etc. Amongst the light steam locomotives may be mentioned Messrs. Tasker, Wallis and Stevens, etc., and several of the big road locomotive firms.

To the makers of heavy lorries, it would be well to draw attention to the seriousness of supplying a lorry with a too narrow wheel width. County authorities are becoming more and more severe on the motor vehicles—in fact, they are, to a great extent, inclined to treat any self-propelled vehicle as the scapegoat for any extraordinary wear and tear on the roads that may take place in their districts. Some authorities will tell you that it is not the broad locomotive wheel with its diagonal plates that does the harm on the properly-made road, but the incessant hammering of the smooth and narrow-faced wheel which so many of the heavy steam lorries are now using; hence, in my opinion, I think it would be an excellent thing if the law as to the smooth-tyred

racq; Crossley, Clement, Richardson and Company, Motor Manufacturing Company, Humber, James and Browne, &c.

Firms interested in the electric carriage trade:—The City and Suburban Electric Carriage Company (1903) Limited; the Electromobile Company; Anti-Vibration Company. The chassis for the City and Suburban Electric Company are supplied from America. The bodies and upholstery, &c., by R. J. Shinnie, of Aberdeen; Barker, of London; and Hooper, of London. The various parts are assembled at their works at Clapham.

In the manufacture of engines for petrol launches we have Messrs. Napier, Wolseley, Lanchester, Daimler, Motor Manufacturing Company, and Thornycrofts, who have done considerable work.

From carefully prepared details the writer estimates that about three-quarters of a million is paid annually in wages in the industry at the present time, and that this supports and gives a livelihood to, in all, some 40,000 persons. At present there is in hand some £840,000 worth of work, exclusive of tyres, which will probably be delivered within the next six months; that in gross figures the total output capability of the firms now in this industry would be capable of close on two million pounds worth of work. Of this amount about one million five hundred thousand may be detailed to light vehicles alone. The total imports of motor-cars into the country last year were about two millions, and as the country itself has produced some one million three hundred thousand worth of cars, or, to be on the right side, shall we say to the gross value of one million, the total demand in the country has been one million plus the imported value, which equals three millions. Not allowing for the natural increase of the demand in this country, and taking that demand as stationary, we could establish at least twice as many factories as there are at present, and keep them fully employed, without there in any way being a glut in the market.

* From a paper read at the Automobile Club on Thursday, February 11th, 1904.

The Crystal Palace Automobile Show.

[FIRST NOTICE.]

Photo by]

General View of Exhibition.

[Russell and Sons.

AT the Crystal Palace, Sydenham, a motor-car exhibition is in progress which has attracted the presence of a large section of the industry, as will be apparent from the reports on the various stands which appear below, and which will be continued next week. As will be readily understood, it is impossible to deal with all the firms represented in one issue, but an effort will be made to secure mention of everything that appeals to motorists, whether from the point of view of novelty or utility. One notable feature of the show is the great increase in the number of cars with six-cylinder engines, these being shown by no less than five firms, viz., Messrs. S. F. Edge, Messrs. Wilson and Pilcher, the Ariel Motor Company, the Maudslay Motor Company, and Messrs. John Marston, Limited.

PETROL CARS.

The "Talbot" cars are displayed by MESSRS. HALL AND CO. The 1904 models of this familiar type of car have already been fully dealt with in the *Journal*, so it will suffice to mention that specimens of the 14-h.p. and 20-h.p. four-cylinder and 11-h.p. double-cylinder vehicles are displayed, including a handsome 14-h.p. brougham. Considerable interest is being shown in the latest "Talbot" production—a double-cylinder, gear-driven car of 8-h.p. This motor, which has mechanically-operated inlet valves, has attached to it all its necessary adjuncts, such as pump, governor, and electrical gear, in such a way that the whole can, if necessary, be lifted out of the frame in one block. Three speeds forward and a reverse are provided. Fitted with a well-appointed tonneau body, this car is one which is likely to become a popular type in the near future. Passing from the 8-h.p. we come to the chassis of the 27-h.p. "Talbot" car which made its debut at the National Cycle Show in November last, at which time we described the vehicle at length. It differs from the usual models in several respects; one point of difference is that the transmission is by means of side chains in place of the cardan shaft and bevel gear. Messrs. Hall and Co. also have on view several of the latest Darracq cars, and in this connection we may mention that Mr. L. Carcenac, who for some years has been head salesman at the Darracq factory in Suresnes, has taken over the management of their new depot at Tunbridge Wells.

The AVON MOTOR MANUFACTURING COMPANY, Bristol, display quite a novel departure in the way of a light car at a popular price. It has accommodation for two passengers and runs on three wheels in place of the usual four. The frame, which is of tubular construction, carries

under the seat, at one side, a 4-h.p. vertical water-cooled motor, the water circulation being on the thermo-syphon system. Three speeds forward are available, but, as the complete vehicle weighs under 3 cwt., no reverse is provided. The crank shaft terminates in one half of a friction clutch, the male portion of which is mounted on a sleeve on the same shaft. The sleeve also carries a pinion meshing with a spur-wheel on the change gear shaft, the first reduction of the engine speed being thus obtained ere the gear box is reached. In the latter are the usual double pairs of pinions, the power being transmitted through the pair brought into mesh by means of a lever on the inclined steering column. From the gear box a single chain conveys the power to the rear live axle. In place of the differential gear the rear wheels are mounted on free wheel clutches, which allow either of the wheels to over-run the other in turning corners. The engine and change speed gear are so mounted that they can easily be removed from the frame if necessary.

MR. STEPHEN A. MARPLES again exhibits the 18-h.p. "Windora" four-cylinder car, of which an illustrated description was given in our report of the National Cycle Show in November last. A new car designed to meet the demand for a popular-priced vehicle is the 10-h.p. "Mercury." This is of French construction, and in general arrangement follows standard lines. The motive power is supplied by a two-cylinder vertical engine, having mechanically-operated inlet valves. Three speeds forward and a reverse are provided, with a direct drive on the top speed. From the gear-box the power is transmitted by a cardan shaft through bevel gear on to a live axle. MESSRS. JOSEPH BAKER AND SONS, LIMITED, again display the Stevens-Duryea cars, of which a full description was given in our issue of December 12th last. Examples of the Baker speed-reducing gear, a very compact arrangement, are also on view. MR. W. H. M. BURGESS displays a variety of Talbot cars and a 15-h.p. Panhard, all fitted with Rothschild bodies. The White and Poppe motor-cycle engine described in a recent issue is also to be seen at this stand. AUTOMOBILIA, LIMITED, confine their exhibit to examples of the 14-h.p. Renault, 15-h.p. Panhard, and 12-h.p. Darracq types.

The RYKNIELD ENGINE COMPANY, LIMITED, of Burton-on-Trent, display for the first time their new 10-h.p. "Ryknield" cars. The new features, such as the clutch and steering, were illustrated and described at length in our issue of the 6th inst., so that we need only now refer to a few of the details not dealt with on that occasion. In addition to a neat tonneau (Fig. 1) painted in dove grey, a novel vehicle is displayed, this being known as a station cart, being designed to convey luggage and also for use in connection with shooting parties, to carry beaters, game, etc. A van to carry a load of one ton is also on view, while special attention may be drawn to a handsome victoria. In order to demonstrate the

various features, a chassis is shown in motion, worked temporarily by an electric motor. The two-cylinder engine has mechanically-operated inlet valves, these being located in the top of the heads and actuated by tappets somewhat on the lines of the Buchet motor. The cylinders are 4 in. bore by 4½ in. stroke, the normal speed being 1,000 revolutions per minute. The ignition is by magneto. The governor is adapted to act on a throttle in the admission pipe, the pump is gear-driven and circulates the water through the engine, a framed ribbed radiator and a separate water tank. At present the Longuemare carburettor is being used, but the company

Fig. 1.—The "Rynkeild" 10-h.p. Tonneau.

have an automatic carburettor of their own design in hand. The frame of the vehicle is of pressed steel, the wheel base being 6 ft. 6 in., and the track 3 ft. 11½ in.

The new models of the Georges-Richard Company, shown by MESSRS. MANN AND OVERTON, comprise quite a number of special features. For the 1904 season, 8, 12, 16, and 24-h.p. cars will be available. Two-cylinder engines will be fitted to the 8-h.p. and 12-h.p., while those of the 16 and 24-h.p. will have four cylinders. Except that the 8-h.p. car has only three speeds forward in addition to the reverse, while the others have four, the following remarks apply to all four vehicles. The main frame is of stamped steel, the engine and gear being supported on a secondary frame of tubular construction. The cylinders, which are cast in pairs, have mechanically operated inlet valves, these being set on the opposite side to the exhaust valves. Magneto ignition is being retained, but the Georges Richard Company have struck out a line for themselves in deciding to abolish the pump, relying on the thermo-siphon action in conjunction with a fan-cooled radiator for the water circulation. The carburettor is an automatic air-regulation one of the Georges Richard Company's own patent. The transmission is by means of a cardan shaft and bevel gear on to a live axle

"back kicks" of the motor, owing to the ignition not having been retarded, is an arrangement whereby the act of putting the starting handle into gear at the same time automatically retards the ignition; the moment the handle is released the ignition returns to its normal position. The 12-h.p. and 16-h.p. chassis are of sufficient length to take bodies with side entrance, while the 24-h.p. type is made with chassis of two different lengths. Messrs. Mann and Overton also display a range of waterproof tool boxes, umbrella cases, etc., for use on motor-cars, made of cane work and painted in any colour to match the car. At the time of our visit to the stand, one of the latest 22-28-h.p. Mercedes cars was expected, to which we shall refer in a later issue.

Fig. 2.—The "Vauxhall" 6-h.p. Car.

While the general features of the popular "Vauxhall" car have been retained, the 1904 models displayed by the VAUXHALL IRON WORKS COMPANY, LIMITED, show a number of notable improvements over the preceding type. In the first place, it may be mentioned that the power of the motor has been increased from 5 to 6-h.p., and that larger bearing surfaces throughout are provided, while improvements have been made in the design which will render the crank case, &c., if anything, more accessible than before. A reverse speed has been added to the gear box, brought into action by friction, and applied by a small pedal on the floor of the car next to the brake pedal. We notice, too, that many of the minor details of the car have been modified, a high-speed trembler coil having been fitted, larger dashboard, lubricator, &c., all tending to improve the running of the vehicle. The road wheels are of the artillery type, shod with 3 in. Dunlop tyres, instead of the wire wheels with 2½ in. tyres of last year. All the exposed metal work and lamps are of bright brass instead of nickel plated. The frame has been widened, enabling a more roomy seat to be fitted, giving the car generally a more handsome appearance. We may add that, as before, the 1904 model can be fitted with a third seat instead of the bonnet, to enable a third passenger or two children to be carried.

Fig. 3.—The Georges Richard 16-h.p. Side-entrance Car.

a new point being the introduction of a universal joint between the engine and gear box, this not only relieving the shafts of the latter of all strain, but permitting the clutch to be dismounted without interfering with the gear box in any way. With the object of rendering the cars quieter than ever, and also of keeping down the dust, a new form of silencer is being adopted; it is of large size and is placed transversely across the rear of the car, the burnt gases finally emerging through two flattened pipes projecting at an angle to the silencer. Enclosed internally-expanding brakes are now fitted, while a new point which will appeal to all who have suffered from

The stand of MESSRS. DEASY and Co. is continually surrounded by an interested crowd, the object of their attention being the identical 14-18-h.p. Martini car on which Captain Deasy recently drove up the cog railway on the Rochers de Naye, near Caux. An attempt has been made to indicate what the feat meant by the laying down under the car of a section of cog railway track, together with the loose ballast on which the wheels of the vehicle had to run. For 1904 only one type is being made, a 16-20-h.p. four-cylinder vehicle (Fig. 4), the engine, although on the same lines as last year's model, being slightly more powerful. Mechanically-actuated inlet valves

are employed, together with a combined honeycomb radiator and water tank, a feature being the provision for drawing off all the water, when necessary, from the radiator tank, pump and cylinder jackets. The carburettor is provided with a jacket through which part of the exhaust gases may be made to circulate. Four speeds forward and a reverse are provided; a direct drive is obtained on the fourth, and the single lever controlling all the speeds has only a forward and backward movement. The clutch is of the leather-faced cone type, and a universal joint is introduced between

mitted through a cardan shaft to a differential shaft below and parallel with the rear axle. On the ends of the differential shaft are pinions meshing with internally-toothed rings attached to the rear road wheels. The governor can be set to act at any desired speed from the steering wheel, a pedal accelerator cutting out the governor, no matter at what point this is set to act. The Chenard-Walcker has a record for economy in fuel consumption, while the special control results in an exceedingly silent-running and flexible engine, it being claimed to be possible to run the car at

Fig. 4.—Plan of the "Martini" 16-20 h.p. Car.

it and the gear box, to prevent any strain being thrown on the latter. The main frame, as well as the secondary one supporting the engine and gear box, are of pressed steel, while the dumb irons extend well to the rear to allow of placing the rear axle well back and the use of long springs. With the exception of one hand-controlled lubricator for the pump and radiator fan spindle, the lubrication is entirely automatic; the base chambers are provided with cocks, by means of which it can readily be ascertained whether they contain the desired amount of oil. The engine and gear box are entirely protected below, while the steering rod is placed behind the front axle.

A car which comprises a number of interesting features is the 18-h.p. four-cylinder Chenard-Walcker (Fig. 5) shown by the WESTON MOTOR SYNDICATE. The engine is provided with mechanically-operated inlet valves located on the opposite side to the exhaust valves; a characteristic point of the motor is the peculiarly-shaped cam, by means of which not the lift, but the duration of the time the inlet valves are kept fully open, can be varied, and the speed of the engine consequently controlled. A novel form of automatic carburettor which furnishes a quality of mixture to

any pace from 2½ miles per hour up to the maximum on the top speed of the car. The 12-h.p. Chenard-Walcker car has a two-cylinder motor; it is provided with the special valve control found on the 18-h.p. car; an ordinary type of carburettor is used, while the transmission is by means of side chains. Three speeds forward and reverse are provided, and the Weston Company claim that the vehicle can be driven at a rate of as low as four miles per hour on the top direct speed.

The Arrol-Johnston cars are shown in a number of styles by the Mo-Car SYNDICATE, LIMITED, the models on view including a four-seated dog-cart, a six-seated car having small side doors to the seats, and a vehicle to accommodate seven passengers. They are all built on the standard 12-h.p. chassis, of which one is shown, the two-cylinder engine being located at the rear. The general features and arrangement of this novel car have been fully described in the *Journal*. We notice, however, that several modifications and improvements have been effected. Among these is the provision of a hand-operated throttle valve on the admission pipe, this being quite distinct from the governing arrangement, which, as hitherto, acts on the exhaust valve. When running down hill, with the throttle closed, fresh air

Fig. 5—Chassis of Chenard-Walcker 18-h.p. Car.

correspond to the engine speed is used; this comprises a compound valve, part of which regulates the supply of air and the other portion the supply of petrol. The water-circulation pump has been discarded in the 1904 Chenard-Walcker, the thermo-syphon system in conjunction with a special honeycomb radiator being relied upon. Magneto or high-tension ignition, with a chain-driven commutator on the dashboard, can be fitted. The special combined clutch and brake is still retained, as is also the Chenard-Walcker transmission, in which, it may be remembered, the power is trans-

is drawn into the cylinder. Not only does this help to cool the motor, but the latter is thus made to act as a brake. Quite a new departure for the Mo-Car Syndicate is a 12-h.p. estate wagon, with the engine in the front. This is intended for carrying servants and luggage to stations, and also for use in connection with shooting parties; it will carry loads up to two tons, and is provided with a body which can be tipped by means of a handle and gearing. The engine is of the standard 12-h.p. type, the power being conveyed to the gear box by a Renold silent chain, thence by a

second chain to the differential shaft, which in turn drives the rear road wheels through side chains. As usual, the engine is arranged to be started from the seat.

A very large display of Panhard cars is made by MESSRS. PANHARD AND LEVASSOR. For the 1904 season no less than seventy types are being made, viz., 7-h.p. two-cylinder, 8-h.p. three-cylinder, and 10-h.p., 15-h.p., 18-h.p., 24-h.p., and 35-h.p. four-cylinder, these powers being in all cases nominal. We gave a description of the new three-cylinder car in our report of the Paris *Salon*, so it will suffice to briefly deal with the changes that have been made in the 1904 models as compared with those of last year. From 8-h.p. upwards the engines have now separately cast cylinders, the chief advantage of this system being that it permits the fitting of a bearing between each crank; while it facilitates more perfect water jacketing, and consequently better cooling of the cylinder walls. Ignition is by means of a chain-driven magneto on the dashboard. The wood and steel frame is retained, as well as the Krebs automatic carburettor. A ribbed radiator, set in a frame which forms the water tank, is employed, an adjustable fan being provided to induce the necessary current of cool air through the same. Mechanically-operated inlet valves are now fitted to all engines from 15-h.p. upwards, and on the two larger sizes extensible cams are provided, so that the lift of the induction valve may be varied by the driver. The valves of each cylinder are accessible by releasing one screw, and the whole of the valves may be removed for cleaning without disturbing any other part. The water circulating pump has been greatly

by a water circulation maintained by a gear-driven pump and honeycomb radiator in the usual way. The inlet and exhaust valves are in one casting, and are placed on the top of the cylinder, both being mechanically operated from a side-shaft. An important part of the Dougill system is an automatic carburettor, which is really four carburettors in one. It consists of a rectangular case on the top of the engine, provided with four gravity-fed petrol leads, each being covered, when the engine is stationary, by short levers held in their relative position by light springs, and operated by the suction of the motor in the following manner:—There are four round openings in the body of the carburettor, the combined area of which give the pre-arranged air speed to the motor at its maximum number of revolutions. The carburettor is adjusted by closing three of the four oil feeds and tightening the tension of the spring on the air control levers, so that one only becomes operative. After starting the engine, release the tension on the second lever and open the oil feed by degrees; the engine then will be giving its full brake power up to 200 revolutions per minute, and the moment the engine is accelerated No. 2 air and oil feed comes into operation, not by spasmodic jerks but by degrees. When the second air lever has opened to its limit—at a speed of about 400 revolutions per minute—No. 3, and in turn No. 4, comes into operation through the increased speed of the engine. Thus the carburettor is adjusted, and the parts firmly locked entirely under the engine's load at all and every speed at which the motor may be designed to run. The normal rate is about 800 revolutions, but by means of the automatic and sensitive carburettor

Fig. 6.—The Panhard 18-h.p. Landauette.

improved and placed in a convenient position under the bonnet, where it is protected from dirt and danger; it is driven by friction off the flywheel, by means of a flexible shaft. Most of the different types are built in two lengths of frame, to enable bodies with side entrance to be mounted upon them, and some excellent examples of this increasingly popular class of vehicle are to be seen on the stand, notable among them being an 8-h.p. brougham and an 18-h.p. landauette, the latter being illustrated in Fig. 6.

One of the most novel cars in the show is the "Dougill" exhibited by the PATENT AUTOMATIC FEEDING MACHINE COMPANY, LIMITED, of Rochdale, a statement which will be at once realised when we state that it has no change-speed gear, and that the engine is a horizontal single-cylinder one of 24-h.p. The cylinder, which has a bore of 8 in., has a central explosion chamber, which forces out two pistons in opposite directions, each having a stroke of 5 in. There are thus a crankshaft and flywheel at each end of the cylinder, the two pistons travelling to and from each other at each revolution, and, in consequence, balancing the impact of the explosion and the reciprocating motion of the pistons. The latter are synchronised by a Renold silent chain, running over chain wheels fixed upon the crankshafts, this chain also transmitting the power from the forward to the rear crankshaft, upon which are fixed an expanding clutch, chain pinion, and epicyclic reversing gear. This shaft being parallel with the live back axle, a single chain drive is all that is necessary to complete the transmission, throughout which there is no end thrust. The clutch is operated either by a pedal or side lever, while the reverse motion, which is the only mechanical gear provided, is controlled by a pedal. The engine is cooled

referred to above, the speed can, it is claimed, be varied between 150 and 1,600 revolutions per minute. A compression release valve is provided, enabling the engine to be started on half compression. Notwithstanding its size, the motor is stated to be very quiet and steady in action. The designer has had in view the quick expansion of the burnt gases, and to this end has provided two exhaust valves in place of the usual one; both are operated off the same rod, to which is fitted a compound tappet lever, so arranged that a slight lead is given to the supplementary exhaust valve. The silencer is 8 in. in diameter, while the bore of the exhaust pipe is 3 in. As already stated, no mechanical change speed is provided, the various speeds being entirely obtained by means of the automatic carburettor, a throttle valve, and the clutch. The experimental car, although somewhat heavy, has been subjected to extensive trials, which have, we are informed, fully realised the designer's expectations.

A large range of Star cars is displayed by the STAR ENGINEERING COMPANY, from the 6-h.p. two-seated vehicle up to a 18-h.p. four-cylinder car. Since we last saw the 6-h.p. vehicle its wheel-base has been slightly increased. The car is chain-driven, three forward speeds and a reverse being provided. A large silencer is fitted, rendering the car very quiet in operation. The Star Company have lately introduced a new light 12-h.p. car, with four-cylinder engine. We notice that the side chains of this vehicle are provided with oil-containing gear cases. To meet the demand for side entrance cars, a 12-h.p. with long chassis has been introduced. The vehicle is up-to-date in every respect, the engine having mechanically actuated inlet valves, to which a variable lift device is fitted.

The CADOGAN GARAGE AND MOTOR COMPANY, LIMITED, display a new petrol lorry of Belgian construction, designed to carry a load of 5 tons and capable of hauling a further 3 tons on a trailer. The frame of the vehicle is of channel steel, its design being of a special character, which cannot well be explained without a drawing. The motor, which is located in the fore part of the chassis, is of the Gobron-Brillié type, having two cylinders and four pistons; it is stated to develop 34 brake h.p. Four

also be made to a 15-h.p. parallel-sided tonneau with canopy, the chassis of which weighs about 12 cwt. The car is fitted with a honeycomb radiator and tank, so arranged that, even should the pump stop, the water is always above the cylinder heads. The four-cylinder engine has no water joint to the cylinder heads. The suction inlet valves are of the multiple port type. The commutator is also worthy of careful examination. We notice that all the wires leading to the commutator are

Fig. 7.—The Cadogan 64-h.p. Petrol Lorry.

speeds forward and reverse are provided, the quadrant on which the change speed lever works having a neutral stop between each notch or gear, so that the latter can be put in the free position at any point. From the gear box, which is of unusually large size, the power is transmitted by side chains. The tare weight of the wagon is under 2½ tons, and with its full load it can attain a speed of 10 miles per hour. One of its features is the low consumption of fuel—it being claimed to carry 5 tons a distance of 5 miles on one gallon of 750 petrol, the cost of which is said to be 7½d. per gallon.

stationary, and are not moved backwards and forwards as the commutator is actuated. Only one coil is used in connection with the ignition in the four cylinders. The carburettor is fitted with the hydraulic air regulator recently described in these columns. The gear box, which gives four forward speeds and a reverse, has a lid which can be removed by merely taking out one small screw. The 24-h.p. cars embody many of the general features of the 15-h.p., but are, of course, made stronger throughout. It is rather a slower-running engine, giving 26-h.p. on the brake.

Fig. 8.—The Napier 24-h.p. Pullman Car

Interest at the stand of MESSRS. S. F. EDGE, LIMITED, is largely centred on the chassis of the new six-cylinder Napier car, of which illustrations and a description were given in our last issue. Apart from this, however, a large display is made of 15-h.p. and 24-h.p. cars, the body work of which is of the highest grade, and here special attention may be drawn to a side-entrance brougham and a 24-h.p. Pullman to seat six people (Fig. 8), both of which appear to have been finished regardless of cost. Reference may

MESSRS. PRITCHETTS AND GOLD, LIMITED, have on view two types of their "Meteor" cars—12-h.p. and 24-30-h.p.—both fitted with four-cylinder engines. They are on standard lines, the 12-h.p. vehicles being made with cardan shaft or side chain transmission. The 24-30-h.p. car, of which a chassis is shown, has a pressed steel frame and a long wheel base, viz., 8 ft. 9 in., which enables a roomy body with side entrance doors to the tonneau to be fitted. The gear box gives four speeds forward and one

reverse. The motor is fitted with a special carburettor, which enables the engine to be run down to a low speed.

MR. MORGAN DONNE exhibits Rochet-Schneider cars, for which he has obtained the British agency. For the 1904 season they are being built in two sizes, both of which have a four-cylinder engine, 16-h.p. and 24-h.p., the former giving 22-h.p. and the latter 30-h.p. on the brake. The 16-h.p. car has a wheel base of 8 ft. 6½ in., the chassis weighing 650 kilos. The 24-h.p. has a wheel base of 9 ft. 2½ in., the weight being 750 kilos. The frame is of pressed steel, and is narrowed in front to increase the "lock" of the steering wheels. The steering rod connecting the front wheels is

Fig. 9.—The Rochet-Schneider Four-Cylinder Motor.

behind the front axle and consequently protected from accident. There are two brakes on the 16-h.p. car and three on the 24-h.p., the latter having two pedals, each acting on its own countershaft brake, this being in addition to the hand lever which actuates the band brakes on the hubs of the rear wheels. The pedals, which are of the "push" type, are mounted upon a transverse shaft underneath the footboard which actuates the clutch, and also the countershaft brakes. Although there is no radical alteration in the engine, there are a number of improvements; it is of the double twin cylinder type (Fig. 9), having the inlet valves, sparking tappets, and the vertical rods and levers for actuating the same on one side of the engine and the exhaust valves on the opposite side, both inlet and exhaust valves being interchangeable and mechanically operated. The ignition is by a low-speed rotary magneto with tappets and advance sparking device, as in the 1903 cars. The governor acts directly on the carburettor; a throttle lever is also fitted on the steering wheel, while adjacent to the wheel are two levers, one for regulating the air to the carburettor and the other for the advance sparking. The gear presents several marked improvements; four speeds and reverse with direct drive on the fourth are provided. The top shaft in the gear-box, which is square in section and connected with the clutch, has mounted upon it the sliding gears; the latter are in two portions, and are operated upon by two forks, one of which controls two speeds and the other two speeds and reverse. These forks are actuated by means of a locking bar, which has several projections and recesses to give the desired motion necessary for placing the various gears in and out of mesh; this arrangement permits of a short gear-box, and at the same time enables very broad and strong gears to be used. The male portion of the clutch is connected to the gear by means of a universal joint, which counteracts any undue strain on the gear-box and engine; the joint also permits of the male portion of the clutch finding its true position in the flywheel. Any type of carriage body can be fitted to the chassis, a noticeable example being a 24-h.p. side-entrance brougham.

The STANDARD MOTOR COMPANY, LIMITED, Coventry, have on view a chassis and a double phaeton of 12-15-h.p. A detailed description of this vehicle was given in our issue of January 9th last, so that a lengthy reference is unnecessary on the present occasion. Attention may, however, be drawn to the double-cylinder engine, which is unique in design, having a bore of 5 in. and a stroke of only 3 in. The advantages claimed for this form of construction are compactness and light weight for the power developed, and great elasticity, it being possible to run the engine at extremely high speeds when required; while, owing to the large flywheel and special design of carburettor, it can be run very slowly and quietly without loss of efficiency. Both inlet and exhaust valves are mechanically operated and interchangeable, and the accessibility of all parts appears to have been carefully studied. Two inspection doors are provided at the side of the crank case, by removing which all the bearings and the camshaft can be examined and the bearing caps adjusted. The pistons can also be removed without dismantling the cylinders. The governor is mounted on an extension of the crank shaft, and, in addition to governing the supply of gas to the engine, also acts as an air regulator, giving the engine more air at high speeds in accordance with the latest practice in automobile engineering.

The stand of MESSRS. JARROTT AND LETTS, LIMITED, has been the centre of attraction all the week, the cause of the same being the new "Crossley" car, of which a highly-finished chassis, as well as a complete car fitted with a Roi des Belges body, painted and upholstered in red, are shown. Having already dealt fully with this car in recent issues, it is unnecessary to go into the details again; but we may mention that, in addition to the chassis, a display is made of the various parts of which the car is built, and that a model is shown of the Xenia automatic carburettor, the public interest in the latter being particularly keen. One-half of the stand is devoted to a display of the latest De Dietrich cars, these including a 45-h.p. racer, two 16-h.p. cars, and a 35-h.p. chassis. For the 1904 season four sizes are being made, viz., 12-h.p., 16-h.p., 24-h.p., and 35-h.p. The inlet valves are now mechanically-actuated off the same cam shaft as the exhaust valves. The carburettor is supplied by gravity from a special petrol reservoir, which is kept supplied under pressure from the main petrol tank. The carburettor is provided with an ingenious but simple automatic device, by means of which the quality of the mixture is kept in consonance with the requirements of the engine. The ignition is by magneto, with provision to test the sparking in each cylinder separately by a simple cutting-out device. To prevent any strain on the engine or gear-box, two universal joints are introduced between the latter and the clutch. The carburettor, which is controlled both by the governor and from the steering wheel, is also connected up to the clutch pedal, so that as the clutch is disengaged the supply of mixture to the engine is throttled. The brakes attached to the rear wheels are now of the internal expanding type, metal to metal. The frames, of pressed steel, are being made of a length to accommodate side entrance bodies. Another exhibit on the stand is

Fig. 10.—The De Dietrich Four-Cylinder Motor.

that of the "C. J. L." supplementary ignition, for use in conjunction with the magneto. This consists of a transformer, which, in conjunction with special batteries, is capable of producing the necessary strength of spark without alteration to any part of the motor, and with the utilisation of the existing ignition plates in the cylinder, thus making it possible to either run on the magneto, if desired, or to switch off the magneto and run on the supplementary ignition. A further advantage claimed for the supplementary ignition is that it facilitates the starting of the car, the motor being put into operation by half a turn of the handle.

DR. WINTER's speed indicator is also to be seen at this stand. The mechanism of this device runs very slowly, so that there is no wear on the working parts; in fact, with the car running at thirty miles per hour, the main spindle takes two seconds to make a revolution. Finally we may mention the "Pompeii" automatic tyre inflator, of which an illustrated description was given in our issue of the 16th ult.

On another stand a large display is made of the popular Oldsmobiles. This car is too well known to need description at this time. The engine is a 5-h.p. single-cylinder, placed horizontally, and the transmission is by a central chain. There are two speeds and reverse, the gears being of the epicyclic type. A feature of the Oldsmobile is its silent running and freedom from vibration. One of the cars is shown fitted with a back seat for two additional passengers; another is fitted with a hood and a specially designed storm apron; while a third is provided with a luggage carrier in the shape of a waterproof wicker basket. A new departure in Oldsmobile cars is a light delivery van, designed for the carriage of light goods of all descriptions up to a weight of about 8 cwt. The mechanism is the same as that on the runabout, with the exception that the springs and running gear have been strengthened and the gear somewhat lowered. Finally, we may refer to the weird Oldsmobile racer, which is merely a chassis with a seat for the driver projecting at the rear.

THE ROADWAY AUTOCAR COMPANY, LIMITED, the British agents for the Mors and Renault cars, have on view some excellent samples of both these well-known types of vehicles. We first examined the chassis of one of the new 19-h.p. Mors cars. The motive power is supplied by a four-cylinder engine having the mechanically-operated inlet valves on the opposite side to the exhaust valves. The carburettor is provided with both hand and automatically-regulated air inlets, and has a jacket through which hot water can be circulated. No governor is now used, but to prevent "racing" the throttle valve is so connected up to the clutch pedal that as the clutch is withdrawn the throttle is partially closed. A lever on the steering wheel also acts on the throttle. A framed ribbed-pipe radiator is used, air being drawn through the same by the arms of the flywheel, which are made to act as a fan. The magneto ignition has been improved in so far as the speed at which the magneto works has been reduced to that of the motor

Fig. 11.—Chassis of Renault 14-h.p. Car.

itself, enabling the number of parts to be diminished and securing quietness in operation. A special form of clutch is employed, while the shafts in the gear box and the differential run on ball bearings. The 18-h.p. Mors cars are represented by a highly-finished brougham, an illustration of which is given in Fig. 12. The exhibit of Renault cars includes a chassis of the new 7-h.p. type, a 10-h.p. two-cylinder landaulette with side entrance, and one of the latest 14-h.p. four-cylinder cars. (Fig. 11.) We gave some illustrations and particulars of these vehicles in our report of the Paris Salon, but it may be mentioned that a feature of the 7-h.p. single-cylinder engine is the provision of a device by means of which the tension of the spring of the inlet valve can be varied and the speed of the engine thus regulated, this being in addition to the centrifugal governor, which acts on the carburettor, automatically regulating the supply of air and the quantity of mixture allowed to pass to the engine. The 10-h.p. two-cylinder shows a number of modifications. The inlet valves as well as the sparking plug are in the top of the combustion chamber, and are

tremblers are used for the four cylinders. The contact breaker is of the wipe type and can be readily detached without using any tools.

One of the stands of MESSRS. S. F. EDGE, LIMITED, is devoted to a display of the "Gladiator" chain-driven cars—9-h.p. and 12-h.p. (two cylinder), and 14 and 28-h.p. (four cylinder), all but the 12-h.p. type being entirely new models. The structural characteristics of the several different models are very similar. The frame is built of wood strengthened on the inside with steel flitch plates to prevent side twists. The engine and gear

Fig. 12.—The Mors 18-h.p. Brougham.

box are mounted on a separate steel frame. The power from the engine to the gear is transmitted through a leather-lined clutch of the internal type, in connection with which ball bearings are fitted to take the end thrust when the clutch is out of action. The honeycomb radiator has been abandoned in favour of one of the ribbed-pipe variety set in a neat frame. The pump is friction driven, the leather-faced wheel being enclosed and protected from mud, except at the point of contact with the flywheel. The pump itself is mounted on a pivot and held to its work by a spring. The ignition is on the high-tension coil and accumulator system. Among the other noteworthy features may be mentioned the carburettor, in which the quality of the mixture is automatically made to correspond with the

Fig. 13.—The Gladiator 28-h.p. Side-entrance Car.

thus readily accessible. Furthermore, it is not now necessary, in order to remove the exhaust valves, to first detach the inlets; instead, they can be quickly taken out by first removing two plugs in the combustion chamber. The inlet valves are provided with the variable tension spring found on the 7-h.p. In the 14-h.p. the four cylinders of the engine are cast in two pairs, with an air space between each pair. The inlet valves, which are mechanically actuated off the same cam shaft as the exhaust valves, are fitted with a special device to give a progressive lift. On all the Renault cars the high tension system of ignition is adopted. On the 14-h.p. vehicle, however, we note that a duplex coil is employed, and consequently only two

requirements of the engine at all speeds, and this without the use of any springs or diaphragm; a branch from the admission pipe is brought to the top of a weighted valve, which is lifted to a height corresponding to the suction of the motor, and more or less air correspondingly admitted. The change gearing is of the sliding pinion type, the drive on the top gear being direct except in the case of the 12-h.p. Two distinct sets of brakes are fitted; the foot-brake is on the countershaft, and is of the metal to metal double-acting variety. The rear brakes are provided with a simple device which holds the bands off the drums when not in use. Of the different vehicles on view we may specially refer to a 14-h.p. four-cylinder car

fitted with a limousine body and upholstered in green leather, and to a 28-h.p. four-cylinder car. An illustration of the latter is given in Fig. 13, from which it will be seen that it is fitted with a new type of side entrance body, which allows free entrance and exit on either side, and provides an unusual amount of room in the rear portion.

MESSES. DENNIS BROTHERS, LIMITED, for the 1904 season have made an interesting departure in adopting a worm gear drive for their 20-h.p. cars, in place of the bevel wheels previously used. The chassis on view is an excellent piece of work; it has a pressed steel frame, on the fore part of which is set a four-cylinder Aster engine of the latest type.

Fig. 14. The Dennis Worm Gear Drive.

In general arrangement the standard lines are followed, except so far as regards the worm gear drive. A view of the latter is shown in Fig. 14. The rear road wheels are not mounted on the axle proper, but on sleeves surrounding the latter, the power being conveyed from the axle to the wheels by jaw clutches in the hubs, as shown in Fig. 15, which also illustrates the double artillery wheels used on this car. Other features of the car are the improved steering pivots, magneto and high-tension ignition, and the spring drive between the clutch and the gear box. Messrs. Dennis exhibit two complete 20-h.p. cars with bodies built in their own works, one having a special limousine body. Examples of the Dennis 12-14-h.p. double-cylinder cars are also shown; in these the bevel gear drive is still retained. Finally, we may refer to a 12-14-h.p. delivery van, adapted to carry a load of one ton, at speeds up to 14 miles per hour. This has worm gear transmission, the double artillery wheels being shod with solid tyres.

THE MOTOR CAR COMPANY, LIMITED, exhibit five complete Decauville cars and a chassis of the new 12-h.p. type (Fig. 16). The various types of bodies fitted include a coupé, a hooded phaeton, and a Roi des Belges tonneau, as well as the standard pattern tonneau fitted to the 10-h.p.

Fig. 15.—The Double Artillery Wheel on the Dennis Car, showing the Driving Clutch.

chassis. The 12-h.p., 14-h.p. and 16-h.p. types embody all the latest Decauville improvements, including the fortified back axle and the metal shield which, securely bolted to the frame, affords additional support to the motor and protects the mechanism from mud, wet, or dust. All are fitted with the Decauville dynamo, by means of which the ignition accumulators are re-charged whilst the engine is running. The brake and clutch pedals, if preferred, can be of the "push" pattern, instead of the more ordinary type usually adopted. The new 12-h.p. car is fitted with a four-cylinder engine, having cylinders of 90 mm. diameter by 110 mm. stroke; the inlet as well as the exhaust valves are mechanically actuated. The centrifugal

governor acts on the inlet, a pedal accelerator being fitted, by means of which the speed of the engine can be increased to 1,200 revolutions per minute. A honeycomb radiator and tank is now employed in connection with the water circulation. The carburettor is of the automatic air regulation variety. Three speeds forward and a reverse are controlled by one lever, the drive on the top speed being direct, the power being transmitted through bevel gearing to a live axle. As usual in Decauville cars, the engine and gear are entirely protected, and the new model should prove as successful as its forerunners. A novelty on the stand is a petrol motor-tramcar.

RYDE MOTORS, LIMITED, have on view a well-finished example of the "Ryde" 14-h.p. three-cylinder tonneau car, of which an illustrated description was given in our issue of January 23rd last. The car is driven by cardan

Fig. 16 —Chassis of 12-h.p. Decauville Car.

shaft and bevel gear on to a live axle, and has three speeds and a reverse, with a direct drive on the top speed. They also show a 10-h.p. car fitted with a two-cylinder horizontal engine, and with a transmission somewhat on the lines of that adopted in the Wolseley cars. The 1904 models of MESSES. A. DARRACQ AND CO. have already been fully dealt with in the *Journal*, so that it will suffice to mention that in addition to a 15-h.p. chassis specimens of the 8-h.p., 12-h.p., 15-h.p. and 24-h.p. types are on view. The frames can be lengthened to permit of the fitting of side-entrance bodies, an excellent example of this type being a 24-h.p. coupé. The frames of these vehicles, it will be remembered, are of pressed steel, having extensions formed on them, to act as a dust and mud-protecting shield to the engine and gear box (see Fig. 17).

One of the novelties of the show is, undoubtedly, the new chassis exhibited by MESSES. LEA AND FRANCIS, LIMITED, of Coventry, this being quite a radical departure from what may be termed standard practice. The frame, which is of I section steel, has arranged in the fore part a three-cylinder horizontal engine, developing 15-h.p., at a normal speed of 700 revolutions per minute. The cylinder heads are at the forward end, so as to render the valves readily accessible. The latter are vertical, both the inlets and exhausts being mechanically actuated by a cam shaft on the top driven off the crank shaft by a longitudinal shaft and skew gearing. The cam shaft is enclosed in a casing hinged to the side shaft, so that it may be lifted up to give access to the valves, which are interchangeable, and with their seatings readily removable. The cylinders are 4 in. bore by 6 in. stroke. One of the features of the motor are the long connecting rods to the crank shaft, which is parallel to the rear axle. The connecting rods, which are no less than 28 in. in length, are claimed to ensure sweetness

Fig. 17.—The Darracq Pressed Steel Frame.

of running, and to reduce the friction on the cylinder walls by reason of the small angle of obliquity. Further, they enable the usual intermediate chain or gear drive to be dispensed with. The governor is adapted to act both on a throttle valve on the inlet pipe and on a supplementary air valve in connection with the carburettor. The ignition is on the high-tension system, while the water circulation is maintained by a pump driven by an eccentric, and a honeycomb radiator and tank; the latter is, we noticed, mounted on rubber pads, to ensure freedom from vibration. Lubricating oil is pumped into the crank shaft, which is drilled to allow the oil to get to all the bearings, including the big ends of the connecting rods, and to the gudgeon pins of the pistons. In the transmission mechanism further radical departures are also noticeable. The crank shaft is provided at each end with a fly-wheel, containing a friction clutch. Each clutch is mounted on an extension shaft, upon the other end of which is a sprocket adapted to receive the chain from a corresponding sprocket on a live rear

axle. In order that the special method of transmission may be clearly understood it is necessary to describe in detail the construction of the live axle, a section of which is given on page 1,000. This consists primarily of a nickel steel shaft, which is continuous from one wheel to the other. Upon one end of this shaft the off-side road wheel is keyed, whilst the near road wheel (subject to the control of the balance gear) is free to rotate upon the other end of the shaft. Surrounding the shaft is a tubular sleeve, B, carrying at each end a chain sprocket. The pinions of the spur balance gear are mounted upon the face of the near-side sprocket and engage a pair of spur wheels, one of which is keyed to the internal shaft and the other to the nave of the adjacent road wheel. The main roller bearings, D, in which the axle as a whole runs, are fitted between the tubular sleeve, B, and an outer tubular casing, E, carrying the rear springs. The design of the transmission gear is such that a direct drive is obtained on the two higher speeds. The side chains are independent of each other, and the power may be transmitted through either of them at will by putting one or other of the two friction clutches into action, these giving respectively the third and second speeds. Both clutches are provided with springs which tend to put them into engagement, and a single clutch pedal withdraws them simultaneously when operated by the driver. When this clutch pedal is depressed the control or speed lever may be moved, and its position deter-

Fig. 18.—Chassis of the Lea and Francis 15-h.p. Car.

mines which of the clutches shall come into engagement when the pedal is released. The low speed and reverse motion are obtained by means of a planetary gear between the friction clutch and the chain sprocket on the high-speed side. The teeth of this gear are always in mesh, but are idle when the car is on the high gear. The foregoing description will serve to indicate the general lines of the new design, and among the advantages claimed for it one of the principal is the efficiency of transmission. By the use of the horizontal engine a low centre of gravity is secured, and the makers claim to have eliminated the objections which are sometimes raised against this type of engine on the score of inaccessibility. Owing to the position of the engine it is unnecessary to provide a bonnet of the ordinary form, its place being taken by the footboard in front of the driver's seat. The axles of the road wheels are provided with roller bearings and ball thrusts, as are also the main bearings in the transmission gear. The chassis complete weighs about 16 cwt. Altogether the vehicle is a complete departure from existing practice, and its behaviour on the road will be watched with considerable interest.

Heavy vehicles for commercial and public service work form the striking feature of the exhibit of MESSRS. MILNES-DAIMLER, LIMITED. Two of the 'buses bear the name Great Western Railway, and represent

further additions to the fleet of vehicles which the Great Western Company are now running in districts not served by railways. One is a double-decker, accommodating thirty-four persons, and the other has accommodation for twenty inside passengers. Both are fitted with 24-h.p. four-cylinder motors, the power being transmitted through a clutch and gear box on to a cross shaft at the rear. On the ends of the latter are pinions

Fig. 19.—The Milnes-Daimler 'Bus for 34 Passengers.

engaging with internally toothed rings bolted to the rear road wheels. As illustrating the favour with which these vehicles are being received we may mention that the Milnes-Daimler Company are supplying six to the Great Eastern Railway Company, twelve to the Birmingham Motor Express Company, and four for a service between Brighton and Hove. The Hastings and St. Leonards Omnibus Company, Limited, who have six in use, one of which is illustrated herewith, have ordered four more, while the Eastbourne Corporation have ordered an additional three. A feature of the vehicles is the provision of wood wheels, each having two solid rubber tyres, side by side. In the delivery vehicle section are shown a 9½-h.p. lorry to carry 2½ tons, and a similar vehicle, fitted with a box van, to carry a ton, the latter being intended for the Furness Railway Company. Messrs. Milnes-Daimler's latest production is a delivery vehicle, the engine of which is adapted to use ordinary petroleum as fuel in place of the more expensive petroleum spirit. Of this type two lorries are shown, a 12-h.p. two-cylinder one designed to carry 3 tons, and one of 20-h.p., four cylinders, for 5 tons. These vehicles, as regards transmission, are on the same lines as the 'buses but are fitted with ball bearings throughout. We hope to deal with them more fully in a subsequent issue.

Fig. 20.—The Lanchester 18-h.p. Water-Cooled Car.

The LANCHESTER ENGINE COMPANY, LIMITED, have recently considerably increased the scope of their operations, as will be seen from the fact that in addition to 10 and 16-h.p. air-cooled types, two new models of cars, 12 and 18-h.p., with water cooled engines, are displayed. Two pumps are provided for the circulation of the cooling water; the radiator is fitted in front of the car, the steering rod having been placed forward of the axle

instead of behind, as in the 10-h.p. types. All the well-known Lanchester features, such as the worm-gear drive and special body suspension, are retained; while among new departures we notice that one of the cars is fitted with a special form of artillery wood wheel. A Lanchester car with artillery wheels has a somewhat strange look, so accustomed are we to the cycle-type wheels hitherto employed. Another point that we noticed is in connection with the mudguards; these are of what is known as the stream-line

Fig. 21.—The "Pipe" 12-h.p. Coupe.

type, they being continuous when the car is running. To allow easy entrance to the driver's seat, a part of the guard is so connected to the pivoted dashboard that as the latter is drawn forward the guards are raised into position and *vice versa*. Those motorists not conversant with the Lanchester system should make a point of visiting this stand, as it is one of the most distinctive in the show. Apart from the complete cars a special technical exhibit is staged, in which working models, actual dissected portions, are shown in operation. It includes a motor dissected to show all the internal organs and their functional operation. A rear frame (complete) and a rear frame (sectional) are exhibited, which give a complete idea of the construction of the worm transmission, balance gear, etc. These exhibits are so arranged that they can be turned round by hand so that the working of the parts may be examined. Special attention may also be drawn to a worm and worm wheel, which has been run 17,000 miles, and yet shows no sign of wear.

The "Pipe" cars are well displayed by the LONDON MOTOR GARAGE COMPANY, LIMITED, the exhibit including three types, 12-h.p., 15-h.p., and 20-h.p. The engine comprises four cylinders with mechanically operated inlet valves. Except as regards the clutch the "Pipe" cars follow the general lines of chain transmission vehicles. The clutch is of the Jenatzy magneto type, in which the engine is connected with the gear box by means of discs, which become magnetised and attracted one to the other when a current of electricity is sent through them. The current is furnished by a small battery kept charged by a dynamo driven off the engine, or can be supplied directly from the dynamo. There is no possibility of slip with this clutch, which, with but a light pressure on the pedal, makes practically a solid connection between the motor and the gear shaft. Fig. 21 shows the "Pipe" 12-h.p. side-entrance coupé, in which the engine is located under the driver's seat, the latter being hinged to give access to the motor. The car is exceedingly quiet in operation, and is equally well adapted for town as for country work. The London Motor Garage Company also have on view two of the 18-h.p. Mercedes cars, to the details of which no reference is necessary on the present occasion. Some of the cars on this stand are fitted with a new anti-skidding band to the tyres, known as the "Desclée."

THE BEAUFORT MOTOR COMPANY have an excellent array of the popular Beaufort cars, which for the 1904 season are being made in five sizes, ranging from 9-h.p. to 24-30-h.p. The latter is an entirely new model; it is a chain-driven vehicle having a pressed steel frame and four-cylinder motor, the cylinders being 110 mm. diameter by 125 mm. stroke. The valves are all mechanically actuated; while two ignitions, the Bergmann magneto and the high-tension system by coil and accumulators, are provided, both being advanced and retarded by one lever. A small four-way switch

is mounted on the dashboard, by means of which the two systems may be used together, or each separately, and all interrupted. Four speeds forward and a reverse are provided, while the driving wheels are shod with 920 mm. tyres. The other cars are of the cardan-shaft driven type, with live axle running in a sleeve extending the whole of its length. The 9-h.p. has a single cylinder motor, the 10-h.p. and 12-h.p. two, and the 15-20-h.p. four cylinders; all have gear-driven magneto and three speeds, in addition to the reverse. An illustration of the 12-h.p. Beaufort Princess side-entrance car is given in Fig. 22. The larger cars are fitted with a governor, which, in addition to controlling a throttle valve on the admission pipe, allows, when the latter is closed, fresh air to be drawn into the cylinders. The quality of the mixture can also be regulated by means of an adjustable cap on an air inlet on the dashboard leading to the carburettor. The brakes are of the internal expanding type; while on the 15-20-h.p. car we noticed that the steering pivots are now mounted within the hubs on the front road wheels. Altogether, there are many points of interest in the latest Beaufort cars.

The SIDDELEY AUTOCAR COMPANY introduce two new models to the motoring world, one a two-cylinder car of 12-h.p., with cylinders of 4½ in. by 4½ in., and the other an 18-h.p. four-cylinder car, with 4 in. bore and 4 in. stroke, built to their specification by the Wolseley Tool and Motor Car Company. With the exception of the engines, the main features of each of these vehicles are identical, so that the following particulars may be taken as applying to both. The frame is of pressed steel, strongly braced at intervals and strengthened by plate webs at the angles. The motor is located in the front of this, under a bonnet in the usual way. The cylinder jackets are of aluminium, and are cast in one piece with the top half of the base chamber, the cast-iron liners for the cylinders being forced into the aluminium casing. The top of the cylinders and valve pockets are a separate casting bolted on. Ample spaces have been provided for the water circulation, and the jackets of the head and cylinders are connected by outside pipes, so that there are no water joints in the cylinders proper. The crank-shaft has hollow crank pins, a small hole being drilled through each pin at right angles, so as to ensure thorough lubrication of the big end bearing. Both valves are mechanically operated by a single shaft on the left-hand side of the engine. The inlet valves are located directly over the exhaust, and actuated by means of vertical rods and tappet levers. The inlet valves are provided with a variable lift device, controlled by means of a small lever on the steering wheel. The water circulation is maintained by a gear-driven pump and a cellular radiator, these being so arranged that but short lengths of piping are required. The carburettor is of the automatic air-regulating type, a disc held by a spring being raised as the speed of the engine rises, and thereby admitting a further supply of air in direct proportion to the requirements of the engine. The governor is of the usual form and acts on a throttle of the pierced disc pattern between the carburettor and the motor. It can be put out of action by the usual foot accelerator. The combination of the automatic carburettor and variable lift of the inlet valve results in a very elastic engine, the speed of which can be regulated between 80 to 1,800

Fig. 22.—The Beaufort Princess 12 h.p. Car.

revolutions per minute, the normal speed being about 1,000. Ignition is on the high-tension system, the accumulator being located on the dashboard. Coming to the transmission, the power is conveyed through a large diameter leather-faced clutch. The connection with the primary shaft of the change-speed gear is by a universally-jointed shaft, so arranged that it can be detached without disturbing the gear. Four speeds and one reverse are controlled by a lever, which has a positive stop at each speed. The

change gear box and the differential, are all carried in what is practically one casing. The shafts run on ball bearings throughout, and are also provided with ball thrusts where required, this applying to the counter-shaft as well as to the two shafts in the gear box. The teeth of the pinions in the latter are one inch in width, the gear throughout being strong enough

Fig. 23.—The Siddeley 6-h.p. Car.

to take a much higher power than it will ever be called upon to transmit. From the differential shaft to the rear road wheels the power is transmitted by side chains. Both the hand and foot brakes are concentrated on the rear wheels, the pedal brake expanding inside the brake drums, and the side brake being of the ordinary external band type, provision being made for keeping the bands away from the rings when the brakes are out of action. The chassis of the 18-h.p. car weighs 14½ cwt., and has a wheelbase of 7 ft. 10 in. That of the 12-h.p. weighs about 3 cwt. less, and has a

| D Brake Band Clips. | I Brake Pivot Bracket. |
| E Brake Lever. | |

7 ft. 1 in. wheelbase. The Siddeley 6-h.p. two-seated car is shown in Fig. 23. The frame is of section steel; the motor is of the single-cylinder horizontal type, 4½ in. bore by 5 in. stroke, developing 6-h.p. at 800 revolutions per minute. The radiator is of the enclosed type, fitted with Clarkson detachable tubes, the case of the radiator forming the water tank,

and the whole fitted in the front of the bonnet. The water is circulated by a gear-driven slow-running pump. The transmission is arranged as follows:—A gear box is attached to the same brackets as the motor, to which it is connected by a chain and driven by a clutch on the first shaft of the gear box; from the secondary shaft of this gear box a chain runs direct to the rear live axle. The gear box is designed to provide three

Fig. 25.—Sectional View of Langdon-Davies Change-Speed Gear.

forward speeds and one reverse speed by means of sliding gear wheels in the usual manner. Three brakes are provided, two on the hubs of the rear wheels actuated by side lever, and one on the differential box worked by a pedal. In addition to the standard two-seated car, one vehicle of this type is shown with a landaulette body adapted for doctors' use.

The 1904 models of Argyll cars have already been fully dealt with in the *Journal*, so that we need only mention that the HOZIER ENGINEERING COMPANY, LIMITED, make a big display of the same on a stand designed to indicate the country in which they are constructed. Of the 10-12-h.p. two-cylinder cars a tonneau and a van to carry 15 cwt. are displayed, the latter having 3 in. solid rubber tyres. These cars are fitted with thermo-siphon water circulation, no pump being used; a new departure in this system is the fitting of the water tank and radiator in front. The 9-h.p. single-cylinder car is also represented, while a chassis and a coupé of the 12-14-h.p. three-cylinder type may also be inspected. This car weighs 16 cwt., and the makers claim to have got over the difficulty of tyre troubles by using 105 mm. tyres—a very large size for this weight of car. The largest, and one of the finest cars on the stand, is a 16-20-h.p. four-cylinder tonneau, with a body of walnut trimmed in red leather. The band brakes on the rear wheels of the Argyll cars are illustrated diagrammatically in Fig. 24. They are of the metal-to-metal type, and act equally well whether the car is running in a forward or backward direction. The brake drums, A, are made so that the centre disc forms the wheel flange, thus preventing the weakening of the spokes by drilling holes in them for fixing the drum to the wheel. The double-acting movement is obtained by the lever C, which is operated by the hand lever E through the rods F. The compensation action is secured by obtaining the brake brands through the bell cranks H.

The LANGDON-DAVIES MOTOR COMPANY, LIMITED, have on view the "Soames" delivery van illustrated on page 949 of our issue of the 6th inst. This is fitted with a 12-14-h.p. Aster motor, and is able to carry its full load of a ton at speeds up to 12 miles per hour. The transmission is by means of a cardan shaft on to a live axle. The friction clutch between the engine and gear box is of novel design; it is of the metal to metal type, and, contrary to the usual practice, runs in oil. Another feature of the vehicle is the change-speed gear, of which a working model is shown, and of which we give a sectional view in Fig. 25. As will be seen, the gear-wheels are always in mesh, and are locked to the shaft

Fig. 26.—The Change-Speed Gear on the Jackson Tourist Car. (See page 998.)

as required by interlocking jaw-clutches. When the clutch pedal is pressed down, it first releases the sliding clutch, then unclutches the wheel which happens to be in gear, and allows the selection of another gear-wheel by means of the handle x, which, in the van, is fixed in front of the driver. When the pedal is released and rises, the spring pulls the cam-shaft o, and, through the medium of one of the forks u, v, w, operates one of the clutches l, m, n. The clutch l engages the shaft k, giving a direct drive on top

speed. The pins and slots *z* on the rod *p* prevent the handle *x* from being moved, except when the pedal is fully depressed, and also prevent any but the selected gear from being engaged, the handle being definitely locked except when the pedal is depressed. The car can thus be left even with the clutch in, and all the change gears in the neutral position, without any danger of the car being started by any unauthorised person. The system is, of course, applicable to more than the three speeds and reverse as shown in the diagram. The makers claim that the system is such that a motor-van fitted with it can be safely entrusted, after a few days'

Fig. 27.—The Electromobile Single Landulette.

tuition, to a carman of ordinary intelligence, accustomed only to horse-drawn vehicles.

The MOTOR-CAR INDUSTRIES COMPANY display several of the "Jackson Tourist" cars, which have been improved in several details for the 1904 season. The engine is of the horizontal single-cylinder type of 8-h.p. and fitted with a heavy flywheel. The motor is coupled direct by means of a flange to the transmission gear, which gives two speeds forward and one reverse. The gear, which has been made much larger than last year, is still very compact, measuring over all 14 in. by 9½ in. A view of it is given in Fig. 26; on the top speed the drive is direct on to the sprocket, which, by a single chain, conveys the power to the rear axle. Combined with the change gear are two powerful band brakes. It is operated by means of one hand lever, which, in connection with the foot control on the mixture passage of the carburettor, will allow the car to be run at any speed from two to twenty-six miles per hour. The live axle is fitted with a spur gear differential in the centre, and runs on ball bearings. Altogether the car, which is made for both two and four passengers, should fulfil the requirements of those looking for a popular-priced vehicle.

ELECTRICAL EXHIBITS.

A new exhibitor is the N. S. ELECTRIC STORAGE COMPANY, LIMITED, who show a battery claimed to withstand the jolting associated with motor-cars. Porous diaphragms separate the elements and prevent the disintegration of the active material. This latter is of a hard and yet highly porous nature so that the cells can be discharged at high rates. The porous nature of the active material and separators secures that sufficient electrolyte is retained within the pores to allow the batteries to continue in action for some considerable time should it happen that a cell becomes fractured.

As usual, MESSRS. PETO AND RADFORD have a display of electrical ignition accessories, accumulators, terminals, protectors, etc. The distinct novelty shown is the "Energy" battery, which consists of a combination of a secondary and primary battery, which is outwardly similar to the ordinary type of accumulator, in celluloid case. There is, however, this essential difference, that there is one negative plate between two positive ones, the former consisting of a lead envelope formed by a couple of lead sheets so joined as to form a pocket. The battery is charged as an accumulator, but the negative plate having no capacity renders the voltage of the battery nearly zero after an hour's discharge. The battery stands, therefore, at zero, and no loss in current takes place. When current is required, a pellet of cadmium is dropped into the negative pocket in each cell; four volts pressure is then obtained instantly, and the battery is ready for use. When the cadmium is removed the battery ceases work. An obvious advantage of this plan is the facility with which the batteries can be conveyed without damage to the negative plate, while the current can be obtained for stated distances as desired. Further, the terminals will not corrode by electrolytic action when not in use, and when there is no cadmium in the negative plate it is impossible for a short circuit to occur, as the voltage of the battery is zero.

The ELECTROMOBILE COMPANY, LIMITED, display examples of their electric landaulettes (see Fig. 27), and coupés, a most comfortable vehicle being a victoria mounted on C springs. As is well known, the feature of these vehicles is the employment of a straight frame, the same as in a petrol car, enabling a low-built carriage to be produced. The Contal-Gasnier 8-h.p. electric motor drives the rear axle through spur gearing. The battery comprises forty-four cells, the capacity of which is sufficient for runs up to forty miles on one charge. The controller, the handle of which is mounted on the inclined steering column, is adapted to give five forward speeds, reverse, two electric brakes and stop.

The LONDON ELECTRO-MOBILE SYNDICATE, LIMITED, have a number of different models of light electrical cars, these including a two-seated runabout, a stanhope, a brougham, and a light van to carry loads up to 4 cwt. The vehicles are propelled by an electric series-wound motor located at the rear, and driving on to the back axle through centrally-

located enclosed spur gearing. The power is furnished by a battery of forty-two accumulators of the Hart type carried in the rear portion of the body, one charge being sufficient for a run of from thirty-five to forty miles on good roads. The controller is of the series-parallel type, adapted to give five forward speeds, two reverse motions, and two electric brakes. A pedal actuates a band brake on the rear axle. Steering is by means of a tiller or inclined wheel. Solid or pneumatic tyres can be fitted to the road wheels, which are of the artillery type. The "Lems" cars, as they are termed, appear to be especially adapted for doctors' use, and have already been adopted by several members of the medical profession. The runabout, with detachable brougham top, is designed to be driven from the inside, while the brougham (Fig. 28) is arranged for those who desire a professional driver.

GENERAL EXHIBITS.

In the Industrial Court the Palmer cord motor tyres, which were exhaustively described and illustrated in a recent issue of the *Journal*, are shown, the peculiar method of manufacture being demonstrated, and a mechanical arrangement having been set up by which it is possible to prove the resiliency of the tyre. It is extremely difficult to introduce novelties into the exhibition of tyres, but the PALMER TYRE COMPANY have succeeded in this. The NORTH BRITISH RUBBER COMPANY, LIMITED, have a full assortment of Clincher and Clincher-Michelin motor tyres, and also solid motor tyres, the merits of which are well known to motorists. Motor rugs are also among their exhibits, interest in which is increased by an assortment of motor coats and motor leggings. In thus associating themselves with the growing business in clothing for automobilists the North British Company have a wide field for their activities. At the next stand is the display of the DUNLOP PNEUMATIC TYRE COMPANY, LIMITED, which comprises tyres of all sections, valves, repair outfits, etc. The company have introduced two new sizes in motor-car tyres, viz.—100 mm. and 105 mm. In waterproof motor clothing the company is increasing its selection, and the "Autosacque" coat is of good material and equally effective design. The MARTIN PNEUMATIC TYRE COMPANY, LIMITED, are now giving special attention to square treads, especially for the driving wheels, and specimens of these for motor-cars are shown. Another tyre likely to be of interest is that shown by the WILLIAMS TYRE COMPANY. This is of the solid variety, and is so attached as to avoid all risk of creeping. A steel band runs round the rim and passes through the rubber of the tyre, being firmly secured by a steel screw. The rubber has a certain amount of play, the hole passing through it being slightly larger than the band. When compressed the rubber comes into contact with a flat surface, thus obviating all risk of cutting the tyre. In view of the discussion lately taking place in the *Journal* on this subject much interest is being shown in the Williams tyre.

Fig. 28.—The "Lems" Electric Brougham.

Somewhat isolated from the rest of the Exhibition the WILKINSON TYRE AND TREAD COMPANY, LIMITED, have a good show of tyres, treads, rims, and covers. It is claimed for the Wilkinson tread that it prevents side slip and protects the tyres from cuts and punctures on the tread. The price list issued by the company is made useful to motorists by the instructions for fixing covers, etc., and by the excellence of the illustrations. A useful display of motor tyres is made by MESSRS. W. AND A. BATES, LIMITED, in which non-slipping bands for motor-bicycles and "Cutcure" patches for the repair of motor-tyres are conspicuous.

The SELF-SEALING AIR CHAMBER COMPANY, LIMITED, has a good type of gaiter, consisting of rubber and canvas with a layer of wire gauze at the

edge, into which the eyelets or hooks are inserted to prevent any loosening when fastened. Several good examples of motor tyre repairs are also on view, while the "Hermetic" special motor solution has many points of recommendation. The special feature to which the ANDERSON MOTOR TYRE COMPANY, LIMITED, draw attention is their plan of vulcanising repairs to motor tyres, and several examples of its application are shown. The tubes are repaired from the inside in a way that is claimed to reduce friction with the outer cover.

The tailors are located together in close proximity, and it is clearly apparent from a glance round that the tendency towards the ordinary attire in motoring garments continues—a fact upon which all concerned may be congratulated. MR. C. R. BASE, whose removal from Chancery Lane, to Regent Street, W., we announced last week, makes a very good display, and seems to have made a feature this year of soft leather goods, including leggings and gloves. The leggings are of brown leather and can be folded up into a size to go into the side pocket of coat or jacket, while the similar pliability of the gloves is a point of commendation. Mr. Base has some good pony coats with ladies' caps to match, thus securing the interest of lady visitors in his stand. A new leather cap with a rear piece to go over the ears, and give a better appearance than the ordinary flap, is another speciality; while the combined boot and trousers, to go as an over-all protection in cold weather, is a further special feature of a display of all-round excellence. MESSRS. SAMUEL BROTHERS, LIMITED, show their "Dreadnought" motor coat and "Omne Tempus" raincloth cloth, both of which give them a favourable introduction to automobilists. MESSRS. SALSBUARY AND SON, LIMITED, have a display of "Komilfo" clothing, comprising every requirement of the motorist in the way of raiment.

MESSRS. HOARE AND SONS have a wide assortment in motorists' clothing in "all wool," leather and fur, and they have been able to demonstrate a practical acquaintance with the needs of drivers and passengers, in place of the theoretical lines upon which so many tailors depended in the early days. In the width of the skirt they have given their coats, the number and amplitude of pockets, and in general design Messrs. Hoare and Sons have deserved the attention of those who motor. AQUASCUTUM, LIMITED, have an interesting assortment of high-class clothing, to which their distinctive title has been applied.

MESSRS. A. W. GAMAGE, LIMITED, are devoting attention to their motorists' tailoring department, with a view of making it as thoroughly representative as is their accessories' branch. Cloth raiment is a feature in which they have some good designs, and the method of securing the collars of the coats by a lappel, which is part of the garment, instead of being an addition buttoned on, should be observed. Leather clothing for motor cyclists, as well as drivers of cars, is another extensive section of the display, in which furs, pony skins, etc., find a place, as well as some good combination garments, notably a rug and coat forming a serviceable piece of attire when the weather is inhospitable.

Among the well-known provincial carriage builders now devoting study to the production of motor-car bodies is the firm of MESSRS. HOLMES AND CO., who make a first appearance at this show with several examples of carriage work, including tonneau, brougham, and coupé bodies, characterised by a good bold design. MESSRS. HAYES AND SON are also showing bodies for motor-cars, giving particular prominence to a covered van body for delivery purposes. This firm are evidently intending to take an important place in catering for the requirements of the automobile industry.

Motor-car wheels are shown by MESSRS. SAVAGE BROS., LIMITED, and from Liverpool come MESSRS. JOSEPH OWEN AND SONS, LIMITED, with a fine display of bent timber and panel boards for motor-cars. The collection includes tonneau sides, wings, bucket seats, and other bends in walnut, birch, and canary white wood; birch and ash for the bottom boards and sides, hard ash for frames, etc. An assortment of bent hickory rims for felloes and cleft hickory and oak spokes is also comprised in a exhibit of much interest to those responsible for the carriage work of motor-cars.

The CAR AND GENERAL ASSURANCE COMPANY are taking advantage of the Exhibition to give publicity to their appointment in connection with the Motor Union, and to draw attention to their terms for car and accident insurances. At another stand the LAW ACCIDENT INSURANCE SOCIETY, LIMITED, call attention to their special insurances for motor-car owners, which include indemnities against seven of the risks associated with motor-car ownership. This insurance question is also being presented by the GENERAL ACCIDENT ASSURANCE CORPORATION, LIMITED, whose policies cover all risks incurred by automobilists. The EMPIRE KEY ASSURANCE COMPANY are busily engaged in making known the merits of their particular line of business to visitors.

The importance of aluminium in connection with the automobile industry is revealed by the BIRMINGHAM ALUMINIUM CASTING COMPANY, LIMITED, and by MESSRS. MILLS AND CO. The latter have an assortment of every kind of aluminium castings for motor-car work, while the Birmingham company show a complete range of castings for motor-cars, motor-cycles, etc., including their patent brazeless aluminium-jointed frames. Brass and aluminium steel castings are a feature of the display worth more than a cursory glance. The castings shown vary in weight from an ounce to a hundredweight.

MESSRS. ARMSTRONG, STEVENS, AND SON have a collection of well-finished tubular and honeycomb radiators, bonnets, tanks, carburettors, etc., as well as forgings and stampings illustrative of the facilities they possess for doing good work. Their bonnets are well designed, and filled with patent catches to prevent the rattling often associated with such

motor-car "millinery." Petrol tanks with protected gauges at the side are also shown, while the construction of the honeycomb radiators is on the best lines.

MESSRS. RUBERY AND CO. and MESSRS. W. BEARDMORE AND CO. make bold displays of frames for motor-cars. The latter firm show pressed steel frames for 12-h.p., 16-h.p., and 24-h.p. cars, all with hydraulic-riveted joints. Pressed steel sections and sections of rivet joints complete a display of practical value to makers, who will doubtless look forward to Messrs. Beardmore and Co.'s appearance at the Agricultural Hall Exhibition next month.

Specimens of solid steel stampings for motor-cars, both the lighter types of vehicles and those for the transport of goods, are exhibited by MESSRS. T. SMITH AND SON, OF SALTLEY, LIMITED. This firm have had half a century's experience of this class of work, and claim high merit for drop forgings or stampings in both iron and steel.

Motor-car chains are shown by the COVENTRY CHAIN COMPANY, LIMITED, in all sizes, from $\frac{1}{2}$ in. to $2\frac{1}{2}$ in. pitch, the attention of the trade being particularly drawn to the fact that the brushes are integral with the side plates. MESSRS. BRAMPTON BROTHERS show no less than seventy sizes and patterns of motor-chains, several of which can be seen on various cars in the Exhibition.

MR. H. S. EYRE shows a new "anti-skidding" device. This consists of a series of loops or bands of twisted steel wire, so arranged that when the wheel is in motion they revolve with it and gently come in contact with the surface of the road, having, however, no effect on the course of the wheel until a lateral or side-slip takes place. When this occurs the wire loops or bands fall consecutively under the tread of the tyre, thus offering sufficient resistance to compel the wheel to again assume a direct course. It is pointed out that the appliance cannot injure the tyre; in fact, it does not come in contact with it unless a side-slip takes place. When not required the appliance can be folded back over the hub, and another of its advantages is that it need not be removed to put on a new tyre or inner tube. The device has been tested at high speeds for some hundreds of miles on a 10-h.p. Panhard over the most variable condition of slippery roads, and we are informed that in no instance has a side-slip occurred when it has been in use.

In oil cans MESSRS. J. KAYE AND SONS, LIMITED, have a serrated oil can with a slide feed hole. The slide is operated automatically by merely opening and closing a hinged lid linked to the original slide. The feed hole is thus kept perfectly clean. The Economiser for storing oil, etc., is well known, and has been adopted by many motorists.

MESSRS. W. H. WILLCOX AND CO.'s display includes special qualities of motor lubricating oil and motor gear oil and greases. A number of appliances are also shown, such as the Willcox semi-rotary motor pump for circulating the water in the water jackets of motors; the well-known Penberthy automatic injector for steam motor-cars, a device designed to accomplish the extra duty required for feeding the boiler on motor-cars. Hose, motor cloths, belting, lubricators of all kinds, tools, etc., are included in this display, as well as a storage cabinet, which, adopted in the garage, will help towards cleanliness in storing lubricating oil, etc.

The "Quick-Grip" spanner and nut-gripping pliers is shown by MESSRS. A. G. TAYLOR AND CO. This is a useful little device for getting at nuts in awkward angles and positions. GARLIO—a well-known cloth for cleaning the bright parts of automobiles—is on view at the north end of the Palace, and its merits have won ample commendation from users. Among a selection of tools and appliances for general engineering and motor work on the stand of MESSRS. R. MELHUIS, SONS AND CO. will be seen a good tool kit as well as several minor fittings and accessories for use on cars.

MESSRS. G. T. RICHES AND CO. make a special point of the "Eisemann" high-tension magneto, which has been previously described in these columns. Their exhibits also include a new wipe contact, the parts of which are interchangeable, auto-tremblers, carburettors, accumulators, tool kits, etc. As an instance of the thoroughness with which Messrs. Riches and Co. cater for the requirements of motorists down to the minutest detail, we may mention that they are putting up split pins and spring washers in small boxes of assorted sizes.

The display of chronographs, etc., made by MESSRS. S. SMITH AND SON, LD., is of special interest to motorists, and we would suggest that the police authorities might also visit their stand with advantage to the cause of accuracy and truth. In motor timepieces are some good types, various patterns for adjusting to any position on the car being a conspicuous feature. The chief interest of the display, however, centres in the firm's improved speed indicator, which is guaranteed to secure accuracy despite any excessive vibration that may be apparent on the car. The indicator is made so that the indicating hand is driven from the centre of the dial, thus governing the entire circle for the spacing of the miles intervening from five to fifty. In the distinctness with which these are shown is an advance that should be appreciated. Uniformity of spacing is also another merit of the device. Upon the stoppage of the vehicle the indicating hand, which in action has no shake or back lash, returns to zero. The indicator can be set for wheels from 28 in. to 40 in. A rim of gun metal is bolted on to the inside hub of the wheel and a small fibre wheel is held friction tight by the employment of a strong spring, a flexible shafting being the connection between the instrument and the driving wheel of the car. In their latest indicator Messrs. Smith and Son, Limited, have achieved a decided success.

(To be continued).

OUR DIRECTORY OF "NUMBERS."

[ALL RIGHTS RESERVED.]

Below is a further instalment of Automobile Numbers. Motorists who have not yet communicated with us are invited to forward their Names, Addresses and Numbers.

Osborn, B. O., Halifax	C.P.	17
Paley Bros., 68, Newgate Street, Morpeth	X.	202
Parkhouse and Sons, Bedford Street, Plymouth	C.O.	3
Parkyn, D. Adamson, The Gerrards, Gee Cross, near, Manchester	D.B.	3
Pascall, J., Ltd. 100-101, Blackfriars Road, S.E.	A.	2066
Parsons, E. Hazeldene, Elburton Cross, Plymouth	T.	28
Paul, W. and Company, 87 and 88, Barrack Street, Colchester	E.F.	11
Pears, E. G., Aberystwyth	E.J.	6
Pilley, H. T., 9, Bargate, Boston	D.O.	6

CORRESPONDENCE.

SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Pneumatic Sick," it is all very well giving his opinion, which no doubt your readers will appreciate, but it is evident he has not tried the right puncture-proof band, as he speaks of heat bringing off patches. I should like, for the benefit of your readers and "Pneumatic Sick," to point out the "Cassell non-puncturable band." I have tried almost every so-called non-puncturable band on my 20-h.p. Wolseley, but with disastrous effects. I was, with a great deal of persuasion, induced to try the "Cassell," and I really feel it my duty as a motorist to say that the results have been most satisfactory. This band does not in any way interfere with the tube, and is also a preventive of heat reaching the same, consequently I have had no trouble with punctures since using it.—Yours truly,

A BELIEVER IN PNEUMATICS.

A SOCIETY OF AUTOMOBILE ENGINEERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice from your last issue that a Society of Automobile Engineers has just been formed in New York. Some time ago there was talk of organising a similar association in this country, but, so far as I can gather, nothing has been done, and hence the honour of forming the first exclusively motor-engineering society belongs to the United States. There can be no question that there is ample need for such an organisation, and that there is plenty of good work it could do. For

So far as my experience goes, with over a year's use of the "auto-trembler," adjustment is very quickly and satisfactorily made by putting on the switch (the trembler blade resting at some point of the cam surface and not in the notch), screwing up the platinum screw until the "auto-trembler" is heard to buzz, and then screwing back very slightly. This position must be confirmed with the trembler blade resting at various points of the cam. Otherwise, owing to tilting of the commutator (from some loosening), or to some slight irregularity of the surface of the cam, contact may be made at some other phase of the revolution of the cam, in addition to the contact made when the trembler wedges drops into the notch. This done, the binding screw is tightened up, care being taken to observe that this has not raised the platinum screw. "Pluvius" must be hard to please if he is not then satisfied with his ignition in all weathers, and with all positions of the sparking lever.—Yours truly,

A. O. 40.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Pluvius" letter on misfiring troubles, it may be of interest to him to know of a similar occurrence which happened to myself. As in his case, my engine would always misfire when the timing gear was in an intermediate position. After much trouble I eventually found that the cause was due to one of the wires short-circuiting by coming in contact with the frame, but when advanced or retarded the wire became removed, thereby giving good results. To all outward appearance the insulation was good, but, owing to the fact that the high tension return and low tension current passed over the one wire, the trouble occurred. This was always worse in damp weather than in dry, as in the case of

The Temporary Triumph of the Horse.

[Motor, New York.]

example, the subject of standardization of the various parts of motor-cars will during the next few years undoubtedly be one of the problems the motor industry will have to tackle. The question as to the advisability of adopting standards in any particular line, and what these standards should be, can only be discussed properly by the engineers responsible for the design of modern motor-cars.—Yours truly,

CORINTHIAN.

MISFIRING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had precisely the same troubles as those complained of by "Pluvius" with my Napoleon car fitted with a 6-h.p. De Dion engine. I attributed the misfiring to short circuiting caused by the road surface water being splashed up by the wheels on to the engine. I have twice been delayed on the road from this cause, once for two hours.

I have now had a shield fitted to the car running from the back of the change speed gear box right up to the under front of the bonnet board, and I have not been troubled since with misfiring although I have been out with the roads deluged with water. The screen is made of patent leather backed with canvas stretched over metal ribs attached to the inner frame, and is not expensive. I hope this information may be of use to "Pluvius."—Yours truly,

P. 74.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Pluvius" will save himself much time and worry if he connects an "auto-trembler" in the primary circuit of his De Dion car.

"Pluvius," and will undoubtedly aid him to discover the cause of his trouble.—Yours truly,

H. J. T.

MOTOR 'BUS SERVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are situated eight miles from railway station; between us and the station (Llanstephan, Carmarthen), lies a comparatively fine country road with one rather steep gradient. Hundreds of visitors come here during summer months; our village, being on the Carmarthen B.y., is considered a fine health resort. There is some talk of forming a company to run a motor 'bus service between the place and the railway station. Will any of your readers kindly give their opinion as to prospects of such a service?—Yours truly,

J. T. DAVIES.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be most grateful if any of your readers could help me with my Oldsmobile car. What I chiefly complain of is loss of power. It will scarcely take even the slightest incline on top speed, even with the acceleration full on; indeed, hills which a year ago it ascended easily with three passengers, on top speed, now, with only myself in, I have to take second speed, and some hills I cannot get up at all. I have done everything I can think of—ground in valves, new piston rings, new plug, new electric wiring, new gauge in carburetor.

rettor, also diaphragm in pump, changed my petrol, new air screen—in fact, done everything I know. Still there is no life in the engine; it seems as if, when the acceleration is put on, it actually slows the engine. It is well oiled, and each part runs easily. The sparking and valves are timed right according to the little book of instructions. If the roads are wet, as they mostly are now, it is with difficulty that I can get along the level at top speed. As I use the car in my practice daily, any help will be most gratefully received.—Yours truly,

M.R.C.S.

BENZ v. LIGHT CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being much interested in the letters now appearing in the *Journal* on Benz v. Light cars, and also solid tyres, I am wondering if any of your readers could give their experience with the more powerful Benz type of car, say from 5 to 9-h.p. I do not remember hearing of any trouble with broken back axles, etc., on these cars, and I know the 7-h.p. geared Benz is capable of a fair average. Such a car as this I should imagine to be what many prospective car owners are looking for, especially those living in the country, and who have to use their cars all through our English winter and over our country roads, which in my experience spell ruination to the best pneumatic tyre at present made, and in so short a time, if the car is heavy, that solid tyres on the drivers will, it seems, be cheaper even if they do slow the car somewhat.—Yours truly,

G. L. B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading the correspondence on this subject with much interest, and agree with "W. H. W." that the result so far is not very

Herr Ettore Bugatti on a German De Dietrich Car. He will probably drive a vehicle of this type in the German Gordon Bennett Eliminating tests.
[Automobil Welt.]

good. I have only had my Benz, a second-hand one, a month, but it has been quite long enough for me to find out that the power is insufficient for the car. On the first day that I had the car I saw, as "W. H. W." says, some great possibilities in the engine, so that when "W. H. W.'s" letter appeared it went to strengthen my humble opinion that the 34-h.p. Benz engine might be made somewhere about double that horse-power.

"W. H. W.'s" letter, however, is most tantalising to me, and, I venture to think, to many other owners of Benz cars. Could he not persuade the gentleman with the improved Benz to give a few hints for the benefit of brother Benzites? I am sure it would come as "a boon and a blessing" if he could.—Yours truly,

B. L. 309.

THE MATERIAL FOR PETROL PIPES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Regarding the query in the last issue of the *Journal* and a paper read before the Institute of Marine Engineers as to a "lead pipe being imperative for the conveyance of petrol in launches," I trust you will pardon me for pointing out that the task of condensing a lecture of some 11,000 words into a column of press matter had the inevitable result that a wrong inference may naturally be drawn from any incomplete and unexplained points. The report would have obviated misconception had it read that "the author would like to make clear that a lead or a copper pipe should always be used, as the chemical components of petrol occasion rapid disintegration in an iron pipe, which ferrous matter, when set free and intermingled with the petrol, seriously reduces the efficiency of carburation, especially in the marine type of vaporiser."

It is no use heavily galvanising the bore of an iron pipe without galvanising the threads of the nipples which connect it, which is scarcely feasible, and if brass nipples be used galvanic action results. Neither iron, block tin, nor brass (even though the latter be solid drawn) should be used, copper and lead being the only metals which, while resisting chemical action, will also "give" under the tensile, compressive, and lateral stresses which are factors to be contended with in any type of craft afloat. The lecture referred to is being issued conjointly with the catalogue of my company, and should your correspondent or any gentleman taking up marine motoring desire it, I will send him a copy immediately the same are out of the hands of the printers.—Yours faithfully,

O. SUMNER.

WHAT IT COSTS TO KEEP A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. T. W. Moorhouse's letter in your issue of the 13th inst., below I give you what it has cost me to drive a 5-h.p. small car for 8½ months:—

	£	s.	d.
Petrol	4	10	7
Lubricating oils	11	0	
Paraffin	2	6	
Spare parts	1	12	8
Charging accumulators	4	0	
New rubber piping for water	3	0	
Repairs (overhauling) by makers	1	18	3
Cleaning	1	6	
Solution	9		
Lamp wicks	4		
Grease	10		
Re-rubbing 2 tyres (bands fitted)	2	10	0
Repairs to accumulator	10	6	
Brushes, sponge, wash leathers, etc.	7	6	
Metal polish	6		
Having outer cover fitted	1	6	
Repairs to inner tube	6		
Two punctures mended	2	6	
Garage (storage of car in daytime)	3	15	6
	£16	13	11

I have driven 2,700 miles and use the car every day to take me to my business and back. Out of the above mileage about 500 miles have been done with only one up, about 300 with three up, and the remainder with two up.

As I do all the cleaning myself and the bulk of any small repairs that have been needed, this accounts for the smallness of these two items, especially the former. The car is an English-made one throughout, but, although I have no interest in the firm who made this, I am connected with the trade, and so have been able to get any repairs to tyres and spare parts at trade price. Petrol has cost me on an average 1s. 5d. per gallon. The above cost and mileage are arrived at from a careful account I have kept from the day I purchased the car.—Yours truly,

AN EVERYDAY USER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps my experience may be of interest to T. W. Moorhouse, who asks for information on the above in the *Journal* of the 13th inst. In May last I purchased a new two-seated car with detachable back seat, single-cylinder, 6-h.p., two speeds, magneto ignition and pneumatic tyres. I then knew absolutely nothing about running a car, had a practical man to drive me, and spend a few hours with me, then took the car home myself, and have driven it nearly 1,400 miles since without a hitch or spending a penny for repairs—except a trifle for "patches." I had a little trouble at first with valve sticking owing to over lubrication, and with nipped inner tubes, all of which I was able to put right. I look after the car entirely myself, and am careful to see that everything is "all there" before starting out. A gallon of petrol runs well on to forty miles, and lubricating oil and grease cost about sixpence per hundred miles. The car practically takes the place of a pony and trap, and I find it infinitely preferable in every way.—Yours truly,

T. 74.

PARAFFIN v. PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Cycle Mechanic," whose letter appears in the *Journal* for the 6th inst., may be interested to know that the calorific value of ordinary petroleum is stated by a well-known authority, whose name I cannot for the moment call to mind, to be 18.5 per cent. greater than that of gasoline of .650 specific gravity. The calorific value of hydrocarbons used in heat engines does not necessarily vary as their specific gravity, and, to answer your correspondent's question correctly, it would be necessary to experiment with the two fuels named.

When testing, some time ago, a vaporizer designed by myself for heavy

spirit, I found that an engine making 800 revolutions per minute with petrol increased its speed to over 900 with paraffin, the same quantity of carburetted air or mixture being admitted to the cylinder; the throttle, placed between the vaporizer and inlet valve, not having been touched. This increase of speed was accompanied by a change in the sound of the explosion. The spirit used was Pratt's 880, which I think always gave good results. I am unable to state the quantities used in a given period. I may say that on this occasion no heat whatever was used with the heavy oil, and the carburation was of course imperfect.—Yours truly,

J. GILBERT GITTO.

THE REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just been looking over the letter of "Chirurgeon" on p. 932, and really I cannot see that the charges are glaringly exorbitant. The items £3, £1 2s., and £3 7s. 6d. seem if anything to err slightly on the wrong side, but this might be easily accounted for if the exact nature of the particular jobs were known. I notice that no less than four of the items quoted by "Chirurgeon" are for "time." We may, therefore, safely conclude that "Chirurgeon" considers 1s. per hour an exorbitant charge for time. Let us consider this for a moment. Suppose "Chirurgeon" gets the local joiner to send a man along to his surgery to put up a few shelves, or suppose his gas leaks, and he sends for a plumber, who comes and moons round for half a day, he will find that he is charged 1s. per hour for the services of these men. Now I do not think anyone will contend that the same amount of skill, intelligence, and careful workmanship is demanded in the above two jobs as is required in the repair of a motor-car.

It would seem, therefore, that 1s. per hour is a very reasonable charge indeed—particularly when it is remembered that a competent mechanic will get 10½d. to 11d. per hour, thus leaving the repairer only 1d. or 1½d. per hour for himself. With regard to the question of charging for the use of engine and lathe, of course it is customary to charge for these, though it is not generally entered as a separate item. The time is usually charged at such a rate as to include it. Engines and lathes have to be bought, there is expense connected with their running, repairs are needed to them, and perchance there comes a day when they are beyond repair and have to be replaced by new ones. In addition to this, they have to be housed, and this means rent, rates and taxes. It is very evident, therefore, that the repairer who only charges 1d. or 1½d. per hour profit on his men's time, and throws in the use of machinery, etc., free, is working his business at a loss. If a repairer charges his customers 1s. 6d. per hour, there will be very little left for himself after paying his mechanic 11d. per hour, paying 1d. per horse power per hour for gas engine, and writing off an allowance for interest on capital, depreciation, rent, rates and taxes.

As I have spoken from the repairer's point of view, I think it is only fair to state that I am not trading as a repairer. I, however, do all my own repair work, and can testify to the careful and painstaking work involved and the apparently great expenditure of time over what may seem only a small job, if only the work be honestly done.—Yours truly,

B. T. O.

STEAM v. PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would be very much obliged if you or some of your readers would be kind enough to inform me with regard to steam versus petrol cars, as a friend of mine intends going in for one, and would like to have some idea as to which would please him most. I am inclined to favour a steam car, which burns paraffin as fuel. The steam-car may be more complicated and a little more expensive to buy, but not in fuel, as petrol costs about three times paraffin, and it is not in every village that petrol is to be obtained. Other advantages are the absence of ignition troubles, vibration, noise, or smell, but surely the petrol cars must have some great advantage, as they are seemingly so numerous compared with steam-cars. I don't claim to know very much about either of these cars, but in the case of long-distance running this extra price of petrol soon adds up, and I should think that the continual vibration in the petrol car is bound to affect the mechanism in some way. How often do we hear of ignition and accumulation troubles? I therefore think that the petrol car is far more expensive to keep up, not so reliable, and consequently not so much pleasure to be derived from them as the steam car. It seems that the purchaser of a car does not mind its first cost so much as the expensive upkeep and want of reliability.—Yours truly,

SEARCHLIGHT.

HOTEL CHARGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much amused by the letter appearing in last week's *Motor-Car Journal* headed "Hotel Charges." The last item mentioned by your correspondent ought not to appear, as it is quite optional, as he states; some people might give half-a-crown and some nothing, according to the attention received. The only item I think too much is the charge for garage, and this is presuming car was not cleaned.

I have been all round the south and east coasts, and through the Midlands, and if I had been supplied with the articles quoted by your correspondent, I should certainly expect to be charged, at any first-class hotel, as much as he paid, and should not consider I had been unfairly treated. If I desired anything less expensive I should avoid first-class hotels, and patronise a temperance hotel or coffee tavern.—Yours truly,

ONE WHO PAYS A FAIR PRICE.

EXPERIENCES WITH THE PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of January 30th some correspondence re the Trusty carburettors. As sole agent for these, I hope that you will in fairness allow me to reply to same. I would first remark that these carburettors are fully guaranteed, and are taken back unconditionally on receipt of proof that they will not work. A carburettor can be generally seen at my address at work, and, before purchasing, Lieut. Windham saw one of these carburettors in operation, and examined many others. Whether Lieut. Windham was satisfied may be best judged by the fact that he applied to the maker for some form of agency, and the application was in due course forwarded to me. In order that you may judge if Lieut. Windham's censures on the workmanship are correct or not, I am sending you an ordinary 4-10-h.p. carburettor, which is exactly similar to that bought by Lieut. Windham. I shall be pleased if you will examine and test the same.

These carburettors, if fitted and used according to the simple directions given, cannot fail to work with paraffin or petrol perfectly. A very large number has been sold, and plant is being laid down to manufacture in large quantities, as the present demand exceeds the supply. The only complaints ever received were traced to imperfect fitting by unskilled persons. This would, no doubt, explain Lieut. Windham's trouble, but as he has not yet returned his carburettor it is evident that it cannot be so bad as he states. Had his carburettor been fitted to directions, and he had taken a few hints as to its management, he would have had no trouble. I notice also, in the same issue, a letter from a Mr. Clifton, who has one of these carburettors running satisfactorily on a stationary engine.—Yours truly,

DAVID G. SMITH.

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing in your *Journal* the letters about drivers, allow me to say I think it is the fault of the owners if they do not get good English drivers. Owners of cars take notice of the following kind of advertisements, viz., "Chauffeur, mechanic, wants situation; can speak French, Dutch and German; wait at table, and can do gardening; wages £1 per week." Is it possible that this genius can do these things properly? If he is a good mechanic, as he is supposed to be, he could earn twice as much money in a mechanic's shop. There are other cases where a gentleman gets a good driver, but if anything goes wrong with the car the driver is always blamed. The owners should understand their cars, and let the driver be a driver and not an odd man.—Yours truly,

H. W. T.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the letters which have appeared in your *Journal* lately regarding the scarcity of good drivers. But, from my experience, there seems to be a scarcity of good berths. I am well up in most makes of cars and have had a large practical experience in driving and repairs of all kinds, from adjusting a trembler to taking down engines and gears and fitting new brasses; can also do brazing and use a lathe. Yet I have advertised for a private job in several papers and answered advertisements by the score, but am still out of a berth. Some of the replies I received were to look after a car and act as valet, and wait at table. One was to help in garden, and the wages offered were from £1 to 30s., yet the advertisements were for a good driver able to do own repairs. I have

PONS ASINORUM.

(Reproduced from the novel poster issued by the makers of the Ascar Cars.)

heard of owners grumbling at the charges made for repairs at garages, but I think it is a wonder there is any part to repair, if this is the class of mechanic they employ. In my opinion, if an owner is willing to pay a decent wage he will have no trouble in getting a good all-round man who will take a pride in the appearance and sweet running of his car.—Yours truly,
PLUG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a driver, my experience is:—Mostly the paid driver is not a mechanic, therefore, is not keenly interested in tackling breakdowns, etc.; does not take his calling seriously; is too young for the responsibility and temptations many chauffeurs have to face. Many drive to the annoyance of other road users, put undue strains upon engine and carriage and have a keen scent for coin. All this bears upon the discussion, as it puts owners to greater expense in upkeep of car and naturally makes them more exacting. To owners I would respectfully point out that if a youth of eighteen or so is not considered old enough to manage a first-class brougham and pair, he cannot be old enough to drive a valuable car. To drivers I would simply say—Study your master and he will study you; in his own interest he will treat you well if he has a grain of wisdom, and your work will be the more pleasant for the confidence and friendliness of your employer.—Yours truly
G.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note your remarks, and also those of Mr. Edge, and I agree with both. The question is rather a serious one, and one that should have greater attention both from car makers and car owners. To be a car driver a man must not only be able to hold the wheel and drive the car when in good order, but he should know how to keep it so. I maintain that a

A Cadillac Car carrying 16 passengers up a gradient of 1 in 7.

modern made car, in the hands of a driver who has learnt how to drive in the true sense of the word—with the exception of unavoidable accidents—would rarely fail when it was wanted, and the cost of upkeep would be much less than now, and the motor-car would, I think, be much more popular.—Yours truly,

H. BURNELL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I, as a driver-mechanic of over twelve years' experience, give my opinion on this subject? Will the gentlemen who state that there is a scarcity of good drivers ask themselves this question, "Can I get a good man for a bad wage"? The question is what constitutes a good man? My opinion is a man who can replace any part of the machinery that has been broken or become defective, adjust bearings, find a short circuit, or anything else that may be required. This class of men do not make the excuse, "Please, sir, the car can't go out, the engine won't start." These men do not take a car to the repair shop for every trifling job. These men save owners a good deal of money in the long run, in spite of their so-called high wages, which I fail to see; surely if employers in shops pay the wage, the private gentleman ought to, in fact, pay more considering the man's lost comforts. May I ask gentlemen, when next visiting a works or repair shop, to ask the foreman how long it takes a man to become a good mechanic. His answer will be at the least six to seven years. I appeal to owners not to blame the car because it is always at the repair shop. Get a man who can do his work. Above all, beware of the certified driver who has had two or three lessons round the park at so much a time and is turned out as a certified motor mechanic and driver. Employ men

who can show a reference as fitters as well as character. Then you will find a difference in both breakdowns and repair bill.—Yours truly,
E. E. M.

DRIVERS.—Communications addressed to several of the writers of letters re drivers have been forwarded.

LINON CARS.—Replying to Mr. James Robertson, the maker of the Linon cars is M. Linon, Ensival, near Verviers, Belgium.

PICRIC ACID AND PETROL MOTORS.—We have a letter from "O. J. C." on this subject. Our correspondent has, however, omitted to send his name and address.

LAMP FOUND.—The motorist who dropped a tail lamp in Avenue Road, Regent's Park, on Sunday, January 31st, can have the same on application to Mr. E. J. Morris, 137a, Finchley Road, N.W.

CONTINENTAL TYRES.—Replying to "Phono," an 820 by 90 inner tube cannot be used with a 760 by 90 tyre. The circumference of an 820 mm. tube is too large, and would not fit properly into a 760 mm. cover. He would only experience trouble in doing so.

STEAM WAGON v. HORSES.

AN interesting comparison of the cost of carriage by a steam wagon as compared with horse-drawn vehicles is furnished by Messrs. Witherington and Sons, of the Sonning Flour Mills, Reading. This firm have in use a five-ton Foden wagon, and have kept a record of the working expenses for the past year, which is given below. During 1903 the vehicle ran 5,275 miles, carried 3,870 tons, burnt 4½ tons coal, at a total cost of £380, including interest on the prime cost of the wagon, and also depreciation. The separate items are as follows:—

ONE STEAM LORRY IN 1903.

	£	s.	d.	£	s.	d.
Wages:—						
Driver at 35s.	91	0	0			
One man at 26s.	67	12	0			
				158	12	0
Repairs				44	7	0
Oil				16	12	10
Coal, 4½ tons				49	0	0
Insurance				11	18	0
Interest on cost				25	0	0
Depreciation				70	0	0
Incidentals				4	10	2
				£380	0	0

SEVEN HORSES IN 1902.

	£	s.	d.
Horse Food	271	0	0
Wages:—2 Carters at 24s. a week	124	16	0
Shoeing Account	30	14	8
Veterinary Bill	8	10	6
Repairs:—Vans and Harness	11	2	9
Interest on Capital:—			
7 Horses at £50, £350; 2 Vans, { £400 at	20	10	0
Carts, etc. £60 { 5 per cent.			
Depreciation on Horses, Vans, etc.	50	0	0
Incidentals	3	6	1
	£520	0	0

Messrs. Witherington worked the motor-wagon 301 days in the year, and state that it has done the work of seven horses, which they sold when they received the automobile.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, FEBRUARY 27, 1904.

[No. 260.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Agricultural Hall at "merrie Islington" is now given up to the display of the equine, and the snorting of horses heralds the coming of the motor-car to the same Hall in three weeks' time. Some enthusiastic lover of the quadruped has declared with glee that the popularity of the horse is on the up grade, supporting this assertion by the fact that this year's entries at the Horse Show total 862 as compared with 680 last year. That is true, but he ignores the fact that the entries in 1902 were 860, this year's figures showing an increase of only two. At the same time we would point out that the Horse Show entries afford no means of comparison as to the respective popularity of the horse and motor-car.

Improvement in the Equine.

As a matter of fact the coming of the motor should make the Horse Shows more popular than ever. The automobile will displace the horse to a large extent as a beast of burden, and the result will be to cause owners to prize more than of yore the horse as a means of pleasure in riding and hunting. The tendency is to improve the race in thoroughbred classes—a fact which is proved by the increased membership of the societies devoted to the horse, and the considerably enhanced prices that have lately been asked for first-class animals.

Parliamentary Motorists.

EVERY week adds to the list of Parliamentarians who motor, and the death of Lord Alington raises to the Upper Chamber the Hon. Humphrey Sturt, M.P., whose car was on show at the Crystal Palace exhibition last week. The Hon. James Hozier, M.P., too, is a motorist, and our Directory is bringing out the names of several others. Away at Brighton, the Premier has been recuperating as the guest of Mr. Arthur Sassoon, and has been enjoying some delightful motor-car trips along the coast and among the famous Downs.

Airships.

In his paper on aeronautics and ballooning at the Automobile Club last week, Mr. Pollock gave an interesting resume of the history of ballooning since the days of the brothers Montgolfier, who first ascended in a fire balloon in France in 1783. Dealing with the question of airships, Mr. Pollock expressed the view that the airship of Mr. Beadle, which will be seen at the Aero Club's Exhibition at the Agricultural Hall in March, has many good points which should commend themselves to those who intend in future to take their pleasures among the clouds.

A Huddersfield Centre.

THE process of decentralisation has begun in the Yorkshire Automobile Club, and the Huddersfield centre has been inaugurated under the chairmanship of Mr. J. Crowther, who has also been elected a vice-president of the Yorkshire Club. The hon. secretary is Mr. Gordon Learoyd. The

centre is entirely self-governing, and is affiliated to the A.C.G.B.I. and Motor Union through the Yorkshire Club. The members of the new centre have all the benefits of the county club, and by this means it is intended to make the nucleus of a powerful and live organisation in the "broad county." Already about fifty new members have been enrolled.

County Arguments.

HITHERTO it has been freely surmised that the title "Yorkshire" club was rather a comprehensive one: seeing that the membership was confined to Leeds, and that Halifax, Sheffield, and York have each their local clubs. Yorkshire is so peculiarly situated that there seems no reason why the idea of local centres, each self-governing and wholly self-contained, should not be formed as branches of a powerful organisation for the whole of the county. Each district would probably seek representation on the central committee; but that is a detail. The idea of a Yorkshire County Club thoroughly identified with every district of the White Rose is worth discussion.

Stubborn Attitude in Wales.

THE Newport Watch Committee has proved itself intractable, and has declined to accede to the wishes of motorists in Wales, as expressed through the South Wales and Monmouthshire Club. It has decided to propose that the speed of motor-cars be restricted to ten miles an hour within the borough, and, despite the protest of the local automobile organisation, has now agreed to persist in that recommendation to the Local Government Board. In view of the conciliatory attitude adopted by the authorities at Deal, Dover, and elsewhere, who, having contemplated making this restriction, subsequently withdrew it on representation being made by local motorists, this attitude of the Newport people seems strangely prejudiced against the advance of automobilism. Fortunately, however, the Newport folk are in an insignificant minority so far as this restrictive regulation is concerned, and we yet hope that the Local Government Board, bearing this circumstance in mind, will be disinclined to accede to any suggestion which will give the town an unpleasant name among motorists.

No. B.B. 1.

THE illustration on the next page of a 10-h.p. "Wolseley" car, belonging to Mr. W. Dunn, of Newcastle-on-Tyne, was taken on the completion of a journey from Newcastle to London which was made by Mrs. Dunn, accompanied by her daughter and chauffeur. Starting at nine o'clock on a Thursday morning, they made excellent running, the car averaging over 20 miles an hour. On that night the party stayed at Newark, and continued their journey on Friday, reaching London about five o'clock in the afternoon. There was no attempt at high speed throughout this run, which was undertaken by Mrs. Dunn, who wished to join her husband in London, and it is significant that no thought of travelling by rail was entertained, the car being taken as a matter of course for the long journey. Mr. Dunn is himself one of the pioneer motorists in England, having been the possessor

of one of the first Benz cars introduced into this country by Mr. Hewetson. He has since driven various makes of cars, and has a rich store of experiences to tell of his adventures during the early days of motoring. It is only fitting that he should have been given the coveted No. 1 license for the Newcastle district.

Mrs. W. Dunn on her Wolsley Car.

In New Zealand.

FROM correspondents in the colony we learn that the prospects of automobilism in New Zealand are very bright, both roads and climate accommodating themselves to the conditions of automobile traffic. There are motor-car clubs in Auckland and Christchurch, and cars are fetching fairly substantial figures. During the past two seasons a large number of American motor-cycles were imported, but do not seem to have given general satisfaction, with the result that a prejudice against such automobiles has been created. The advent of more reliable machines will, however, remove that.

[Motorists in the Colony.

SEVERAL motorists at Auckland own motor-cars, and have lately been taking trips into various parts of the colony. Dr. A. C. Purchas, on his 12-h.p. Darracq, has had a run to Rotorna through the Waikato—a difficult road, seeing that it has not been metalled, and that it is badly graded. On a Locomobile Mr. W. T. Gilmour toured the Waikato and Hot Lakes. Mr. H. Butcher, of Napier, has been touring at Rotorna, and amongst others who motored at Christmas were Mr. Humphrey Haines, who achieved the feat of making an ascent of Ngongotaha Mountain on his car. Mr. H. P. Barry visited Tauranga, breaking the record between there and Waihi. Arrangements were being made when the mail left for a camping-out party to be inaugurated by a meet of the Auckland Automobile Association on the 25th inst.

The Caravan Restaurant.

To the popular fancy there was much that was gratifying in the "Caravan" restaurant shown at the recent Motor-Car Exhibition by a company which intends to put the idea to a practical test at the next race meeting at Kempton Park. The "restaurant" is a glorified coffee stall, but, instead of the solitary ass or dejected equine usually engaged to draw the peripatetic commissariat from place to place, there is a modern automobile, the body of which forms a large restaurant, from two sides of which people can be served with steaks fresh from the grill or water aerated on the premises. The employment of the superheated steam from the engine will ensure a

constant supply of hot water, and will also constitute an economic form of obtaining heat.

Breakfast while you Travel.

THIS combination of the automobile with the kitchen and the restaurant should prove a capital innovation wherever large numbers of people are drawn together, and at race meetings, popular demonstrations, and the like, the motor-caravan ought to become a regular feature. Half a dozen of the huge machines are already on order, and, should the notion prove acceptable to the public taste, the adaptations of the idea are endless. Just as the traveller by rail now takes his luncheon or dinner "on board," so the business man of the future may be expected to have his breakfast while running up to town by the public motor-car service.

Cases Dismissed.

ALTHOUGH the long list of cases of supposed and actual furious driving no longer appears in our columns, due notice will be taken of instances where harshness appears to have been indulged in by the Bench. Where magistrates recognise the evidence on both sides to such an extent that acquittal is the only result, we propose to make a record for the benefit of other motorists similarly circumstanced. Hence the heading of "Cases Dismissed," begun on another column of the present issue, should be of tangible service.

London's Motor 'Buses.

LONDONERS have lately been interested in the peregrinations of a motor 'bus with "Kilburn and Marble Arch" conspicuously painted on the side. This is one of a fleet of eight which the London Power Omnibus Company is putting upon the road between Brondesbury station and the Marble Arch. It is the intention of the company to give a frequent service of half-a-dozen motor-omnibuses between these points. The vehicles are made by Messrs. Stirlings, Limited, upon their well-known lines, and will carry fourteen passengers. It is thought that being without seats on the top will facilitate the rapidity of the service by obviating the comparatively long waits which are caused by passengers descending or ascending the steps of the ordinary 'bus.

An advance has been made in having the windows removable, thus giving a much-needed circulation of air through the vehicle.

Good Wishes for Success.

COMFORT and absence of the jolting usually associated with London 'buses has been secured, and the general appearance of the vehicles is decidedly favourable. Evidently this experiment may be regarded as the first really important tackling of the problem, and all interested in the development of automobilism as well as the transit questions

that occur in every modern city will wish well to the undertaking, which has established its garage at Salisbury Road, Kilburn:

The Car and the Cow.

WHEN asked as to what would happen if a railway train ran into a cow, George Stephenson remarked it would be "bad for the cow." It is similarly unfortunate for the animal when collision occurs with a motor-car, as has just been demonstrated by an animal belonging to a Patcham farmer which assaulted, or was assaulted by, a car which was being driven by Joseph Maris Leon Olivier. The latter was charged at the Hove Police Court with driving a motor-car "in a manner which was dangerous to the public"—the public in this case, apparently, consisting of a cow. Despite the fact that the defendant was represented by Mr. Staplee Firth, the magistrates convicted Olivier, who was fined £5 and £1 costs.

On the Land.

A GROWING feature of automobile exhibitions is the way in which the motor-car is being adapted to the purposes of the land. The "Ivel" agricultural motor attracted visitors into the corridor at the Palace, where heavy vehicles were stationed, who would not otherwise have found their way to a place so difficult to discover. Then, in addition to the eastern counties firm, whose lawn motors have been conspicuous at exhibitions, came a Leeds engineering company, also with a petrol lawn mower of good design. This will be found at the forthcoming Agricultural Hall Show, along with several kindred ideas, all tending to prove the universality of the automobile when it has surmounted prejudice and broken down the barriers of vested interests that now fear loss should it gain general favour.

Alas, poor Jarrett!

SERGEANT JARRETT has lost a case and is to be commiserated with. Under the old regime his word was a law unto itself, and no Surrey magistrate would fail to convict when Sergeant Jarrett gave evidence against a motorist. "What I have said I have said" might be his motto, and the confidence which the magistrates reposed in his judgment was simply colossal. But times have changed, and on Saturday his declaration that a motorist was going at twenty-five miles an hour fell upon doubting ears—or rather the magistrates recognised that there was a possibility of even the redoubtable Jarrett making a mistake. They were not satisfied that there might not have been an error in the case on account of the small margin between twenty and twenty-five miles. What comfort for motorists in that view. We thank Sir W. Chance for his sensible attitude, which will come as a healing balm to many an old victim of Jarrett's watchfulness.

Our Artist's View.

BUT should the magistrates fall into a disbelieving mood with regard to the police, and should they begin to give credence to the evidence of motorists, the system of promotion will have to be revised. Somehow or other our artist has got hold of the idea that this has previously been associated with motor-car cases, hence his sketch on page 1028; on what basis will it be arranged if this is no longer possible?

The Irish Service.

ALTHOUGH it is about a year since the Pirrie-Iveagh transit scheme was given newspaper publicity, little has lately been heard of the plan, and nothing has been seen of the vehicles. The promoters of the project have, however, been working quietly in their own way, and Mr. W. J. Pirrie has just informed Captain Donelan, M.P., that they hope shortly to commence in a few isolated districts and then extend their ramifications as rapidly as the utility of the services is demonstrated. In view of the

condition of the country, the sooner the motor service is in actual operation the better will it be for the general prosperity. The subject was mentioned in the House of Commons on Tuesday, when Mr. J. F. X. O'Brien moved a resolution asking Parliament to say that "excessive railway rates and defective transit facilities generally constitute a serious bar to the material advancement of Ireland, and should receive immediate attention from the Government." The Chief Secretary for Ireland, in his reply, said that two cardinal difficulties obstructed the application of motor traction in Ireland, the first being the speed limit and the weight of the "trailer," whilst the second lay in the condition of the roads. The Local Government Board, announced the right hon. gentleman, were prepared to increase the speed limit to ten miles, the weight of the motor vehicle to four tons, and the weight of the trailer to a ton and a half. This, however, he added, with the ready assent of the Irish Nationalist members, must be subject to arrangements with the county councils of Ireland. Transit developments would not be confined to the railways, although the object should be to induce the Irish railway companies to pluck up courage and co-operate in the common task. Altogether about a score of routes will be suggested for the collection of agricultural produce by motor vehicles.

Mr. T. A. Edison and his Electrical Car.

Confusion Inevitable.

RECENTLY we mentioned a case in the North of London where confusion arose as to the number on a particular car, and expressed the opinion that such instances would be frequent under the new regulations to which motorists are now subject. Our attention has just been called to a similar mischance which has happened to the Baron de Barreto, who was visited the other day by the inspector of the police at Fakenham. This gentleman threatened to charge him with driving his motor-car, number A.H. 9, without a light at 9.30 p.m. on February 11th, within the Metropolitan police area. Now, it so happens that the Baron was not in London on that day, neither is he possessed of a car located in the capital, nor have any of his automobiles, numbers A.H. 8, A.H. 9, and A.H. 10, ever been in the metro-

polis. It is therefore apparent that a serious mistake was made by the police authorities, and we record it in order to emphasize the view we have always expressed, viz., that numbering, while useful for a purpose, must inevitably lead to mistakes such as this. It will also, we fear, in many instances be productive of a great deal of trouble and expense, not to say of possible injustice.

Berner's Hall.

ONE of the interesting sections of the forthcoming Exhibition will be that of accessories, tyres, fittings, etc., in the Berner's Hall—a commodious building opening out from the gallery at the Agricultural Hall and providing a good opportunity for the display of exhibits for which no room can be found elsewhere. The fact that it has three entrances will ensure the circulation of visitors through the Hall; and although its devotion to the purposes of a motor-car exhibition is something of an innovation it should prove popular with exhibitors as well as with spectators. Well lighted, well ventilated, and well visited, it should quickly become a popular feature of the Exhibition.

Motor Fees in London.

IN the report of the Highways Committee of the London County Council, submitted on Tuesday, was a statement of the number of motor-cars and motor-cycles registered under the new Act and of licences issued. Up to February 17th 2,356 cars were registered at a fee of £1 each, while the motor-cycles numbered 1,385, which, at a fee of 5s. each, yields £346 5s. The licences to drive motor-cars or cycles totalled 5,187, giving, at 5s. each, £1,296 15s. Makers' or dealers' licences number 209—a return, at £3 each, of £627. Altogether the London County Council has received £4,626. The question is, what will be done with the money? As there are apparently no danger-boards or notices of speed-limited areas to be erected in the Council's district, motorists will be curious to see if the sum will be applied in ways in which they are interested.

Motor-Car Services.

SEVERAL proposals for motor-car services are already appearing in view of the summer season in England, and among the definite arrangements made are several for which railway companies are responsible. The enterprise of the Great Western Railway has already been fully recorded in our columns, and we hope shortly to congratulate the Great Eastern Railway Company on its successful inauguration of a motor-car service at Southwold, Yarmouth, and two or three other of its popular resorts on the east coast. These seaside services have been uniformly successful, so far as the South of England is concerned. The North, however, has proved somewhat laggard in this respect. Now comes news that a motor-car service is to be established by the G.W.R. in South Buckinghamshire, between some places of historic and literary interest, as well as of picturesque association. This will be inaugurated on March 1st between Slough, Stoke Pogis, Farnham Royal, Burnham Beeches, and Beaconsfield, the vehicles to be used being Milnes-Daimlers.

The Acceleration of Omnibus Pace.

MOTORISTS will perhaps find some satisfaction in the report that the London omnibus companies have ordered that wherever traffic permits the omnibuses are to travel more quickly, in order to make an extra journey a day. Whether the horses are to have relief, or whether they, too, are to perform the extra journey, we know not. But the quickening of the pace is all to the public convenience, and shows a recognition of the needs of the time of which the omnibus companies have never yet had occasion to be charged. At the meeting of the London Road Car Company, Limited, last week, it was stated that the total number of passengers carried has declined slightly,

although certain routes showed an advance. Mr. J. H. Moore, J.P., announced that in a very short time the company would have two motor 'buses on the road, and, we understand, from an authoritative source, that contracts for the purchase of two steam 'buses have been entered into by the London Road Car Company.

Lending Marks.

MOTORISTS must not lend their marks, for even the most innocent action of this kind may result in their appearance in a police-court, as one firm has just discovered. At the Mortlake Petty Sessions, on Wednesday, Mr. H. Maskew, of High Road, Chiswick, was summoned for allowing an identification mark on a motor-car to be used by another person. Evidence was given that a person named James was stopped at Barnes for driving a car without a light to illuminate the identification plate, and that he said he owned the car. Inquiries showed that the mark on the car had been assigned to the Keene Automobile Company, Limited, and subsequently defendant, who had charge of the repairing branch, was interviewed, when the witness alleged he said he lent the mark to James, whose car he had repaired, to go to Barnes. Defendant, sworn, stated that he had repaired the car and gave James permission to try it, saying he might go as far as Hammersmith. Nothing was said about Barnes. James did not return with the car, and he went to his house and complained to his wife. He waited there from four o'clock till eleven for James to return. The Bench considered that defendant had not acted fraudulently within the meaning of the section and dismissed the summons.

Directory and Dealers' Marks.

PRESSURE on our space, consequent on the full reports we have given of the Exhibition at the Crystal Palace, has compelled us to hold over the list of Dealers' Marks and also the Directory of Numbers, both of which have assumed large dimensions. Next week, however, we hope to resume both lists, to which additions are being made daily. In order to remove any misapprehensions that may exist we may mention that we include motor-cyclists as well as owners of cars in the list.

THE Earl of Shrewsbury and Talbot has consented to open the Motor-car Exhibition at Manchester.

THE officers of the Motor Volunteer Corps will be presented at the Levee on Monday by Lord Roberts.

APPLICATIONS for the ten miles limit have been made by the authorities at Longton, St. Albans, and Stoke-upon-Trent.

THE expenses of the police in connection with the Gordon Bennett race in Ireland were £3,752, of which the Treasury is paying £2,752.

THE kilometre race for the Sneden Cup, organised by the Automobile Club of Algeria, was run off on Sunday last. The winner was Baron de Crawhez, who, on a 70-h.p. Panhard, covered the distance in 32 sec. M. de Malglaive on a 45-h.p. De Dietrich was second in 57½ sec.

THE special committee of the Norfolk County Council to consider the Motor Car Act has recommended the Council to restrict the speed of motor-cars to ten miles an hour within limits indicated by notice-boards in the following areas which are lighted at the public expense:—Attleborough, number of signals required, 4; Aylsham, 7; Cromer, 4; East Dereham, 7; Diss, 5; Downham, 4; Fakenham, 4; Feltwell, 4; Gaywood, 4; Harleston, 3; Hingham, 4; Holt, 4; King's Lynn, 4; Loddon, 3; Mundesley, 4; Sheringham, 4; Swaffham, 6; Thetford, 7; Thorpe St. Andrew, 2; Trowse, 3; North Walsham, 6; Walsingham, 3; Walsoken, 4; Watton, 4; Wymondham, 6. Altogether, it is considered that for the indication of the places mentioned in the schedule at least 110 signs will be required, at a total cost of £192 10s.

WHEELS FOR MOTOR-CARS.

IN the course of a paper presented by Commandant Ferrus at the last International Automobile Congress in Paris, the author discussed the question of the most advantageous diameter for the wheels of motor-cars. Theorists have often attempted to determine by calculation this question of the size of wheels for motor-cars. Unfortunately, they are not even agreed upon the data upon which their calculations are based. Some consider the draft inversely proportional to the square root of the wheel diameter; others claim it to be inversely proportional to the wheel diameter itself. It appears, in the author's opinion, that the latter are correct.

The results obtained by Morin are in accordance with those of Coulomb, who was the first to establish the laws of friction, and these results are based upon a large number of experiments conducted during several years with various types of vehicles and wheels. In the work of Morin on the draft of vehicles may be found tables containing the results of 170 experiments on the influence of the diameter of the wheels, 267 on the influence of the speed, and 175 on the influence of the width of the rims.

All authors agree that the friction of rolling motion diminishes as the diameter of the wheel increases, and in ascribing this phenomenon to the variations in the extent of contact surface between wheel and ground, it has too frequently been overlooked that with pneumatic tyres of similar construction, and with a given weight and a given pressure, the contact surface between the tyre and ground is constant. It is therefore to be concluded that for roads which are not too much cut up the draft is independent of the wheel diameter within reasonable limits. Another fact to be considered is that in motor-cars the use of wheels of large diameter necessitates a greater ratio of speed reduction from motor to road wheel, entailing greater friction losses. In increasing the wheel diameter the loss may therefore be greater than the gain, and the excellent results obtained with small directly driven wheels substantiate this possibility.

It would appear that the wheels at present employed, mostly 32 or 36 inches diameter, leave little to be desired from this point of view. The range of possible diameters is, moreover, limited by all sorts of considerations, among which only the desirability of having all four wheels on an automobile equal

A service of Motor-Buses has just been inaugurated between Bolshelm, Dulken, and Viersen, in the Rhine Valley. The illustration shows the Parish Priest of Bolshelm blessing the new service, which is at present maintained by two De Dion Vehicles. [Allgemeine Automobil Zeitung.]

Dupuit, on the other hand, made only a small number of observations deserving any confidence, a total of twenty-six, and these observations were made on wheels of only five different types. It is therefore generally admitted, with Morin, that the traction effort is inversely proportional to the wheel diameter, proportional to the vehicle weight, and independent of the width of tyres within certain limits.

Starting with these facts as a basis, it is possible to calculate the most advantageous wheel diameter for ordinary vehicles carrying a given load, the nature of the surfaces in contact being determined in advance. While this may be an excellent exercise in algebraical calculations, it has no relation to the actual problem, on account of the multiple hypotheses which it is necessary to make, and, as might be expected, the calculation gives the most varied results. The problem is still far more difficult to solve for automobiles. It should be remarked that the experiments of Morin, however much confidence they may deserve, were made exclusively with steel-tyred carrier wheels. To apply their results without reserve to driving wheels fitted with pneumatic rubber tyres would be somewhat risky.

in diameter may be mentioned. This consideration fixes the upper limit of the diameter, as with very large front wheels the car could not be turned in a sufficiently small radius. On the other hand, the weight and frailty of wheels increase very rapidly with the diameter. It is needless to insist upon the increase in the price of tyres.

There is, therefore, little probability that anything could be gained by increasing the wheel diameters actually used, and there is no more probability of anything being gained by reducing them. Wheels of 28 inches diameter, commonly used on bicycles, surmount even small obstacles, such as a street kerb, with great difficulty. Such wheels, of course, possess greater structural strength than those of larger diameter, but the tyres on them wear out more rapidly. The argument that an increase in diameter might have an influence on the speed of racing vehicles merits little consideration, as at racing speeds the air resistance is so much greater than resistance to rolling motion.

A SERVICE of motor-cars has been started between Lemba and Songolabo, in the Belgian Congo, a distance of 220 miles.

CONTINENTAL NOTES.

NOTHING has yet been definitely decided with regard to the course for the German eliminating trials preliminary to the Gordon Bennett race. It is reported that a new road has been unearthed in connection with the course for the great event itself which would render it unnecessary for the cars to pass through Oberursel and Königstein. The Benz Gordon Bennett cars will be of about 80-h.p., and of the gear-driven type.

THE French Automobile Club has issued the programme of the tour to Homburg on the occasion of the Cup race it is organising for its members. It is proposed to leave Paris on June 13th, the night being spent at Rheims; on June 14th Treves will be reached, and Homburg on June 15th. M. Hautvast, who will drive one of the Pipe cars in the Belgian team, went over the course last week. The Pipe racers will, it is said, be of 110-h.p.

SPEED trials on the road not being authorised at the moment, the Nice Automobile Club has decided to organise a two-days' trial for tourist cars to take place on March 22nd and 23rd. The total length of the course will be 400 kilometres. On the first day the cars will run from Nice to Sospel, Fontan,

Motoring in Algeria. Mr S. E. Guy and his 12-h.p. Darracq.

San Dalmazzo di Tenda, Tende, Breil, Vintimille, Mentone, La Turbie, and back to Nice. The route has been selected with a special view to testing the powers of the engines and the efficiency of the brakes. There will be three classes of vehicles, viz., below 12-h.p., 12 to 24-h.p., and cars of more than 24-h.p. The vehicles will have to be complete touring cars carrying passengers. On the second day, an entirely new form of competition will be what is known as the "corso-loto." The course selected is from Nice to Cannes, Agay, Sainte-Maxime, Cogolin, Pioule, l'Argens, Le Muy, the Esterel, and back to Nice. It is somewhat difficult to see the idea or object of the rules regarding the second day's competition, which are as follows:—The cars leaving between 7 and 7.30 will receive three numbered tickets; between 7.30 and 8.30 two tickets, and between 8.30 and 10 o'clock one ticket. The lunch will be fixed at noon at a certain point, and each car arriving before time will receive a ticket, while any competitor arriving afterwards will give up a ticket. At lunch tickets will

be awarded by vote to the competitors who have shown most wit and good humour during the repast, for the most comfortable touring vehicles, for the cars whose passengers are dressed in the most comfortable costumes, and for the vehicles which raise the least dust, all these awards being adjudged by a vote of those taking part in the lunch. The tickets will be doubled in the case of a car driven by a lady the whole day. On the return to Nice each competitor arriving before six o'clock will receive a ticket.

A HILL-CLIMBING competition is to be held on March 6th under the auspices of the Automobile Club of Marseilles. So far five cars and seventeen motor-cycles have been entered for the event.

CONSIDERABLE interest is being shown in the anti-skidding competition which commenced on Wednesday at Versailles, under the auspices of the Automobile Club de Seine et Oise. No less than thirty-four entries have been received, these including the Samson non-skidding band and the Parsons and Sainbury anti-skid devices. The municipal authorities of Versailles have kindly offered to put certain roads into a dangerous condition "for this occasion only," so as to thoroughly test the various arrangements, which on Sunday will be subjected to trial on a prepared track.

THE "Criterium de Consommation" organised by "L'Auto" is to be held on March 3rd, 4th and 5th. The competition promises to be of an interesting character, as about thirty cars have been entered. The types represented are the Chénard-Walcker, Creanche, Gillet-Forest, Peugeot, Mainant, Automotrice, Bardou, Motobloc, Roy, Herald, and Aries.

A SUMMARY of the rules governing the contest for the trophy presented by Professor Hubert von Herkomer to the Automobile Club of Bavaria for international competition amongst tourist cars was given in the *Journal* a month or so ago. It is now announced that the first contest will take place in the first half of August next, the starting and finishing points being at Munich, and entries, accompanied by a fee of £25, should be forwarded to the Bavarian Club by May 1st. The contest for the trophy will include a *concours d'élégance* lasting three days, a three days' road trial, and consumption, brake, hill-climbing, and speed trials. Each vehicle taking part in the contest must be constructed in the country from which it is entered, the only exception to this rule being made in respect of tyres, and no maker will be allowed to enter more than two vehicles. The kilometre speed trial will be run in three classes, for cars up to 15-h.p., cars of 15 to 30-h.p., and for cars of more than 30-h.p.

THE Municipal Council of Brussels has been petitioned to establish a school for professional motor-car drivers, with the object of instructing young men in the theory and practice of the mechanism and driving of automobiles.

IT is reported that six large cars are to be added to the list of automobiles owned by the Kaiser. They will be used to convey heavy luggage between the new palace at Potsdam and that at Berlin.

THE Gillet-Forest Company, which has hitherto only made cars with horizontal engines, is reported to have decided to build vertical engines. A 12-h.p. two-cylinder and a 24-h.p. four-cylinder will, it is said, shortly be on the market.

THE Dutch Government is reported to have placed an order with a Nuremberg firm for an automobile road train of quite a unique type. The driving power is supplied by a 40-h.p. alcohol motor, which drives a dynamo; each wheel has an electric motor fed directly from the dynamo, and the wheels are thus driven without any mechanical complication. The road train will weigh, empty, $7\frac{1}{2}$ tons, and when fully loaded 10 tons; under normal circumstances it is expected to be able to haul a load of 20 tons.

THE OUTLOOK FOR THE CLUB.

SOMETHING like a heat wave seems to be passing over automobile circles in the Metropolis, and wherever two or three motorists are gathered together the prospects and position of the Automobile Club of Great Britain and Ireland become the main topic of conversation. This rapid revival of interest in an organisation whose activity has been almost hydra-headed shows that automobilism is becoming a real force in the land. Whether the Automobile Club will remain as the fount of inspiration for the widening movement largely depends on the results of the agitation that is dividing the trade into factions, and those who motor for pleasure into sections.

It is said that the fact that the Automobile Club has given its patronage to the Ninth International Automobile Exhibition, which opens at the Agricultural Hall on the 19th prox., is the cause of the hubbub. That is certainly assigned as the "head and front of the offending," although there are other matters which have been simmering for months. Something was perhaps needed to precipitate events. Nothing occurred until the Society of Manufacturers sought to disturb the equanimity of things by a suggestion that the Club should undo the resolution adopted in the old rooms in Whitehall Court, and give its name to an exhibition of sectional interest. Naturally the Club could not legislate in such a direction without consulting other organised trade interests, and just as there was one society holding an exhibition, so there was another association sheltering a second display—a second display which, we venture to think, will prove of the first importance. But that is by the way.

The question thus revived all being agreed that an official recognition of an exhibition would be of possible benefit to the industry, the Club naturally considered terms, and had some regard to the raising of funds wherewith to further benefit the industry. Those terms having been offered, they were rejected by one exhibition and accepted by the other. Then the way of the Club was clear. It gave its patronage to Mr. Cordingley's show. One of the results has been the printing of circulars, the writing of letters, and the other effective means of making known the great event of the year. Now comes a demand for a re-constitution of the Automobile Club committee, with the introduction of new men, new manners, and new methods. Only a few weeks ago the trouble with the provincial clubs was negotiated safely without a hitch; now comes an agitation far more serious, and one likely to have even greater results. Even the "Reformers"—agreed though they are upon reform—are divided as to the means, and one caucus seems to be running a list of candidates in which the trade element is prominent. A plea is also being put forward elsewhere for the total elimination of all such interests.

All this will add zest to the annual meeting to be held on the 10th prox., and give rise to many sad reflections on the part of old members. We remember the time when all met together on a friendly footing, when the tours and trips promoted a good social feeling, and the Trials were the joint pleasure of trade and amateur. Times have changed. The new-comers into the Club have proved its disturbing forces; "Society" influence seems to be stepping forward, and it would appear that the A.C.G.B.I. will have soon to consider whether it shall become a purely social club for West End gentlemen, or whether it will continue to recognise its original purpose, viz., the advance of automobilism.

MESSRS. E. AND B. APTE, of Battersea, have sent us a sample of a new terminal for ignition wires they have lately introduced. It consists of a special rubber cap, with hook-shaped terminal, the latter having a screw threaded stem. In fitting the device to ignition wires, about one-eighth of an inch of the insulation should be trimmed off, and the short strand of wires spread out over the end of the cable; the rubber cap is then put on, and the terminal properly screwed in. The terminal, which is known as the "Be Tall," is easy to fix, and has the advantage that there are no bare wires.

MOTOR-CYCLING NEWS.

AN international reliability trial for touring motor-bicycles from Paris to Bordeaux and back is to be held at the end of April by the Autocycle Club de France. The first day's run is to Tours, the second from Tours to Bordeaux; the third day will be devoted to an exhibition of competing machines; on the fourth day the return journey will be made as far as Tours, Paris being reached on the fifth day.

At the Spelthorne (Surrey) Petty Sessions, Mr. Cecil Hewitt was summoned for using a motor-cycle without number or license. Mr. Wilson, of Ashford, the owner of the machine, stated in court that he asked defendant, who was his nephew, and understood motor-bicycles, to try it for him, as he (witness) was about to purchase the machine. The local postmaster said that he did not think a licence would be required for such a trial. The bench, under these circumstances, thought it would be sufficient if the defendant paid the costs of the summons, a concession which will not be repeated elsewhere, seeing that it

A German Military Motor-Bicycle.

is wholly contrary to the clearly-expressed intentions of the Legislature.

AFTER the Auto-Cycle Club's dinner, on the 26th, a discussion on "Ignition" was to be inaugurated by Mr. D. Elyard Brown.

THE annual meeting of the Glasgow Motor-Cycle Club was held last week, when Mr. H. White Stevens, the hon. secretary and treasurer, submitted his report and financial statement, the latter showing the club to have a substantial balance in hand on the year's working. Office-bearers for the ensuing season were appointed as under:—President, Lord Provost Primrose; vice-president, Mr. J. F. Bradford; captain, Mr. C. M. Farrow; hon. secretary and treasurer, Mr. J. S. Fulton, 131, West Regent Street, Glasgow.

CONSIDERABLE activity is being displayed by the Auto-Cycle Club with regard to the organisation of runs and trials. Their latest idea is to sound the trade with regard to holding "all day trials" supplementary to the ordinary 1,000 miles, and arranged with a view of giving the public an opportunity of judging of the merits of particular machines.

The Crystal Palace Automobile Show.

[SECOND NOTICE.]

Photo by]

Fig. 29.—The Spyker Six-Cylinder Racer, with all Four Wheels Driven.

[Russell and Sons.

BELOW we continue our review of the recent Exhibition. Several of the notable stands have yet to be reported upon, and this we hope to do in the concluding report to be published next week.

PETROL CARS.

The striking feature of the stand of the **ELSWORTH AUTOMOBILE COMPANY** was the 60-h.p. Spyker racing car, of which an illustration is given in the photograph reproduced above. The vehicle, which was driven down from Bradford by Mr. A. House, is interesting not only on account of having a six-cylinder engine, but by having all four wheels driven. The power is transmitted through a leather-faced clutch to a gear-box, from which extend two cardan shafts, one driving on to the rear axle and the other on to the front one, so that all four wheels are driven. No less than three differential gears are employed, one on each of the axles and one in the gear-box. It is claimed that the car is proof against side-slip, and is more easy to control than the usual type; the vehicle is to be entered in all the leading events of the year, and its behaviour will be watched with interest. As regards the standard Spyker cars, these are being made in three sizes—12-16-h.p., 20-24-h.p., and 30-36-h.p.—all having four-cylinder engines. The car follows the usual lines of cardan-shaft transmission vehicles, among the features being the ready means of access to the pinions in the gear-box, and the pivots of the front wheels, which are entirely enclosed and work in an oil bath. The engine in the Spyker cars is of the vertical type, but a chassis was shown with a special four-cylinder engine known as the 1905 model. At first sight it resembles more than anything else a dynamo. Two cylinders and their valve chambers are cast in one with a large circular water jacket which surrounds the whole. The two castings to form the four-cylinder engine have faces which fit closely together, and are kept in position by bolts. A large body of water—about 1½ gallons—is always maintained around the cylinders, this being circulated in the usual way by pump and fan-cooled radiator. The frame of the Spyker cars is of a special pressed steel shape, filled with ash. The chassis are adapted to take all types of carriage bodies, including those with side entrance. Special provision is made in the way of lockers and drawers for tools and spare parts. We understand that the Spyker Company, for which the Elsworth Company are British agents, have just patented a new automatic carburettor, in which provision is made whereby the petrol supply can be magnetically cut off from the steering wheel. We are not at liberty to give details at the moment, but hope to do so in a subsequent issue.

A new car to England is the "Aries," which is being introduced by the **ANGLIAN MOTOR COMPANY, LIMITED**. It is being made in four sizes—

12-h.p., 16-h.p., 20-h.p., and 30-h.p., all except the first having four cylinders. While following standard practice, they appear to be of high-grade construction, and have certain features of their own. The frames are of pressed steel, with a separate underframe to carry the engines and gear box. The chassis we examined was of the 20-h.p. type. This has an Aster motor, with mechanically-operated inlet valves, and one of the latest Longuemare automatic carburettors. The flywheel has arms made to act as a fan to induce a current of air through the framed ribbed-pipe radiator. Joints are introduced between the clutch and gear box and between the latter and the differential shaft. In the larger cars the transmission is by side chains, but in the 12-h.p. it is by bevel gear on to a live axle. The latter is in one piece, carrying on its centre the differential case. A fixed axle is also provided to carry the weight, and also to avoid the disadvantages of having the back bridge in two pieces. The Anglian Company also had on view a standard 6-h.p. light gear-driven car, fitted with De Dion engine. It is provided with a large two-seated body, with a large luggage and tool box at the rear, this being also fitted with a useful collapsible seat for a third passenger.

The **NORMAL POWDER AND AMMUNITION COMPANY, LIMITED**, who have acquired the agency for the "Prunel" cars in this country, showed a couple of these vehicles—one of 12-h.p. and one of 24-h.p. Both follow, so far as the chassis is concerned, the standard lines of chain-driven cars. The 12-h.p. vehicle has a two-cylinder motor, three speeds and reverse, and a well-finished tonneau body. The 24-h.p. car on view was a more elaborate vehicle, having a side-entrance body of special construction; it is known as a "My Lord," and is capable of accommodating six persons. The motive power is supplied by a four-cylinder Mutel engine having mechanically-operated inlet valves. Four speeds forward and a reverse are provided. A useful feature is the provision of a sliding shelf at the rear, which can be drawn out from under the body when required to carry luggage.

The **GOBRON MOTOR COMPANY** made an excellent display of 12, 20, and 25-h.p. cars, the body-work of which was of the highest class. The well-known Gobron motor, with its two pistons to each cylinder, supplies the motive power. For the majority of the cars the tubular frame construction is retained, but the 25-h.p. car has a frame of pressed steel. The four-cylinder engine, which has eight pistons, is now fitted with a jet carburettor, provided with automatic air-regulating device. The clutch is of new design, being practically in duplicate. The smaller one, which is metal-to-metal, engages first, followed by the engagement of the larger one, the cone of which is leather-faced. Both clutches are controlled by the same pedal; the advantage of the arrangement is that the engine is put into gear without shock, while, to further reduce any strain on the

gear-box, a universal joint is introduced between the latter and the clutch. Four speeds forward and a reverse are available, the transmission being by means of side chains. The Gobron Company, which has taken up the West End agency for the "Vauxhall" 5 and 6-h.p. two-seated vehicles, also included a couple of these cars in their exhibit.

In addition to their well-known "Traveller" voiturette, the ALLDAYS AND ONIONS COMPANY, LIMITED, exhibited for the first time a new 6½-h.p. light car, which appears to be constructed on sound lines. The motive power is supplied by a 6½-h.p. single-cylinder engine with external fly-wheel and mechanically-operated valves. Two forward speeds and reverse, with the direct drive on top gear, are provided, the power being transmitted by bevel gear on to a live axle. Cardan shafts are introduced between engine and gear box and between the gear box and live axle. The standard car has seats for two persons, but one vehicle exhibited had accommodation for three, a separate seat being provided for the driver. We hope to illustrate the Alldays car in a subsequent issue, as it is one which should quickly become very popular.

An interesting vehicle, which hails from Scotland, is the 12-h.p. car of the ALBION MOTOR CAR COMPANY, LIMITED. While following the usual lines of chain-driven vehicles, there are many special features both in connection with the motor and the transmission. The engine has two cylinders, each 4½ in. bore by 5 in. stroke, running at a normal speed of 750 revolutions per minute. The inlet valves are mechanically-operated, while the ignition is by means of the Albion Company's special magneto. A new form of automatic carburettor is provided, the governor acting on this as well as on the magneto and on the throttle valve, so that it will be seen that the engine is provided with a very sensitive control. A honey-comb radiator with belt-driven fan has been adopted in connection with the cooling of the cylinders. The spring drive between the engine clutch and gear box is retained, while we note that the method of controlling the change-speed gear has been improved. A feature of the Albion transmission is that the differential gear is mounted on the longitudinal shaft projecting from the gear box; the cross shaft is in two parts, each driven by its own bevel wheel in the balance gear. They are thus not quite in

Fig. 30.—The Albion 12-h.p. Brougham.

line with each other, one chain being slightly longer than the other. The arrangement, which we hope to illustrate later on, is stated to have given excellent results in practice. The Albion cars are designed and constructed to run on solid rubber tyres. Of complete vehicles the exhibits included a standard tonneau and one with a new type of body, by Penman, of Dumfries, known as the "Mayfair," which may be used as an open double tonneau or partly closed in in dusty weather or completely closed for winter use. Fig. 30 illustrates the Albion 12-h.p. side-entrance brougham.

The LONDON GENERAL AUTOMOBILE COMPANY, LIMITED, confined their exhibit to a well-finished example of their 16-h.p. "Maxim" car, which, while possessing no striking departure, is on modern lines throughout. The frame is of pressed steel, in the forepart of which is set a double-cylinder engine having cylinders 110 mm. diameter by 120 mm. stroke, and developing 16-h.p. at a speed of 1,000 revolutions per minute. A special form of automatic carburettor is employed, this being so arranged as to give a correct mixture at all engine speeds. Three speeds forward and a reverse are provided, the transmission being by means of side chains. The body is hinged at the rear, so that it may be raised when necessary, to give easy access to the clutch and gear box.

A new light two-seated car which attracted much attention was that shown by MESSRS. J. J. LEONARD AND CO. This is fitted with a 6-h.p. De Dion engine, and drives through a clutch and gear box on to a rear live axle by means of a cardan shaft and bevel gearing. The water-circulation is maintained by a friction-driven pump, the tank and radiator being, however, so arranged that should the pump fail the circulation will be maintained on the thermo-siphon system. The speed of the engine is controlled by means of an exhaust valve lift. Two speeds forward and reverse are provided, controlled by one lever, the power on the top speed being transmitted direct. The brakes are of the double-acting variety

while the lubrication of the engine, gear box, and differential is secured by means of a lubricator with three-way cock, on the dashboard. Fitted with two separate seats, and a large tool box at the rear, the little car compares most favourably with the many that are now being offered to the man of moderate means. Messrs. Leonard also had on view one of their belt-driven motor-bicycles, fitted with 3½-h.p. M.M.C. engines, having Longuemare carburettor and large capacity accumulators. The frame of this machine is of specially strong construction, the engine being set vertically in a loop frame.

MESSRS. S. R. BAILEY AND LAMBERT, LIMITED, confined their exhibit of petrol cars to a neat little two-seated car which they are introducing

Fig. 31.—The "B. & L." Voiturette.

under the name of the "B. & L." The vehicle follows the usual lines of gear-driven cars, but has a combined wood and steel frame. The motive power is supplied by a 6½-h.p. De Dion or Aster engine, driving through a gear box on to a rear live axle. Three speeds forward and a reverse are controlled by one lever. The car has a long wheel base, and is fitted with two bucket seats and a large tool box at the rear, and also room for luggage. Steering is by means of the usual inclined hand-wheel, while the speed of the motor is varied by means of a pedal acting on the exhaust valve, the pedal being provided with a locking arrangement.

MR. A. MEIER, of the Station Carriage Works, Redhill, had on view a 20-h.p. four-cylinder Thornycroft car, fitted with a handsome landaulette body. The latter, which is Mr. Meier's part of the work, is fitted with canopy and front glass sliding in under the roof. The entrance to the interior is through the left half of the front seat. The body is trimmed in real blue leather, painted blue, with fine orange lines. On the same stand was shown a new two-seated petrol car, of which, in view of its extremely

Fig. 32.—The Horley Co.'s Two-seated Car.

low price, a good number are likely to be seen on the roads in a short time. It is being introduced by the HORLEY MOTOR COMPANY, and in general arrangement follows the usual lines of cardan-shaft driven cars. The motive power is supplied by an 8-h.p. M.M.C. motor, with mechanically actuated inlet valves. Three speeds forward and a reverse are controlled by one lever, and 3½ in. pneumatic tyres are fitted to the artillery type road wheels. The body, made by Mr. A. Meier, is trimmed in real leather, and painted in cream, with fine red lines. Ample space is available at the rear for luggage, or a detachable tonneau can be fitted.

MESSRS. JAMES AND BROWNE, LIMITED, had an excellent display of their 9-h.p., 12-h.p., and 18-h.p. cars, which are fitted with horizontal engines, the 9-h.p. having two cylinders, and the 12-h.p. and 18-h.p. four cylinders. Either mechanically-operated or suction inlet valves can be fitted, a feature of both being the ready way in which the valves can be withdrawn. The carburettor has been slightly improved, to give an additional supply of air at high speeds, but the same type of control is retained. The commutator, too, has been altered, though approximating closely to that formerly employed. The 18-h.p. motor has cylinders 4 in. bore by 6 in. stroke, and runs normally at 700 revolutions per minute. Large hand holes are fitted to the crank cases. The clutch is of the metal to metal type, and is connected with a change-speed gear giving four speeds forward and a reverse. In addition to standard tonneau bodies, some of the cars were fitted with a new type of body known as the "Armitage," having entrance to the rear seats at the side. Fig. 33 illustrates the 12-h.p. double landaulette, which, as will be seen, closely resembles an electrical vehicle.

For the 1904 season the SWIFT MOTOR COMPANY, LTD., have brought out several new models which, while following the standard lines of gear-driven vehicles, bear evidence not only of careful design, but of sound construction. We first examined the 7-h.p. car (Fig. 34), which has a tubular frame, in the fore part of which is set a single cylinder engine, 95 mm. bore by 110 mm. stroke, and running at a normal speed of about 1,700 revolutions per minute. The motor has internal flywheels, and is cooled by means of a gear-driven pump, the water circulating through a combined tank and frame and ribbed-pipe radiator. On the outer end of the crank shaft is mounted a drum, which forms part of a conical clutch, transmitting the power to the gear box, which is adapted to give three speeds and reverse with direct drive on the top speed. From the gear box the power is conveyed through a cardan shaft and bevel gearing to a rear live axle, which runs on four ball

Fig. 33.—The James and Browne 12-h.p. Landaulette.

bearings, and is well supported by tie rods. The foot brake is of the metal to metal type mounted on the rear end of the gear shaft, while the hand brake acts on drums connected with the rear wheels. The speed of the engine is controlled by a lever acting on the exhaust valve. The tubular frame is carried on four long and flexible springs, and it is also worthy of note that the fore part of the body is independently mounted on four cushion springs, which eliminate all vibration at the footboard. The steering is of the irreversible worm and segment type. Altogether the new 7-h.p. Swift is an excellent production, and should prove as successful as its forerunner. The Swift Company are also building a 9 11-h.p. car with wood and steel frame. The engine is an Aster two-cylinder with mechanically-operated inlet valves. The latest type of Longuemare automatic carburettor is fitted, while the car is gear driven, three speeds and a reverse being available. Provision is made in connection with the change-gear lever that the latter cannot accidentally be dropped into the reverse motion notch in the sector. The motor is provided with a governor acting on the inlet, a pedal accelerator being also provided. In addition to a tonneau, this type of chassis is also being furnished with a side-entrance double phaeton or landaulette body.

Although only two types of cars were shown by the BELSIZE MOTOR-CAR AND ENGINEERING COMPANY, LIMITED, considerable interest was taken in the display. The Belsize Company were amongst the first firms in this country to introduce the three-cylinder engine, and have adopted this type as the standard for their 1904 16-20-h.p. car. Many novel features are embodied in the vehicle, and in some respects entirely new and complete changes have been made. The cylinders are cast separately, the head and body being in one piece. The diameter is 4 in. and the stroke 5 in. The valves are placed directly on the top of the cylinders, both the inlet and exhaust valves and seatings being readily removed by unscrewing one nut. The crank, instead of being built up as formerly, is now made of

solid nickel steel. The crank case is constructed in two pieces, and so arranged that the lower half can be removed without disturbing the crankshaft and bearings. The valves are operated by two cam shafts running down each side of the crank case and driven by two gear wheels outside the main crank chamber, but enclosed in a separate chamber on the front of the engine. The admission-cam shaft is arranged so as to slide longitudinally, and the cams are stepped down in such a manner that the lift of the inlet valves can be varied at will. This can be regulated from the steering post by a small lever, which enables the engine to be run very quietly when

Fig. 34.—The "Swift" 7-h.p. Car.

in traffic, as well as resulting in economy in fuel consumption. The pump is of the eccentric travelling blade type and is driven direct from the crankshaft. The circulating water is kept cool by a honeycomb radiator and fan driven from the crankshaft. Special provision has been made for keeping the level of oil in the crank chamber, and a tap is fitted so that this can be corrected if found necessary on examination. A special form of ignition device has been adopted, all three cylinders being worked from one trembler coil. The commutator is chain driven, and is mounted on the dash-board; it has only one platinum-pointed adjusting screw for all three cylinders. The power is transmitted through a large diameter inverted cone clutch to the gear box. Three forward speeds and reverse are provided, with a direct drive on the top speed. The gears are fitted in such a way that they can readily be detached from the sleeves on which they are mounted. When driving on the top speed none of the gears are in mesh. The power from the gear-box to the back axle is transmitted by a cardan shaft with universal joints and bevel gearing to the rear live axle. The foot brake is applied internally to large drums on the back wheels, and is of the expanding toggle type. The hand brake is also toggle jointed, and acts externally on the same drums. Both brakes are of the double-acting variety. The clutch and brake pedals are of the "push" type. Inclined worm and segment steering is fitted, and the whole of the control levers are arranged on the steering column. A noticeable feature of these vehicles is the method of attaching the springs, these being mounted on special supporting rods on which they are free to slide. To meet the demand for a two-seated vehicle the Belsize Company have arranged to turn out a large number of such cars, embodying all the latest features of the larger

Fig. 35.—The "Belsize Junior" 7-h.p. Car.

and more expensive vehicles (Fig. 35). They are built on pressed steel frames, the ends of which are made in such a manner that they form dumb irons for the springs both back and front. The engine, which develops 7-h.p. at 1,000 revolutions, has a single cylinder, 4½ in. diameter by 5 in. stroke; the exhaust and inlet valves are placed directly on the top of the cylinder head, both being mechanically operated, and by unscrewing one nut the two valves and seats can be removed for adjustment and grinding in. The pump is of the internal cog-wheel type, driven direct from the crankshaft, the water being carried in a honeycomb radiator and tank

combined. An adjustable governor is provided to work on the throttle of the admission pipe and can be regulated from the top of the steering wheel. The change-gear mechanism is placed transversely across the frame in line with the engine and clutch. Three forward speeds and reverse are provided, the drive on the top speed being direct, no gears being in mesh when on this speed. The drive is taken from the engine by a chain to a small countershaft in the centre, and thence by a centrally-located chain to the rear live axle. The chains are enclosed in dustproof cases, so that their life is increased and the minimum of cleaning is required. The steering is of the worm nut and rack type and is irreversible. The control

Fig. 36.—The Cadillac Delivery Van.

levers are mounted on the steering-wheel, as in the Mercedes, and the change speed and hand-brake lever racks are fixed between the steering post and dash-board, so that it is possible to get into the driving seat from either side of the car. Metal to metal compensated hand and foot brakes are fitted, and both work equally well either backwards or forwards and act on inside and outside drums on the rear wheels. The live axle is entirely enclosed in an aluminium case so as to protect all the working parts and differential gear from dirt and grit. The length of the car over all is 9 ft., the wheel base 6 ft. 3 in., and the track 4 ft. The total weight is 8 cwt. The body is fitted with two tulip-shaped bucket seats, trimmed in real leather; a box is provided at the back, which is removable, leaving a flat platform on which either a third seat, basket, or portmanteau can be fitted. Fig. 35 shows the car with chain case removed, so as to show the

top. Fig. 36 gives a view of the latter, which is well adapted for tradesmen's purposes, being designed for loads up to 7 cwt. One of the 1904 model 20-h.p. Winton cars was also to be seen at this stand. We notice that the body is of a larger size, giving additional room in the tonneau, and that bigger tyres are now being used. Among the changes in the mechanism may be mentioned an improved contact breaker, and a new system of oil lubrication. The crank shaft bearings are of increased diameter and width. The rear springs are 8 in. longer than those used in 1903.

As we gave a description of the silent Bollée car (Fig. 38) in connection with our report of the Paris Salon, it is only necessary to mention that the SPEEDWELL MOTOR AND ENGINEERING COMPANY exhibited three or four of these magnificent 24-h.p. vehicles in addition to a chassis. A noticeable car was a double phaeton, having a wheel base of 9 ft., while a landaulette

Fig. 37.—Chassis of Cadillac Car.

of the same power was none the less striking. Among the features of the Bollée vehicles is that the engine is suspended at three points of the frame only, one of the points being in a bearing; the gear-box is fixed in the same manner, consequently both of these parts are made to "float" on the frame, and a special form of clutch takes up any non-alignment between the engines and the driving shaft, due to temporary distortion of the frame. The Speedwell Company are catering for all classes of motorists, and for "the man of moderate means" had an interesting series of cars, from 6 to 10-h.p., the latter having a two-cylinder engine. They are on standard lines, and appear to be excellent value for the price, which ranges from 125 guineas upwards.

Messrs. ARMSTRONG, WHITWORTH AND Co., LTD., who have taken over the business of Messrs. Wilson and Pilcher, exhibited chassis of the

Fig. 38.—The Leen Bollée Car.

chain drive, and gives a good idea of the general appearance of the complete vehicle.

THE ANGLO-AMERICAN MOTOR-CAR COMPANY, LTD., displayed the Cadillac car as built for both pleasure and business purposes. Fig. 37 gives a view of the chassis, from which it will be seen that it is fitted with a single-cylinder horizontal engine of 6½-h.p., fitted with heavy flywheel. Two speeds forward and a reverse are provided by means of a planetary gear, the transmission being by means of a single centrally-located chain. It can be fitted with either a two or four-seated body, or with a van

18-24-h.p. six-cylinder and 12-16-h.p. four-cylinder cars made in accordance with the latter firm's design, as well as several complete vehicles. The Wilson and Pilcher vehicle, which is noticeable for its quiet running, strikes us at first sight as being unduly complex, but from the testimony from users this complexity is more apparent than real. The general arrangement of the two types is practically alike, the main difference being that one has six cylinders as against the other's four; they are horizontally arranged equally on each side of a central crank shaft, which is parallel with the long sides of the frame. The cylinders of the 18-24-h.p. vehicle are 4 in. diameter

by 4 in. stroke. The engine is supported, or, rather, suspended, from an angle steel cradle, and held in a central position by two transverse helical springs, which, when within limits, permit of a slight compensating thrust under road stress or sudden shock. The inlet valves are of the suction type, and the exhaust valves are placed below the cam shafts; the commutator and a winged pump for the water circulation are driven by helical gear wheels. There are three speeds forward and reverse; the driving-shaft, being longitudinal, extends right through to the rear shaft, passing through the firm's patent reduction gear. This is worked by

Fig. 39.—Sectional and End View of Clutch on Sunbeam Six-cylinder Car.

friction clutches of the direct-acting cone type. The drive on the back axle is through special helical gearing, the reverse motion being operated by sliding one of the two helically-cut bevels on the axle into gear with the helically cut bevel on the propeller-shaft end. Samples of the Wilson-Pilcher commutators, piston rings, and patent induction valves were also on view. The commutator is made to suit engines with from one to six cylinders. It is fastened to a sleeve running loose on the half-speed shaft, and one of the special points in connection with it is that the rubbing contact cannot become detached from the carrier as long as the outer ring is in place. It can, however, be immediately removed by drawing off the outer ring from the two bolts, without the necessity of disconnecting the wires from the contact pieces.

The chief feature of interest at the stand of MESSRS. J. MARSTON, LIMITED, was the new six-cylinder Sunbeam car, of which a brief description was given in our issue of the 6th inst. To the particulars then given we may add that the engine is rated at 16-18-h.p. The pump is friction driven, and is located just below the dashboard. The flywheel has arms formed to act as a fan to draw a current of air through the honeycomb radiator. The clutch (Fig. 39) is of the metal-to-metal internal expanding type running in oil. Two speeds forward and a reverse are provided, with a direct drive on the top speed. From the latter the power is transmitted by side chains to the rear road wheels. The brakes are three in number, two internal metal-to-metal on the rear wheels running in oil and in the chain cases, and the third, also metal-to-metal, on the differential shaft, the latter brake being water cooled. Carried on the steering wheel are the two levers for the accelerator and variable lift to the inlet valves, whereas

Fig. 40.—Plan of Humber 2 1/2-h.p. Light Car.

the advance spark lever is underneath the wheel in the position it occupies on the 12-h.p. cars. The steering is non-reversible, with the cross bar located behind the axle so as to reduce to a minimum the risks of accidents. An effort has been made in the new car to abate the dust fiend by putting a new type of steel shield under the vehicle from end to end. There is nothing whatever below this shield excepting the steering arm and the pipe to carry away the exhaust. The 12-h.p. Sunbeam cars show little change from last year, the type having proved so satisfactory that radical alterations have not been found necessary.

In addition to a display of motor-bicycles and Olympia tandems, MESSRS. HUMBER, LIMITED, had a large exhibit of cars ranging from 5-h.p. to 25-h.p. The larger types—14-h.p. and 25-h.p. four-cylinder—have undergone but little changes since last year, while the 5-h.p. two-seater car fully maintains the favour it met with on its introduction. To meet the demands of those requiring a rather more powerful car, two new models have been brought out. Fig. 41 shows the new 6 1/2-h.p. two-seater vehicle. The engine, which has a bore of 3 1/4 in., and stroke of 4 in., is fitted with an ordinary type of centrifugal governor, which acts upon the throttle on the induction pipe between the Longuemare carburettor and the inlet valve, a pedal-actuated accelerator being also provided. In addition to the enclosed flywheels, a large diameter flywheel is keyed to the crankshaft, and forms one half of the conical friction clutch. A gear box giving three speeds and a reverse is fitted to this car, the drive on the top speed being direct. Cycle-type wheels are fitted to the Coventry-made cars, and artillery wheels to those turned out at the Beeston works. The body is made extra wide so as to give ample seating room for two passengers, and it is provided with side doors. The weight of the car complete is about seven hundredweight. The 8 1/2-h.p. car (Fig. 40) has a vertical water-cooled double-cylinder engine. The normal speed is 1,000 revolutions per minute. The power is transmitted through a light aluminium leather-faced cone clutch, so arranged as to prevent any end thrust on the bearing. The engine is fitted with a governor acting on the admission pipe. The change speed gear is of the usual sliding type, giving three speeds forward and a reverse, with a direct drive on top speed. From the change-speed gear the power is conveyed to the live rear axle by a universally-jointed shaft and bevel gearing. The usual Humber patent single arm steering wheel is fitted, thus giving perfect accessibility to the control levers. The steering is of the worm and segment type, and the height of the steering wheel can be readily adjusted to suit requirements. The road-wheels are of the artillery type, 28 in. in diameter, fitted with 3 in. pneumatic tyres. With the advent of these two new types Messrs. Humber, Limited, have now a range of cars which should suit all tastes and requirements.

The "Fiat" cars, shown by FIAT MOTORS, LIMITED, take a very high place among modern automobiles. They are of Italian construction, and

Fig. 41.—The 6 1/2-h.p. Royal Humberette.

in many respects are closely allied to the Mercedes; they possess many features of their own, however, among which may be mentioned the automatic advance and retard of the magneto ignition, this being provided with its own centrifugal governor. Needless to say, the frame is of pressed steel, and the engine is of the four-cylinder type. The 16-21-h.p. type has cylinders 110 mm. in diameter by 110 mm. bore, the normal speed being 800 to 1,000 revolutions. The engine speed can, however, be varied from 150 to 1,800 revolutions. The carburettor is of the automatic variety, regulating both the supply of air and petrol by means of a needle valve and plunger, acted upon both by the governor and from the steering wheel. The clutch is of the coil type, while the transmission is by side chains. A special point is the lubrication, all bearings being oiled from the dashboard. The oil is contained in a reservoir in which is a spindle driven by the engine through a belt and worm gear. To the spindle are provided a number of very small buckets, which, as they rotate, pick up a certain amount of oil, which is emptied into its corresponding pipe. There are many other points of interest in the Fiat cars, of which a handsome 16-h.p. side-entrance double phaeton and a limousine, in addition to a smart 24-h.p. racer, developing up to 37 h.p., were exhibited.

THE DAIMLER MOTOR COMPANY, LIMITED, had a large and imposing stand, consisting of vehicles mainly of two types—18-22-h.p. and 28-36-h.p.—a chassis of each being shown. Each of the 1904 type chassis is fitted with a slow-running engine, and among the new features may be cited the suspension of engine and gear, entirely obviating the use of a lower frame, and ensuring perfect alignment; mechanically-operated valves; single trembler coil system of ignition, and magneto system when desired; double-acting compensated band-brakes, on sprocket pinions and rings. The four-cylinder engine fitted to the 28-36-h.p. chassis has a bore of 110 mm. and a piston stroke of 150 mm.; at 750 revolutions per minute it develops 28-h.p. It can be readily accelerated to 1,000

revolutions per minute, and under these conditions gives 36-b.h.p. Both induction and exhaust valves are mechanically operated, and are placed on the same side of the engine. The carburettor and throttle is of new design, giving a positive regulation of mixture at all loads and speeds of the motor, and combined with it is a graduated throttle, which is actuated by the governor and also by hand. The fan-cooled radiator, pump, and engine water jackets are located closely together and connected by short and direct pipes, thus ensuring free circulation and effective cooling. Passing from the engine and its adjuncts, we find

Fig. 42.—The Engine and Gear Box of the new 24-28 h.p. Burlington Car.

that the power is transmitted to the road wheels by the usual system of friction clutch, cog gear and chains. The first is provided with a simple and easy method of adjustment. The gear-case and transmission gear does not present any strikingly new features, but it may be noted that the case itself is so suspended as to permit of self-alignment. The bearings are fitted with automatic ring lubrication. The brakes are two in number, the one being fitted on the inner side of the driving pinions on the cross-shaft, and the other on the inner side of the sprocket rings fitted to the driving wheels. As in last year's types, the application of the hand brake does not withdraw the clutch. Turning to the frame, a new construction has been adopted, straight steel plates being used in combination with wood and channel steel. It is narrowed in the front, without in any way weakening the side members, and the underframe of former years has been entirely dispensed with. The length of the springs has also been increased. The wheel base is 9 ft. 6 in., and the approximate weight 18½ cwt. The 18-22-h.p. chassis is to all intents and purposes a replica of the 28-36-h.p. referred to above, except, of course, in the matter of actual dimensions, and the lighter character of its component parts. The four-cylinders have each a bore of 95 mm. and a stroke of 130 mm. Passing to the complete cars, we noticed a 28-36-h.p. covered phaeton, with a wheel base of no less than 11 ft. It has accommodation for seven passengers, and is provided with a door on either side.

In addition to several De Dietrich cars from the French works, the BURLINGTON CARRIAGE COMPANY, LIMITED, had on view the chassis of a new car made from the designs of Herr Bugatti, at the German works of the De Dietrich Company, and which they are introducing into this country under the name of the "Burlington." The car, which is made in two sizes, 24-28-h.p. and 30-36-h.p.—the one on view being of the smaller

Fig. 43.—Chassis of National 15-17 h.p. Three-cylinder Car.

type—differs materially from the French De Dietrich vehicles, which are made on what is known as the Tureat-Mery system. In the first place the engine and gear box are mounted on a frame entirely separate from and attached to the main frame by four bolts. Fig. 42 gives a view of the engine, gear box, and differential shaft, mounted on its special frame, this being so contrived that no deformation of the car frame can affect the motor or gear, and that the weight of same is taken directly by the springs of the car without bearing on the main frame. The motor is a four-cylinder one, and possesses mechanical inlet and exhaust valves, actuated by two sym-

metrical shafts arranged on both sides of the motor. The position of the valves on the top of the cylinders permits them to be easily inspected and detached. On the upper surface are situated also the sparking plugs and the four compression cocks. A novel feature of the engine is that the cylinders are cast in pairs, each pair being surrounded by a removable sheet copper covering. The removable water jacket facilitates the formation of the cylinder body and permits hollow spaces to be provided everywhere, so that all the walls of explosion chambers, valve seats, etc., can be plentifully surrounded with cooling water. In fact, the cooling of the motor owing to this arrangement is claimed to be more effectually provided for than by any other system. A special form of carburettor is employed to furnish an automatically-regulated mixture in connection with the advancing of the ignition, so giving the motor great elasticity, and allowing of any desired speed from six miles per hour up to the maximum speed, without changing gear. The motor and change-gear are connected by an aluminium cone leather-faced clutch. Four speeds and reverse are actuated by one lever, the transmission from the differential shaft being by means of side chains.

The "National" is the name of a new British-built 15-17-h.p. three-cylinder car exhibited by MESSRS. LAMB BROTHERS, the selling agents for the makers, Messrs. Rose Brothers, of Gainsborough. The vehicle (Fig. 43) is of high-class construction, having a frame of pressed steel, to which is riveted a steel underframe carrying the engine and gear box. The motor has three vertical cylinders, 4 in. diameter by 5 in. stroke, cast separately with combustion chamber and water jacket complete. The valves are all mechanically operated off one cam shaft; they can be detached by unscrewing one nut. The commutator is conveniently arranged in an inclined position at the rear end of the crank case, and is gear driven. The crank shaft is of nickel steel carefully balanced and supported in four long bearings. The carburettor is of the self-adjusting spray type. The governor only comes into action when the maximum number of revolutions is attained, the normal speed being 850 revolutions per minute. The inlet valves are provided with variable lift device controlled by a small lever on the steering wheel. The water circulation is effected by a gear-driven pump in conjunction with a tubular radiator. The fan which induces a current of air through the

Fig. 44.—Chassis of Ariel Six-cylinder Car.

latter is designed so that the slack or stretch of the belt can be instantly taken up by a spring device. From the engine the power is transmitted by a conical friction clutch of improved design, and thence by means of large gear wheels to cardan shaft and a live axle. A feature of the clutch is that the male portion, on being released, runs idly on the gear shaft, so facilitating the changing of the gears. The gear box is made in halves—on removing the top half both shafts and gears are exposed. Three speeds forward, with direct drive on top speed, and a reverse, are operated by one lever. A double-acting metal-to-metal internal expanding band brake is fitted on the main shaft outside the gear box, actuated by foot lever. Double-acting internal expansion brakes are also fitted to each of the rear wheels, these being controlled by a hand lever.

One of the finest displays was that of the ARIEL MOTOR COMPANY, LIMITED, not only from the point of view of excellent cars, but also from the standpoint of automobile education, for in addition to the chassis of the four and six-cylinder types, samples of the material and component parts of the cars were on view. For the coming season four types are being made, viz., 15, 18, and 20-h.p. four-cylinder, and 30-h.p. six-cylinder. The engines have mechanically-operated inlet valves, operated off the same cam shaft as the exhaust valves, with which they are interchangeable. Provision is made for varying the lift of the inlet valves from the steering wheel. A special form of spray carburettor is employed, and the governor is arranged to act on the admission. The water circulation is maintained by a friction-driven pump on the four-cylinder cars, and a gear-driven one on the six-cylinder, all having fan-cooled radiators. The flywheel is quite separate from the clutch, the latter receiving the power from the engine shaft through a forked arm. The clutch itself is of the leather-faced cone type. All the vehicles are gear driven, the four-cylinder type having four forward speeds, and the six-cylinder (Fig. 44) three, in addition to the reverse in each case. The rear road wheels are not mounted on the differential axle, but on a sleeve surrounding the latter, the power being transmitted to them at the ends. There are many other features of interest in the Ariel cars which pressure on space prevents us dealing with at the

moment, but we may briefly refer to the carriage work, which is of a very high class; especially was this noticeable in the 15-h.p. landaulette with long wheel base. Finally, we may state that the actual car which recently made the climb up the railway on Snowdon was on view, and looked none the worse after its formidable task.

In addition to the 12-h.p. British-built car described in our report of the National Cycle Show, in November last, the DURYEA COMPANY exhibited a new 15-h.p. vehicle, with Willans and Robinson engine, special change speed gear, braced fore-carriage and steering gear, as well as improved brake and control gear. Needless to say the workmanship is of the highest class, the new models being a distinct advance on their American progenitor. The three-cylinder horizontal engine is retained, but a number

Fig. 45.—The Duryea 15-h.p. Side-entrance Car.

of modifications have been made with the view of increasing its efficiency. Thus the water jacket is larger than hitherto. The water circulation is maintained by a chain-driven pump and radiator. Both the inlet and exhaust valves are mechanically operated off one cam shaft, and all six valves are interchangeable. The crank chamber is of aluminium with removable inspection covers, and the three-throw crankshaft is cut solid out of one piece of steel. Whilst the magneto generator is still retained for spark generation, it is chain driven, and the current is passed through a coil, transformed to high tension, and used in the engine through ordinary sparking plugs. Several important improvements are introduced in this system, the magneto generating current of sufficient intensity for sparking at "dead slow" speed, and not only so, but automatically governing the spark advance in accordance with the speed of the engine. The power is transmitted by a specially-constructed Renold roller chain. The engine is used as a brake, and supplemented by three powerful metal to metal grip brakes, two of which act in direct connection with the wheels. The axle is made of nickel steel, and by the construction of the new fore-carriage not only is the front (tubular) axle held to its work by tension rods, but these are so fitted on universal joints that the axle is free to move vertically at either end without throwing any strains on other parts of the car, and an entirely new front spring system is introduced. On the stand were shown samples of the engine and various other component parts of the cars, as well as a number of large drawings illustrating different types of bodies. Of special interest was a 15-h.p. vehicle with long wheel base, having a side-entrance tonneau body (Fig. 45). In their new form the Duryea

Fig. 46.—Chassis of Duryea 15-h.p. Car.

cars are not only of high-grade construction but of pleasing outline, and we look forward to seeing many of them on the road at no distant date.

Although located in side courts, a large number of visitors found their way to the stands of the CANNSTATT AUTOMOBILE SUPPLY ASSOCIATION and MESSRS. MANN AND OVERTON, the attraction being the examples of the 1904 models of the 18-28-h.p. Mercedes there exhibited. The vehicle varies in several details from last year's type; the engine has four cylinders, 100 mm. diameter by 130 mm. stroke; all the valves are mechanically operated and interchangeable, the inlets being on the left and the exhaust on the right, looking from the dashboard. As will be seen from Fig. 47, the carburettor is located quite close to the admission ports. The magneto,

which is on the right side, has in connection with it a plug switchboard, by means of which any one of the cylinders may be cut out for testing purposes. The variable lift to the inlet valves has been abandoned. The flywheel has arms made to act as a fan; it is of larger diameter than last year. The gear box shows little alteration, but an ingenious arrangement is provided for automatically opening a cock when the brake pedal is applied, allowing water to flow to the band brake on the differential shaft. The frame is somewhat longer than last year, being now 8 ft. The axles are of H section, but stronger than in the 1903 models. Provision is made for locking the

Fig. 47.—View of Inlet Side of 1904 Mercedes 18-28-h.p. Engine.

differential shaft, in case of damage to one of the chains. We are also informed that the car is capable of running 20 per cent. faster than hitherto.

The "GERMAIN" cars were displayed by MR. THEO. MASUR, principal interest being centred on the new Germain Standard 16-h.p. four-cylinder car, which is noticeable for its extreme quietness in operation. The four cylinders are separate and are each made from a solid bar of steel. The water jackets are of copper. The inlet and exhaust valves are interchangeable, and actuated mechanically off the same cam shaft. The inlet valves are provided with a device, controlled from the steering wheel, by means of which the lift of the same can be varied, and consequently the speed of the motor regulated. Both battery and Eisemann high-tension magneto ignition are fitted, one advance and retard lever controlling both systems. The radiator is of the honeycomb type, the arms of the fly-wheel being formed to act as a fan to draw a current of air through the radiating tubes. Three

Fig. 48.—The 1904 Mercedes 18-28-h.p. Car.

point suspension has been adopted for the change speed gear box, which provides four forward speeds and a reverse, controlled by one lever. The car is chain driven from the countershaft, and can be fitted with any type of carriage body. On this stand was also a 9-h.p. delivery van, to carry loads up to 30 cwt., and the Samson non-skidding unpuncturable bands for pneumatic tyres.

At the stand of AUTOCARS AND ACCESSORIES, LIMITED, were displayed specimens of the 10-h.p. two-cylinder and 15-h.p. three-cylinder Minerva cars, built by La Société La Minerve, of Billancourt, near Paris, and of which a description was given in our report of the Salon in December last. The bore and stroke of the cylinders of both types are similar, and

the inlet valves are mechanically operated. Interest at this stand was mainly centred on the working models of the Hitchon change-speed gear, the pinions of which are mounted on free-wheel clutches. The pairs of pinions are so arranged that there are always at least two pairs in mesh, the power being transmitted through the pair giving the higher gear. Thus, while the other pair is running it is doing no useful work, being overrun by the higher gear. As the speed is changed down by bringing the pinions of the lower gear already partly in mesh fully so, this takes up the drive. In this way the changing of gears is facilitated, as there is always a gear partly in mesh to take up the drive when necessary. The way Mr. Hitchon, the inventor, could pass from one gear to another made a distinct impression, while the fact that it has been subjected to a lengthy trial on a heavy car with good results speaks much in its favour.

There are many special features in the new 10-h.p. silent safety car exhibited by the ALBANY MANUFACTURING COMPANY, of which a general view

Fig. 48.—The Albany "Safety Silent" 10-h.p. Car.

is given in Fig. 49. The engine is of the horizontal single-cylinder type, 5 in. bore by 6 in. stroke, the normal speed being about 850 revolutions per minute. The engine is set in the front end of the frame, a little to one side, and with the flywheel parallel with the road wheels. Both valves are mechanically operated; a large vertical silencer is provided in the front part of the car, a novelty being that the exhaust gases are first made to pass through a kind of turbine, which in turn drives the fan connected with the tubular radiator. A special form of carburettor is employed to furnish the mixture, the clutch pedal being connected with it in such a way that the engine is slowed down when the clutch is withdrawn. The engine is connected through a leather-faced cone clutch to a short shaft, on the rear end of which, in a gear-box, is a worm screw meshing with a special worm pinion on the change gear speed shaft, which is at right angles. Two speeds and a reverse are provided, the drive on the top speed being direct through a cardan shaft and bevel gearing on to the rear live axle. The first speed and reverse motion are obtained by means of gears of the Crypto type. The Albany Company also exhibited a 16-h.p. four-cylinder car on the standard lines of chain-driven vehicles, a feature being the special apparatus by means of which the engines and different bearings are lubricated. On the dash under the bonnet is an oil reservoir, in which is a cylindrical drum rotated by mechanical means. Bearing lightly on

Fig. 53.—The Wolseley 6-h.p. Light Car.

the drum are a series of little trays, each connected with a feed pipe leading to a different bearing. The little trays are of different sizes; and as the drum rotates, a thin layer of oil adheres to it, which is gathered up by the trays; a continuous supply of lubricant is thus assured to the various bearings as long as the engine is running. Various types of the Albany radiators and condensers were exhibited, as well as pressed steel frames. We learn that the Albany Company are putting down a plant for the production of the latter at their works at Willemsden Junction.

The WOLSELEY TOOL AND MOTOR-CAR COMPANY, LIMITED, had, as usual, a large stand, on which were shown examples of their 8-h.p., 12-h.p.,

16-h.p., and 24-h.p. cars fitted with various types of bodies. Among the detail improvements in the popular Wolseley cars we may note the adoption of pressed steel frames and H section front axles. The countershaft brake has now been removed, and the gear box rendered practically oil-tight. The brakes are concentrated upon the road wheels, the pedal brake being of the expanding type, and the hand brake of the external band variety, both acting on the same drums. The silencer has been increased in size, while the gear box is now suspended from three points only. The Wolseley Company are also bringing out a new automatic carburettor, the pressure of the exhaust being utilised to act on a diaphragm connected with a valve, which, as the engine increases its speed, allows more air to be drawn in. The new 6-h.p. two-seated Wolseley car was shown in England for the first time and came in for an unusual amount of attention. As will be seen from Figs. 50 and 51, it is a replica in miniature of the large Wolseley cars. It is provided with a single cylinder horizontal engine, $4\frac{1}{2}$ in. bore by 5 in. stroke, running normally at 800 revolutions per minute, and giving $6\frac{1}{2}$ h.p. at that speed. No governor is provided, and the motor is capable of acceleration to about 1,000 revolutions. It is suspended horizontally underneath two transverse members of the frame, and is so arranged that the crankshaft and countershaft are both parallel to the rear axle. The moving parts are carefully balanced, and a heavy fly-wheel is provided. The inlet valve is placed immediately above the exhaust valve. The commutator is actuated directly from a worm wheel fixed on the end of the crankshaft. Ignition is high tension, the coil being placed on the dashboard. The carburettor is of the float-feed type with gravity feed from the petrol tank. The speed of the motor is controlled by a hand-operated throttle on the admission. The clutch, by means of which the motor can be thrown in or out of gear, is fitted on an extension of the first-motion shaft in the gear box, and is of the ordinary cone type actuated by pedal; a spur wheel is attached to the male portion of the clutch, which is driven from the crankshaft by means of a Renold silent chain. The gear box is of the usual Wolseley pattern, and is provided with three speeds forward and one reverse, actuated by one lever. In this car, on account of its light weight, the Wolseley Company have departed from their usual practice and have fitted the car with a live axle of an entirely new pattern, driven by a

Fig. 1.—Plan of Chassis of Wolseley 6-h.p. Light Car.

central chain from the gear box countershaft. The differential gear is of the straight tooth type. A pedal operates a band brake on the differential box, and a side hand-lever actuates equalised band brakes acting on the driving wheel hubs; both brakes act equally well in either direction. Steering is controlled by the usual inclined column and hand-wheel. The wheels are of the artillery type, 28 in. diameter, fitted with $3\frac{1}{2}$ in. heavy pneumatic tyres. The wheel base is 5 ft. 6 in., and the track 4 ft. The car, which weighs $8\frac{1}{2}$ cwt., can attain a speed of 25 miles per hour.

MESSRS. SELBACH, LIMITED, making their first appearance since the registration of Mr. Selbach's business as a limited liability concern, had a large display, extending over three stands, of various accessories, fitting, etc., as well as of Regal cars, which are now made in several sizes, from the single cylinder 6-h.p. vehicle to the 24-h.p. car. Recognising the demand from the middle classes for a good car at a moderate price, Messrs. Selbach made a feature of the Regal car, the points of which have been rendered familiar to motorists at several recent exhibitions. This has a 6-h.p. De Dion engine, with a carburettor of the same make. A centrifugal pump, driven by friction off the flywheel, circulates the water through the radiator in front of the bonnet. The water tank is placed above the motor, so that should the pump fail to work no damage would result, the water being circulated by gravity (thermo-syphon). The ignition is on the high tension system. A conical friction clutch, which can be connected to and disconnected from the flywheel by the left pedal on the footboard, transmits the power to the change-speed gear. This clutch is of the internal type, all enclosed in the flywheel, so that oil and dirt cannot get to it. The change-speed gear provides two speeds forward and one reverse, operated by the same lever; the drive is direct on the top speed, so that the power is transmitted direct from the motor to differential on live axle. A universally jointed shaft connects the speed gear to the differential, which is of the spur-wheel type. The forward speeds are 7 and 20 miles an hour, and a reverse speed is also fitted. The right pedal actuates, by means of rod connections, a

large band brake, the drum of which is on the shaft at the back of the gear box. The side brakes are actuated by a lever; the hubs of the driving wheels contain two segments, which, when expanded, can block the wheels if necessary. The two sets of brakes are metal to metal, and double acting. The car is fitted with a two-seated body.

MESSRS. DE DION BOUTON, LIMITED, had a very interesting display of their 6, 8, 10, and 12-h.p. cars. The 6-h.p. type has undergone but little

Fig. 52.—The De-Dion 8 h.p. Landulette.

change from last year, except perhaps in body work. One car on the stand was arranged for use by doctors, having solid tyres and a spider seat at the rear. In the 8-h.p. types, the cars on view comprised a landulette and a double phaeton, with side entrance, both being built on extended chassis. The 10-h.p. cars were perhaps the most interesting type; these have double-cylinder engines, lubricated by means of a special pump attached to the motor itself. Other points of note are found in the contact maker and in the carburettor, this having one float chamber and two spraying chambers—one for each cylinder. The carburettor is provided with a hot water jacket; a hand lever controls both the throttle valves on the admission pipes and the air inlets, so that the quality and quantity of mixture allowed to pass to the engine can be varied. The car is fitted with three speeds and reverse, the change gear being a modification of the De Dion clutch system. The De Dion Company's stand was a most instructive one, as it included sectional models of the engine, change gear, etc., so arranged that visitors could examine their method of action.

MESSRS. B. THOMPSON AND CO., LIMITED, made a display of the "Achilles" cars, which are made throughout at their own works at Frome; without presenting any radical departure from standard practice, they are of the gear driven variety, and appear to be soundly constructed and of excellent value. They are made in four sizes, 6-h.p., 8-h.p., 9-h.p., and

Fig. 53.—The Achilles 8-h.p. Car.

12-h.p., the latter having a two-cylinder engine. Selecting the 8-h.p. car for special notice, we may mention that the frame is of tubular construction. The engine has a cylinder 100 mm. bore by 110 mm. diameter, and runs at a speed of from 1,500 to 1,600 revolutions per minute, its speed being controlled by means of the ignition and a throttle valve from the steering column. The water circulation is maintained by a gear driven pump. Three speeds forward and a reverse are controlled by one lever, on the top

speed the drive is direct, none of the gear wheels on the side shaft rotating. From the gear box the power is transmitted by a cardan shaft, having two special universal joints and bevel gearing, on to a live axle. The differential gear is of the spur wheel type. The brakes are of the metal-to-metal type. We may add that Goodall's Automobile Agency have secured the representation of the "Achilles" cars in London and the home counties.

THE VULCAN MOTOR COMPANY, LIMITED, had on view a little two-seated car of 6-h.p., which, in view of its relatively low price, should meet with much favour. The single-cylinder engine is set in the fore part of the frame, and drives through a clutch, cardan shaft, and bevel gearing on to the rear live axle. The change speed gear is enclosed in the same casing as the balance gear at the rear, and is adapted to give three speeds forward and a reverse. Steering is controlled by a hinged side tiller, on which the change-speed lever is mounted. Altogether, the little car is one of the best we have seen at the price. The other vehicle exhibited was of a large type, having a 10-h.p. double-cylinder engine, with mechanically-operated inlet valves. The mixture is furnished by an automatic carburettor, while the governor is adapted to act on a throttle on the admission pipe. The transmission is by cardan shaft on to a live axle, three speeds and a reverse being provided.

Still another firm to take up the construction of six-cylinder cars is the MAUDSLAY MOTOR COMPANY, LIMITED. This is of 40-h.p. and consists of two pairs of three cylinders, each one of the pair being in one casting and having its own separate crank chamber. The bore of the cylinders is 5 in. and the stroke $3\frac{1}{2}$ in., the engine normally running at 900 revolutions per minute. All the valves are located in the top of the cylinder heads, and are mechanically actuated by a pivoted cam shaft running along the top of the engine. Ample inspection doors are provided to the crank chambers to give access to the connecting rods and big ends, etc. The carburettor is of the float-feed type and provided with valves which automatically allow additional air to enter when the motor is running at a high speed. Four speeds forward and a reverse are provided, the

Fig. 54.—Chassis of Maudslay 40-h.p. Six-Cylinder Car.

transmission being through a leather faced cone clutch, gear box, and side chains. The frame is of square section tube filled with ash, a speciality which the Maudslay have used for some time with great success. The 18-h.p. cars are practically a replica of the above, except that instead of six the engine comprises only three cylinders of the same bore and stroke. Another type is one having a three-cylinder engine developing 25-h.p. The Maudslay cars have a very long wheel base, and are thus adapted to be fitted with large bodies. Those on the stand included a eight-seated wagonette-omnibus with a removable top and an 18-h.p. double-phaeton, all of the highest class and construction.

MESSRS. J. E. HUTTON, LIMITED, had a large stand, on which were exhibited several of the latest types of three and four-cylinder Panhard cars; noticeable vehicles being one of 24-h.p., fitted with a special phaeton body by Labourdette, and one of 18-h.p. arranged as a brake for shooting parties, with accommodation for eight passengers. A 12-h.p. standard Brooke car, fitted with a Roi des Belges body, was also displayed. In this car Messrs. Brooke and Co. have not departed in any material manner from their regular practice, and we learn that, owing to the great success of this type, it is intended to continue its manufacture in addition to two new models—12-h.p. three-cylinder light car and 15-h.p. four-cylinder touring car. The engine of the standard car has three cylinders giving 14-h.p., and is placed transversely on the frame, the drive to the gear box being by Renold silent chain. There are three forward speeds and reverse, all actuated by one lever, and the change speed gear is by means of chains on the patented system of Messrs. Brooke. It was also intended to exhibit a chassis of the new 20-h.p. Hutton car, made in accordance with Barber's patents, but this is being reserved for the Show at the Agricultural Hall next month. Parts of the vehicle were, however, shown, including the engine, which has four cylinders cast in two pairs. The valves are mechanically actuated off one cam shaft; the inlets, which are located on the top of the cylinder heads, are provided with a valuable lift device. The governor is mounted on the half-speed shaft. The cylinders

are 90 mm. diameter by 124 mm. stroke, the normal speed being 1,000 revolutions per minute. The radiator is of novel design, and is made of aluminium; it consists of a large number of tubes bent to a special shape, and arranged in five groups; it is stated to be very efficient, while its weight is only 30 lbs. A model of the Barber variable gear was also shown; this is quite a radical departure, and cannot be well described without a drawing. It must suffice for the moment, therefore, to say that it gives infinite variation of speed between zero and the maximum, this being obtained by means of a variable throw eccentric on the driving shaft.

Fig. 55.—The Pick 10-h.p. Car.

Altogether the Hutton car promises to be one of the *clous* at the forthcoming show.

MESSRS. KRUPKAR, LIMITED, had on view no less than four types of cars. First we examined the 12-h.p. "Opel Krupkar," a two-cylinder vehicle very much on the lines of the Darracq, but noticeable owing to the relatively low price at which it is being offered. Another interesting vehicle is the 16-20-h.p. "Cudell Krupkar," which has a pressed-steel frame and all other features of modern gear-driven vehicles. The "Krupkar" 12-14-h.p. two-cylinder vehicle was also on view, while a very novel three-wheel car, as illustrated in Fig. 56, was displayed. The motive power is supplied by a two-cylinder V-shaped 6-h.p. engine, driving on to the front axle through a gear giving three speeds forward and a reverse, and a chain. The pinions in the gear box are always in mesh, the requisite pair being brought into gear by a sliding feather. The axle of the rear wheel works on a circular path and forms the steering wheel, which is controlled by a side tiller,

the 10-h.p. (Fig. 55) 3½ in. by 4 in., the normal speed being 1,200 revolutions per minute. Three speeds forward and a reverse are provided, a Renold silent chain connecting the engine with the gear box, and a single centrally-located roller chain conveys the power from the latter to the rear live axle. The engine has been much improved in detail, all bearings have been lengthened, and the lubricating arrangements improved, the Dubrulle exhaust pressure lubricator being now used. The Pick patent cam brake, which has been illustrated in the *Journal*, is fitted to these cars.

Fig. 56.—The Krupkar 6-h.p. Three-Wheel Car.

In addition to one of their standard 10-h.p. single-cylinder cars, the REX MOTOR MANUFACTURING COMPANY, LTD., exhibited a number of the 12-h.p. "Rex-Simplex" vehicles (Fig. 57), fitted with various types of bodies. The engine, which is mounted on the fore part of a hammered steel frame, has two vertical cylinders, 4 in. dia. by 4½ in. stroke. The engine and gear box, as well as the body, is directly attached to the main frame, no under-frame being employed. A feature of the engine is that no outside fly-wheel is employed, each connecting rod being attached to a couple of discs acting as flywheels inside the crank case. The exhaust as well as the inlet valves are located in the top of the cylinder head, the exhaust valves being operated by a side rod and suitable levers very much in the way adopted in the Buchet engines. The carburettor is of the float-feed type with a throttle valve attached. The gear box, which is adapted to give three forward speeds and a reverse, with a direct drive on the third, is supported from the frame by long arms extending from the case to the sides of the frame.

Fig. 57.—Plan of Chassis of Rex-Simplex 12-h.p. Car.

not shown in the illustration. The vehicle is designed to attain speeds up to twenty miles an hour, and is arranged to be fitted with a chest to carry parcels for tradesmen's use.

For the 1904 season the PICK MOTOR COMPANY, LIMITED, are making cars of 6 and 10-h.p., each of which can be fitted with different types of bodies. The engines are of the horizontal type, with opposed cylinders, those on the 6-h.p. having cylinders 3½ in. diameter by 3½ in. stroke, and in

Very wide pinions are employed in the gear box; the cardan shaft and bevel gear system of transmission on to a live axle is adopted, universal joints being introduced not only in the cardan shaft, but between the gear box and the clutch. The latter is of the cone type, 15 in. in diameter, and can be readily dismantled without disturbing the change speed gear. Altogether the new Rex car is a marked advance on its predecessors from the same works. On the same stand were shown a number of the popular

Rex motor-bicycles and a "Rexette"—a two-seated three-wheel vehicle which can neither be classed as a car nor a cycle. It is fitted with a 4-h.p. water-cooled engine, which drives the rear wheel through a clutch and chain, the latter being enclosed in a gear case.

The PHOENIX MOTOR COMPANY confined their exhibit to a chassis and a complete car of their 12-h.p. type, which is fitted with a vertical double-cylinder engine. The valves are all mechanically-operated, a feature being the variable lift device fitted to the inlet valves, an arrangement we hope to illustrate later on. The car is of the gear-driven, live-

Fig. 58.—A Coulthard 4.5 ton Lorry carrying 6 tons up a gradient of 1 in 7½.

axle type, special provision having been made to keep the bevel gear drive properly in mesh. Three speeds forward and a reverse are provided, with direct drive on top speed. Other points of interest in the Phoenix car are the quick-release joint on the admission pipe, the double silencer, and the joint between the clutch and gear box. Altogether there is ample evidence that a good deal of time and careful study has been devoted to its production.

In addition to their standard 10 and 20-h.p. pleasure cars, the THORNY-CROFT STEAM WAGON COMPANY, LIMITED, exhibited for the first time a petrol motor lorry, designed to carry loads of two tons. The engine is of the four-cylinder type of 20-h.p.; four speeds forward, ranging from 2½ to 10 miles per hour, and a reverse are provided, the transmission being by means of side chains. The SIMMS MANUFACTURING COMPANY, LIMITED, displayed examples of their 10-h.p. two-cylinder, 20-h.p. and 30-h.p. four-cylinder pleasure cars, a 12-h.p. delivery van to carry 15 cwt., and the chassis of a new 5.6-h.p. voiturette. The well-known magneto ignition and the Arbel stamped steel frames and disc wheels were also to be seen at this stand.

A new firm to London shows was MESSRS. WILSON BROTHERS, of Bedford, who had on view three "Bedford" cars of respectively 6-h.p., 10-h.p., and 16-h.p., all of the gear-driven variety. The 6-h.p. car was noticeable for its long wheel base, 6 ft., and the fact that it was fitted with "compound" cushion tyres; it having been built to the order of a doctor. The De Dion engine is provided with a water-circulation, maintained by a friction driven pump and framed radiator. Three speeds forward and a reverse are provided. The frame is constructed of wood and steel, on which is mounted a neat two-seated body, having a sliding drawer and tool box at the rear. The 10-h.p. car has a Tony Huber engine, with mechanically operated inlet valves. Three speeds and a reverse are controlled by one lever, the drive on the top speed being direct. The 16-h.p. car was fitted with a handsome Roi des Belges body; the motive power is supplied by one of the latest 16-h.p. Aster four-cylinder engines, lubricated positively by means of a Dubrulle exhaust-pressure lubricator. The change speed gear box is adapted to give four forward speeds in addition to a reverse motion. Without possessing any striking departure, the Bedford cars appear to be soundly constructed vehicles.

A German car new to this country was exhibited by the NEUE AUTOMOBIL GESELLSCHAFT, of Berlin. Two were shown, a 20-h.p. four-cylinder chain-driven limousine and a 10-h.p. two-cylinder tonneau with cardan shaft transmission. They follow standard lines, a feature being the radiator with which they are fitted; this consists of a large number of small vertical tubes set in a circular frame, and so arranged that any tube which may get damaged can easily be replaced.

STEAM VEHICLES.

MESSRS. T. COULTHARD AND Co.'s, LIMITED, exhibit was an instructive one to users of heavy motor vehicles, as, in addition to showing one of their latest four-five ton wagons, they also had on view a vehicle which has, in the service of Messrs. F. Skurray and Sons, Swindon, covered over 18,000 miles. Messrs. F. Skurray were one of the first millers in the country to put motor-vehicles to work in connection with their business, and, as an indication of their satisfaction with the same, we may state that the new wagon on

view was also intended for them, making the third Coulthard vehicle they have had. The boiler is of the vertical fire tube type, centrally fed from the top and constructed for a working steam pressure of 200 lbs. per square inch. A feature of the compound engine lies in the method of suspending it from the frame, while another of the specialities to which much of the success of this type is due are the spherical bearings and flexible joints which prevent any distortion of the frame which might otherwise be caused by variations of the load or uneven roads.

MESSRS. JESSE ELLIS AND Co., LIMITED, exhibited two heavy steam vehicles, one being a sanitary tip wagon, the body of which can be removed and a large tank for road watering purposes fitted in its place. The one is a new design, of four-ton capacity, fitted with an improved form of fire-tube boiler and patent spring arrangement.

The largest display in the heavy-vehicle section was that of the STRAKER STEAM VEHICLE COMPANY, LIMITED, no less than eight vehicles being shown. The five-ton wagon has been modified in several details with a view to securing increased efficiency and economy. It is designed to carry a net load of five tons at a maximum speed of seven miles an hour, and to be capable of ascending gradients up to 1 in 6. The weight of the vehicle is taken at three points, two on the back axle and one on the spring cradle on the front, which allows the axles to assume different inclinations to each other. The steering gear has been almost entirely re-designed, so that it now gives a straight front axle in all vehicles, with the worm spindle at right angles to the axis of the wagon. The boiler is of a new and improved pattern and of much larger capacity. It consists of four shells, each two of which form a concentric annular water space, connected up by a nest of horizontal radial water tubes, which form the effective heating surface. When cleaning becomes desirable, it is only necessary to break the two joints formed by the outer dome, which, when removed, exposes the whole of the tube nest. The engine is of the compound type, having cylinders 4 in. and 7 in. by 7-in. stroke, which, at the working pressure of 200 lb., is capable of developing 40-i.h.p. Another of the new features is the ease with which the engine casing can be opened up, the top cover being mounted on a parallel motion, which enables it to be easily raised and pushed to one side. The five-ton Colonial wagon differs from the standard type in having stronger steering gear, supported with a back stay, and in being equipped with rear wheels 4 ft. diameter by 15 in. face, and front wheels 3 ft. diameter by 7-in. face, enabling it to pass over soft and unmade roads. A winding drum is also fitted on the back axle, so that in the event of the machine ever getting into difficulties when far away from assistance, it can always extricate itself. The two-ton chassis is a new type, designed to meet the requirements of railway companies and general carriers. It is intended to carry a net load of two tons at a maximum speed of ten miles per hour, and to be capable of ascending gradients up to 1 in 6. As in the case of the five-ton, the spring suspension is taken on three points. The boiler, although of smaller size, is identical in design. The engine is of the compound horizontal type, having cylinders 3½ in. by 6 in., and 4½-in. stroke, giving approximately 25-i.h.p. Two gear speeds are provided, four to ten miles an hour. Lorry or van bodies can, of course, be fitted to the chassis. An interesting vehicle was a twenty-passenger omnibus, intended for service between Penrith and Patterdale, in the Lake District. It is designed on the same lines as the five-ton wagon, but is of a somewhat lighter description, and with the necessary modifications for obtaining an increased speed. It is designed to carry one ton of luggage in addition to twenty passengers. The over-all dimensions are 21 ft. by 6 ft. 6 in., and the maximum speed

Fig. 59.—The Straker 5-ton Delivery Wagon.

ten miles per hour. The wheels are shod with steel tyres, but, to reduce vibration, the body is mounted on rubber blocks, interposed between the frame and the bearers. The machine is fitted with sand-boxes for the prevention of skidding when the roads are in a greasy condition, while, for the comfort of passengers during winter weather, a system of steam heating, supplied from the boiler, is arranged. Another public service vehicle was a twelve-passenger omnibus, constructed on the two-ton chassis described above.

Messrs. BAILEY AND LAMBERT had on view a *chassis* and a complete tonneau of the Miesse 10-h.p. steam cars, built by TURNER'S MOTOR MANUFACTURING COMPANY, LIMITED. The car is driven by a horizontal three-cylinder engine, steam for which is provided by a flash-type generator. The latter is made of solid-drawn weldless steel tubing of about 200 ft. in length, which is made up into sixteen layers of snake coils. The burner is of the Bunsen type, and consumes ordinary American paraffin oil as fuel. The oil is fed from tank to burner by air pressure, automatically maintained by a small pump mounted on the engine crank-shaft. The engine is of the single-acting trunk type, and has inlet and exhaust valves of the mushroom

over 120 miles. The frame is of channel steel, the boiler at the rear being placed lower than usual. The engine is a four-cylinder one. Automatic pumps have been discarded, the water pump being actuated by an eccentric and rod from the rear axle. One lever controls a combined water and fuel distributor. The weight of the 9-h.p. *chassis* is between 12 and 13 cwt.

Messrs. O'NEILL AND Co., one of the recent additions to the list of traders in London, had a display of "Argus" cars, ranging from 6 to 15-h.p. In general it may be said that they follow the now generally adopted lines, one of the features being their relatively low price. The smaller cars are

Fig. 60.—The Miesse 10-h.p. Steam Car.

pattern, a construction which obviates the necessity of any glands or packing. The valves are operated by two cam rods, actuated by the steam lever on the steering post. Among the detail improvements in the 1904 model is a pilot light which keeps up the necessary temperature of the generator, enabling the car to be left standing for hours without attention, and yet be ready at a moment's notice to start. Steam is now cut off as desired by a throttle valve, operated by a pedal, which also applies the brake; while the water regulator has been improved to enable the driver to see at a glance how much water is passing to the generator. Sufficient water for a run of eighty miles can be carried; while the capacity of the fuel tank is equal to 100 miles running.

Considerable interest was shown in the exhibit of the WHITE STEAM CARS, which have gained a high reputation among motorists during the past year or so. The new 10-h.p. models are but little changed so far as relates to the engine, boiler, and transmission, which have already been dealt with in the *Journal*. We note, however, that the condenser is now protected from the engine heat by a wind shield, which at the same time increases the efficiency of the engine. Hand pumps have been fitted to the automatic oil-cups on the dash; the springs have been slightly changed, so that the suspension of the body is exceedingly comfortable. Increased dimensions are also to be noted in the cardan joints and in the live rear axle. Perhaps the greatest change is noticeable in the carriage work, the bodies being now of English production, and of larger dimensions than hitherto. Furthermore, in addition to the ordinary tonneau, limousine bodies are now being fitted, an excellent example of this type being one built to the order of Sir E. Reed, late chief constructor to the Admiralty. The industrial side is not being neglected by the White Company, as was testified by a delivery van built for Messrs. Liberty and Company, this being the second ordered by this firm. So far as regards the *chassis*, it is of the standard type; the van body, which has a neat appearance, has a capacity of 66 cubic feet, and is designed for loads up to about 10 cwt.

The Gardner-Serpollet steam cars were represented by a *chassis* of the new 9-h.p. "Simplex" type, shown by the SPEEDWELL MOTOR AND ENGINEERING COMPANY. This is a new type for the 1904 season, and has a water capacity sufficient for a run of

fitted with De Dion engines, and have cardan shaft transmission, three speeds forward and a reverse being available. The large car has a four-cylinder engine with mechanically-operated inlet valves and side chain transmission. Messrs. O'Neill also displayed the *chassis* of a 10-h.p. Corré car, reference to which was made in our report of the Paris Salon. This is a two-cylinder car, with tubular frame, very much on the lines of the Renault.

THE CENTURY ENGINEERING COMPANY had an extensive display of "Century" cars ranging from 10 to 22-h.p., they being all of the chain-driven variety. This company are now using the Mutel engine, which is a well-known and favourite type in France. The cars throughout are on up-to-date lines, and among the small features of interest is the provision of a small electric light on the speed change lever, to enable the driver to see that he has got the lever in the right notch in the sector at night. Reference may also be made to a strongly-built 10-h.p. delivery van, designed to carry loads of 15 cwt. at speeds up to 15 miles per hour. The well-known 5-h.p. Century tandem was shown in two forms—one for two passengers and the other having a parcels chest in place of the front seat, the carrying capacity being about 3 cwt. The Mutel engine, which is being sold separately to the trade, is made with two and four cylinders, in sizes ranging from 10 to 26-32-h.p. The inlet valves are interchangeable with the exhaust. At this stand was also to be seen the Xenia automatic carburettor, illustrated and described in a recent issue of the *Journal*.

Messrs. WALLIS AND STEEVENS, LIMITED, exhibited one of their miniature traction engines for hauling loads of from three to six tons. The firm claim to be the pioneers of this type of motor, and now have a large number in use in various parts of the country. They are fitted with enlarged smoke-box, spark-catcher, a patent arrangement for controlling the draught, and an auxiliary valve which enables the engine to be started instantly. The "Little Giant" steam motors were shown in two forms by Messrs. W. TASKER AND SONS, LIMITED, one being fitted with a single-acting motor, and the other with a compound engine. These are miniature traction engines, designed to haul loads of from five to six tons on trailing wagons.

A description of the new "Keenelet" steam car has unfortunately to be held over till next week.

Fig. 61.—The White Steam Tonneau, with Canopy.

ELECTRICAL EXHIBITS.

The KRIEGER ELECTRIC CARRIAGE SYNDICATE, LIMITED, displayed one of the Krieger four-seated landaulettes, propelled by two 4½-h.p. electric motors, driving through spur gearing on to the front road wheels. The battery consists of 45 cells of the Fulmen type of accumulator, one charge of which is stated to be sufficient for a run of fifty miles over good roads. The controller is adapted to give eight speeds forward, one reverse, and two electrical brakes. The company has established a garage at 48A, Gillingham Street, Ecclestone Square, S.W.

A newcomer in the electrical vehicle field is the ANTI-VIBRATOR, LIMITED, which had on view a well-finished landaulette. No frame, in the usual sense of the term, is used, the body being supported on the axles in a special way; the axles are tied together by tubular radius rods in such a manner that each may adjust itself to any inequalities in the road. Two 3-h.p. motors are provided; they are of the enclosed type, with the armatures running on ball bearings; each motor drives one of the rear wheels through spur gearing. The necessary energy is furnished by a battery of forty-four cells, arranged in two groups—one under driver's seat and one behind the rear seats. The capacity is equal to a run of about forty miles over good roads on one charge. The speed controller measures only 15 in. by 4 in., and is fitted under the driver's seat. It provides three speeds forward, one reverse, and one neutral or off position. By a special contrivance it is rendered impossible for the driver to start off with a rush or to change the speeds abruptly from first to third, a frequent source of damage to the motor and gear wheels. Four brakes are provided—two on the driving wheel and two on the motor shafts. Each is double-acting and will hold the carriage from running backwards or forwards. Near the driver's left hand is a safety device, by which, on withdrawing a plug, all electrical connections are cut off, so that the car may be left without danger. Two roller bearings, which carry the weight, and two sets of ball bearings for taking up the thrusts are fitted to each wheel, thus allowing the carriage to run very smoothly and reducing friction to a minimum.

The ANGLO-AMERICAN MOTOR-CAR COMPANY, LIMITED, displayed examples of the Baker runabout and "Imperial" light electrical two-

Fig. 62.—The Anglo-American Grand Victoria.

seated vehicles, well adapted for town use. A more pretentious car was what is known as a rear boot grand victoria, this having the driver's seat at the rear. The car is of American construction, and is fitted with two motors, driving the rear axle through spur gearing. The electrical energy is furnished by a battery of forty-four cells, one charge of which is sufficient for a run of forty miles. The controller is adapted to give three speeds forward and reverse and two electrical braking positions.

A new patent accumulator was on the stand of the ELECTRIC BATTERY COMPANY, who also showed the "Sparkwell" plug, which is claimed to be indestructible and soot proof. The mica is compressed by hydraulic power, so that the fear of getting a spark through the mica need not be entertained. A new dead heat voltmeter was also shown, by means of which the driver can take a direct reading of his accumulators, even when the motor is in motion.

GENERAL EXHIBITS.

Oils and greases formed an interesting display by the STERN-SONNEBORN OIL COMPANY, who have given much attention to the lubrication of motors. Their Motostern oil for the water-cooled cylinders and bearings of motor-cars has attained much celebrity, while for air-cooled cylinders Auto-stern oil is recommended as a pure hydro-carbon, non-corrosive, and free from impurities and acids. Greases, belting bricks, elastic paste for chains, cogs, wheels, pinions, etc., and Gearoline for axles and gear-cases, were among a variety of other specialities of the kind. The Stern-Sonneborn Company also showed some new types of lubricators. At the south end of the Palace, the ELEPHANT CHEMICAL COMPANY had a display of their lubricants, rubber solutions, celluloid cement, adhesive tape, etc. This company's specialities also include acetylene gas burners, and the concern is well equipped for the supply of similar goods to motorists. The AUTO-LUBRINE COMPANY limited their exhibit to Auto-Lubrine, which is so favourably known to motorists as to obviate detailed eulogy on this occasion. MR. CHARLES WHITE made a special display of the "Speedoline" motor lubricants, both for water and air-cooled motors.

The motometer was shown by MESSRS. ELLIOTT BROTHERS, who demonstrated the convenience of adjustment with which the instrument can be fixed in any position on the car. It is really a combined speed indicator and cyclometer, the former having a specially designed governor mechanism with the smallest possible number of parts. All the parts are made of a metal which will not rust. The construction provides for a steady but very sensitive pointer movement under the very worst conditions of vibration. The whole weight of the governor is carried on ball bearings. The position of the pointer indicates the speed of the car on a dial, which is marked off in miles per hour. At the same time every revolution of the mechanism is counted up on a cyclometer by means of suitable gearing.

MESSRS. LECOQ AND Co. had a good display of fittings and accessories, including plugs, accumulators, etc.

MESSRS. J. TYLOR AND SONS, LIMITED, made a display of their petrol engines for electric light plants, and also a float-feed carburettor of aluminium, the float being of copper. A valve of German silver is fitted accurately ground to fit the seating, which can be lifted for the purpose of testing its efficiency by means of a milled handle. After passing through a strainer the petrol enters the float chamber through the needle valve. By slightly throttling the air round the jet in the suction pipe a partial vacuum is caused above it, the petrol being carburised against a baffle cone dividing the suction stroke of the piston. A valve carburettor for petrol launches and a centrifugal water-circulating pump were also shown.

At the stand of the "SEE" MOTOR-CAR COMPANY was the "See" fluid for use in connection with tyre troubles. A new feature of the company's display was, however, the "See" pump, which can be fixed on the car within easy reach of the driver. By means of a long connecting tube the operator can inflate the tyre on any of the wheels without removing the pump. It is said that a 6 in. tyre can be inflated in less than a minute with this pump, which, being only 20 in. long, and made of aluminium, does not add much to the weight of the vehicle, or present any unsightly obtrusion to the view of the passer by.

A portable canopy, of which more should be seen should the weather improve, was exhibited by MESSRS. BURKIN AND Co. This can be fitted to any body, and be utilised to completely cover in the vehicle on all sides, or it may be utilised to protect the passengers from the wind entering on either side, or from the rear. The method of fixing is simple. Metal uprights are dropped into sockets at the four corners of the car, and held at the top by horizontal rods. Along the top a strongly made curtain is run and other curtains are placed to let down on rollers along the sides, forming a splendid protection. By using only the back curtain a capital dust shield is obtained.

THE ACME LATHE AND PRODUCTS COMPANY, LTD., showed their Acme four-spindle automatic screw machine and an Acme semi-automatic screw slotting machine. The feature of the firm's automatic machine is production, which they claim to exceed any single spindle machine on the market. The Acme machine carries four bars of stock, on which all tools are operating simultaneously.

A good style of motor-car watch and a large show of lubricators, grease and oil cups, tank fillers, nuts and unions, and other small parts for the trade, comprised the display made by MESSRS. ROTHERHAM AND SONS, whose long reputation gives confidence as to the way they are catering for automobiles.

Comprehensive so far as the accessories for automobiles are concerned was the display made by MESSRS. BRANSON, KENT AND Co., LTD., including lamps, silencers, horns, coils, jacks, etc., in fact, everything of the kind required in connection with the equipment of a motor-car. MESSRS. J. RICHARDS AND Co. had a collection of motor axles, handles, locks, and general iron work for motor-cars. A double-acting jack having a long run-out of just over a foot, with a height when closed of only 9½ in., was shown by MR. R. DALMER.

On the stand of the BEBBIE MANUFACTURING COMPANY, LIMITED, which we shall notice next week, was the "Pearson" motor-bicycle, fitted with a 4-h.p. Aster engine, located in a vertical position in a weldless steel tube of extra gauge. Three tubes are provided to take the thrust of the engine, which is given a position of great rigidity and security. The transmission is by means of a ½ V belt with deep V pulleys. A large silencer has been fitted which is free from back pressure on the engine. The outlet holes are in the end so as not to blow up the dust. The Longuemare carburettor which is fitted is of the type usually employed with a 6-h.p. engine, it being contended by the makers of the motor-bicycle, Messrs. Pearson Brothers, that such a carburettor enables them to attain a speed of twenty-five miles an hour up-hill. The tank has capacity for two gallons of petrol, three pints of lubricating oil and two Litanode or other accumulators. The ignition, air and throttle levers are of the inventor's special design, and the exhaust valve lifter lever is on the handle bar. Good brakes are provided and the mudguards are in two halves to permit of easy detachment.

"Jehu" motor-cycles were exhibited by the JEHU MOTOR COMPANY, LIMITED. In their motor-bicycle they make a special claim for their method of transmission. This is a chain-drive with a friction clutch interposed, a free engine being thus obtainable.

The "Grose" non-skidding and puncture-proof bands were the staple exhibit of MESSRS. GROSE, LIMITED. This band is made of chrome leather and is fitted with a steel-studded strip on the tread, which prevents sliding or skidding. It should be stated that the leather, being formed into the exact curve of the cover it is to be fixed upon, ensures a neat appearance being presented by the band when on the tyre. No interference with the

resilience of the tyre occurs through their use, and they have the advantage of considerably strengthening the whole.

In our reference to the exhibit of MESSRS. DENNIS BROTHERS last week we incidentally referred to the patent twin spoke wheel introduced by the ARTILLERY WHEEL WORKS, LIMITED. This wheel (Fig. 63) is designed to withstand severe strains caused by side-slips or turning corners at high speed. Owing to the fact that the alternate spokes are set at different angles, the wheel is so constructed that each spoke takes a counteracting strain to that of its neighbour, and so, in the case of side-slips, the strain is never thrown

Fig. 63.—The New Twin Spoke Wheel.

all in one direction at the same time. The wheel is made with the ordinary number of spokes, and is not heavier than the ordinary type of artillery wheel. It can be made to suit any hub, the only alteration being the difference in length of the flange bolts. It is well known that the wheels on racing cars are subjected to a terrible strain, especially in rounding corners; hence the value of this design, which has a smart appearance that should help its adoption by motor-car builders.

MESSRS. E. GREEN AND SON, LIMITED, show the petrol motor mower with which they gained distinction at the Manchester Exhibition of the Lancashire Agricultural Society. This is made in various sizes, the 20-inch having a 1½-h.p. engine, the 24-inch a 2½-h.p. and the 36-inch a 5-h.p. engine, a Fafnir motor being adopted in each case, as well as compensating gear. They also showed a 42-inch steam-propelled motor.

A grooved solid motor tyre, known as the De Nevers, was shown by MESSRS. J. LIVERSEDGE AND CO. The accompanying illustration gives a good view of the appearance of a wheel fitted with this tyre. It has, at certain intervals apart, transverse grooves, giving an impression of a tyre constructed in sections, but having an integral connection with the same base. The grooves allow each section, when under pressure, to distend, independently of the others, into the adjacent grooves, and when leaving

Fig. 64.—The De Nevers Solid Tyre.

the ground each section is able to recover its original shape. There is thus no fear that the weight on the rubber will cause the tyre to spread in such a way as to ultimately come out of the rims. The grooves produce the effect of a pneumatic tyre without its liability to punctures or bursts. These grooves also prevent side slips. The wearing surface of the rubber being grooved is neither under compression nor tension, consequently it retains its natural resiliency, and greatly adds to its durability.

Several good examples of high-class coach work were shown by MESSRS. THURPP AND MABERLEY, notably a landaulette body intended for a car being built for the latest accession to the House of Lords, the Hon. Humphrey

Sturt, M.P. A holdly outlined Roi des Belges body was also conspicuous on this stand.

At Mr. T. H. HOLDING's stand was his new car-poncho, a motor garment in mackintosh and real Paramatta. This is an adaptation of the parapluie idea, but by means of the collar, as shown in the illustration, the trouble usually associated with the taking on and off of that garment is reduced. The new garment is an effective protection in wet weather and an excellent addition to the range of motorists' raiment now available. Other special lines shown by Mr. Holding included the Ayrshire motor

Fig. 65.—Holding's Car-Poncho.

ulster, lined with leather or fur, the "Holding" patent apron in box cloth, the "Kangaroo" and other leather vests, and a good selection of drivers' liveries.

Mention must also be made of MESSRS. H. J. NICHOLL AND CO., whose frieze motor-coats lined with leather were a feature of considerable interest. Clothing for both lady and gentleman motorists was shown at their stand.

MESSRS. S. BOWLEY AND SON took occasion to show their lubricating oils for petrol motors, and, in showing their "Champion" oil, urged that increased temperatures do not lessen its viscosity, while it neither "gums" nor gives acid reactions. Special oils for gear boxes were also shown, as well as Bowley's motor spirit, which is becoming increasingly known to the trade. This is supplied in rectangular tins of two gallon capacity. Three grades are on the market, their specific gravities being .680, .700, and .718 respectively.

The exhibit of the TWENTIETH CENTURY MANUFACTURING COMPANY was entirely confined to lamps for motor-cars and motor-cycles, a special feature being a drip feed acetylene lamp of 800 candle power. Lamps of the type illustrated herewith are used as a side light on many large cars, and as a head light on the smaller types of vehicles. Another speciality was a combined hand and carriage lamp; while, to meet the demands of those authorities desiring a subdued light as compared with the brilliant

Fig. 66.—The Twentieth Century Lamp.

searchlight, which often dazzles others on the road, the company have produced an excellent lamp fitted with a screen, which deflects the light on to the roadway. The lamps are produced in gun-metal, nickel and brass and have good points of construction.

MESSRS. MARTIN AND FLEWITT showed some excellent specimens of coachbuilding, including a tonneau body with side entrance. An aluminium fore-carriage body on this stand also attracted considerable attention.

As usual, the display of PRICE'S PATENT CANDLE COMPANY, LIMITED, was comprised of their lubricating oils, etc., for automobile purposes. These are now so well known that the mere recital of their names will suffice on the present occasion, including as they do "Belmoline" solidified oil for gearing and axles; the "Battersea" gear oil for change-speed gear; and other specialities for the cylinders, valves, and bearings of all classes of automobiles.

(To be concluded.)

HERE AND THERE.

MESSRS. MORT have opened a garage in the Uxbridge Road, W., where they will also undertake repairs.

ON Friday last week about thirty of their agents were entertained to dinner at the Hotel Cecil, London, by Messrs. A. Darracq and Company.

MR. E. J. PENNINGTON, of automobile and airship fame has again been heard from as the head of the Cleveland Motor Company, Cleveland, O., U.S.A.

THE Anti-Vibrator, Limited, of Croydon, who are now building electric motor vehicles, have established a garage and charging station at 19A, Carlyle Square, Chelsea, S.W.

AN outcry is being raised in Calcutta against the speed at which motor-cars are alleged to travel. This can be taken as a certain sign that automobilism is making headway in our Indian dependency.

THE Motorists' Tyre Union, Limited, has been registered with a capital of £1,000, the object being to adopt an agreement to establish and conduct a club, to manufacture, repair, and deal in tyres, motor-cars, cycles and vehicles, etc.

At the annual general meeting of Friwell, Limited, held last week, it was resolved to pay a dividend of 10 per cent. on the ordinary shares, and 6 per cent. on the preference shares, to write £3,550 off the goodwill account, and to carry to reserve the sum of £13,462 16s. 4d.

At the recent show Messrs. Rubery and Company's display of pressed frames proved an attractive one. The accompanying

Testing a Rubery Pressed Steel Frame.

photograph shows one of these frames under test, an exaggerated condition of things that would not occur in the ordinary way. The frame in question is 11 ft. 7½ in. over all and is only held up at two points. On the centre of the frame is a weight of nearly thirty cwt. and yet the deflection is only one-eighth of an inch. It may be added that the frame shown in the illustration is a standard one for a 20-h.p. car and was actually on view at the exhibition.

MR. R. WOODHEAD, of King Cross, Halifax, has opened the motor works and garage formerly occupied by the Anglo-American Motor Company, Limited, Bull Close Lane, Halifax. The basement has been fitted up with inspection pits and electric light, and on this floor there will be garage accommodation for fifty cars.

MESSRS. DENTS, of Tamworth, have completed successful trials with change speed cones for single belt driven cars. Their invention, which they style the "B.R.C." (belt race cone) system, consists of tapered surfaces between ordinary pulley surfaces, and the belt is shifted into any of the speeds by means of a combined shifter and jockey. It does away with all chains and chain-wheels, gear-box, or fast and loose pulleys, clutch, engine flywheel, and cardan shaft, by merely using two belt race cone pulleys (one forming the engine flywheel, the other driving direct into back live axle with reducing pinion), and one belt. The whole is encased. Slipping is overcome by ample length and width of belt; and by the automatic tension of the ball-bearing jockey, which can be regulated at will.

MR. S. F. EDGE, who has been seriously indisposed recently, left England for Madeira on Saturday last. He has our best wishes for a speedy recovery.

THE active membership of the Automobile Club of America has reached the limit of 400 provided for in the rules, and a waiting list of applicants for active membership has been established.

THE Relyante Motor Works, Limited, has been registered with a capital of £100 to carry on the business of motor engineers, contractor, etc. The registered office is at Black-horse Lane Works, Walthamstow.

WE are informed, on the authority of the Town Clerk of the borough of Mossley, that the application of the Town Council of that borough to the Local Government Board for a regulation providing that the speed of motor-cars within the borough shall not exceed ten miles an hour has been withdrawn.

THE Anglican Motor Company, Limited, of Beccles, are establishing a large depot and garage in the west-end of London, they having acquired the Cadogan Rooms, Basil Street, Sloane Street, W. The new premises will be opened as soon as the necessary alterations are completed.

FEW of those who made trial spins in the Gobron-Brillie car at Sydenham last week had any idea that the young smiling driver was none other than Duray, the French professional *chauffeur* who will drive one of the 100-h.p. Gobron cars in the forthcoming eliminating trials for the French Gordon Bennett team.

MESSRS. JAMES WALMSLEY AND COMPANY, LIMITED, has been registered with a capital of £20,000 to adopt an agreement with Mr. J. Walmsley for the acquisition of the business of a coach and motor-car builder and dealer carried on by him at Guildford Street, Preston. The first directors are Messrs. J. Walmsley, J. L. Cross, and H. P. Cross.

A BILL has been introduced into the Massachusetts House of Representatives which prohibits the operating of any automobile which has a seat in front of the driver. The penalty for violation is a fine of £40 or imprisonment for ten days, or both. If the bill becomes law it will seriously affect the sale of a number of well-known motor-cars which are designed with folding seat to carry extra passengers in front.

MR. F. C. BLAKE, of Kew Gardens, S.W., has just issued a new catalogue of the Blake petrol motors suitable for motor-car and launch propulsion; they are made in one, two, and four-cylinder form, ranging from 3-h.p. up to 40-h.p. Mr. Blake has lately brought out an improved high-speed trembler coil, for ignition purposes. The trembler is of novel and ingenious construction, having only one moving part; it is extremely sensitive to high speed vibration, at the same time it is simple in construction and easy to adjust.

MESSRS. MERRYWEATHER AND SONS are constructing to the order of the Romford Rural District Council a motor-driven apparatus for the emptying of cesspools. It will be propelled by a two-cylinder steam-engine, and will travel at the rate of six to eight miles an hour. A special device for rope haulage will be fitted for use in the event of the vehicle getting into soft ground from which it cannot propel itself. It is to be furnished with a galvanized tank, capable of holding 700 gallons of sewage, filled by a steam suction pump.

A COMPANY is being formed in Adelaide, Australia, with a capital of £100,000, to run a public service of motor-cars between South and North Adelaide. It is proposed to put six cars on the service, each making two trips per hour; length of working day, fourteen hours. In connection with the proposed service, the expenditure, exclusive of cost of cars, is estimated at £6,132; cost of six cars is put down at £1,200 each—£7,200, and two emergency cars are allowed for at same price—£2,400, making a total outlay of £9,600. It is calculated that there should be a clear profit of 14 per cent. on the operations of the proposed company.

A SECTION of the Swiss Automobile Club has just been established at Geneva.

THE Antwerp Automobile Club has decided to organise a tour to Homburg on the occasion of the Gordon Bennett race.

MR. M. F. MIEVILLE, of Chichester, has registered his Baby Peugeot as B. P. 175, an interesting coincidence as to the initials and price of that particular car.

The "Avon" 4-h.p. Two-seated Car. (See page 957 last issue).

THE Hampton District Council has wisely recognised that there is no need to restrict the speed of automobiles passing through its area to less than the legal limit. A similarly sensible decision has been reached at King's Lynn.

AMONG the several absentees of heavy steam vehicle builders at the show just closed was the Lancashire Steam Motor Company, Limited; a big display will, however, be made by this concern at the Exhibition at the Agricultural Hall next month.

FROM the Locomobile Company comes a neat booklet giving the rates of their garage, the system of charge both for storing cars and for repairs, and other information useful for those on the look-out for good facilities for the storage of their motor vehicles.

"How to Choose a Motor-Car" is the title of a neat pamphlet issued by Messrs. J. R. Richardson and Company, Limited, of Saxilby, near Lincoln. Without too much reference to their own particular cars, they have managed to give in a small compass some useful hints which intending motorists will do well to consider.

THERE seems to be some doubt about the personnel of the American team for the Gordon Bennett race. Three cars have been entered for the event, but one or two of these may not be finished in time. The secretary of the A.C.A. has written to each entrant asking that a report be made to the Race Committee of the Club of the progress that has been made.

THE final act in the proceedings for freeing the bridge at Maidenhead has just been performed, when the toll-house on the south side was removed. That on the north side was pulled down a short time ago, and the toll-gate itself was removed at midnight on October 31st last, when the bridge-tolls were abolished. The Maidenhead Corporation are now obtaining a special Act of Parliament to enable them to pay off the bridge bondholders.

FROM Messrs. Docker Bros., Limited, comes a catalogue of their varnishes, paints, and colours, specially prepared for the decoration of motor vehicles. Their system of preparation of the paints is such as to give a good degree of fineness, and at the same time not detract at all from the high finish. The paints are also prepared with a view to resist the effects of heat. The catalogue should do much to put the firm in favour with coachbuilders and the like, the illustrations being the best we have yet seen in this class of work.

BECAUSE of the lack of financial support the scheme to run motor-cars between Bewdley and Kidderminster has fallen through.

THE Lynn Town Council have passed the plans of the new motor works Messrs. W. H. Johnson and Sons are erecting in Tower Place, King's Lynn.

MESSRS. R. REYNOLD JACKSON AND COMPANY are now in their commodious new premises at 11 and 13, High Street, Notting Hill Gate, London, W.

AMONG the well-known garages on the Great North Road is that of Mr. J. Smith, of Grantbarn, who has every facility for the recharging of accumulators, etc.

FORTUNATELY for lawyers, observed counsel at the City of London Court the other day, motor-cars seem likely to produce the same class of dispute as their old friend the horse has done for many years.

MESSRS. J. TYLOR AND SONS, LIMITED, who have attained distinction in connection with sanitary fittings, etc., are giving attention to petrol engines, and hope shortly to put on the market a new motor for cars.

MR. A. WALROND, director of the Union Bank of London, has purchased a 24-h.p. "Fiat" car from the British Automobile Commercial Syndicate, Limited. The car is to be fitted with a Rothschild three-quarter landaulette body.

It is reported that the roads in the Luneberg district, where it was proposed to hold the German eliminating trials for the Gordon Bennett team, are too narrow for the purpose. Another course between Kiel and Hamburg is now being surveyed.

AT the next general meeting of the Automobile Club on March 10 the Earl of Shrewsbury and Talbot will propose the following resolutions:—(1) That no member of the Automobile Club in the trade or journalist connected with an automobile journal be eligible for membership of the committee of the Automobile Club of Great Britain and Ireland, and that the meaning of 'member of the trade' be settled by the committee of the club. (2) That the committee of the Automobile Club of Great Britain and Ireland shall have power to appoint sub-committees who shall deal with the matters in which the trade may be interested, such as racing trials, administration, finance, and Parliamentary questions.

The "Crossley" Car.

THE driver of the motor mail van from Warwick, Leamington, and Kenilworth to Coventry and Birmingham reported on his arrival at Coventry one night last week that a serious accident occurred at Kenilworth. He was endeavouring to avoid a vehicle at the top of Rosemary Hill, when the van came into contact with the kerbing, with the result that the vehicle was considerably damaged. The mails were taken on to Coventry by means of a horse and trap. They reached Coventry at 10.20, only twenty minutes late.

CORRESPONDENCE.

EXPERIENCES WITH THE PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to my experience with the Trusty carburettor which I gave about a month ago, in reply to "Cycle Mechanic," with regard to the consumption of the two oils, I have tested this many times, and find practically the consumption of petrol or paraffin to be about the same; that is, with my 7-b.h.p. engine, doing thirty amperes at 115 volts, the consumption is, for one hour and fifteen minutes, one gallon of either petrol or paraffin, so that every hour I run I save about 7d. by using the Trusty carburettor. I stated in my last that only under certain conditions would my engine pick up on paraffin. I thought this to be the fault of the carburettor being too large, so I wrote the maker, and he was kind enough to send me a smaller one to try; this I fixed and found to act and work well on paraffin after running about fifteen minutes on petrol—that is, until the engine is thoroughly warm. I say until the engine is warm. The makers say until the carburettor is warm. I think this rather misleading, as I have run mine for an hour on petrol or benzoline, and then could not get the carburettor warm; as one knows, petrol is very cold stuff and tends to keep the carburettor cold, so I say when the engine is warm one can turn on the paraffin.

I find the best method is to run about ten minutes on petrol, and then open the mixture lever a little and turn tap on to paraffin and back

favour. A steam car burning paraffin as fuel would cost more for running than a petrol car of corresponding power, the consumption being considerably greater. The working parts are also more likely to get out of order, and the generator is continually out of order, which generally incurs great expense. With regard to obtaining petrol, this can be purchased now in almost any town or village of any importance, and one has seldom any need to worry on that score, as tanks are made sufficiently large to carry enough for long journeys. The ignition on petrol cars is undoubtedly the greatest source of trouble, but if this be carefully attended to one has seldom serious trouble. With reference to steam cars there is also the necessity for carrying a large supply of water as well as the oil for fuel, otherwise numerous stoppages for replenishing same are necessary. Taking all points into consideration, "Searchlight" will, I think, find that the petrol car is far in advance of the steam car both as to reliability or upkeep.—Yours truly,

J. H. J.

CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having been a motorist for between three and four years, I would like permission to record my opinion in favour of solid tyres. Given a well-sprung and strongly-built car—as all cars ought to be—combined with a reasonable rate of travelling, solid tyres will give satisfaction and practically absolute freedom from worry. At least, such is my experience. The diameter of the tyres on the driving wheels should not be less than 2½ inches. The professional man who has decided to purchase a motor-car, and who desires to have reliability,

The Chances of Promotion. (See page 1007.)

on to petrol several times, when the engine will pick up the paraffin without any trouble; then I put the mixture lever almost back to petrol mark. Now, with regard to the small carburettor the maker sent me, this works well, but I found a loss in power; I could not under any conditions get the engine to do more than fifteen amperes at 110 volts, so I took off the carburettor again. I may say here that the maker promised to send me on a new and smaller spraying tube for the larger carburettor which he assured me would do equally as well as the small one, but, owing to pressure of work, the delivery of same was delayed. However, I have now got the large one at work again with the spray altered, and am more than satisfied with the results, as with it I save 7d. per hour in oil for each hour I run the engine, and do thirty per cent. more work with this carburettor on. With regard to the carburettor for motor-cars, I am afraid, until something is done to regulate the air automatically, so as to keep the mixture regular, it will be rather troublesome, but for stationary engines I can vouch for it being in every way a success.—Yours truly,

TALBOT C. CLIFTON.

STEAM V. PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Searchlight's" enquiries in your last issue, I think he will find greater economy in the upkeep of a petrol car, and greater satisfaction combined with reliability. The up-to-date petrol car is free from all vibration and perfectly silent, points greatly in its

simplicity, and economy, is, I think, most likely to attain his wishes by going in for a single cylinder (no water joints) slow-running engine, about 8-b.h.p., and belt driven (two belts only). By using belts one does away with troublesome clutches and expensive gear boxes. If a belt should break it is a very simple matter to mend it. Personally I prefer accumulator ignition, as also a tonneau shaped body. One soon tires of a car which can only seat two people. Why the leading makers do not build cars of about 8-b.h.p., single cylinder and belt driven, is a considerable puzzle to—Yours truly,

MOTORING MEDICO.

REPAIR OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The correspondents who have written re my letter on p. 932 labour under a mistake entirely. I do not complain at all about the charge of 1s. per hour for time; this in itself is reasonable enough. What I do grumble about is the quality of work done in the time, the length of time taken, the having to do the work over repeatedly, and the charging for boys as for journeymen. A few instances of these I may give haphazard from the account lying before me, viz.:—To taking off clutch and new leather fitted, fitting same five hours, leather, 7s. 6d.; this was on the 13th of the month. On the 16th, taking off clutch, 8s. 3d. Another item:—To petrol tank soldering and brake, self and man, twelve hours, 12s.

Another. To turning and fitting plate in pump, self and man, seven hours. I could go on *ad infinitum*. I think, when the repairs had to be

done at least three times for each repair before they were done right, that there is considerable room for complaint. Then, after spending weeks in trying to find out the cause of overheating, and having taken the cylinder down repeatedly, also overhauling the pump time after time, I have to pay for an expert at the rate of £1 10s. per day to get my so-called repairer out of his difficulties. This is enough to diminish the ardour of future motorists, unless they have sufficient time to do their own repairs. It is dreadful to think that one is at the mercy of such people, the majority of whom have never been trained as mechanics.

"Francois" states that there was something wrong with the car—that I had met with several accidents. I can only say that the car is an 8-h.p. Progress, costing over £270, and that in the time (eighteen months) that I have had it it has not cost over £2 12s. in the way of a slight accident; he will see that there is no need for such a large account for the last few months. My mistake was in giving the repairers (?) *carte blanche* to do what was required, and I find that I am charged for repairing or renewing most of the parts.

I may say also that in the account referred to, in addition to the items mentioned, there is an item of £16 for work with the cylinder. The use of engine and lathe for about two months amounted to £6 10s.

New bushes (material alone) £2. I find a good many motorists are, like myself, wishing we had known more about the motor repairers before we got our cars, and then we would have done without altogether, or have bought one from some firm not too far away, as we find these repairers, knowing absolutely nothing about the various cars, gain a little experience of each kind, and are still floundering in the dark when attempting to do any repairs.

When I requested my repairer to return all the old parts which he had renewed, all I could get, under pressure, was four caps, four cones, four bushes and four cog wheels from rear axle. This will give any thorough motor repairer a true idea of my complaints.—Yours truly,
CHIRURGEON.

THE BRITISH AUTOMOBILE INDUSTRY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are surprised to note in your issue of February 10th a reprint of a paper on British Automobile Industry, 1904, read by Mr. T. C. Aveling at the Automobile Club just recently, in which estimates are made of the production of various makes of cars. We would point out that Mr. Aveling requested us to provide him with certain information which we did not consider it necessary to furnish him with; and as he has made an estimate of the production which is ridiculously wrong in our case, we can only presume that it is equally so in several of the other firms mentioned.

In presenting a paper of this description before an important assembly like the Automobile Club, it is a great pity that the data given should not be more reliable, as it is very detrimental to the movement in this country, and will no doubt be read by many of our foreign competitors, and reproduced in their journals. We shall be glad if you will therefore prominently mention in your next issue that the figures mentioned, so far as they relate to the Wolseley Company's business, are totally wrong.—Yours faithfully,

THE WOLSELEY TOOL AND MOTOR CAR CO., LTD.

BENZ V. LIGHT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I find this correspondence very interesting and instructive. I can sympathise with owners of underpowered cars, although mine is not a Benz. If I had a Benz and wished to increase its power, I should either fit a longer stroke crank and so increase the cylinder capacity, or else increase the speed of the engine, and gear the car down to suit it. By doubling the engine speed the power is practically doubled. Larger inlet and exhaust valves might, however, have to be fitted in order to get increased engine speed, and perhaps a new carburettor might be required, or the present one would supply plenty of gas, except when the throttle was fully open and the engine running fast. Throttle control would be advisable, and would tend to lessen engine vibration.—Yours truly,

O. O. C.

WHAT IT COSTS TO KEEP A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the correspondence re cost of running a car, I give the following as my experience of a 12-h.p. chain-driven double-cylinder car with pneumatic tyres. I drive the car myself and do all the minor repairs. The car has been run 3,000 miles.

Petrol, £7 6s. 8d.; lubrication, oils, grease, etc., £1 9s.; tyre bands for back wheels, £6 9s. 6d.; two inner tubes, patches, plugs, lost nuts, brake leathers, and adjustments, £5 7s. 9d.; one set batteries (reserve), 14s. 6d.; accumulator charging, 8s.; paraffin, acetylene, etc., for lamps, 10s. 9d.; two inlet, one exhaust spring (only), 1s. 2d.; cost of coal, etc., for heating motor house (slow combustion stove), about 7s. 9d. Total, £22 15s. 1d. The car cost me £415. I have had about twelve punctures, but I would not have solids fitted at any price.—Yours truly,

B. E. BOLTON

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been troubled with my baby Peugeot in exactly the same way that M.R.C.S. has. My car was an extraordinary good hill-climber, but suddenly it began to lose power—in fact, it failed at the slightest incline. I could get only a very small amount of compression. I ground the valves, then tried it, still no better; during the time it suffered from loss of compression I ground the valves about five times, still no improvement. I then put in two new piston rings without making the slightest difference. At last I took out the valve again, and, after examining it closely, I found the bevel of the valve seat was slightly deeper than it was on the valve. When I discovered this I stopped the trouble in a very short time. With a very fine file I filed the seating down until I could just see the edge of the bevel of the valve after placing it in its seating, and then ground it in again. It completely cured it, and has stayed cured. The engine has as good a compression now as ever it had. If M.R.C.S. will closely examine his valves, I confidently anticipate he will locate the cause of all his trouble.—Yours truly,

DONE ENOUGH GRINDING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to M.R.C.S., re loss of power of Oldsmobile, he might overhaul his silencer; the small pipes sometimes get sooted up and the symptoms he describes then take place. Personally, I like a little more noise and less back pressure. I suppose the cylinder lubricating pipe is not choked.—Yours truly,

E. D. P.

MOTOR-CARS FOR COMMERCIAL TRAVELLERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you, or a reader, could give me any information respecting the utility of a car for a commercial traveller. My journeys being principally in the eastern and southern counties, so much time is lost by the poor service of trains on the numerous branch lines, that it has occurred to me that a car would be invaluable. Although I have heard of several C. Ts. using motors, I have not yet come in contact with one, and should be glad if any commercial traveller or reader of the *Journal* could give me the value of his experience, with the cost of running, etc. As I should have to buy the car myself, could I get a second-hand one heavy enough for the work for, say, £60 to £70, and what make would be advisable.—Yours truly,

A DRUMMER.

TYRE EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I thought perhaps my experience with pneumatic tyres might interest your readers. My car is a 6½-h.p. Gladiator bought in 1902, and fitted with Dunlop tyres. At first I had a great deal of trouble with the inner tubes nipping until I did the following:—Take the tyres off and file the rims perfectly smooth, finishing them off with emery cloth. Next wipe the rims quite clean and give them two or three coats of enamel. When the enamel is dry put the covers on, having first carefully cleaned them from all grit, and put canvas patches over any cuts that may have come through. Then put in the inner tubes, being very careful with the studs, and do not spare the French chalk—in my opinion one cannot use too much.

Since doing this the tyres have behaved well, but I am strongly in favour of solids for cars not exceeding 20 m.p.h., as there is always the chance of picking up a nail, and if one has very thick treads or bands fitted they must affect the resiliency of the tyre. I once drove the car from Droitwich to Barnet, 105 miles, in seven hours, average 15 miles per hour, and without the slightest hitch, although it rained the whole time.—Yours truly,

G. E. R.

HOTEL CHARGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I can hardly credit that your correspondent "One Who Pays a Fair Price" is a *bona fide* motorist, as there is a strong tinge of personal interest in his letter. I still maintain that the majority of motorists cannot and will not pay 9s. 6d. for a trifling lunch for two persons. Personally I would not object to pay a sovereign for a good meal if everything was equal and consistent with the charge. When one lives in London and is accustomed to the luxurious hotels and restaurants where one can dine in palatial saloons at fifty per cent. less than at a leading (I will not say first-class, as the words have lost their significance) rural hotel, I think I am justified in pointing out, for the benefit of your readers, what they may expect if they are foolish enough to follow my footsteps. There is no necessity for us to put up at a temperance hotel or coffee tavern if we are prepared to pay a fair price, but even these institutions could give many so-called first-class hotels a long start in cleanliness and comfort combined with moderate charges.—Yours truly

OWEN JOSEPH.

TIMING GEAR TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to know if any of your readers have ever had such a singular event happen as I have had just recently; it occurred on an 8-h.p. Daimler car. The large wheel of the two to one gear jumped seventeen teeth out of time, without even marking the teeth of either wheel. It was caused by one of the suction valves on the water pump (a semi-rotary) becoming fixed in an upright position and thereby preventing the eccentric on the cam shaft from completing its proper circle and so springing the large wheel out of mesh. The cam shaft is not bent and the bearings are fitted perfectly, the car having been only just overhauled; the engine is running excellently now.—Yours truly,
H. BROWN.

DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that "Owner" agrees with Mr. Edge that if good men were easy to get, one would not find the car as driven and cared for by the driver run at less per mile than the *chauffeur* driven one. He also notices that the owner-driven and cared-for car is always ready to run. So much for luck. But I, as a driver and one who has served my time to the trade, can tell "Owner" if he had my car, he might not be so fortunate in getting off so soon. All cars are not alike. I can tell "Owner" I have spent hundred of hours in keeping it in good working order, but

premium. Mechanics, as a rule, do not take kindly to such men, consequently they obtain only a smattering of the business, and in a few weeks' time they are entrusted with an expensive car and a set of tools, and they soon develop from anything into a mechanic-driver.—Yours truly,
M. D. L.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The demand seems mainly to be for a man to drive and keep in repair a motor-car, and do some domestic duties in addition, such as lamps and boots, valeting or stable help, at wages ranging from 20s. to 30s. per week. The supply who will work under these conditions are mostly men of no particular calling, who have been through a course of instruction as per the many advertisements in all the motor papers. What can be expected from such? If an owner wants a really competent man, he must pay a proper wage, and get him out of the workshop. The best man for the job is the man who has been apprenticed, spent money and much hard work and study in learning as much as he possibly can. That man is in the workshop and will very naturally stay there, at least until the present order of things alters.—Yours truly,
ARGYLL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being one of your first correspondents on the question of drivers, may I say we are indeed having some very varied opinions. For F. Ralph Harding's information, I beg to state I am (or was) one of

The Benz-Parsifal 35-h.p. Side-Entrance Double Phaeton.

as soon as one thing is right another goes wrong. I have never heard my master grumble over my not trying to do my best, nor yet say he could run the car cheaper than myself. As regards receiving commission on purchases paid for by driver, I have paid bills and not asked for such a thing and never expected it. Some owners are a bit "near," and I would forgive any mechanic-driver who gets anything out of them. I hope "Owner" will go on driving his own car, as he can run so much less per mile, and I hope he will always have it ready to start at a moment's notice.—Yours truly,

DRIVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the correspondence re drivers, and should like to give you my opinion. As a young man I gained a few years' experience in an engineer's workshop and office, and at night attended commercial classes. Arriving in London from the Colonies, I found that the motor-car trade was booming. I entered a petrol motor workshop and remained there two years, gaining a knowledge of petrol motors with practice in motor driving added. Unfortunately I was thrown out of work during the winter and all my efforts to get employment have been in vain, and the only remedy is to seek other employment. Herein lies the difficulty of obtaining practical men that Mr. Edge complains of. Novices enter a workshop or garage, paying a small

the man employed by the gentleman mentioned in my first letter. I am a qualified mechanic, who served and finished my time ten years ago. I have also had a motor experience dating back to 1897, when some of the first cars came to Scotland. I have here letters of proof where some of my former employers have requested me to come back to their service. Other men who have been with the gentleman above referred to hold some of the best positions as motor-men mechanics here in Scotland. I might also mention that this same master has also had a mechanic who has run in the Gordon Bennett races. Also, for another correspondent's information, I might say I am unable to overhaul a car with a sponge, chamois, spoke-brush, a few spanners, a pair of pliers, a couple of files, and a sparking plug or two. If my master has not got a workshop with the necessary plant, I am indeed unable to overhaul a car. There are lots of drivers going about who when they are about to take up a situation say they can take a car to pieces and reassemble them in two days; but their masters live to find it different.—Yours truly,

SUB JUDICE.

GRADIENT OF ANERLEY HILL.—"Gradient" asks for the exact gradients of Anerley Hill, which is paved on one side to assist heavy traffic.

THE MONARQUE MOTOR.—In answer to Mr. W. Lorkin, Messrs. Bailey and Lambert, Limited, 217, Piccadilly, W., inform us that they can supply all particulars of these engines,

AERONAUTICS AND BALLOONING.*

By MR. C. F. POLLOCK.

No doubt you are all aware that the fathers of aeronautics were the brothers Montgolfier, who first ascended in a fire balloon in France in 1783, and when one considers the nervousness with which some people view modern ballooning, with all its appliances, one must regard with admiration the courage of these pioneers in the science.

In the case of what is called a fire balloon, the ascending power is hot air—that is to say, you carry in the car with you a furnace, by means of which the air inside the bag of the balloon is kept warm, and, consequently, lighter than the surrounding atmosphere, and I need hardly point out that the danger of having such a furnace in the air must necessarily be very great. In 1783 also Messieurs Roberts and Charles, two French aeronauts, made an ascent in a hydrogen balloon. Hydrogen gas, I may here mention, is about ten times lighter than air, and 1,000 cubic feet of it will lift, approximately, seventy pounds weight. In the case of coal gas 1,000 cubic feet will lift about forty pounds weight.

The first ascent in England was made at Moorfields, near London, in September, 1784, by Vincent Lunardi, who may consequently be regarded as the father of ballooning in this country. In January, 1785, Messrs. Blanchard and Jeffries made the first voyage across the English Channel from Dover to Calais, and I have read thrilling descriptions of how, in order to reach the other side, they had to throw almost all their clothes into the sea, and I believe even consider if one should jump over the side in order to save the other.

Passing on over a number of years, we come to November, 1836, when the longest balloon voyage ever made from England was accomplished by Messrs. Green, Holland, and Monck-Mason, in the great Nassau balloon. These gentlemen ascended from Vauxhall Gardens one November evening, and after traversing the Channel during the night, descended the following afternoon at Weilburg, in Nassau, after being eighteen hours in the air.

We next come to the scientific ascents of the late Mr. James Glaisher and Mr. Coxwell in 1862, under the auspices of the British Association. I do not propose to trouble you with any particulars of these ascents, which are well known, but, personally, I think it doubtful if the estimate that a height of seven miles was attained was quite accurate.

In 1863 Nadar's great balloon, which was capable of holding 215,000 cubic feet of gas, the largest ever constructed, was used, but I believe it was not a great success, and it must certainly have been most unmanageable.

We next come to the first use of balloons for military purposes in connection with the escapes from Paris in 1870, and, as you are no doubt aware, General Gambetta adopted this mode of leaving the besieged town.

During the eighties there was quite a run on cross-Channel ballooning. Colonel Burnaby crossed in 1882, and, again, Mr. Simmonds later in the year from Maldon to Arras, 140 miles in two hours, which must have meant a gale.

Again in 1883 Mr. Simmonds and Sir Claude de Crespigny went from Maldon to Oudekerk, near Flushing, the only time the North Sea has ever been crossed.

In December, 1887, Monsieur L'Hoste and a friend attempted to cross from Amiens to England, but were drowned in the attempt; and this seems to have put rather a stop to cross-Channel ballooning, until I took it up again ten years later.

I now come to modern times, and to my own experiences in ballooning, an account of some of which may prove interesting.

It was a fine day in July, 1896, that I and a friend arrived at Olympia, and found Mr. Percival Spencer, with a balloon of some 21,000 cubic feet capacity, waiting to start. Apparently, Mr. Spencer had over-estimated the lifting power of the gas, for the balloon declined to leave the ground until practically the whole of the ballast had been discarded. At last, however, it rose from the ground, but immediately afterwards we found ourselves crashing through the bandstand, which was rather a nerve-trying operation for beginners.

Worse, however, was to follow, for the balloon still declined to lift clear of the houses, and in the course of a few seconds we were knocking against the chimney pots of a row of small houses outside Olympia.

Fortunately, however, Mr. Percival Spencer rose to the occasion, and while my friend and myself were holding tightly to the ropes to prevent ourselves being thrown out, he was untying the anchor, weighing about 70 lb., which he dropped into the street just in front of a hansom cab. The dismay on the face of the driver amused me, even in the unpleasant position in which I then was.

This action of Mr. Spencer's saved us from accident, for the next moment the balloon lifted clear of the houses, and rose well into the air. Our position even then was not altogether satisfactory, for there we were, over London, with only a light breeze, and no ballast to throw out, or other means of maintaining our position in the air. Fortunately, however, the wind drifted us towards Hampstead Heath, about the nearest open space to Olympia, and there we descended without mishap, after being in the air some twenty minutes or half-an-hour.

Although this first ascent was by no means a satisfactory one, I caught the aeronautical fever, and in the January following I again made an ascent with Mr. Spencer from the Welsh Harp, Hendon.

In July, 1897, I made my first ascent alone from the Welsh Harp, and in September, 1897, it occurred to me that a cross-Channel balloon voyage would be an interesting experience, and I consulted Mr. Percival Spencer on the subject. He took a great interest in the attempt, ultimately selecting Devonshire Park, Eastbourne, as the best starting point.

Arrangements were duly made in the way of laying on gas, etc., and on October 11th, the wind being then in the north-west, Mr. Spencer and I went down to Eastbourne with a view to my attempting the voyage on the following day.

The morning of October 12th opened with a moderate north-west wind, and there seemed little doubt of the success of the voyage.

The balloon was inflated by 10 o'clock, and at that hour the word to let go was given, and the next instant I was drifting over the park and out to sea. The balloon was of 35,000 cubic ft. capacity, and in addition to the trail rope—200 ft. long—carried fourteen bags of sand, weighing 7 cwt., and one or two other articles in the way of life belts, a sea anchor, etc.

I had a fair lift at the start in order to clear the houses round Devonshire Park, and steadily attained an altitude of 4,000 ft.

Towards eleven o'clock the balloon began to descend, and I threw out half a bag of ballast. The English coast disappeared at 12.10, though I fancy I saw Beachy Head an hour later. One is accustomed to think of the English Channel as crowded with shipping, but, as a matter of fact, at times on this voyage nothing was visible but sea and sky.

By 12.45 o'clock the balloon had reached 5,000 ft., and there were some wonderful cloud effects. I naturally kept a keen look-out for the French coast, and about 1.30 o'clock it loomed into view. Soon afterwards I noticed that the balloon was descending, and as I was anxious to ascertain my course, I determined to allow the trail rope, which was hanging below the car, to touch the water. At 2.30 the balloon had risen to 8,000 ft., and I was crossing the bar of the Somme River, near St. Valery, having thus occupied 4½ hours in the trip over the Channel. From 2.30 o'clock to 4.30 o'clock the balloon passed over France with the trail rope on the ground most of the time, and I ultimately descended near Domart, which is ninety-five miles from Eastbourne as the crow or balloon flies.

Returning now to the subject of aeronautics generally, I think that the next most important event in this history is the attempt by André to reach the North Pole by balloon. André left Danes Island, 800 miles from the Pole, on July 11th, 1897, with the wind slightly to the west of south, and since then the only news has been received by carrier pigeon, and in my opinion there is very little chance of anything further ever being heard of the bold traveller. Although André's expedition proved fatal, I am myself inclined to think that the idea of reaching the North Pole by balloon is a good one, and that with management and luck there is no reason why the attempt should not be successful. The drawback would be, however, that, assuming the North Pole was reached by balloon, it would be dangerous to descend, and, consequently, there would not be much opportunity of taking note of the conditions existing there. I believe André thought that his balloon would remain a number of days in the air, but in this I think he was mistaken, as the variations in temperature must, in my view, bring any balloon to the ground within a comparatively few days from the start, although the even temperature of the Polar regions would no doubt permit a balloon to remain longer in the air than in other parts of the world. I think that André made the mistake of having too elaborate apparatus, and that he might have done better if he had carried fewer trail ropes and not troubled about sails.

I will now deal briefly with the question of airships. As you are all aware, a number of airships have been tried of late years with varying success and various accidents. I think that on the whole M. Santos Dumont has done the most from a practical point of view, although I believe that the airship of M. Lebaudy has been nearly, if not quite, as successful. Of our countrymen, the airship of Mr. Stanley Spencer is the only one which has made any practical ascents; but I am told that the airship of Mr. Beadle, which I hope we may see at the Aero Club Exhibition at the Agricultural Hall next March, has many good points. All the airships which have so far made any practical ascents have been of the type known as "lighter than air"—that is to say, they have been suspended in the air by means of a hydrogen gas bag. This necessitates the driving through the air of a large and comparatively fragile fabric, and I do not myself consider that airships of this type can ever be safely manoeuvred except in calm weather. If, for instance, the wind is blowing at the rate of twenty miles an hour, which is a moderate breeze, it is necessary, in order to go against it at the rate of ten miles an hour over the ground, to drive the balloon through the air at the rate of thirty miles an hour, and the pressure on the gas bag would be considerable, and perhaps cause it, if of the ordinary cigar shape, to buckle up. I believe that Count de la Vaulx, the famous French aeronaut, considers that the spherical balloon with motor propellers would be more satisfactory than the usual cigar-shaped airship, but I do not agree with this view, as the resistance to the air would then be considerably greater than in the case of the cigar-shaped ships. The difficulty in the case of the "heavier than air" ships is to get them into the air at all, and, in fact, so far as I can make out, this has never been done, except, perhaps, in the case of Mr. Maxim's airship some years ago, when I understand that, with the assistance of a run, the airship did rise some three or four feet. I think, however, that as time goes on, and we are able to get more power or less weight, something might be done in the direction of an airship "heavier than air," and possibly the St. Louis Exhibition may show developments in this direction.

* From a paper read at the Automobile Club on Thursday, February 18th.

CASES DISMISSED.

At the Dorchester County Police Court, on Saturday, Dr. Wm. Ernest Good, police physician, was charged under the Light Locomotives Act with driving a motor-car on January 29th at 6.15 p.m., at Stratton, without showing a red light at the rear. Dr. Good stated that he was carrying three lamps lighted, an acetylene lamp in the centre on the front, and a paraffin lamp on each side. Each side lamp showed a red light on the reverse. He had no tail light showing the number, but he was not charged, under the new Act, with not showing the number. Dr. Good produced the off-side lamp from his carriage, which was that night lit and exposing a red light at the back of the lamp. The lamp produced was one of the side lamps similar to those upon an ordinary carriage. The summons was dismissed.

At Bournemouth, Louis Clayton, of Westbourne, has been summoned for having driven a motor-car at an excessive speed in the Old Christchurch Road, on the 2nd inst. P.S. Tarrant stated that on the evening of the 2nd inst., whilst on duty in the Old Christchurch Road, he saw the motor-car. Shortly after he passed the car it started, and defendant apparently "put on a lot of power," as the car went at a considerable speed down the road. At the time a tram-car was coming round the curve. The car pulled up immediately, but the motor-car struck it on the off side, the impact driving the motor-car on the kerb. The Rev. Charles Seagrim, curate at St. Peter's Church, said he was watching the car at the time of the accident, and made a remark to several persons that it was clearly a case of skidding. The driver of the motor-car was going perfectly steadily at a pace of between six and seven miles an hour. The Bench, after a short retirement, found that, from the evidence given, which was very distinct on both sides, there was a doubt in the case, and they dismissed it.

MR. STEPHEN SIBLEY, of Richmond, was summoned before the Woking county magistrates on Saturday for driving his motor-car at a speed exceeding the legal limit of twenty miles per hour at Ripley on January 24th. He pleaded not guilty. Sergeant Jarrett stated that the car covered the one hundred and seventy-six yards in 14.2-5 sec.,

The Arrol-Johnston 12-h.p. Estate Wagon. (See page 989, last issue.)

which was at the rate of twenty-five miles per hour. Police-constable Pink said he stopped the car on receiving the sergeant's signal. It was going fast, but he should not like to estimate the rate of speed. Mr. Staplee Firth (instructed by the Motor Union) pointed out that the new Act provided that a person should not be convicted merely on the opinion of one witness as to the rate of speed, and contended that on this point alone the prosecution must fail. In the result the chairman (Sir W. Chance) said they did not propose to give any opinion on the point which had been raised, but they were not satisfied that there might not have been an error in this case on account of the small margin between twenty and twenty-five miles. Therefore the case would be dismissed.

At Aylesbury Petty Sessions, the first case under the new Motor-car Act for the county, with reference to the speed of cars, came before the Bench. Mr. William Fletcher, of Dadbrook, Widdington, was summoned for driving his motor-car in Aylesbury to the public danger. Mr. R. S. Wood, solicitor, defended. Mr. William Crouch, Clerk to the Bucks County Council, stated that he saw the defendant driving at a very high speed in Oxford Road, Aylesbury. He was just able to distinguish the number of the car. Mr. Wood, for the defence, contended that the case was not proved, as it was not shown at what speed the car was travelling. If this case were upheld, it would be open to anyone to lay an information, if he thought a car was proceeding at a dangerous speed. The Chairman of the Bench (Mr. T. Gurney) said they would dismiss the case on defendant paying the costs, but he must be very careful how he drove in future.

AN ECHO OF OLD TIMES.

At the Hailsham Petty Sessions, Edward Lehwess, of Curzon Street, London, was summoned for driving a motor-car to the common

danger in the highway, Dicker, on July 28th, 1903. This was an old case instituted before the present Act came into force. Defendant did not appear. P.C. Waghorn, of Lewes, gave evidence of timing the car over a measured furlong, which, he said, was covered at a speed representing thirty-two miles an hour. A fine of £10, with 7s. costs, was imposed.

CLAIM FOR DAMAGES.

MR. JUSTICE WILLS and a special jury, in the King's Bench Division, has heard the case of *Wethered v. Motor Manufacturing Company, Limited*. This was an action brought by Mr. Henry Wethered, of Malden, Surrey, against the Motor Manufacturing Company, Limited, to recover £395, the amount which he had paid for a motor-car. Defendants denied liability. The plaintiff's case was that he gave an order for a 10-h.p. motor-car at the exhibition held at the Agricultural Hall in March, 1903, and that it was delivered to him at Eastbourne. The car broke down on several occasions, and plaintiff said he sent it back to be overhauled. It was returned to him and stated to be in good working order. Plaintiff again tried the car, and he said that as it was not a success he returned it to the company and demanded his money on the ground that it was not what it had been represented. Defendants denied that the car was not equal to the description given of it, and alleged that the defects were due to inexperience on the part of the plaintiff or his servants. The jury returned a verdict for the plaintiff, awarding £300 damages. Judgment was entered accordingly, a stay of execution being granted pending an appeal.

THE PURCHASE OF A MOTOR-CAR.

IN the King's Bench Division of the High Court of Justice, Mr. Justice Buckley had before him an action, brought by Charles Garland against Julian Humphries, for £500 damages for alleged breach of contract for sale by the defendant to plaintiff of an 18-h.p. motor-car. Mr. Matthews, for the plaintiff, said that the defendant had filed an extraordinary plea. He admitted that he entered into a French contract with the plaintiff to procure delivery to him of the chassis of an 18-hp. Mercedes motor-car, 1903 model, with Mercedes body, at the price of £1,050, and that a sum of £350 was paid to the defendant by the plaintiff on account of such price, but said that no time was fixed for delivery, and that a reasonable time for the purpose had not elapsed at the commencement of the action. Mr. H. G. Burford, managing director of the Milnes-Daimler, Limited, Tottenham Court Road, W., said the value in the market of a car of the description contained in the contract, delivered at the end of May, 1903, would be about £1,350. He was delivering a car this month, which was sold about the same date at £1,400. He did not know the defendant. All cars were sold twelve months ahead. If such a car had been sold for immediate delivery, the price would have been about £1,450. Mr. Alfred Mansell, managing secretary of Automobilia, Oxford Street, W., said in his opinion the plaintiff could not, in the open market, have got a Mercedes open car at the end of 1903 for less than £1,300. Mr. Matthews submitted that the plea of defendant was a clear admission of breach of contract, and that the plaintiff was entitled to the £500 damages which he claimed. His lordship gave judgment for the amount claimed, defendant not appearing.

CLUBS AND ASSOCIATIONS.

SOUTH WALES AND MONMOUTHSHIRE.

MR. GODFREY L. CLARK (Talygarn) presided at a meeting of the Automobile Club of South Wales and Monmouthshire, held last week at Cardiff, to consider *inter alia* the recent proposals of the Newport Corporation to restrict the speed everywhere in the Borough of Newport to ten miles per hour. It was pointed out that these restrictions would have a serious bearing in regard to motorists in South Wales and the West of England. It was also noted that Glamorgan county and Cardiff had placed no such limit. The hon. sec. was instructed to send votes of thanks to the Glamorgan County Council and to the Cardiff Corporation for having expressed their willingness to give the present Act a trial without restrictions, and a hope was expressed that the confidence thus reposed would not be abused by motorists.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.
